Many learned Authors have observed such an Incrustation; Pancirollus, for Example, four Miles from Rome, without the Gate of Ostia, commonly called St. Paul's; and Doctor Martin Lister, in the Conduit d'Arcueil at Paris, whence he conceived a bad Opinion of it, the learned and worthy Gentleman concluding, that whatever lined the Cavities of the Pipes of an Aqueduct with a strong Crust, would probably work the same Effect in the Reins and Bladder, especially if those Parts were infirm and tender. See his *Journey to Paris*, and *Essay on the Stone*. If you would know more of the *Adarces*, read Boetius, p. 405. *Dale*.

It is called also *Calomochmus*, or *Calomochanus*. *Salmasius*.

ADARNECH. The same as *Auripigmentum*. Orpiment. *Rulandus*.

ADARIGO. Castellus quotes this Word from Rulandus and Johnson, and explains it *Orpiment*. But neither of these Authors mention the Word. Johnson has *ADARIGES*, which he says is *Armoniacum*, which he transcribes from Rulandus, by Mistake, for *Adirige*. I am inclinable to believe he means the Salt, not the Gum, for both have been wrote thus, instead of *Armoniacum*.

ADARRIS. Rulandus explains this by *Flos Maris*, which should mean the Spuma or Foam of the Sea. But according to the German Word, by which he translates it, it seems to be some Flower. However, I am rather inclined to believe it means the former.

ADARTICURATIO. A Species of Articulation of the Bones, the same as *ARTHRODIA*. See *ARTHRODIA*.

ADAXOMÆ. Castellus has latinized this Word, and made it an Article in his Lexicon. The Word is from a Greek Verb *ἀδαξομαι*, to be affected with a painful Itching. *Galen*.

ADDEPHAGIA, or ADEPHAGIA. *Ἀδδφῆα*, or *Ἀδδφῆα*. From *ἄδδ*, abundantly, and *φῆα*, to eat. Insatiability. A voracious Appetite. *Constantine. Castellus*.

ADDITAMENTUM. The same as *EPIPHYSIS*. The large Epiphysis of the Ulna, at the Elbow, is called *ADDITAMENTUM NECATUM*. *Castellus*.

ADDITIO. ADDITION. When any Thing that is deficient is supplied by Surgery, it is called *Addition*, *ὑπόθεσις*, to distinguish it from another Part of Surgery, which consists in removing what is redundant, and superfluous, which is called *Ἀφαιρέσις*, *Subtraction*. And of these two the whole Art of Surgery consists.

ADDUCTOR. Many Muscles are called by this Name, as

ADDUCTOR MINIMI DIGITI PEDIS, or TRANSVERSALIS PEDIS PLACENTINI, arises tendinous from the external *Os Sesamoidæum* of the great Toe, firmly adhering to the tendinous Part of the *Adductor Pollicis*, soon growing fleshy, it passes over the Extremity of two of the *Metacarpal* Bones, between them and the *Flexores Digitorum*, and then, growing broader, is inserted into a Tendon that proceeds from the *Extensor Tendinosus* in the Sole of the Foot, and partly into that cartilaginous Ligament that covers the Articulation of the first Joint of the third lesser Toe, with its *Os Metatarfi*, some of its fleshy Fibres being contained upon the same Part of the little Toe.

Its Use is to bring the third and fourth lesser Toes nearer the other two and the great one. *Douglas*.

ADDUCTOR OCULI, arises tendinous and fleshy, from the Edge of the Hole in the *sphenoidal Bone*, that transmits the *Optic Nerve* between the *Obliquus Major* and the *Humilis*.

Is inserted by a thin Tendon into the *Tunica Sclerotica*, where it respects the great *Canthus*.

Its Use is to bring the Eye toward the Nose. *Douglas*.

ADDUCTOR POLLICIS MANUS AD INDICEM, ANTITHENAR RIOL. Arises from the Outside of the upper Part of the *Os Metacarpi Indicii*.

Is inserted into the first Joint of the Thumb, sending off a thin Tendon, which runs along with the *Extensor Pollicis Longus*.

Its Use is to draw the Thumb nearer the Fore-Finger. *Douglas*.

ADDUCTOR AD MINIMUM DIGITUM. Arises a little tendinous, but chiefly fleshy, from the whole Length of the *Metacarpal Bone*, that sustains the Middle-Finger, from whence its Fibres, contracting equally on both Sides, run up to the Thumb.

Is inserted into its second Joint, a little below one of its Seed-like Bones.

Its Use is to bring the Thumb towards the Ring and Little-Finger. *Douglas*.

ADDUCTOR POLLICIS PEDIS. Arises by a long, thin, disgregated Tendon, from the *Os Calcis*, under the tendinous Part of the *Massa Carnea*, from the *Os Cuboides*, from the *Os Cuneiforme Medium*, near the Insertion of the *Peroneus Primus*, and from the upper Part of the *Os Metatarfi* of the second Toe: It is soon dilated in a pretty large Belly.

Is inserted into the external *Os Sesamoidæum* of the Great-Toe.

Its Use is to bring this Toe nearer the rest. *Douglas*.

ADEC. Sour Milk. Or Butter-Milk. *Rulandus. Johnson*.

ADECH. Paracelsus says, *Spiritus interior agentem Distinctionis Causa Adech vocare soleo*. The Author of the Explications of the Words used by Paracelsus defines *ADECH*, the invisible internal Man (or Part of Man) which impresses the Ideas or Forms of those Things on the Mind, which are visible or tangible by the external Man. Rulandus says it is the internal and invisible Man, which conceals, or lays the Plan of whatever the external and visible Man afterwards executes or imitates with the Hands.

This any one in his Senses would probably call the Soul, but Enthusiasts, Alchymists, and Madmen, think it a Derogation from their Honour to make Use of the intelligible Dialect of the Vulgar.

ADECTOS, *Ἀδδτος*. From a Negative, and *δδω*, to bite. It is an Epithet of those Medicines which relieve from Pain, by removing the uneasy Sensation caused by the Stimulation of acrimonious Juices, or Medicines. *Castellus* from *Tiraquellus*.

ADEDENTES. *Phagedænic*, or eating. See *PHAGEDÆNA*. It is applied to Ulcers. *Castellus*.

ADEHEMEST, AIOHONEC, or ALHOHONEC. Rulandus explains it by *Lamina*, a thin Piece of Metal, a Blade.

ADELOS, *Ἀδδλος*. From a Negative, and *δδλος*, manifest. Not manifest, insensible. *Ἀδδλα πρδσκαρῆα*, are Things which are the Subjects of the Senses when they appear, but which at the present Time do not appear; their being insensible therefore is only temporary, which the Word *πρδσκαρῆα* implies. This is a Term of the Physicians of the Empiric Sect. *Goræus* from *Galen*.

ADELPHIA. From *Ἀδδφῆα*, a Relation. Thus Distempers are called by Hippocrates, which are like, bear Relation, or Analogy to each other.

ADELPHIXIS. *Ἀδδφῆξις*, of the same Derivation as *Adelphia*. The Analogy, Relation, or Similitude, which some Parts of the Body, and some Distempers have with others. Or the Communication, Consent, or Sympathy of some Parts with others. *Hippocrates. Foesius*.

ADEMONIA. *Ἀδδμονία*. From a Negative, and *δδμων*, a Genius, Divinity, or Fortune. This is a Word used sometimes by Hippocrates, to express that great Uneasiness, Restlessness, and Anxiety, which Patients frequently complain of, in acute Diseases more especially, and is remarkable in some Kinds of hysterical Fits, of which it is mentioned as a Symptom by Hippocrates in his short Treatise, *De his quæ ad Virginem spectant*.

ADEN. *Ἀδδν*. A Gland. See *GLANDULA*.

ADENIOS, *Ἀδδνιός*. From a Negative, and *δδνος*, Council. It signifies inadvertently, carelessly, done without Care, or Forecast. *Foesius* from *Galen* and *Hesychius*.

ADENOIDES, *Ἀδδνιδής*. From *ἄδδν*, a Gland, and *ιδής*, a Form. It signifies Glandiform, or like a Gland, and is used as an Epithet for the *Prostata*. See *PROSTATA*. *Castellus*.

ADENOSUS ABSCESSUS, is a hard, crude Tubercle, resembling a Gland, very difficult to be resolved. *Castellus* from *Marcus Aurelius Severinus*.

ADEPHAGIA. See *ADDEPHAGIA*.

ADEPS. *Ἀδδψ*. This is an Animal Oil, contained in the *Membrana Adiposa*, or, as Boerhaave calls it, the *Membrana Cellulosa*, which is not a single Membrane, but a Congeries of a great Number of membranous Laminæ, joined irregularly to

to each other at different Distances, so as to form numerous Interstices of different Capacities, which communicate with each other. These Interstices have been named *Cellule*, and the Substance made up of them, the *cellulous Substance*.

The Thickness of the *Membrana Adiposa* is not the same all over the Body, and depends on the Number of Laminæ, of which it is made up. It adheres very closely to the Skin, runs in between the Muscles in general, and between their several Fibres in particular, and communicates with the Membrane which lines the Inside of the Thorax and Abdomen.

This Structure is demonstrated every Day by Butchers, in blowing up their Meat, when newly killed; in doing which, they not only swell the *Membrana Adiposa*, but the Air insinuates itself likewise in the Interstices of the Muscles, and penetrates even to the Viscera, producing a Kind of artificial Emphysema.

These cellular Interstices are so many little Bags or Satchels, filled with an unctuous or oily Juice, more or less liquid, which is called *Fat*, the different Consistence of which depends not only on that of the oily Substance, but on the Size, Extent, and Subdivision of the Cells.

It is generally known, that the illustrious Malpighi took a great deal of Pains about this Substance; that in Birds and Frogs, the Viscera and Vessels of which are transparent, he thought he saw a Kind of Ductus Adiposi; and that, by pressing these Ducts, he observed oily Drops to run distinctly into the small Ramifications of the Vena Portæ.

The Manufacture of Soap, the Composition of Unguentum Nutritum, and the different Mixtures of Oils with saline and acid Liquors, give us some Idea, at least, of the Formation of Fat in the human Body; but the Organ which separates it from the Mass of Blood, which ought to be the Subject of our present Inquiry, is not as yet sufficiently known.

Fat is more fluid in living than in dead Bodies. It melts with the Heat of the Fingers in handling it, and its Fluidity is in Part obstructed by the Sacculi, which contain it. To take it intirely out of these Bags, the Method is to set the Whole over the Fire in a proper Vessel; for then the Bags burst, and swim in Clusters in the true oily Fluid.

This Substance increases in Quantity in the Body, by Rest and good Living, and, on the contrary, diminishes by hard Labour and a spare Diet. Why Nourishment should have this Effect, is easily conceived, and it is likewise easy to see, that an idle sedentary Life must render the Fat less fluid, and consequently more capable of blocking up the Passages of insensible Transpiration, through which it would otherwise run off.

Hard Labour dissolves it, and consequently fits it for passing out of the Body, with the other Matter of insensible Transpiration. Some are of Opinion, that it returns into the Mass of Blood, by the capillary Veins, and that it can, for some certain Time, supply the Want of Nourishment.

By this, they think, the long Abstinence of some Animals may be explained; but, I am apt to believe, the mere Decrease of cutaneous Transpiration, occasioned by the continual Rest and Inaction of these Animals, has a great Share in this Effect.

The proportional Differences, in the Thickness of this *Membrana Adiposa*, are determined, and may be observed to be regular in some Parts of the Body, where either Beauty or Use required it.

Thus we find it in great Quantities, where the Interstices of the Muscles would otherwise have left disagreeable hollow or void Places; but, being filled, and as it were padded with Fat, the Skin is raised, and an agreeable Form given to the Part.

The Appearance of a Person moderately fat, of a Person extremely lean, and of a dead Carcass, from which all the Fat has been removed, proves sufficiently what I have said.

In some Parts of the Body the Fat serves for a Cushion, Pillow, or Mattress, as on the Buttocks, where the Laminæ and Cells are very numerous. In other Parts this Membrane has few or no Laminæ, and consequently little or no Fat, as on the Forehead, Elbows, &c.

In some Places it seems to be braced down by a Kind of natural Contraction in Form of a Fold; as in that Fold which separates the Basis of the Chin from the Neck; and in that which distinguishes the Buttocks from the rest of the Thigh. We observe it likewise to be intirely sunk, or, as it were, perforated by a Kind of Dimple or Fossula, as in the Navel of fat Persons.

These Depressions and Folds are never obliterated, let the Person be ever so fat, because they are natural, and depend on the particular Conformation of the *Membrana Adiposa*, the Laminæ of which are wanting at these Places.

The Fat is likewise of great Use to the Muscles in preserving the Flexibility necessary for their Actions, and in preventing or lessening their mutual Frictions. This Use is of the same Kind with that of the unctuous Matter found in the Joints.

Lastly, the Fat is a fine oily Substance in its natural State, and may be some Defence against the Cold, which we find

makes more Impression on lean than on fat Persons. It is for this Reason, that to guard themselves against the excessive Colds of hard Winters, and to prevent Chilblains, Travellers rub the Extremities of their Bodies, and especially their Feet, with spiritous Oils, such as that of Turpentine, &c.

This Mass of Fat, which makes an universal Integument of the Body, is different from that which is found in the Abdomen, Thorax, Canal of the Spina Dorsi, Articulations of the Bones, and in the Bones themselves.

But the Differences of all these particular Masses of Fat consists chiefly, as I have said, in the Thickness or Firmness of the Pellicles, in the Largeness or Smallness of the Cells, and in the Consistence, Fluidity, and Subtlety of the oily Matter. *Winslow's Anatomy.*

To this Account of the Fat I shall add that of the celebrated Leeuwenhoek.

After the Discoveries that I had made concerning the Circulation of the Blood, particularly that the Blood-vessels had no Endings, I began to consider how the fat Particles could be formed, since I did not think that they were separated from the Blood, and came out of the Blood-vessels. But having now plainly discovered, that the so called Membranes were nothing but very small Vessels, and believing that they were created for no other End but to transport Nutriment, as also that there was no Circulation in these Vessels, I imagined, that the Matter, which we call Fat, was brought into them, which, when there was too great a Supply of Nutriment, so that it could not be forced farther on, must be driven out of these Vessels; for all the Particles of Fat, that I have as yet observed, are inclosed in small Films.

This Original of the Fat is to me much more credible, than that it should be forced out of the Blood-vessels; and yet how these fatty Particles, which consist of large Globules, and those of still smaller Globules (as it appears to me) are made and formed, I cannot as yet determine: As also where these Vessels, which constitute what we call Membranes, have their Beginning, and how this Fat is brought into them.

I had in my Drawer a Piece of Ox's Flesh, that I believe had lain there about four Years, wrapped up in a Paper, which Piece I found in some Places to be covered with a Membrane; from this I cut off several small Slices along with the Membrane; and I found that, near the Membrane, there lay about sixteen or eighteen nervous Fibrils, which, in the drying of the Flesh, were so squeezed together, that they were almost twice as long as they were broad. In some of which I saw very distinctly those Vessels which are in the Nerves.

These nervous Fibrillæ were inclosed by a Sort of Half-round, separating them from their muscular Fibres, which Half-round consisted of a Row of small tendinous Fibrillæ, each of which was about twice as thick as a Hair of a Man's Beard. Without these tendinous Fibrillæ lay the muscular Fibres, that had been cut through transversely; and in this Part of the Half-round there were several Apertures, which seemed in the Microscope to be big enough for Hemp-seed to pass through them, which might well be taken for Vessels, but that there lay so many of them together. But, considering that the Nerves are commonly covered with fatty Particles, I concluded, that these Apertures were no Vessels, but mere fatty Particles, which I found to be true when I had cut through them, and discovered that the inward Fat was eaten out by the Mites, which had left only the Husks, or Cortices, of the fat Globules behind, which Cortices I never had as yet been able to discover, because the Cortices of the fat Globules would, upon any Heat, melt away as fast as the inward Fat.

I have formerly said, that the Matter which we call Meal, or Flour, in Wheat, Rye, Barley, Oats, and in all Sorts of Beans, is shut up, as it were, in little Cells, or Chambers, and that those little Cells are separated from each other by thin Membranes, which are thinnest in Wheat: And as in the Enquiry into what is called the Periosteum of an Ox or Sheep, I have often broke in Pieces the fat Particles thereof, and as often viewed them through a Microscope; so have I likewise placed a few of the fat Globules upon a clean glass Plate, and held it over a Coal-fire, or the Flame of a Candle, till they were all melted and reduced into a liquid Matter; so that not only the Fat, which was shut up in the Skin of the fat Globules, but likewise the Skin itself was reduced to a fluid Matter; and thereupon I immediately brought it before my Sight, and, viewing it with Attention, perceived, when the melted Fat was cold, that there were different Matters inclosed in the said fat Globules; for there appeared an inconceivable great Number of exceeding small coagulated Particles, and the rest of the Parts, of which the Fat was composed, lay in one smooth and even Substance, and I have considered, whether there might not be inclosed, in such a Globule of Fat, so many little Cells and Partitions, as we see in a little Grain or Seed, but, if it be so, it will remain concealed from our Eyes.

But having now again carefully contemplated these coagulated Globules of Fat, many of which go to the making of one little

little Bubble, I did often fancy, that I saw, that each of the said small Particles was provided with such a transparent Dent, as I have before said, that the Meal Globules of Wheat, &c. are furnished with.

Nay, I have fancied to myself, though it did not appear to my Sight, that each fat Particle is furnished with little Cells within, like the Seeds or Fruits of Plants.

Since I wrote this, I was informed my Butcher had killed a Sheep of an uncommon Bigness, and that it weighed 140 Pounds, without the Fat that they took out of it, after it was killed, which weighed 51 Pounds, so that the whole Sheep weighed above 190 Pounds.

I caused a Piece of the Fat that grew about the Kidnies to be brought to me, imagining, that its fat Particles would be of a coarser Grain than those of ordinary Sheep; for I have observed several Times, that the bigger an Ox was, the larger were the fat Particles thereof; and since not one Man in a Thousand has any Knowledge of the Contexture of these fat Particles, for we find that there are not any two of one and the same Figure, they being compressed by other Particles with which they are surrounded, I have caused some few of these fat Particles to be drawn, as between A. B. C. D. *Plate III. Fig. 1.*

Now when we meet with one of these little Bundles of fat Particles, as has frequently occurred to us, in which the fat Particles were four Times this Thickness, I imagine, that such fat Particles cannot be produced out of one single adipose Vessel, but that out of such a Vessel several small Springs issue forth, and out of each of those small Springs proceed others still smaller, and that out of these Particles one larger fat Particle is formed like a Bunch of Grapes.

Now I cut off with a Razor the Fat in several Places of a greater Piece, as thin as I could, laying the thin Pieces upon several glass Plates, and put them upon a Coal-fire, so as to cause them to melt; and, being melted, immediately viewed them with a magnifying Glass, when I observed the Skins, or membranous Coats of the fat Globules lying among the melting Particles, and in the said melting Particles there was nothing to be perceived but a limpid Matter, surrounded with small Air-bubbles; but, when the Fat was congealed, we could observe but very little of the Membranes, because they were covered with the Particles of Fat, with which these Membranes or Skins had before been filled.

I caused a few of these Skins of the fat Globules to be drawn, between E. F. G. H. *Plate III. Fig. 1.* During the said Observation, I fixed my Eye with Attention upon the fat Particles of the Sheep which had been melted, and were again coagulated; and I could not but judge, that these fat Particles, which were exceeding small, were analogous to that internal Matter, wherewith some of the smallest little Seeds are furnished, and, in a great many of these exceeding small Particles, I could in clear Weather discover some Transparency.

Moreover, I cut as thin Slices as it was possible of the Fat, yea, so thin, that five or six of them did not weigh a Grain, and put them into a little Water, in order to try whether I could make any farther Discoveries thereby, with Respect to the small Particles of Fat, but it was in vain; only I saw floating upon the Water very small Particles of Fat, which were coagulated in a spherical Figure, and the very biggest of those fat Particles was no bigger than a Grain of Sand. I placed these Particles upon a glass Plate, and viewing them with a Microscope, I observed the Figure, which I mentioned above, as plain as before, and other fat Particles seemed to be of a different Figure; I put one of these into the Hands of my Painter, or Designer, bidding him to draw what he had observed, it being the Figure of one of the said fat Particles, which was coagulated on the Water, as it is represented between I. K. L. M. *Plate III. Fig. 1.* which was not very conformable with the other melted fat Particles; for, in the doing it, all the Particles did not melt, for the fat Particles are not all extracted by the Water, and coagulated upon the Water in smaller and greater globular Particles; and when we take out of it the Remainder of the thin Slices of Fat, which float upon the Water, and view them with a Microscope, we find, that many of the fat Particles appear intire to the Eye; and whereas they were before very smooth and even in their Sides, they were now changed into rough and uneven Particles; so that one should be apt to think, that there were two different Sorts of Particles in the Fat, and that one Sort melted more easily than the other.

Now in order to get these melted Particles of Fat out of the Water, without altering them, I made Use of a round Glass, and with it skimmed the Superficies of the Water, by which Means some of the coagulated Particles stuck to the Glass. Moreover, I did again melt some of the fat Particles, which had been coagulated upon the Water, over a Coal-fire, as they lay in the Water; and, when they were again coagulated, viewing them with a Microscope, I found the small fat Particles to be yet smaller than those that were melted out of the Water.

In this last Observation I observed, with Astonishment, the inconceivable Number of Veins and Membranes, which were diffused through the Fat, and the Multitude of separated fat Particles, that were involved in their several Membranes.

After this there was laid before me the Hind-quarter of a sucking Lamb, over which was spread what we call the Net, or Caul; and having cut off some Pieces of the said Net, or Caul, upon which there was little or no Fat, with a pair of Scissars, and placing them before a Microscope, I observed again, that the fat Particles, where there were very few of them included between the Membranes, were of a more globular Figure than in other Parts, where a good many lay together, and that in other Places they were pressed and bruised, which I fancy was occasioned by the Butcher's squeezing the Caul in that Place with his Fingers; and in another Place the fat Particles had been so torn in Pieces, that I could see nothing remaining but the Skins of the fat Globules.

Moreover, I saw that the fat Particles had such a Pinch, or Dent, in them, as I have shewn, that there were in the Globules of Flour of Wheat; from which Spectacle, I am confirmed, more than before, in my Opinion, that the fat Globules might be separated intirely, or in Part, from the Skin with which they are surrounded, by opening the Dents, without breaking the Skin.

Then I took off the thin Membranes, which encompassed the fat Particles, and viewing them with a Microscope, observed, that the fat Particles had imprinted a roundish Figure on the Membranes inclining to a hexangular Shape, that it was a Pleasure to look on them; but in other Parts they were of an oval Figure.

Moreover, I took a flat Fish, which we call *Plaife*, and took off the Fat which adhered to the Vessels, or Bones, and viewed it with a Microscope, and observed, that the fat Particles were of several Sizes; and some were so small, that I judged that fifty of the least were no bigger than one great fat Globule; and moreover, I saw that many of the fat Globules had such a Dent in them, as we find in the Meal or Flour of those little white Beans, which we call French or Kidney-beans.

Afterwards my Servant brought to me the Fat of a Peach, which was nine or ten Inches long, and taking a little of it, I viewed it with a Microscope, but could not discover any small Particles in it, nor any internal Dent, as I had observed in the Fat of a small *Plaife*.

After that the Fat of the Peach had lain an Hour or two upon the Glass, I viewed it again, and observed, that the Particles were become smaller, and that the Skin of the fat Particles, which as yet was beset with some fat Particles, was, as it were, shrunk or wrinkled, and the Fat, that was burst out, lay about the fat Particles, and was so fluid and transparent, that we could not discover any Parts in it.

From this Observation I began to think, whether each of these fat Particles was not provided with an Orifice, or Hole, out of which the Fat might be protruded at all Times, as often as the Parts of the Fish stood in Need of Nourishment, without an intire Laying open the Skin of the fat Globules; for, we constantly find, that when the Eggs of the Peach, which we call the Roe, increase in Bigness, its Fat decreases, and that in such a Manner, that when the said Eggs, or Roe, are arrived at their utmost Bigness, there is seldom or never any Fat to be seen upon the Intestines of the Fish.

As to the Composition of Fat, it is formed by a small Portion of Earth, joined with elementary Fire, acid Salt, and Water, according to the Account Geoffroy gives of it, who adds, that if Oil of Olives and Spirit of Nitre be mixed together, and digested, a Substance will be found in every Respect resembling the Fat of Animals.

This confirms what I said under the Article of *ACID*, in Regard to the Inflammability of animal Oils, which see.

As to the medicinal Use of Fat, Quincy having mentioned that of the Goose, Dog, Man, Viper, and Bear, says, these are to be met with in the Intention of Ripening and Drawings, because they are reckoned to be of a penetrating Nature, and therefore suited to dissolve and rarefy the Humours inclosed in Tumors, and bring them, as it is called, to Maturity. There are some specific Virtues ascribed to these in particular Cases, but they have not been supported by Reason or Experience. And they seem not possessed of any Properties different from other Substances of like Kind, unless what may arise out of their different Consistencies and Degrees of Volatility.

I apprehend by this, that the Author means, there is little or no Difference with Respect to Medicine, betwixt the Fat of one Animal and another. But if we consider, that Fat is not an homogeneous Substance, but composed of Principles greatly different from each other, as are Earth, Fire, Water, and acid Salts; and again, that animal Fats have always a small Portion of alkaline volatile Salts mixed with them, we shall find Reason to believe, that the Fat of one Animal may have medicinal Effects, very different from that of another, as the Proportions, and Combinations of the component Principles vary, and as the volatile Salts are more or less volatilized, by circulating in the

the animal Juices. I should suspect the Fat of Animals who use little Exercise, and live on Vegetables, to be the most lenient and mollifying; and that of Animals which move a great deal, or feed on other Animals, to be more penetrating, warming, and resolvent, because, in these, the Juices in general are more exalted and attenuated than in others.

Thus we see the specific Virtues, ascribed to some animal Fats in particular Cases, are supported by Reason; and as for Experience, we have that of all Mankind to warrant them, who have mentioned them from the Infancy of Physic to this Day, unless a few, who have of late affected to determine the Efficacy of Medicines by particular Theories, without consulting Experience, the only sure Guide, which in the present Case, if carefully attended to, would have convinced Dr. Quincy, as it has me, that the Fats of different Animals are actually endued with different medicinal Virtues.

In the Course of this Work, I shall have frequent Occasions of making Remarks upon this Folly of contradicting actual Matters of Fact, only because their Causes are not obvious and manifest. Mean Time I will give some Account of the medicinal Virtues of the Fats found in different Animals.

FATS OF BEASTS.

Of the HORSE.

The Fat of the Horse is proper for anointing luxated Limbs. *Dale.*

Of Cows, or OXEN.

All Sorts of Fats are endued with the Virtues of Warming, Softening, and Rarefying.

But that of Bulls, Cows, and Calves, is in some little Degree restraining. *Dioscorides.*

Beef's Fat, or Suet, is particularly recommended in Mortifications of the Intestines, a Tenesmus, for Ulcers, and Chaps of the Lips, and gouty, or scirrhus Disorders. The Fat of the Buffalo is in Virtue like the Preceding. *Dale.*

The Fat is emollient, and is used in Balsams, Ointments, and Plaisters. It eases Pains proceeding from Colds; cures Kibes and Chilblains; and heals the Chapping of the Hands, Lips, Nipples, Fundament, &c. *Pomet.*

Of LIONS.

The Fat of Lions is in Virtue like those of Cows. *Dioscorides.*

The Fat of Lions, washed, according to the Directions of Dioscorides, and dropped into the Ear, eases Pains thereof; it is a good Application for Limbs in Danger of a Mortification from Cold. It is useful in scirrhus Tumors, and Kibes. *Dale.*

Of ELEPHANTS.

The Fat of Elephants keeps Serpents and venomous Reptiles away from those that are anointed with it. *Dioscorides.*

Of STAGS.

The Fat of Stags has also the same good Effects as that of Elephants, in preserving from venomous Reptiles. *Dioscorides.*

Hippocrates recommends the Fat of a Stag as a mollifying Ingredient in a Pessary. *De Natura Muliebri, L. 1.*

The Fat of Stags is said to be good for mollifying Tumors, for Kibes, and for easing Pains. *Dale.*

The Fat, or Suet, is equal to the best Emollient. It lenifies and softens Callosities, Contractions, scirrhus and cancerous Tumors. *Pomet.*

Of the GOAT.

Hippocrates recommends the Fat of a Goat as a good mollifying Ingredient in a Pessary. *De Natura Muliebri, L. 1.*

The Fat of Goats is somewhat astringent. The Fat of the He-goat is a powerful Discutient, and for that Reason a proper Topic in the Gout, beat with Trickles of Goats, and Saffron. *Dioscorides.*

The Suet, or Fat, of the He-goat powerfully discusses, is useful in the Gout, cures the Strangury, and relieves the Pains caused by the Piles. *Dale.*

We bring from Auvergne, near Lyons, and Nevers, a great deal of Goats-suet, it being not only of some small Use in Physic, especially that of the He-goat, but is also used to many different Purposes. It ought to be dry, of a clear White within and without, and take Care it be not mixed with Mutton Suet, which it is not easy to distinguish; therefore do not deal with Merchants you cannot trust.

Of SHEEP.

Hippocrates recommends the Fat of a Sheep as a mollifying Ingredient in a Pessary. *De Natura Muliebri, L. 1. and, De Morbis Mulierum, L. 2.*

The same Author advises the Fat taken from the Kidney of a Sheep, as preferable to any other, to be mixed with Elaterium for the forming a Pessary, to promote the Menstrues. *De Morbis Mulierum, L. 1.*

Hippocrates advises the Fat of Sheep boiled with Lentiles and Wine, for washing painful Exulcerations of the Uterus. *De Morb. Mul. L. 1.*

And in many other Places he advises Pessaries of Sheep's Fat made up in Wool, as being very mollifying.

Hippocrates directs the Fat of a Sheep to be taken internally, to prevent a Miscarriage. *De his quæ Uterum non gerunt.*

Sheep's Fat is a proper Topic in the Gout. *Dioscorides.*

The Suet, or Fat, of Sheep, given in red Wine, checks Hæmorrhages, stops Diarrhoeas, Dysenteries, and cures the Gripes. *Dale.*

Of SWINE.

Hippocrates advises the Fat of Swine, boiled with Lentiles and Wine, as proper to wash painful Exulcerations of the Womb. *De Morb. Mul. L. 1.*

Swine's Fat, or Lard, is accommodated to Disorders of the Uterus, and Anus, and for Burns. *Dioscorides.*

The Fat of Swine is said to heat less than that of other Animals, and therefore it is more proper in refrigerating Ointments. It eases inveterate Pains in the Loins and Joints.

The Fat of the Wild Boar has the same Virtues in a greater Degree. *Dale.*

Of ASSES.

The Fat of Asses is reported to make Scars of the same Colour with the rest of the Skin. *Dioscorides.*

Of BEARS.

Bears Fat is excellent for making the Hair grow, and a good Application for Kibes. *Dioscorides.*

The Fat of a Bear warms, mollifies, and discusses. It cures Baldness, is good for the arthritic Pains, and cures Swellings of the Parotid Glands, and other Tumors, as also Ulcers in the Legs. *Dale.*

Bears Grease and Tallow are brought from the Mountains of Switzerland, Savoy, and Canada. The Grease, if it be good, ought to be fresh, or new melted, greyish, gluey, and of a strong ill Smell, of a middle Consistence, that is to say, betwixt hard and soft; and meddle not with that which is white and hard, being mixed with Suet. This Fat, or Grease, is a sovereign Remedy for curing cold rheumatic Humours. It is also much valued for easing Pains of the Gout, by rubbing the afflicted Part, and to make the Hair grow; it being esteemed admirable against Baldness, especially when incorporated with Bees in Powder and Nut-oil. As for the Bears-tallow, there is but very little of it brought into France, it being little used, and that only by those who will not come up to the Price of the Grease. *Pomet.*

Of FOXES.

The Fat of Foxes is good in Disorders of the Ears. *Dioscorides.*

The Fat of the Fox is good for Convulsions, Tremors, and Contractions of the Limbs; it is useful in Pains of the Ears, Wounds of the Head, and Baldness. *Dale.*

Of the CAMEL.

The Grease, or Fat, is emollient, softening, and resolute, proper for the Piles or Hemorrhoids. *Leмери.*

Of the MOUSE.

At Venice they sell a Pomatum at an extravagant Rate, made of the Fat of Mice, which is famous for curing Baldness.

Of the CAT.

The Fat of a Cat is heating, emollient, and discutient, and wonderfully relieves Affections of the Joints. *Dale.*

Of DOGS.

The Fat of a Dog is warmer than that of most other Animals, and is given internally, to deterge and consolidate Wounds and Exulcerations, and therefore it is proper in a Phthisis, or to dissolve Blood coagulated by Falls or Bruises. Externally it is applied in the Gout, to ease Pains of the Ears, to kill Nits and Lice, to cure Deafness, and in the Itch. *Dale.*

Of WOLVES.

The Fat of the Wolf is equal in Virtues to that of the Dog. It warms, digests, cures Disorders of the Joints, and is good for Eyes that are inflamed. *Dale.*

If the Bridle of a Horse is anointed with the Fat of a Wolf, it is said the Animal will not move forwards.

Of the OTTER.

The Fat of the Otter is by Hollerus esteemed a very good Ingredient in Applications for Disorders of the Joints. *Dale.*

Of the HEDGE-HOG.

The Fat of the Urchin or Hedge-hog is reckoned by Hartman a Specific in Ruptures. *Dale.*

A D E

Of the HIPPOPOTAMUS, or SEA-HORSE.

The Fat of the Hippopotamus, or Sea-horse, applied to the Pulse, or Stomach, relieves against Fits of the Ague, and is emollient and nervous. *Pomet.*

Of the CHAMOIS.

The Fat of the Chamois, or Gems (*Capra Alpina*) is recommended in a Consumption, and Exulcerations of the Lungs. *Dale.*

Of the HARE.

The Fat of a Hare, applied externally, has such a drawing Quality, especially when old, that it is said to bring away Thorns accidentally fixed in the Skin, or Flesh. It breaks Abscesses, and cures Pains of the Teeth. *Dale.*

Of the RABBIT.

The Fat of a Rabbit is useful for Indurations of the Joints and Nerves: (*I suppose he means the Tendons*). *Dale.*

Of the BEAVER.

The Fat of the Beaver is peculiarly adapted to Disorders of the Uterus, and nervous System, and therefore is useful in Epilepsies, Palsies, Convulsions, and Apoplexies. *Dale.*

The Fat of a Beaver is used as an Ointment against the Palsy, Convulsions, hysterical Fits, Apoplexy, and falling Sickness. Take half a Pound of Beavers Fat, Oils of Rosemary, Nutmegs, Amber, and Mace, of each one Dram. *Pomet.*

Of the TIGER.

The Fat of a Tiger agrees in Virtues with that of a Dog. *Dale.*

Of the LEOPARD.

The Fat of a Leopard is reported to be an excellent Cosmetic. *Dale.*

Of the LYNX.

The Fat of the Lynx, or Ounce, is recommended for Limbs that are paralytic, convulsed, or luxated. *Dale.*

Of the CROCODILE.

The Fat of the Crocodile is recommended in Wounds and Cancers. *Dale.*

Of VIPERS.

The Fat of the Viper is sudorific, resolute, and anodyne, taken internally or externally, the Dose from one Drop to six. *Lemery.*

Of HUMAN FAT.

Human Fat is said to strengthen and discuss, to relieve Pains, and cure Contractions, to mollify the Hardness of Scars, and to take away unseemly Marks left by the small Pox. *Dale.*

Human Fat or Grease is brought us from several Parts, as every Body knows in Paris; the public Executioner sells it to those that want it; so that the Druggists and Apothecaries sell very little. Nevertheless, they vend a Sort that is prepared with aromatical Herbs, and which is without Comparison much better than that which comes from the Hands of the Hang-man. This Adeps, or Axungia, is reckoned very good for Rheumatisms, and other Diseases, proceeding from a cold Cause.

Man's Grease is emollient, discussive, anodyne, and anti-paralytic. It is good against the Gout and contracted Nerves, made into an Ointment, as follows: Man's Grease two Pounds; Gum Elemi half a Pound; Bees-wax and Turpentine, of each one Pound; Balm of Gilead or Peru, four Ounces; mix and make an Ointment by melting all together. *Pomet.*

OF THE FAT OF BIRDS.

Of GEESE.

Hippocrates recommends the Fat of a Goose as a mollifying Ingredient in a Pessary. *De Natura Mulierum, L. 1.*

The same Author advises the Fat of a Goose, as a proper Ointment for painful Exulcerations of the Uterus. *De Morbis Mulierum, L. 1.*

Hippocrates says, the Fat of Geese is the best for Pessaries. *De Morbis Mulierum, L. 2.* And he advises Pessaries of Goose Grease in several other Places.

Hippocrates advises to take the Fat of Geese internally to prevent a Miscarriage. *De his quæ Uterum non gerunt.*

The Fat of Geese is proper in the Disorders of Women; and is useful in Chaps of the Lips, to smoothe the Skin, and to ease Pains in the Ears. *Dioscorides.*

The Fat of the Goose is more hot than that of the Swine, and, because of its Subtily, sooner penetrates and resolves, it is therefore used as a Clyster in Erosions of the Intestines. It makes the Hair grow in an Alopecia, heals Chaps of the Lips, removes Noises in the Ears, cures Spasms and Rigidity of the

A D E

Nerves, (*Tendons I suppose he means*) and prevents Costiveness, especially in Children. *Dale.*

The Virtues of the Fat of Wild Geese are the same, but in a greater Degree.

Of HENS.

The Fat of Hens is recommended by Dioscorides in the Disorders of Women, and is useful in Chaps of the Lips to smoothe the Skin, and to ease Pains in the Ears. *Dioscorides.*

The Fat of Hens and Capons warms and moistens, is emollient and lenient, and is said to be of a middle Nature betwixt that of Swine and Geese, whose Acrimony it corrects. It is good for Chaps of the Lips, Pains of the Ears, and Pustules on the Eyes. *Dale.*

Of the OSTRICH.

The Fat of the Ostrich is a proper Application for the nervous Parts, by Inunction it mollifies an indurated Spleen, and relieves nephritic Pains. *Dale from Schroder.*

The Fat is hotter than Goose Grease, and may be used with great Advantage to dissolve hard Swellings, relax contracted Nerves, and ease Pains. *Pomet.*

Of the SWAN.

The Fat of a Swan is emollient, lenient, attenuant, and therefore useful in the Piles, and Indurations of the Womb; it clears the Eyes, and, mixed with Wine, takes off Freckles, or Pimples from the Skin. *Dale.*

Of the FRIGATE.

The Oil or Fat of these Creatures is a sovereign Remedy for sciatic Pains, and for all others, proceeding from a cold Cause. It is held in great Esteem throughout all the Indies as a precious Medicine. *Pomet.*

Of the SHELL-DRAKE.

The Fat of the Vulpanser, or Shell-drake, is recommended in an Herpes, and Tumors of the Face. *Dale.*

Of the RAVEN.

The Fat of the Raven is said to render the Hair black. *Dale.*

Of the PEACOCK.

The Fat of the Peacock, mixed with the Juice of Rue and Honey, is excellent in the Cure of a Colic. *Dale.*

Of the QUAIL.

The Fat of the Quail is said to be effectual in taking Spots off the Eyes. *Dale.*

Of the TURTLE-DOVE.

The Fat of the Turtle-dove is recommended as an Ointment proper for the Kidnies, Belly, Breast, and Groins. *Dale from Schroder.*

Of the VULTURE.

The Fat of the Vulture is peculiarly adapted to Disorders of the Nerves. *Dale.*

The Fat is the only Thing belonging to the Vulture Kind that is sold in the Shops, and used to anoint withal in Palsies and other nervous Cases. *Pomet.*

Of the KITE.

The Fat of the Kite is applied in Pains of the Joints. *Dale.*

Of the SPARROW-HAWK.

The Fat of the Sparrow-hawk is good in Disorders of the Eyes, and all Diseases of the Skin. *Dale.*

Of the OWL.

The Fat of the Owl, either white or gray, sharpens the Sight. *Dale.*

Of the CRANE.

The Fat of the Crane, instilled into the Ears, cures Deafness. It mollifies hard Tumors of the Spleen, and other Parts of the Body. It also immediately relieves Stiffness of the Neck. *Dale.*

Of the STORK.

The Fat of the Stork is good in gouty Complaints, and for Limbs that tremble and are unsteady. *Dale.*

OF THE FAT OF FISH.

The Fat of River-fish melted in the Sun, and mixed with Honey, clears the Sight, if the Eyes are anointed with it. *Dioscorides.*

Of the PIKE.

The Fat of the Pike is used as an Ointment to the Soles of the Foot,

A D E

Foot, and Breasts of Children, in order to cure their Catarrhs and Coughs. *Dale*.

The CARP.

The Fat of a Carp is of Service in hot Disorders of the Nerves or Tendons. *Dale*.

Of the DARE.

The Fat of the Dare is good for Pains in the Ears, and Dimness of Sight, mixed with the Gall of the same Fish. *Dale*.

Of the GRAYLING.

The Fat of the Grayling wears away Specks and Films from the Eyes. Melted in the Sun and mixed with Honey it takes away Spots of the Skin, and Marks left by the small Pox. *Dale*.

Of the TROUT.

The Fat of the Trout is good for the Piles, and Fissures of the Anus. *Dale*.

Of the DOLPHIN.

The Fat of the Dolphin, melted and drank with Wine, cures the Dropsy. *Pliny. Dale*.

The Method of preparing Fat for Use is thus laid down by the Compiler of the *Edinburgh Dispensatory*:

The Fat, being first purged of its Membranes, Blood-vessels, and Strings, is to be washed in fresh Parcels of Water, till it will no longer tinge the same red; then let it be melted, strained, and preserved from the Injuries of the Air.

The Antients were more curious, and took greater Pains in preparing their Fat, as may be seen by the following Directions from *Diocorides*.

Of the Fat of HENS or GEESÉ.

The Fat of a Hen or Goose, either new, or kept without Salt, is good in Diseases of the Womb; but salted, or grown acrimonious with keeping, is hurtful to that Part. Take the fresh Fat of either of these Kinds, and, stripping it of the Membranes, put it into a new earthen Pot, that will hold double the Quantity you design to preserve. Expose the Pot carefully closed to the burning Sun, and let the Fat, as it melts, fall through a Strainer into another earthen Pot, till all be run off. Then remove it into a very cool Place, and let it stand for Use. Some, instead of the Sun, place the Pot over hot Water, or Coals that give a very gentle Heat. There is yet another Way of curing it. They take the Fat, and, clearing it from the Membranes, beat it, and put it into a Pot, where it is melted, with a little fine Salt cast therein. Then they strain it thro' a Linnen Rag, and place it aside. This Sort is an useful Ingredient in Remedies provided against Lassitudes. *Diocorides, L. 2. C. 86*.

Of the Fat of BEARS and SWINE.

The Fat of Bears and Swine is prepared after this Manner: Take the newest and grossest, such as grows about the Kidnies, and, stripping it of the Membranes, throw it into a good Quantity of Rain-water, perfectly cool; then break it, and rub it carefully with your Hands, as though you would reduce it all to Crumbles. Then wash it in several fresh Waters, and afterwards put it into an earthen Pot, that will hold double the Quantity. Pour in as much Water as will cover the Fat, and set it over a gentle Fire, and stir it with a Spatula. When it is thoroughly melted, pass it through a Strainer into Water, and let it cool. Let the Water drop clean away, and then shift it into another Pot, first washed, and, pouring in some Water, give it a gentle Melting. This done, take it off, and, having let it stand a little for the Dregs to subside, pour it into a Mortar first wiped with a Sponge. When it is congealed, take it out, and, first cleaning it from the Dregs residing at the Bottom, give it a third Melting without Water. Then pour it back into the Mortar, from whence, being well purged of all Feculencies, remove it into an earthen Pot, and place it aside well covered in a cool Place for Use. *Diocorides, L. 2. C. 87*.

Of the Fat of GOATS, SHEEP, and DEER.

The Fat of these Animals is thus prepared: Take either of them, wash it, clear it of the Membranes, and put it into a Mortar to be softened. Beat it, pouring in now and then a little Water, till nothing bloody rises to the Surface, or Greasiness swims at the Top, but all looks clear and shining. Then put it into an earthen Pot, with Water just enough to cover it, and set it over a gentle Fire, stirring it. When it is thoroughly melted, pour it into Water, and, after it is congealed, melt it over again in an earthen Pot first washed, and proceed as in the former Chapter. After the third Melting, which is without Water, strain it into the Mortar first moistened, and, when it is congealed, remove it into your Pot, and lodge it as was directed for Swines Fat. *Diocorides, L. 2. C. 88*.

A D I

Of the Fat of OXEN.

This Fat is also to be chosen from the Kidnies, stripped of its Membranes, and then washed in Sea-water. After this, it must be put into a Mortar, and carefully beaten with Sea-water. When all is dissolved, pour it into an earthen Pot, with Sea-water enough to rise a Span above it, and boil it till it has lost its proper Smell. Then for every Pound of Fat cast in four Drams of Tyrrhene Wax, and strain it off. Next (after it is congealed) take away the Dregs that settled at the Bottom, and put it in a new earthen Pot, which is to stand covered every Day in the Sun, till the Fat has lost its rank Smell, and acquired a Whiteness. *Diocorides, Lib. 2. C. 89*.

Of the Fat of BULLS, PANTHERS, and LIONS.

The Fat of Bulls is thus prepared: Taken fresh from the Kidnies, it is washed in running Water, then stripped from the Membranes, put in an earthen Pot, and melted with a little Salt cast therein. After this they strain it off into fair Water, and, when it begins to congeal, they take and rub it well with their Hands in several fresh Waters till it be thoroughly washed. Then they clap it into the Pot again, and boil it with an equal Measure of sweet-scented Wine. After it has boiled up twice, the Pot is taken off the Fire, and left to stand all Night. The next Day, if any Rankness of Smell remains, it is removed into a new Pot, has more sweet-scented Wine poured upon it, and is treated as before, till all the ill Savour be vanished. Some melt it without Salt, especially for some Diseases, in which Salt is accounted hurtful; but, thus prepared, it will acquire no considerable Whiteness. After the same Manner is prepared the Fat of Panthers, Lions, Wild Boars, Camels, Horses, and the like. *Diocorides, L. 2. C. 90*.

ADEPTA PHILOSOPHIA. *Adept Philosophy.* It is generally understood of that Philosophy, whose End is the Transmutation of Metals, and the universal Remedy. The *Adept Philosophy* is represented by Paracelsus as one taught by Inspiration from Heaven, and which cannot be communicated from Man to Man, though in other Places he tells it may be learned from those who are *Adepts*. Both he and Helmont have taken much Pains to inform us what it is not, but have not been so obliging as to explain what it is. The Professors of this Philosophy in the Clouds are called *ADEPTI, Adepts*.

Paracelsus calls that *Adept Medicine, MEDICINA ADEPTA*, which treats of those Diseases only, which are contracted by celestial Operations, or communicated from Heaven.

Those, whose Curiosity may incite them to know more of this Philosophy, may consult Paracelsus's Treatise, *de Occulta Philosophia, L. 1. C. 8*. But I will not be answerable that they shall meet with satisfactory Information.

ADER. Rulandus explains this by *Lat recens sine Butyro*. I suppose he means either new Milk before it is creamed over, or else fresh Butter-milk.

ADHÆRENTIA. ADHERENCE, growing together. *Castellus*.

ADHATODA. The Malabar Nut.

The CHARACTERS are,

The Leaves grow opposite; the Cup of the Flower is oblong, and consists of one Leaf; the Flower is monopetalous, of an anomalous Figure, and consists of two Lips; the uppermost is crooked, and is raised in Form of an Arch; the under Lip is divided into three Segments, and hangs downward; the Ovarium becomes the Fruit, which is in Form of a Club, and is divided into two Cells, in which are contained flat Heart-shaped Seeds.

There are but two Species of this Plant known at present, which are:

1. *Adhatoda Zeylanensium*, H. L. The common Malabar Nut.
2. *Adhatoda Indica*; folio saligna, flore albo, Boerh. The Willow-leaved Malabar Nut, commonly called, *The Snap-tree*. *Miller's Dictionary*.

Its Virtue is to expel the dead Foetus, that being the Meaning of *Adhatoda* in the Zeylanic Language.

ADHEHE. Sour Milk. Butter-milk. *Rulandus*.

ADHO, or **ADOC.** Milk. *Rulandus*.

ADIACHYTOS, *Ἀδιάκτος*. From a Negative, and *διὰκτος* to diffuse, scatter, or be profuse. Decent in Point of Dress, or Habit. Hippocrates makes Use of this Word in his Treatise, *de decenti Habitu*. This great Man esteemed the Dress of a Physician of Importance enough, to take the Trouble of giving some Advice upon this Head. He thinks the Character of a Fop derogatory from the Honour of a real Physician; and describes a Set of Practitioners in his Days, who attempted to supply the Defects of Knowledge in their Profession, by Ornaments of Dress. These, he says, frequented the public Places, in order to deceive People by their Appearance into a good Opinion of them, and this for the Sake of Gain. He adds, that they may be known by their Dress, and that the greater their Extravagance is in this Respect, the more they are to be avoided, and despised, by those that see them.

ADIAN.

ADIANTHUM. Maiden-hair.

The Account Dioscorides gives of it is as follows :

Adiantum, by some called *Polytrichon*, has Leaves like the Coriander, indented at the Top, and growing on very slender, black, shining Stalks, a Span high.

The Decoction of the Herb, drank, helps Difficulty of Breathing, and the Asthma, Disorders of the Spleen, Difficulty of Urine, and the yellow Jaundice. It breaks the Stone, binds the Belly, and relieves those who are bitten by venomous Creatures. It is drank in Wine for Weakness of the Stomach. It provokes the Menfes, and the Lochia, but stops Vomiting or Casting up of Blood. It is applied in a Cataplasm against venomous Bites, to make Hair grow where lost, and to disperse scrophulous Tumors. A Lye made thereof cleanses scald and scabby Heads. Applied with Ladanum, Myrsinum, and Oil of Lillies, or, with greasy Wool and Wine, it puts a Stop to the Shedding of Hair, and strengthens what is left. The Decoction thereof, with the Lyes and Wine, produceth the same Effect. Given to Cocks and Quails among their Food, it incites them to fight. It is planted about Sheep-folds for the Benefit of the Sheep; and grows also in shady and marshy Places, on old mouldering Walls, and near Springs. L. 4. C. 136.

The Moderns have given the Name of *Adiantum* to many capillary Plants. The first is thus distinguished by Authors :

1. *Adiantum vulgare*, *Capillus Veneris*, Offic. *Adiantum*, Cod. Med. II. III. *Adiantum*, sive *Capillus Veneris*, J. B. 3. 751. Raii Hist. I. 147. *Adiantum*, *Capillus Veneris*, Chab. 555. *Adiantum verum*, sive *Capillus Veneris verus*, Park. 1049. *Adiantum foliis Coriandri*, C. B. 355. Tourn. Inst. 543. Elem. Bot. 433. Hist. Oxon. 3. 587. *Capillus Veneris verus*, Ger. 982. Emac. 1143. TRUE MAIDEN-HAIR.

ADIANTHUM VULGARE. This is a capillary Plant, which, from a brownish, stringy Root, sends forth black shining slender Stalks, near a Foot high, divided into several very fine Branches, on which grow small, very thin Leaves, roundish, in Shape of Coriander-leaves, set on alternately on the Stalks; on the Edges of the Leaves, when the Plant is come to its full Growth, are several small Folds, under which is contained a small Dust, which is the Seed.

This Maiden-hair is brought to us from the Southern Parts of France, though it is said to grow plentifully in the County of Cornwall.

This being the true *Capillus Veneris*, is what ought to be used in making the Syrup of Maiden-hair, and every where else, where the true is prescribed. But for Want of it, it not being to be had in any Quantity, we generally use the *Trichomanes*.

This Maiden-hair is opening and attenuating, good for Distempers of the Lungs and Breast, as Coughs, Shortness of Breath, Hoarseness, and the like; it is also accounted serviceable against the Stone and Gravel, Heat and Difficulty of Urine. The only officinal Preparation is the Syrup. Miller.

Adiantum, or the true Maiden-hair of the Shops, is a Plant that bears several slender, blackish Stalks, of about half a Foot or a Foot high, divided into fine delicate Branches, which are adorned with little Leaves, like those of Coriander, almost triangular, fragrant, and of an agreeable Taste: This Plant bears no Flowers; its Fruit, according to Mr. Tournefort's Observations, is produced in a Folding of the End of one of the Leaves, which, after it is stretched out, incloses several spherical Coverings, which are caked to the said Foldings, and cannot be discovered but by the Assistance of a Microscope. These Capsulæ, or Coverings, are furnished with, as it were, a Purse-string, which, by its Contraction, opens it; they contain some little Seeds in them that are almost round: The Root is fibrous and black; it grows in shady, moist, or stony Places, against Walls, or Sides of Wells and Ditches: The best they have in France, grows about Montpellier in Languedoc. Lemery.

The Leaves of the true Maiden-hair are much used. They are said to purify the Blood, by reducing the Humours mixed in the Mass thereof to a just Temper. It prepares and purges Phlegm, and the Bile of both Sorts, that is, the Bile, properly so called, and what the Antients called the *Atra Bilis*. It dissipates Superfluities, resolves serous Humours, and carries them off by Transpiration. It provokes Urine and Sweat, and powerfully resists Putrefaction; hence it is given with Success in all Sorts of Fevers.

It is specifically adapted to cure all Disorders to which the Hair is subject. Thus it is a Remedy against Baldness, clears the Hair of Scurf and Filth, restores that which is decayed to its former Lustre and Beauty, prevents its falling off, and preserves it from growing grey.

It excites all the Faculties of the Brain, tempers any Excess in the Humours deposited upon it, and corrects in them what is amiss. It therefore depurates the animal Spirits, restrains hot and bilious Vapours, and renders those mild, which are inclinable to be acrid, acid, or narcotic. It is on these Accounts admirable in Want of Rest, comatous Disorders, Epilepsies, Phrensies, Madness, Melancholy, Head-ach, and all Disorders,

and Tumors, which happen to any Part of the Head. It sharpens the Sight, and restrains and dissipates all habitual Fluxes of Humours upon the Teeth, Ears, and Glands of the Neck and Fauces. By its agreeable Odour it exhilarates the Heart, and strengthens the vital Faculties. It is good in Disorders of the Breast, purges the Lungs, incising and evacuating thick and viscid Humours, which stick to the Sides of the Branches of the Aspera Arteria. Hence it becomes an effectual Remedy against a Cough, Difficulty of breathing, Asthma, Peripneumony, Pleurisy, Spitting of Blood, fainting Fits, and Heart-burn.

It braces up, and restores a proper Tone to the relaxed Fibres of the Oesophagus and Stomach. It purges off Collections of the Excrements, which cause Nauseas, or Inclinations to Vomit. It quenches Thirst, and penetrates, moistens, and purges very gently the Stomach and Intestines. It cools the Liver and Spleen, and opens Obstructions formed therein, let them be never so inveterate. It wears away the Stone in the Kidnies or Bladder, and opens the urinary Passages. It is both a Preservative against, and a Cure for the Jaundice and Green-Sickness. It is particularly useful to the Parts of Generation. Thus it prevents Sterility, expels Immundities, and the Secundines out of the Womb, promotes the Menfes, if deficient, and restrains them, if immoderate, as it does the Fluor Albus. It is of Service in Disorders of the Joints, and nervous System, and cures Stupors, Spasms, and Pandaliculations, and windy Affections of the Muscles. It softens and resolves hard Concretions formed upon the Ligaments of the Joints, and, for this Reason, is serviceable in ischiadic Pains, and the Gout. It is also good against Tumors of all Sorts, whether hot or cold; oedematous, scirrhus, inflammatory, or erysipelatous. It is also good in Wounds, Ulcers, Fractures, Luxations, and all Disorders of the Skin. Ray from *Petrus Formius*.

This is a very great Character of a Plant, and perhaps stretched a little too far; but we may learn from hence, that it has been esteemed as a great Deobstruent, and excellent Alterative. And if we consider that most of the capillary Plants abound with a neutral, saponaceous Salt, which approaches to the Nature of Nitre, we may the easier believe that the *ADIANTHUM* may be possessed of great Virtues, in all Disorders where Obstructions are either the Cause, or the Effect. But then it must be taken in considerable Quantities, and those frequently repeated, and the Course must be persisted in for a long Time.

The best Way of taking it is in very strong Decoctions, or Infusions.

Mr. Ray observes, that because this Plant is temperate, in regard to all its Qualities, he is inclinable to believe the Virtues of it weak and inconsiderable. But we now know that the alterative and deobstruent Virtues of Simples, by no Means, depend on the Excess of any of their sensible Qualities, and therefore nothing can be concluded from this.

Somewhat like this, in Figure and Virtues, is the *ADIANTHUM CANADENSE*, Maidenhair of Canada, much used by the French, and thus distinguished:

Adiantum Canadense, vel *Capillus Veneris Canadensis*, Cod. Med. 4. *Adiantum Americanum*, Corn. 7. Raii Hist. I. 148. Fill. Hort. Pis. 3. Tourn. Inst. 543. Elem. Bot. 433. Boerh. Ind. A. 26. *Adiantum fruticosum Americanum*, Park. Theat. 1049. *Adiantum fruticosum Brasiliense*, C. B. Prod. 150. Pin. 355. Chomel. 83. *Adiantum fruticosum Americanum, summis ramulis reflexis, & in orbem expansis*, Pluk. Phytog. 124. Almag. 10. Hist. Oxon. 3. 588. CANADA, or AMERICAN MAIDEN-HAIR. Dale.

The Capillaries, or Maiden-hair, are little Plants that are brought intirely whole to us from several Parts; the chief and most esteemed are those which come from Canada, and are called *Maiden-hair of Canada*, and by the Botanists, *Adiantum album Canadense*, or the white Canada Maiden-hair. This grows about a Foot high, with a very slender Stalk, hard and blackish; from whence there arise small Branches, bearing green Leaves, pretty deep indented, as may be seen by the Figure. It grows likewise in Brasil. This is cultivated with great Care in the King's Garden at Paris, as well as other Sorts of exotic Plants, which are brought from several Parts of the World, by Messieurs Fagon and Tournefort, the King of France's principal Physicians.

The other Capillaries that are brought from Canada, are made Use of for Syrups, which are boiled to a good Consistence, and have Ambergreese added to them. There are many Virtues attributed to this Syrup, especially for Coughs, Catarrhs, Diseases of the Breast, and to administer to Infants new born, with a little Oil of sweet Almonds. As to the Choice of Maiden-hair, you must take such as is newest, very green, and the least broke that you can get. *Pamet*.

In Canada, Brasil, and several other Parts of America, there is a Sort of the dried Maidenhair, a great Deal larger than ours, called by C. Bauhine, *Adiantum fruticosum Brasiliense*, and is the same with the Maidenhair of Canada: The Stalk is slender, hard, and of a brownish Red, or purple Colour, tending to black, divided into many Branches, which bear little Leaves, almost like the common Sort, long, and indented on one Side, but

but whole on the other, soft, tender and fragrant; this is what is most valued, as being the best scented of all the Maiden-hairs. It is common in several Parts of America, and especially in Canada; so that the Traders pack up their Goods with it, instead of Hay, when they would send them to a distant Country. It is by this Means we have such Quantities of it; but it would be much better if they would pack it up in Papers or Bags, that would preserve the Scent and Virtue of it. Chuse such as is fresh, green, well scented, whole and soft to the Touch. This Plant contains little Phlegm, a good deal of Oil, but not much Salt; it is pectoral, aperitive, and promotes Expectoration, sweetens the Blood, and provokes the Menfes. *Lemery.*

The next Plant, called *Adiantum* by Botanists, is the Wall-Rue, thus distinguished.

ADIANTHUM. Maiden-hair.

ADIANTHUM ALBUM, *Ruta muraria, Salvia vitæ*, Offic. *Adiantum album*, Raii Hist. I. 146. Synop. 48. *Adiantum album montanum*, Herm. Hort. Lugd. Bat. 10. *Ruta muraria*, C. B. 356. Tourn. Inst. 541. Elem. Bot. 433. J. B. III. 753. Chab. 555. Boerh. Ind. A. 26. *Ruta muraria sive Salvia Vitæ*, Park. 1050. Ger. 983. Emac. 1144. WALL RUE, or RUE MAIDEN-HAIR. *Filicula petraea Ruta facie*, Hist. Oxon. iii. 585. *Muraria semper virens vulgaris*, Dill. Cat. 73. TRUE WHITE MAIDEN-HAIR. *Dale.*

This is a small low Plant, growing seldom above two or three Inches high, its slender Stalks being of a whitish Colour, whereon grow a few small roundish, stiff Leaves, resembling those of Rue, crenated a little about the Edges, of a whitish green Colour above, covered underneath, when come to its full Growth, with brown dusty Seed. It grows on old Stone Walls and Buildings, its little fibrous Root abiding several Years.

This is one of the five Capillary Herbs mentioned in the Dispensatory, and has the same Virtues with the rest of the Maiden-hairs, and is sometimes used in pectoral Decoctions, and diuretic Apozems.

This is the Herb that has been taken for the Hyssop of Solomon. It grows on Walls in hot Countries, and is of wonderful Virtue in curing Disorders of the Breast. It tastes like sweet Oil, and cures a stinking Breath. Bruised with warm Water and Honey, it helps the Asthma and other Distempers of the Breast; it provokes Urine, expels Gravel, and is good in the Asthma and Pleurisy. *Boerhaave.*

The third is the *Adiantum nigrum*, Offic. *Adiantum nigrum Officinatum*, J. B. iii. 742. Raii Hist. i. 152. Synop. 50. *Adiantum nigrum vulgare*, Park. 1049. *Adiantum foliis longioribus pulverulentis, pediculo nigro*, C. B. 355. Hist. Oxon. iii. 588. Boerh. Ind. A. 26. *Onopteris mas*, Ger. 975. Emac. 1137. *Filicula quæ Adiantum nigrum Officinatum*, El. Bot. 432. *Filicula quæ Adiantum nigrum Officinatum, pinnulis obtusioribus & acutioribus*, T. Inst. 542. Buxb. 113. COMMON BLACK MAIDEN-HAIR.

This Maiden-hair grows about a Span high, its slender Stalks being smooth and black, divided into many Segments, of small, firm, shining, green Leaves, notched pretty deep, and sharp pointed, growing on little Branches, sometimes two opposite together, and sometimes alternately to the Number of twelve or fourteen Pair, the Top ending like a Fern; the Backs of the Leaves have the Margin covered with a brown dusty Seed. The Root is pretty large and fibrous.

It grows in shady Lanes, and at the Roots of Trees.

This also is one of the five capillary Herbs, and its Virtues the same with common Maiden-hair; and is accordingly used for Coughs, and all Affections of the Lungs, and Diseases of the Kidneys; some commend it for the Jaundice.

The fourth is the *Adiantum aureum*, & *Polytrichum aureum*, Offic. *Adiantum aureum majus*, Raii Hist. i. 123. Synop. 28. Cat. Angl. vii. 123. *Polytrichum aureum majus*, C. B. 356. Park. 1051. *Polyt. Apulei, & majus quibusdam*, J. B. iii. 760. *Polytrichum Apulei majus*, Chab. 558. *Polytrichum vulgare & majus capsula quadrangulari*, Dill. Cat. 221. *Muscus saxatilis, aut sylvestris Trago*, El. Bot. 439. *Muscus capillaceus major, pediculo & capitulo crassioribus*, T. Inst. 550. Bux. 219. *Aureus capillaris medius*, Herm. Hort. Lugd. Bat. 431. *Muscus coronatus major pileolo villosa aureo*, Hist. Oxon. iii. 630. Boerh. Ind. A. 21. *Muscus capillaris, seu Adiantum aureum*, Ger. 1371. *Muscus capillaris, seu Adiantum aureum majus*, Ger. Emac. 1559. GOLDEN MAIDEN-HAIR. *Dale.*

This is a large kind of Moss, with a Stalk three or four Inches high, whose lower Part is wholly covered with small, short, hard and stiff brown Leaves; the upper Part is quite bare to the Top, on which grows a long roundish Head, or Seed-vessel, covered with a woolly, sharp-pointed, reddish yellow Cap, which falls off as the Head grows ripe; the Root is small and stringy. It grows in heathy, barren and boggy Ground, and frequently on old Ant-hills.

This is one of the five capillary Herbs, though it is but rarely used. Some Authors attribute as much Virtue to this, as to the former Maiden-hairs; besides which, it is said to be

very good to prevent the falling of the Hair, and to make it grow thick, being boiled in Water or Lye, and the Head washed with it. Dale says the Decoction is commended for the Pleurisy. *Miller.*

ADIAPHOROS. *Ἀδιάφορος*. From a Negative, and *διαφέρω*, to differ. Indifferent, or without Difference. *Constantine.*

It is sometimes applied to Foods.

ADIAPNEUSTIA. *Ἀδιαπνευστία*. From a Negative, and *διαπνέω*, to perspire. It is a Symptom arising from the Density of the Pores, when Perspiration is deficient. It is mentioned by Galen. lib. xi. *Metb. Med. Goræus.*

It signifies nothing more than a Stoppage of Perspiration, the Cause or Consequence of all Distempers, whether acute or chronic.

ADIAPTOTOS. *Ἀδιάπτωτος*. From a Negative, and *διαπίπτω*, to stumble, or slide. The Word signifies firm; but in Medicine it is the Name of a Remedy against the Colic, which Galen, lib. ix. *τὴν κατὰ τὸν*, says consists of these Ingredients, viz. Stone Parsley, the Seed of Henbane, white Pepper, of each forty Drams; Juice of Poppies twenty Drams; Saffron six Drams; Opobalsamum three Drams; made into an Electuary. It seems to take its Name from its prevailing Virtue in all Inflammations. *Goræus.*

ADIARRHŒA. *Ἀδιάρρηα*. From a Negative, and *διέρχω*, persudo, to flow out, or through. It signifies an intire Suppression of all the necessary Evacuations of the Body, and Retention of the Humours which ought to be discharged. *Foesius.*

ADIB. A Beast mentioned by Avicenna, which Castellus takes for the Wolf.

ADIBAT. Mercury, in the Alchymistical Jargon. *Rulandus. Johnson.*

ADIBISI, or ADIBIZI. *Testudo*, a Tortoise. The German Word which Rulandus explains it by, signifies a Snail. *Rulandus.*

ADIDACUS. Rulandus calls this *ADIDE ALARCHOS*; *ADIDA LARCHOS, id est, CALCECUMENON.* Johnson, the literal Transcriber of Rulandus, and Castellus, have both prudently omitted taking notice of this Word, and many more of the most difficult, because I suppose they could not explain them. As I have not met with the Word in any Author, except Rulandus, I can only explain it in his Words, which I confess I do not know what to make of.

ADJECTIO. The same as **ADDITIO**, the adding of any thing that is deficient. *Castellus.*

ADICE. *Ἀδίκεν*. The Nettle is sometimes called by this Name. *Goræus.*

ADIPSATHEON. This is, according to Pliny, a thorny Shrub, growing in the Islands of Nigros, and Rhodes. *Pliny, l. xxiv. c. 13.*

ADIPOSA MEMBRANA. See **CELLULOSA MEMBRANA** and **ADEPS**.

ADIPSON. *Ἀδίψων*. From a Negative, and *δίψω* Thirst.

Hippocrates, in his Treatise *de Ratione Victus in Acutis*, says the Psillana, by its Glutinousness, is (*ἀδίψων*) Adipson, that is, a Preventer, or Curer of Thirst; and in this Treatise he applies the same Word to Oxymel, meaning that it quenches Thirst.

Medicines were so called, because they prevented or allayed Thirst; whether drank, or in a Linctus, or Gargarism; and the Name may be applied even to such Medicines as simply do not provoke Thirst. Now because Dryness is the principal Cause of Thirst, it is plain that what quenches Thirst must be moist; and if it be cold besides, it is by so much the more effectual; for Coldness preserves the Moisture, which Heat would consume. However many hot things are effectual in allaying Thirst, as Liquorice and Pepper in some, if held in the Mouth; the first because of its moist and clammy Juice, the other by its drawing Phlegm from the Head into the Mouth and Jaws. Of the same Virtue are cooling Potions and Eclegms, many of which are described by Galen, lib. *τὴν κατὰ τὸν*.

ADIPSOS. *Ἀδίψος*. The Egyptian Palm. It is a great Tree, not streight but wreathed, green, smelling like a Quince-tree, with a Leaf like Myrtle, Fruit like Capers, not good to eat, but of a pleasant Smell, not at all ligneous. The Fruit, a little before it is ripe, is called *μυροβάλανος* [a Myrobalon] when ripe and blackish *γονιμακάλανος*. Theophrastus calls this Tree *βάλανος*, that is, *Mast*, from its Fruit; but it is called *ἀδίψος*, because its Fruit, gathered before it is ripe, and tasted, restrains Thirst; or because, as Solinus relates, a Drink is made of its cool, sour and astringent Juice, which quenches like what is made of our Pears, Apples, and the Fruit of the Service-tree.

ADIPSOS is also Liquorice; so called by Theophrastus, Dioscorides and Pliny, because with the sweet and clammy Juice of its Root it satisfies both Hunger and Thirst. Wherefore it was often given to hydropical Persons to prevent their Thirst.

ADIPSOS is also the Name of a Catapodium, or Pill, composed by Asclepiades as follows:

Take of the Seeds of Garden Cucumber and Purflane, each eight Drams, Gum- Tragacanth three Drams; dissolve the Tragacanth in the Whites of new-laid Eggs, and add it to the other Ingredients, which must be finely powdered, and all mixed together, and made up in the Form of Pills. Dry them in the Shade, and let the Patient hold one of them under his Tongue, and suck up the Liquor that comes from it. Galen mentions it, *lib. viii. τὸν καλὸν τόνον*. *Gorræus*.

ADIRIGE. Rulandus explains this by Armoniacum. I suppose he means the Salt, that being of more general chymical Use than the Gum Ammoniacum, is frequently called by Mistake Armoniacum.

ADJUTORIUM. The Bone of the Arm, called usually the Humerus. *Castellus, from Johannes Anglicus, and Vesalius*.

ADJUTORIUM also sometimes signifies a topical or external Remedy, applied to a Part affected, in Aid of internal Medicines. *Castellus from Theodorus Priscianus*.

ADJUVANTIA. Medicines are so called, which aid and assist Nature in the Cure of Distempers.

ADYLISTOS. *Ἀδύλιστος*. From a Negative, and *ἀδύλω*, to strain, or defecate. Wine not fined clear from the Dregs, or not passed through the Strainer, which was the usual Method of managing such Wines as were kept in order to improve their Taste; and was sometimes practised on others to lower their Strength, and make them milder and fitter for drinking. *Gorræus*.

ADMIRABILIS. An hyperbolical Epithet given by many of the Chymists to particular Preparations of their Invention. It is generally applied to factitious medicinal Stones, of which there are many. Lemery says, that which he describes is by much the best.

Powder and mix together of white Vitriol eighteen Ounces, of fine Sugar and Nitre each nine Ounces; of Alum two Ounces; of Sal Ammoniac six Drams; of Camphire half an Ounce. Put this Mixture into a glazed earthen Pot, moisten it to the Consistence of Honey with the Pickle of Olives. Put the Pot over a gentle Fire, and dry the Mixture leisurely till it acquires the Consistence of a Stone. Keep it close covered, because it otherwise readily attracts Moisture from the Air.

This Stone is deterfivè, vulnerary, and astringent. It resists Gangrenes, stops Hæmorrhages, either dry or dissolved; it is used in Collyria for Cataracts of the Eyes, is applied to scorbutic Ulcers, and is an Ingredient in Injections for Gonorrhœas.

Great Care must be taken, during the Operation, to moderate the Fire, otherwise the Camphire, by Reason of its Volatility; exhales. But with all the Care that can be taken, a great Part of the Camphire will be dissipated; for which Reason a little Camphire may be added to it when it is used. *Lemery Cours de Chymie*.

Castellus quotes a Lapis Admirabilis from Junken.

ADMISURAB. Earth. *Rulandus*.

ADNATA TUNICA. A Coat of the Eye, called also **CONJUNCTIVA**, and **ALBUGINEA**. It is that which makes the White of the Eye. It is formed by the tendinous Expansions of the Muscles which move the Eye. This Coat covers the whole Ball of the Eye, except the Fore-part, which is called the Sight, but is not numbered amongst the proper Tunicks of the Eye. It is extremely sensible and abounds with Veins and Arteries, which are very visible in Inflammations of the Eyes. *Winslow, Drake, Keil*.

It covers so much of the Eye as is called the White, and being reflected all round, it lines the two Eye-lids; it being thus returned from the Eye to the Inside of the Eye-lids, it effectually hinders any extraneous Bodies from getting behind the Eye into the Orbit, and smooths the Parts it covers, which makes the Friction less betwixt the Eye and the Eye-lids. *Cheselden*.

ADNATA, or **ADNASCENTIA**, are those Off-sets, which, by a new Germination under the Earth, proceed from the Lilly, Hyacinth, Narcissus, &c. which afterwards grow to true Roots; which the French call *Cayeux*. *Miller*.

ADNATA also signifies things that grow upon animal or vegetable Bodies, which are either inseparable from them, as Wool, Hair, Horns, and Fruits; or else accidental, as Fungusses, Mistleto, and Excrescences. *Galen*.

It is sometimes spelt **AGNATA**.

ADOC. Milk. *Rulandus*.

ADOLESCENS. The Iron Bars that support the Fire in a Grate, or Furnace. This is the Signification of the German Word, by which Rulandus explains it; but I do not know by what Analogy Iron Bars are so called. The German Word is **GRENDER**, which will bear another Signification. Paracelsus, amongst other Extravagances, had an Inclination to produce a Man without the Assistance of a Female, probably with a View of rendering that Sex useless, for which he had no great Com-

plaisance. His Disciples say he actually did produce something in the Shape of a little Man, by digesting Semen Masculinum inclosed in a Glass Vessel in a Dunghil. This Production was called the Homunculus of Paracelsus, which Sense the German Word will bear, and this answers better to **ADOLESCENS**.

ADONION. *Ἀδώνιον*. Gorræus says this was a Species of Southernwood, which used to be set in Pots, and served as an Ornament for Gardens.

ADONIS FLOS. Pheasants-eye. Red Maithes.

The **CHARACTERS** are,

The Leaves are like Fennel, or Chamomile; the Flowers consist of many Leaves, which are expanded in Form of a Rose. The Seeds are collected into oblong Heads.

There are three Varieties of this Plant.

1. **ADONIS hortensis Flore minore atrorubente.** C. B. The common red Birds-eye. *Miller*.

This, Gerard says, is called, by the Herb-women in London, *Rose a Ruby*.

The Seed is thought to be good against the Stone. The Powder of the Seeds stamped given in Wine, wonderfully helps the Colic. *Gerard*.

The Flowers infused in Wine and drank, are found by Experience to relieve the Colic. *Ray from Parkinson*.

2. **ADONIS sylvestris, Flore luteo, Foliis longioribus.** The long-leaved yellow Birds-eye. *Miller*.

This, Ray says, only differs from the former in the Colour of the Flower.

3. **ADONIS Hellebori Radice, Bupthalmi Flore.** The Hellebore-rooted Pheasants-eye, commonly called the Fennel-leaved black Hellebore.

This is used by the Germans in Medicine as the true Hellebore. *Miller*.

ADOR. A Sort of Corn called also **SPELTA**, and **ZEA**. See **SPELTA** and **ZEA**.

ADORAT. The Weight of four Pounds. *Rulandus*.

ADOS. Water wherein Iron has been extinguished. *Rulandus*.

ADPLUMBATUM. This is a Word used no where, that I know of, except by Scribonius Largus, 271. He directs a Sort of Acopum, there described, to be put into a Tin Vessel diligently covered, and (*adplumbato*) soldered with Lead I suppose he means. Cato, in giving Directions for making an Olive Mill, or Press, uses the Word *circumplumbato* in much the same Sense.

ADRA RIZA. Blancard says the Root of the Aristolochia is thus called. I meet with the Word in no other Author.

ADRACHNE. The Strawberry Bay. It is thus distinguished by Authors.

ADRACHNE Officinarum, Park. Theat. 1490. Raii Hist. ii. 1577. *Adrachne Theophrasti*, Ger. Emac. 1602. J. B. 87. *Adrachne Theophrasti, Arbutus, seu Cernaro, proxime accedens*, Chab 4. *Arbutus Folio non Serrato*, C. B. Pin. 460. Pluk. Almag. 49. Jons. Dendr. 65. Tourn. Cor. 41. *Arbutus Dioscoridis vera Cometa dicta*, Wheel. Itin. 452. **THE STRAWBERRY BAY.** Dale p. 312.

It grows plentifully in the Island of Candy, on the Hills of Leuce, and in other Places among the Rocks, more like a Shrub than a Tree. It is an Ever-green, and its Leaves are so much like Bay-leaves, that they are not to be distinguished but by holding them to your Nose; for the Leaf of the *Adrachne* has no Smell at all. The Bark of the Stem and all the Branches is so smooth, red, and shining, that they look like Branches of Coral. The Bark cleaves in Summer, and falls off in very thin Chips; at which time it loses its fine-red and shining Colour, and takes up with a Sort of Medium betwixt a pale and an Ash Colour. It flowers and bears Fruit twice in the Year, as does the Arbutus Strawberry-tree, and their Fruits are so alike, that there is no Way of distinguishing them. But this Tree differs from the Arbutus Strawberry-tree, in that it grows only on Hills, nor has the serrated Leaf, nor the Bark of its Stem ragged. The Wood of the Tree is extremely hard, brittle, and inflexible.

It serves the Peasants for Fuel, and the Women for Whirls to their Distaffs.

Theophrastus reckons this Tree among such as are not killed by stripping them of their Bark, and are always green, preserving the Leaves on their Tops in Winter.

This Tree, in Crete, and all over Greece, is called *Ἀδράκη*, *Adracla*. *Bellus*.

Bellonius observed these Trees in many Places of his Travels, particularly in his Journey from Aleppo to Antioch, upon the Hills, but robbed of all their Fruit by his Fellow-travellers to eat on the Road; for it was ripe, and of a very inviting Colour. It grew in Clusters, and was of the Bigness and Colour of a Raspberry.

None who have read the Account of this Tree in Theophrastus can doubt that the Tree thus described by Bellus was the *Adrachne*.

dracme of that ancient Author, which is confirmed by the Name *Adracla*, *Adracla*, by which the modern Greeks call it.

Adracla, *Adracla*, differs from *Andracla*, *Andracla*, as Pliny would have us observe; for the latter is an Herb, by the Latins called *Portulaca* [Purflane] the other a Tree.

Mr. Wheeler observed this Tree in Achaia, near the Pentelican Hills, and saw some of the Fruit at Smyrna. *Ray*.

ADRAM. Sal Gemmae. *Rulandus*.

ADRARAGI. Garden Saffron. Called also ALFAR, AFAN. *Rulandus*.

ADRARIGES. Green Ink. *Rulandus*.

ADRIANUS. We learn from Aurelius Victor, that the Emperor Adrian had some Knowledge in Physic. This Circumstance is of too much Importance for the Honour of the Profession to be omitted; though, upon the whole, the Art rather lost than got Reputation by this Prince, who died, as it is said, much out of Humour with Physic and Physicians, because he could not be cured of an habitual Hæmorrhage, which at last brought on a Dropsy, which occasioned him to kill himself, in order to avoid a lingering Death.

The Antidote which bears his Name has been said to be his Invention. It is thus prepared:

Take of Pepper, and Seed of white Henbane, each twenty Drams; of Opium ten Drams; of Saffron five Drams; of Spikenard, Euphorbium, Amomum, Pellitory of Spain, Cyperus, Cardamom, Malabathrum, or Indian Leaf, dried Leaves of Rue, Cassia, Castor, Seeds of Daucus, Myrrh, Parsley, of each one Dram; of dried Roses, and Seeds of Smallage, each a Dram and half; of Ginger, and Opobalsamum, each two Drams; Honey enough to make it into an Electuary.

The greatest Dose is the Quantity of a Hasel-nut, the least that of an Egyptian Bean. It is good for the Colic, taken in warm Water before Sleep; for Infirmities of the Stomach, and those who cannot retain their Food; it is given in Posca, [Vinegar, and Water]; for the Strangury, in warm Water; for spitting of Blood, in Posca; for the Dysentery, reduce it into Pills, and let the Patient take a little warm Posca after them. To consumptive People give it at Night in Hydromel; for a dry Cough take it in a Linctus with Honey; for the Bites of Spiders and Vipers, in Mulsam [Wine boiled with Honey]. It provokes the Menstrues, taken in Mulsam in which Pennyroyal, or Calamint, or Rue hath been boiled. *Aetius Tetr. 4. Serm. i. cap. 108*.

ADROP. *Rulandus* does not give much Information in his Explication of this Word, which he calls AZAR, LAPIS IPSE, AZANE.

Ripley calls it UZIFUR, or PLUMBUM RUBEUM. *Theatrum Chym. Vol. ii. p. 114*. By this he means the Mixture of the Philosophers-Stone, or the Substance whence that is to be procured, as appears by a parallel Passage of an anonymous Author in the same Collection, Vol. iv. p. 474. *Castellus* is mistaken when he explains it Lead; for Lead, in the alchymistical Sense, is Antimony, as the Luna Philosophorum is the Regulus of Antimony; and thus *Adrop* is to be understood in David Lagneus, *Theatrum Chymicum*, Vol. iv. p. 726, who, from Arnoldus, interprets *Adrop*, Saturnus, that is, Antimony, the Matrix of the Philosophers-Stone.

ADROBOLON. *Adrobolon*. From *adros* large, and *bolos*, a Glebe, Bole, or Mass. The Indian Bdellium, which is a coarser Sort than the Arabian, being impure, black, and in larger Lumps. *Constantine, Gorraeus*.

ADROS. *Adros*. Plump, of a good Habit, adult; in this last Sense it is used by Hippocrates, *Lib. de Genitura*. Hence *adros*, plentifully, mentioned by the same Author, speaking of purging melancholy Patients.

ADROS is also applied to the Pulse, when it is ample and full, and the Artery is greatly distended in all its Dimensions. *Gorraeus*.

ADSAMAR. Urine. *Rulandus*.

ADSELLARE. This Word is peculiar to Vegetius; for I do not know that it is used by any other Author. It signifies literally to go to stool. He mentions it *L. iii. c. 45*, and in some other Places.

Castellus quotes it from the *Rei Rusticae Scriptores*.

ADSTRICTIO. ADSTRICTION. It either signifies the Retention of any natural Evacuation by the Rigidity of the respective Emiffaries, and is usually in this Sense applied to the Pores of the Skin, and intestinal Excretion, or is used to express the styptic Quality of Medicines.

ADSTRINGENS. ASTRINGENT. Styptic. See STYPTICA.

ADULTERATIO. Adulteration of Medicines, or counterfeiting those which are genuine by something like them in Appearance, though not in Efficacy. This has been complained of in all Ages; but is at present become a Trade so common, that unless the Legislature finds some effectual Method of putting an End to it, half Mankind will be destroyed, and the Profession of Physic rendered utterly useless; for Physicians may prescribe with great Judgment, and Apothecaries may admini-

ster with an equal Degree of Honesty, and yet the Abilities of one, and Diligence of the other, will be rendered even prejudicial to the Patient, if the Medicine, designed as a Relief, is so artfully adulterated as not to be discovered unless by the Effects, which I know is too often the Case.

I am sensible that no good Effect upon those who are guilty of Adulterations can be expected from any thing I may say; for they who can reconcile themselves to Robbery and Murder, which is the Consequence of Adulteration in a heinous Degree, are too abandoned to be reasoned out of their Iniquity.

In the Course of this Work, I shall do all in my Power to discover these egregious Cheats, by laying open the usual Methods of Adulteration, and specifying the Marks of genuine Medicines, and the Ways of knowing those that are counterfeited.

ADULTERIUM. Paracelsus, in his enthusiastical Way, has made a figurative Marriage betwixt the sensitive Soul, which he treats as the Husband, and the Body, which, in his Sense, is the Wife. Hence he calls overloading the Body with Aliment by the Instigation of the Appetite, ADULTERY.

ADUSTIO. BURNING. Avicenna, in his Epistle to Harsen, *Theatr. Chym. p. 869*, explains *Adustio* with the usual Obscurity of the Alchymists. *Adustio autem est quando commiscetur, aut adurit, aut corrumpitur Humiditas substantialis rei*. *Castellus* has taken no Care to render it more intelligible.

ADUSTION, otherwise called SIRIASIS, is an Inflammation of the Parts about the Brain and its Membranes, attended with Hollowness of the Sinciput [Top of the Head] and Eyes, a pale Colour, and Dryness of the Body.

The Remedy is the Yolk of an Egg, with Oil of Roses, laid on the Forehead, in Form of a Liniment, for the Convenience of often changing. *Oribasius Synop. lib. v. cap. 13*.

Apply the Leaves of Turnsole, called *Scorpiurus*, (because it twists its Branches and Flowers like a Scorpion's Tail) to the Forehead; or the Paring of a Gourd, or the Skin that surrounds the Pulp of a Pumpkin, or the Juice of Garden Nightshade, with Oil of Roses. *P. Aegineta, lib. i. cap. 13*.

ADYNAMIA. *Adynamia*. From a Negative, and *δυναμις*, Strength, or Force. Weakness, or Impotence from Sickness. See ADUNATOS.

ADYNAMON. Of the same Derivation as the former. A Sort of factitious Wine, made by putting to two Gallons and a half of Must half as much Water, and boiling it to the Consumption of the Quantity equal to the Water. It is made for sick Persons, for whom pure Wine would be too strong; for it is weak and of no Force, whence it takes its Name. But Dioscorides prescribes an equal Quantity of Wine and Water, to boil till all the Water be boiled away, and when it is cold, to run it up in a Vessel well pitched. *Gorraeus*.

ADY. The Palm-tree of the Island of St. Thomas. It is a very tall Tree, exceeding even the Pine in Height, with a thick, bare, upright Stem, growing single on its Root, of a thin, light Timber, and full of Juice; its Leaves like those of the cocciferous Palm-tree. Its Head shoots forth into a vast Number of Branches, which being cut off, or an Incision made therein, they hang up a proper Vessel to receive the Tears or Juice that distil from the Wound; and this supplies the Place of Wine among the Indians, and easily intoxicates. It is sweet when new, but sour in a few Days; nor do the rest of the Branches which escape unhurt ever fail of bearing Fruit. The Inhabitants of this Island do not cut the Buds of this Tree, as the Indians do those of the cocciferous Palm-tree.

The intire Fruit is called by the Portuguese, *Caryocet*, and *Cariocet*; and by the black Natives, *Abanga*. Its outer Rind is yellow, under which is a yellowish Pulp, and after that a hard blackish Stone, which contains a black Kernel, that is good to eat, and peeled of its Skin, is white. The Fruit intire is of the Size and Shape of a Lemon. They eat it roasted, and frequently at their Tables mix the whole raw Kernels with Mandioc Meal. They believe these Kernels to be of wonderful Virtue in restoring Strength to those who pine under a Distemper, and give their Patients three or four of them twice or thrice a Day, to comfort their Hearts. Besides this, they make an Oil out of the Fruit, thus: They take the Pulp off the Stone; and mix it with a good Quantity of very hot Water, and afterwards set it over the Fire to boil a considerable time, carefully stirring it; then it is taken off, and suffered to stand till all the Dregs settle at the Bottom, after which, with a Ladle they take off the Oil that swims on the Water. This done, they repeat the Operation, by adding more hot Water. The Oil is of the Colour of Saffron, concretes with Cold, but is otherwise liquid, eatable, and serves the Inhabitants for the same Purposes that Oil of Olives, or Butter, does the Natives of our Climate; though, to speak the Truth, it is inferior to either of them, both in Smell and Taste.

This Oil is in common Use with the Inhabitants for anointing those Parts of the Body which are stiff and contracted; and they say it is of singular Efficacy in relaxing rigid Tendons. They anoint the whole Body with it also after Exercise and Weariness.

Weariness with Labour. By Exercise, say they, the similar Parts of the Body exhale and are dried up, which ill Effects are prevented by a slight rubbing with this Oil. In short, it is their Acopon, and a noble Remedy, they say, against Lassitudes. *Ray's History of Plants.*

ADYNATOS. *Ἀδυνατός.* Its Derivation is the same as **ADYNAMIA**, and **ADYNAMON**. In Hippocrates it signifies Weak, Feeble, or Impotent, and this Weakness is said to be a very bad Symptom, when it occurs in Diseases, where no Evacuation has happened sufficient to account for it. When it is attended with frequent Stools, Lassitude, Pain in the Head, Thirst, Want of Rest, and the Patient mutters obscurely, so as not to be understood, it is a Sign of an approaching Delirium. *Prædict. l. i. Coac. Prænot.*

AEAZO. *Ἀεζω.* To lament, complain, exclaim, or groan. *Foef. Castellus, from Hippocrates.*

AEDES. *Ἀέδης.* From *α* Negative, and *ἔδω*, Sweet. Unpleasant, Disagreeable. It is sometimes applied to Aliments.

AEDOIA. *Ἀέδοια.* From *αἰδέομαι*, Modesty. The same as **PUDENDA**, by which is meant the Parts subservient to Generation in both Sexes.

ÆGAGROPILA. From *ἄγρῳπος*, the Rupicapra, or Rock-Goat, Chæmois, or Gems, and *πίλος*, a Ball. Velschius wrote a Treatise on the Virtues of this. It is a little Ball found in the Stomach of Does and Goats in Germany, which some have pretended to be formed by the Doronicum, or Leopards Bane, on which these Animals feed; but it is now certain that it consists only of Hairs, which they swallow; and the like Balls are found in the Stomachs of Cows, Hogs, Boars, &c. and consequently are of no medicinal Virtue; though, from the false Opinion concerning their Original, some have celebrated them in Loosenesses, Hæmorrhages, &c. because of the Plants from whence they conceived them to be formed. They have likewise been recommended in a Vertigo, because the Goats which produce them climb very steep Rocks without being giddy. *Geoffroy.*

ÆGEIRINON. *Ἀγείρινον.* From *ἄγρῳπος*, a Poplar. An Ointment so called, because the Catkins, or Fruit of the Poplar is one of the principal Ingredients in it. It is made after the following Manner:

In the Spring Season, when the Seeds of the Black Poplar have most Resin about them, bruise them, and put four Ounces of them into a Pint of sweet Oil; let it digest forty Days in the Sun, or boil three Hours in a double Vessel (*a Circulatory I suppose*) and afterwards be strained. *Paulus Egineta, l. vii. c. 20.*

ÆGEIROS. *Ἀγείρος.* The Poplar. Hippocrates recommends nine Grains of the Cretan Poplar to be taken bruised in black Wine, as a Medicine to promote the Expulsion of the Foetus. Foefius interprets it the Black Poplar. See **POPULUS**.

ÆGIDES. *Ἀγίδης.* A Disorder of the Eyes. It is mentioned by Hippocrates, (*Prædict. l. ii.*) where, in the Opinion of Foefius, it signifies small white Cicatrices in the Eye, caused by an Afflux of corrosive Humours upon the Part. But he interprets the same Word in a different Manner in his Commentary on the Passage where it again occurs (*Coac. Prænot. 218*). Here, he says, it signifies small white Concretions of Humours, which stick upon the Pupil, and obscure the Sight. Castellus blames Foefius for calling one of these Cicatrices or Concretions *ἄγιδης*, which, he says, should be wrote *ἄγιδας*; but it is not certain that this Correction is right; nor do I see any Reason to think the Word should be taken in different Senses in the two Passages quoted above. Crispinus interprets *ἄγιδας* a white Membrane or Cicatrix in the Eyes. In Inflammations of the Eyes, where there is a considerable Afflux of Humours to the Part, we frequently observe little white Specks to arise upon the Pupil, which sometimes increase so much as to become a Film. These always disappear spontaneously, as the Inflammation is resolved, and the Humours diverted another Way. But if sharp painful Powders, or Collyria are applied, they are frequently so hardened and fixed, as not to be removed afterwards by any Means whatever.

These seem to be what are meant by **Ægides**.

ÆGIDION. *Ἀγίδιον.* From *ἄγιδας*, or *ἄγιδης*. The Name of a Collyrium described by Aetius against Defluxions or Inflammations of the Eyes. *Aetius.*

ÆGILOPS. *Ἀγίλωψ.* The *Cerrus Mas majore Glande* (Park.) is called thus. Gerard mentions it under the Name of *Cerris majore Glande*. HOLME OAK, with GREAT ACORNS.

It is the *Quercus Cæhye echinato*, *Glande majore ἄγιδωψ* *Idæorum*, *Aspris Maurorum*, *Cerrus Latinorum* of Casp. Bauhine. J. Bauh. thinks it the *Aspris* of Theophrastus.

We saw the Cups of the Acorns of this Tree at Venice, where they are called Vallonia, taking the Name from Apollonia, a City of Dalmatia, now called Vallonia, whence they are brought. They use them for the same Purposes as we do the Bark of Oak, namely, to dress Leather.

The Cup of this Acorn, which was brought from Cape d' Istria by Valerand Dourez, is thus described by J. Bauhine:

Its Cavity was an Inch and a half in Diameter, and somewhat less in Depth. The Cup itself was surrounded with a Multitude of thick stiff Prickles, somewhat resembling the Fragment of a craggy Rock. It was not less than three Inches in Diameter, and was hairy on the Inside; its Scales were broad, and of a white Ash Colour. Whether the Tree was ever described I cannot tell; for those found on the Road from Pesaro to Rome, described by Lobel, I suppose to be the same with those we saw about the Lake of Bolsena; but these Corri had smaller, smoother, and less prickly Caps.

Nor does that seem to be any other, whose Branches were sent to Bauhine by Dalechampius. It had the Leaves of the common Oak, only longer, and more finely and deeply jagged, the upper Face shining, the under of an ash Colour. The Fruit sticks close to the Wood, and the Cups of the Acorns were prickly and thorny, an Inch in Breadth, but the Acorn was not yet ripe, and the Cups were in every Respect like the prickly Cup of the Oak of Burgundy.

The Leaves of the *Cerrus* observed by us about the Lake of Bolsena in Tuscany were exactly such as Bauhine here describes; but the Cups of the Acorns were different from those of the *Cerrus*, which are called Vallonia.

The Use of the Cups is to die Woollen Cloth black instead of Galls; but they give a fainter Colour, and not so lasting or valuable. *Ray's History of Plants.*

There are some other Vegetables called by the Name of *Ægilops*, as the

Festuca Avenacea sterilis elatior, C. B. *Bromus herba frve Avena sterilis*, Park. *Bromus sterilis*, Ger. *Ægilops Matthiolo*, J. B. GREAT WILD OAT-GRASS, or DRANK.

The Roots are full of small Fibres, and entangled one with another; the Stalks rise several from one Root, a Cubit high or more, slender and divided by several Joints or Knots, often five, each Stalk bears a Panicle divided many Ways, little Bits of which hanging by long and slender Filaments, and compacted of several husky Substances laid one upon another, put on the Appearance of a small Ear, not much unlike the husky Heads of Oats, with a long soft Beard, sometimes of a purple Colour. The Leaves are of a moderate Breadth, rough and hairy at the Edges. When the Plant turns to Straws, the Root withers.

It grows by Hedges, Paths, and the Sides of Fields, in the Month of May.

The Root boiled in white Wine, and the Decoction drank for some Days together, is commended by Tragus as a singular Remedy for the Worms in Children. *Ray.*

Dioscorides gives the following Account of it:

The *Ægilops* is a small Plant, with Leaves like those of Wheat; but softer, and producing its Seed at the very Top, which are two or three in Number, of a red Colour, and inclosed in bearded Husks.

The Herb applied with Meal, by Way of Cataplasm, cures the *Ægilops*, and dissolves Hardnesses. Meal wet with the Juice, and afterwards dried, is kept for the said Purposes. *Dioscorides, l. iv. c. 139.*

The second Sort of *Ægilops* is the

Festuca longissima aristis, C. B. *Ægilops bromoides*, Tab. Ger. BEARDED WILD OATS.

It shoots forth many small, narrow, oblong Leaves, distinguished by several fine Curls, among which arise three or four slender Stalks, a Foot high, bearing Oaten Ears, with empty Husks, of a spadaceous [bright bay] Colour, and armed with a very long Beard, which proceeding from leafy Husks, leans all on one Side.

We observed this Species more than once in Germany. Tabernamantanus took notice of it between Worms and Frankendale. Its slender Beard is often turned in the Manner of Curls.

The third Sort is the

Ægilops Narbonensis, Lob. *Festuca frve Ægilops Narbonensis*, Park. *Festuca Italica*, Ger. *Gramen Festuca xiv. frve Festuca altera capitulis duris*, C. B. HAVER GRASS.

It has a little white and fibrous Root, which shoots forth some slender Stalks, about a Foot high. It has but few Leaves, and those best resembling the Leaves of Wheat and Barley; but softer and smoother, and hairy round the Edges. At the Top of the Stalk come forth small Ears, proceeding from two or three hard Heads, and consisting of some striated Husks, that contain the Seed, which is like Barley, only somewhat smaller and broader, and three in Number, immediately under the Cover of an inner chaffy Husk. From the Husks, and not from the Seed, comes forth a fine, sharp, oblong, white Beard.

It is very common in Sicily, Italy and Languedoc, and Provence in France, in hot and sandy Soils, and in Fields among Wheat and Barley (*Lob. C. B.*). Cultivated in Gardens, it grows higher and bigger, the Ears consisting of five or six Heads. In Sicily there is a white and a black Species, and the Beard is more raised. *Cas.* We observed no such Difference.

We have, more than once, had Experience of its Virtue against the *Ægilops*; but it was in the Beginning of that Distemper, and before it had made any considerable Progress. It is an Astringent and a Dryer, without much heating. The Seed made into Malt with other Corn, communicates an inebriating Quality to the Beer. *Lob. Ray* 1289, 1290.

An *Ægilops*, or *Anchilops*, is an Abscess in the Canthus of the Eye, next the Nose, containing Pus, which breaking, either corrodes the Bone, or discharges itself at the Canthus, or into the Nose. *Gal. in Isag. vel Medico, c. 15.*

Between the Bone of the Nose and the great Canthus near the Eye, a small Tubercle, like an Abscess, often rises, and usually breaking into the Corner, becomes difficult to cure, if not taken care of. *Gal. de Compos. Med. sec. Loc. l. v. c. 1.*

An *Anchilops* is a Tumor in the great Canthus, containing a Collection of Humours, perforated or not perforated. *Galen. Definit. Med.*

An *Ægilops* is an Abscess near the great Canthus. It is difficult to cure, because the subjacent Bone, from the Thinness of its Substance, is corroded. *Act. lib. viii. cap. 87.*

An *Ægilops* is an Abscess between the great Canthus and the Nose, which, if it breaks, and is neglected, causes a Fistula even to the Bone. Before it breaks and becomes an Ulcer, it is called an *Anchilops*. *P. Æg. lib. iii. cap. 22.*

An *Ægilops* is a suppurated Tumor between the great Canthus and the Nose. *P. Æg. lib. vi. cap. 22.*

An *Ægilops* is an Abscess broken between the great Canthus and the Nose. Before it breaks it is called an *Anchilops*; and, if neglected after it breaks, turns to a Fistula, and spreads to the Bone, being then not easy to be cured. *Albucasis, lib. i. de Diagnof. Path. cap. 7.*

In the Corner of the Eye next the Nose, a kind of small Fistula discovers itself, from which a Humour constantly distils. The Greeks call it *Ægilops*, and it is a perpetual Nuisance to the Eye. Sometimes it eats through the Bone into the Nose. Sometimes it turns cancerous, when the Veins appear distended and crooked, the Colour pale, and the Skin hard, and being easily irritated, it raises an Inflammation in the neighbouring Parts. It is a dangerous thing to attempt the Cure of those that are cancerous, because it only hastens Death.

When this Ulcer penetrates into the Nose, all Remedies are in vain, for the Patient will never be cured; but whilst it is confined to the Angle of the Eye, a Cure may be attempted, though even that is difficult; and the nearer the Foramen is to the Corner, the greater will be the Difficulty, because of the very little Room the Hand has to act; but the Work is like to be the easier, whilst the Distemper is recent.

The superior Part of the Orifice must be taken hold of with a Hook, then cut out all that is hollow, as in Fistula's, till you come to the Bone, the Eye and other adjoining Parts being well defended. The Bone is to be well cauterized, and if it be carious, some apply Caustics, that a larger Portion of the Bone may exfoliate, such as Chalcantum, Chalcitis, or Verdigrease, which last works more slowly and with less Effect than the two former. The Bone, thus cauterized, is to be healed as other Bones are which are treated in the same Manner. *Celsus. lib. vii. cap. 7.*

Ægilops, so called from *αἴς*, a Goat, and *ὄψ*, an Eye, because People who have this Distemper are said to have a Cast of their Eye, which resembles that of a Goat, and which Virgil alludes to, *Transversa iumentibus Hircis*. Paulus Ægineta has given it the Name of *Anchilops* before it is ulcerated, which Distinction has been observed by later Writers. When the Tumor is burst it is called *Ægilops*. Avicenna calls it *Garab* and *Algarab*.

It is a Tubercle in the inner Canthus of the Eye, and is either scrophulous, atheromatous, or of the Nature of a Meliceris; it is very apt to turn sinuous, and being so, whether it proves callous or not, is however called a *Fistula Lachrymalis*. *Wiseman.*

The Matter contained in this Tumor is so sharp and purulent, that it corrodes not only the Skin, but even the Lachrymal Ducts, the Fat seated near the Sinusses of the Eyes, and sometimes the Bones called *Ossa Plana*, and even the adjacent Bones of the Nose, where it causes frequently a dangerous Caries. Sometimes the inferior and superior Lachrymal Ducts are so totally eroded, that the Tears mixed with Matter continually flow into the Eye, from the *Puncta Lachrymalia*, and at last cause a true *Fistula Lachrymalis*. But oftentimes Tears only trickle from the Eye, when it is properly enough called *Epiphora*. *Heister.*

In the Beginning of this Disorder, a Tumor with, and sometimes without Inflammation often appears superficially; and at other times seated so deep, that unless the Part is pressed with the Finger it cannot be perceived. The Matter often makes its Way under the lower Eye-lid, from the Tubercle there ulcerated, where it increases by Degrees, till it runs over with the Tears. *Semertus.*

We generally find a *Fistula Lachrymalis* joined with the *Ægilops*, which is chiefly owing to its being seated in such a

Manner, that the Tears and Matter cannot pass to the Nose, and so consequently must weaken and extend by Degrees the Lachrymal Bag.

The principal Cause of an *Ægilops* is an Abscess consequent to an Inflammation. I have seen it very often caused by an Ophthalmia, and the Small-pox. *Heister.*

The Causes of an *Ægilops* are the same that produce the like Tumors in other Places; but in some Cases it is made by Fluxion, and appears first as a small Phlegmon. This Disease is frequently a Symptom of the *Laes Venerea*.

If it is made by Congestion, as in the Atheroma, Steatoma, and Meliceris, the Tubercle is round, without discolouring the Skin; but if by Fluxion, then it appears red, with Pain and Inflammation over the whole Eye. Sometimes it begins only with a weeping of that Corner, and is not discovered till it affects the Eye with Redness, and then, by Pressure with your Finger upon that Canthus, a mixed Matter may be discharged, Part of which is not unlike the White of an Egg. This Matter sometimes eats through the Bone, and discharges itself through the Nose with a foetid Smell. *Wiseman.*

The *Ægilops*, if not taken in time, is difficultly cured.

It is also very troublesome when seated deep; but is worse if it bursts inwardly, because it often corrupts the adjacent Bones.

If the Tumor is not inflammatory, as the Meliceris and Atheroma, the Cure is effected not so much by Medicine, as by Surgery.

If it turns cancerous, it is very dangerous to attempt a Cure, as Death is often hastened by it. *Semertus.*

If the Ulcer be accompanied with Erosion, it will be apt to terminate cancerous, in which Case the Cure is deplorable. *Wiseman.*

The Indication of Cure is taken from the Condition of the *Ægilops*, whether it is in its beginning with Inflammation, or Congestion, passing its Matter under the Cilium into the Eye.

In the Beginning, Bleeding and Purging are necessary, also such Alteratives as are prescribed in the general Cure of Strumas, (See STRUMA) with Regulation of Diet accordingly.

Externally we apply Repellents to the diseased Part, to prevent Fluxion, of the Waters of Purslane, Lettuce, Plantain, Horse-tail, Night-shade, and Frogs Spawn, with the Whites of Eggs, and Armenian Bole. To intercept the Matter, we apply Gum Mastic, Tacamahac, or the Rupture Plaster, to the Temples, and adjacent Parts.

If the Tumor increase with Tension and Pain, it will be then reasonable to endeavour Discussion, by a Decoction of Wormwood, Elder-flowers, Rue, Lentil and Vetch-meal, either in Wine or Water. If the Tumor tend to suppurate, it must be forwarded with a Cataplasm of white Lilly Roots, Mucilage of Marsh-mallow-Seeds, Linseed, Foenugreek, Wheat-flower, and Hogs-lard. When the Matter is well concocted, let it be discharged either by Knife, or Caustic. The only Caution is, that it must be opened at such a Distance from the Edge of the Eye-lid, that it may not divide; for in so doing, a remediless Blemish will be left, and the Eye will be subject to Fluxion, and apt to water ever after.

If it is opened by Caustic, it will require the greater Care. I, for the most Part, open them by Incision; then digest them with a Doffil dipt in Oil of Roses, and the Yolk of an Egg, over which I apply Galen's Cerate, or such like, with a Compress dipped in some of the before mentioned distilled Waters, to temperate the Heat in the Part; and afterwards deterge with Honey of Roses, and Syrup of Roses, or with this:

Take of common Honey two Ounces; Verdigrease a Dram; Spirits of Wine four Ounces; boil them till one third Part is consumed.

Then dispose them to cicatrize with this:

Take of yellow Myrobolans one Dram; Frankincense and Myrrh each two Scruples; Tutty one Scruple; Camphire two Grains. Infuse them in Rose-water and white Wine, each four Ounces; then boil to a Consumption of a third Part, and filtre for Use. And afterwards with Ointment of Tutty, and Lime-Water, and with good Compression cicatrize them.

If the Ulcer is fistulous, it becomes a *FISTULA LACHRYMALIS*, which see. *Wiseman.*

As the inflammatory *Ægilops* rather tends to Suppuration than Resolution, it must be brought to Maturation as fast as possible, lest perhaps by Delay it should degenerate into a troublesome Fistula. The Applications proper for this Purpose are emollient Cataplasms, or Plaisters of Diachylon with the Gums. But as soon as Matter is known to be formed, the lower Part of the Tubercle ought immediately to be opened with a Knife or Lancet, and the Matter being pressed out, the Abscess must be carefully deterged with the *Oleum Philosophorum*, a digestive Ointment, or with Honey of Roses, with a little Myrrh, Ægyptiacum, or red Precipitate, and then the Ulcer must be healed with some proper Balsam. But if the Abscess breaks of its own Accord, as it often does, and the Aperture

is so small that the Matter cannot discharge itself, it ought immediately to be enlarged with a Piece of prepared Sponge, or Gentian-root, or with the Knife, after which it must be treated as is said above. If the Bone is discovered to be carious, it will be proper to dress it with Lint wet with Spirits of Vitriol, or of Sulphur; or, instead of them, the Powder or Essence of Euphorbium may be used, and over the Dressings a Compress dipped in Lime-Water, or some cooling Liquor must be applied, till the Caries is removed, and the Wound fit for healing. The Caries may sometimes be scraped off with the Rugeine. But the actual Caustery applied through a proper Canula forwards the Cure surprisingly; the Ulcer afterwards will be cured by Balsamics. *Heister.*

A young Gentlewoman abounding with acid Serum, was seized with an Inflammation and Tumor in the great Canthus or Angle of her Eye. She had been dressed by some neighbouring Friend till the Inflammation closed up her Eye-lid, and alarmed her by the great Discharge of a mixed serous Matter. I observing the Tumor perfectly suppurated, and the Matter shining under the Cuticula ready to burst through, opened it by the Point of a Lancet, without drawing one Drop of Blood. The Matter discharged, I dressed it with a Doffil dipped in the Yolk of an Egg, with a Plaister of Galen's Cerate, and Cloths dipped in red Wine over all, with convenient Bandage. The next Day I took off the Dressings, and fomented it with a Decoction of the Leaves of Mallows, Violets, Betony, Sage, and red Roses, in Wine and Water, repeating the Dressings as before, and let her blood in the Arm. At the next Day's Dressing, I found the Swelling of her Eye-lid relaxed, and the external Inflammation mitigated, but the Eye itself inflamed. I fomented and dressed the Abscess with a Doffil dipt in Syrup of Roses, applying a Pledgit of Ointment of Tutty over it, with a soft Compress thereupon, leaving the Eye at Liberty to be refreshed with the Air, and to be dressed with Breast Milk as they pleased. To the Forehead Frontlets were applied, to restrain and intercept the Influx. Lenient Purgatives and traumatic Decoctions were prescribed. The Orifice was kept open sufficiently for the Discharge of the Matter, and Convenience of Dressing: Externally refrigerant and exsiccant Medicines were applied, and a few Drops of Tincture of Verdigrise were added to the Syrup, in which I dipped my Doffils. Yet notwithstanding my Endeavours, the Matter having made its Way into the Eye, flowed both Ways in too great a Quantity for some time. Upon which I dressed the Ulcer with a Doffil dipped in Precipitate, and applied over it a Pledgit with Vigo's Ointment of Tutty with Compress and Bandage. After I had thus digested it, I dressed it with a Doffil dipped in Aqua viridis, which I lessened daily, and at last cicatrized it firm. *Wise man.*

The Bandage is the same as for the Fistula Lachrymalis. See FASCIA.

ÆGIMIUS. A Physician who was the first that wrote a Treatise on the Pulse, as we learn from Galen. His Country was Velia, or Elis. His Age is uncertain. Le Clerc thinks he lived before Hippocrates. Pliny mentions one of this Name who was remarkable for his great Age, *lib. vii. cap. 48.* having lived two hundred Years. As he says nothing more of him, it is not known if he was the same as the above mentioned, or another.

His Treatise on the Pulse was entitled *Περὶ Πάλμῳν, Of Palpitations*, which was the ancient Word to express the Pulse. Hence Schulzius concludes he must be very ancient, as having lived before the other Words afterwards used by medicinal Writers to express the Pulse were in Use.

Another Argument for the Antiquity of *Ægimius* is drawn from Galen's representing him as the first who wrote on the Subject of Pulse, which cannot be true unless he was prior to Hippocrates, because the last named Author makes frequent Mention of the Pulse.

Schulzius makes a small Mistake in saying the *Ægimius* taken notice of by Pliny was of Velia; for Pliny only mentions his great Age, without specifying his Country.

ÆGINETA (PAULUS) a Physician of the seventh Century, was so called from *Ægina*, the Place of his Birth, as appears from two Lines prefixed to the first Edition of his Works.

Πάυλος αὐτὸν με γένετο, τὸ γὰρ τὸ παλαιόν
Διαδραμύσας, φησὶ ἐν γένει Ἀργίνας.

This is the Work of Paulus, a Native of *Ægina*, who had travelled over the greatest Part of the World.

This Circumstance of his Life is the greatest Part of what is known of him; and the Curiosity which the Mention of a Traveller naturally excites, must remain unsatisfied, and we must confine ourselves to an Account of his Works.

That Reputation of every kind is capriciously distributed cannot but be frequently observed; nor is it less usual for Authors, than for Men of every other Class, to be recompensed for their Endeavours in a Manner disproportioned to their

Merit. *Paulus* is, in the Opinion of Dr. Freind, one of those unfortunate Writers who have been long rated below their Value, and been despised for want of being read.

He appears, upon a careful Examination, not to be so implicate a Transcriber as he is generally represented; but to have considered the Practice of the Ancients attentively, and to have admitted or rejected it upon just Consideration. He sometimes differs from Galen, and once ventures to hint his Disapprobation of the Doctrine established by Hippocrates himself.

In his sixth Book, in which he professedly treats of surgical Operations, and which Freind esteems the best Body of Surgery produced before the Restoration of Learning, there are many Practices and Operations mentioned, which no preceding Author appears to have been acquainted with.

He describes the several Sorts of Hernia's with great Exactness; and very circumstantially lays down the Method of making the Incision, when the Gut cannot be replaced without it.

The Operation of opening the Arteries behind the Ears by a transverse Section, and the Application of a Caustery afterwards are very accurately laid down by him.

He has a very exact Account of Bronchotomy, which is translated by Dr. Freind, and will be given under the Article BRONCHOTOMY.

His Work in seven Books has been several times printed in Greek.

The first Edition is that of Aldus 1528.

The second was published at Basil 1538, by Andreas Cratander, under the Care of Hieronymus Gemufæus, who made some Emendations in the Text, and added some Notes.

It has been translated into Latin by three different Hands, Albanus Torinus, Johannes Gunterius Andernacus, and Janus Cornarius, to whom the World is obliged for many useful Remarks upon this Author.

The Arabians call this Physician *Bulos Al Agianithi*.

Herbelot says he lived in the time of the Emperor Heraclius, and in the Reign of Omar, the second Chalife of the Musulmans, who died in the Year of the Hegira 23, which answers to the Year of Christ 645. Honani, the Son of Isaac, translated the nine Books of *Paulus Ægineta* into Arabic. I do not know whether he met with two more than are now extant in Greek, or whether these seven were divided in a different Manner, so as to make nine. Fabricius is of Opinion, that the sixth and seventh Book, which are pretty long, were each divided by the Arabian into two.

It is esteemed the peculiar Excellence of this Author to have understood the Disorders to which Women are subject; he acquired the Name of *Al-Kavabehi*, that is, *Obstetricius*, because he used to instruct Midwives in the Duties of their Office, and teach them how to treat Women in Child-bed. *Fabricius.*

ÆGLE. An allegorical Daughter of *Æsculapius*. Le Clerc thinks by *Ægle* is meant the Light of the Sun, which purifies the Air.

ÆGLIA. *Ἀργία*, or *Ἀργίνα*. According to Gorræus and Castellus the same as *argis*, *Ægis*, or *argias*, *Ægias*. See *ÆGIDES*.

ÆGOCERAS. *Ἀργυρῆρας*. From *αἰς* a Goat, and *κερας* a Horn. Fœnugreek, so called from the Form of the Siliquæ or Pods which it bears; these were imagined to resemble the Horns of a Goat. *Gorræus.*

ÆGOLETHRON. From *αἰς* a Goat, and *ἐλεθρον* Destruction.

Tournefort describes a Plant by the Name of *Chamaerodendros Pontica, maxima, Mespili folio, flore luteo*, which he takes to be the *Ægolethron* of Pliny, and which he met with in Asia.

It is a Tree which grows higher than a tall Man, with a Trunk about the Size of the Leg. From this arise many Branches, subdivided again into smaller, which are uneven, weak, brittle, white within, and covered with a greyish Bark, naked except at their Extremities, where they are clothed with Tufts of Leaves like the Medlar. These Leaves are about four Inches long, and an Inch broad in the Middle, pointed at both Extremities, but most so at that next the Pedicle, of a lively green, somewhat hairy, and bordered at the Edges with Hairs like the Eye-lids. The Rib of the Leaf is strong, and divided into Nerves which are spread on the Surface. This Rib is only a Continuation of the Pedicle, which is three or four Lines long, and about a Line in Thickness. The Flowers grow at the Extremities of the Branches, eighteen or twenty together in a Tuft, each sustained by a Pedicle about an Inch long, hairy, and springing from the Axæ of certain small, membranous, whitish Leaves, seven or eight Lines long, and as many broad. Every Flower forms a Canal of two Lines and a half Diameter, superficially channelled, hairy and yellow, inclining to red, which, at about an Inch Distance from the Basis, is expanded, and divided into five Parts, one of which is about an Inch long, and as much broad, which bending backwards, like

like the other four; forms a kind of Gothic Arch; the Colour is a pale yellow, but more like Gold about the Middle. The other four Divisions are of the same Colour, but neither so long nor so broad. This Flower is perforated at the Bottom, and at this Perforation articulated with the Pistil, which is pyramidal, channelled, and about two Lines long, of a pale green, somewhat hairy, and terminated with a crooked Filament two Inches long, which ends in a pale green Knob. Round the Perforation of the Flower arise five Stamina, shorter than the Pistil, uneven, bent and furnished with Heads full of a yellowish Dust; the Stamina are of this Colour, hairy from their first Appearance as far as the Middle, and all bent to one Side, like those of the *Fraxinella*. The Pistil becomes a Fruit of about fifteen Lines long, and six or seven Diameter, and divided into seven or eight Apartments. Mr. Tournefort never saw the Fruit ripe.

The Leaves of this Plant are styptic. The Smell of the Flower is like that of the Honey-suckle, but stronger and intoxicating.

Mr. Tournefort goes on to tell us, that he was so taken with the Beauty of this Flower, that he made a Nosegay of it, which he designed as a present for Numan-Cuprogli, at that time Bassa of Erzerum, whom he had the Honour to accompany on the Black Sea; but he was informed by his Chaia that the Smell of it was thought to cause Vapours, and a Vertigo; and was told by the People of the Country, that it was esteemed prejudicial to the Brain.

These People have a Tradition, probably founded on repeated Observations, that the Honey which the Bees get from this Flower, stupifies those who eat it, and inclines them to vomit.

Dioscorides speaks of this Honey in much the same Terms, *lib. ii. cap. 103.* About Heraclea in Pontus, says he, at certain times of the Year, the Honey makes those mad who eat of it, and raises a plentiful Sweat; this Effect is owing to the Flowers from whence they gather it. Those whom it affects are relieved by eating Rue, and salt Meats (*ῥαπῆς*), and drinking Wine mixed with Honey, which are to be repeated as often as they are discharged by Vomit. I suppose he means Honey of a better Kind. Dioscorides adds, that this Honey is acrid, and makes those sneeze that smell to it. It takes away Freckles, by anointing them with it, mixed with Costus; and with a Proportion of Salt, Pliny says of Aloes, it cures Lividness from Bruises.

To this Pliny adds, that the same Disorders are communicated to Dogs, that eat the Excrements of those who have taken this Honey.

This Plant, and the *Chamerodendros Pontica, maxima, folio Laurocerasi, flore e ceruleo purpurascens*, grow about Heraclea in Pontus, now called *Penderastis*, or *Elegri*, and are found in great Plenty upon the Coast, and in the Woods all the Way to Trebifond and beyond.

The Account which Pliny gives of the Plants from whence the Bees extract this Honey, is more plain than either that of Dioscorides or Aristotle, which last believed that it was gathered from the Box-tree, and that it made those mad who eat of it, if they were well before; and on the contrary, cured those who were mad before they took it. The Passage in Pliny is thus. *lib. xxi. cap. 13.*

About Heraclea, in Pontus, some Years the Honey is extremely pernicious. Authors have not informed us what Plant it is gathered from; what I have discovered of this I shall relate. There is, in those Parts, a Plant called *Egoletbron*, from its being Poison to Cattle, but particularly to Goats. The Flowers of this, in a moist Spring, acquire a poisonous Quality when they wither. Hence it happens that the Honey is not every Year noxious. That which is poisonous is distinguished by remaining more fluid than the other Honey, and not concreting; the Colour also is more red, the Smell is different from that of good Honey, and causes Sneezing, and it is more ponderous than that which is wholesome. Those who eat of it cast themselves on the Ground, and seek by all Means to cool themselves, because they sweat immoderately.

The Antidote specified by Pliny is the same in Dioscorides. He adds, that Mead prepared with this is innocent when it grows old, and that in the same Country (Pontus) amongst the Sanni, there is another Sort of Honey, which, by reason of the Madness it produces, is called *Mænomenon*. This Effect is said to be owing to the Flower of the Rododendros, with which the Woods abound. And that Country, though it pays Tribute to the Romans in Wax, never sell their Honey, because it is Poison.

From this Passage Mr. Tournefort concludes, with very good Reason, that the *Egoletbron* is the Species of *Chamerodendron* I have described above; and that the Rododendros, mentioned by Pliny, is the *Chamerodendros maxima folio Laurocerasi, flore e ceruleo purpurascens*, which he says may be called *Rododendros Pontica Plinii*, to distinguish it from the common Rododendros, Oleander, or Rose Bay.

It is certain that the Oleander, or Rose Bay, Rododendros, does not grow on the Coasts of the Euxine Sea, that Climate being

too cold. Very few are to be found beyond the Dardaniels; but they are very common by the Sides of the Rivulets in the Islands of the Archipelago. Hence it is certain that the Rododendros of Pontus, taken notice of by Pliny, cannot be the Oleander, or common Rododendros. Tournefort, in these Quotations, has made some little Mistakes, which I have endeavoured to rectify.

Xenophon relates a very extraordinary Effect of this Honey upon the ten thousand Men, which he commanded, in their Retreat. He tells us when they approached near Trebifond, they found a great Number of Bee-hives, and the Soldiers eat plentifully of the Honey. Upon this they were seized with a Vomiting and Purging, which was succeeded by a Delirium, insomuch that those who were least affected seemed to be drunk, and the rest either mad or dying. The Camp had the Appearance of a Field of Battle, so many Bodies lying about, which seemed either dead or expiring. However nobody died by it; for the next Day the Disorder ceased about the same time that it began the Day before; so that the third or fourth Day the Men recovered, but remained weak and faint, as if they had taken some strong Medicine.

Diodorus Siculus relates this Story with the same Circumstances. The Father Lamberti, a Missionary, relates, that the Honey which the Bees collect from a certain Shrub in Colchis or Mingrelia, is dangerous and emetic. This Shrub he calls *Oleandro giallo*, yellow Oleander, which Tournefort thinks without dispute the same as the *Chamerodendros Pontica, Mespili-folio, flore luteo*, or *Egoletbron*. The same Lamberti describes the Smell of this Flower, as betwixt that of Musk and yellow Wax. Tournefort says it is not unlike that of the Honey-suckle, but much stronger. *Memoires de l'Academie Royale des Sciences. 1704.*

ÆGONYCHON. *Ἀγώνυχον*. Dioscorides, *lib. iii. cap. 158*, says the Lithospermon, Gromwell, is sometimes thus called. It is derived from *αἶς*, a Goat, and *ὄνυξ*, the Hoof. Because of the Solidity and Hardness of the Seed, in the Opinion of Gorræus.

ÆGOPROSON. The same as **ÆGIDION**, which see.

ÆGYPTIACUM UNGUENTUM. A Composition that is ascribed originally to Mesue, and has been received by most *Dispensatories* that have been since wrote, without any material Alteration. It is thus given in the *Dispensatory* of our own College.

Take of Verdigrease, or of the green Rust of Brass finely powdered five Parts; of Honey four Parts; of the sharpest Vinegar seven Parts; boil them altogether to a due Consistence, and a dusky red Colour.

The Scum of this Ointment is called *Mel Egyptianum*, Egyptian Honey.

The Compilers of the *Edinburgh Dispensatory* seem to have thought this too strong of the Verdigrease, and have lowered it by increasing the Proportion of Honey.

Take of Verdigrease, reduced to fine Powder, five Ounces; of Honey fourteen Ounces; of Vinegar seven Ounces; boil them together over a gentle Fire to the Consistence of an Unguent.

This is an admirable Detergent, and much recommended by chirurgical Writers to keep down fungous Excrescences in Ulcers; but it is too corrosive, especially that of the *London Dispensatory*, except lowered according to the Circumstances of the Case. The Hint of this Composition is taken from Dioscorides, who recommends Verdigrease boiled with Honey for deterring foul Ulcers. And Aetius, *Tetrab. iv. Serm. ii. cap. 3.* prescribes an Ointment very little different from this. See **ABSCÉSSUS**.

It would perhaps be somewhat difficult to account for the Name of this Ointment, because none of the Ingredients bear any Analogy to Egypt. Aetius however takes notice of an Application made use of by a certain Egyptian in the Cure of an Achor, wherein Verdigrease is a considerable Ingredient: Perhaps the Name may owe its Original to this, which indeed is not an Ointment, but a Plaster. *Tetrab. ii. Serm. ii. cap. 68.*

ÆGYPTION. *Ἀγίπτιον*. Very frequent Mention is made of this in Hippocrates, as a Topic in Uterine Disorders. Galen informs us there were four things which went by this Name. First, the

ÆGYPTIUM OLEUM. *Ἀγίπτιον ἔλαιον*, Egyptian Oil, also called *Cicinum*, which Dioscorides says was expressed from the Seeds of the *ξίκι*, (*Ricinus*) or, as we call it, *Palma Christi*; he represents it as unfit for internal Use (*ἀσφαλές*) but very proper for Lamps and Plaisters.

Aetius informs us it was prepared in Egypt from the Seeds of the above mentioned *Ricinus*, which was also called *Croton*, by Bruising, Expression and Boiling. He recommends it in Leprosies, Foulnesses of the Skin and Freckles, which he says it will take away by continual Use.

The Second was the **ÆGYPTIUM OLEUM ALBUM**, *αἰγύπτιον ἔλαιον λευκόν*, White Egyptian Oil, prepared, according to Galen,

Galen, with Lillies, and called also Crininon, or Sufinon Oleum. This is probably the simple Oil of Lillies mentioned by Dioscorides.

c third Sort of *Ægypti* on was the *αἰγυπτίαν μέρον λευκόν*, *Unguentum Ægyptium Album*, white Egyptian Ointment, called also *Mendesium*, *αἰγυπτίαν μέρον*, or *σάβωνα μέρον*, and is probably that described thus by Dioscorides.

Take of Oil nine Pounds five Ounces; of Calamus five Pounds and a Quarter; of Myrrh five Ounces; mix them well with sweet-scented Wine, and then boil them. Then strain off the Oil, and, after infusing in it three Pounds and a half of Cardamoms, that have been bruised, and macerated in Rain-water, pour it back. Let them macerate, and then press them. This done, take of this Oil inspissated three Pounds and a half, with Lillies a thousand in Number. Strip these of their Leaves, and put them in a broad but not deep Bason, and pouring the Oil upon them, stir them well with your Hands anointed with Honey. Afterwards let them rest a Day and a Night, and the next Morning remove it into your Sieve and strain it, speedily taking off the Oil that swims upon the Water that was pressed out with it; for this will not bear Water mixed with it, like the Rosaceum; but, if they are heated together, ferment and putrefy. It may be convenient therefore to move it often from one Vessel to another anointed with Honey, first sprinkling a little fine Salt, and taking away carefully the Impurities that gather upon it. After this, take the Residuum out of the Sieve into the Bason, and pour on it an equal Quantity of Oil impregnated with the same Aromatics as before, and cast therein ten Drams of bruised Cardamoms. When you have well stirred it with your Hands, after a short Rest, press it, and remove the Impurities of the Liquor. Pour on Oil the third time, and do as before, adding the Cardamoms and Salt, and working it with your Hands anointed with Honey. The Oil that comes off by the first straining is the best, the second next, and the last in Order is the worst. Then again take a thousand Lillies, and plucking off the Leaves, dispose them as before, and pour upon them the Oil that was first drawn off, and proceed with them in the same Manner as with the first thousand, adding the Cardamoms before straining. This done, pour on the second Oil, and likewise the third, observing a like Process for each as for the first. The oftener you macerate fresh Lillies, the more Virtue and Goodness will there be in your Ointment; but when you think you have done enough, add to every Preparation of the best Myrrh seventy-two Drams, of Saffron ten Drams, of Cinnamon seventy-five Drams; others put an equal Weight of Saffron and Cinnamon. Bruise them and put them in a Bason of Water, and pour thereto the Ointment that was first drawn; a little after pour it into small dry Vessels, first rubbed with Gum, or Myrrh, or Honey and Saffron diluted with Water. Do the same by the second and third Ointment. Some content themselves with a simple Ointment, made of the Oil of the Ben-Nut, or any other Oil, and Lillies.

What is made in Phœnicia and Egypt seems to excel others, and of this the best is that which has the fragrant Smell of the Lillies.

It warms, softens and opens Obstructions of the Womb, and is good in Inflammations of the same Part; and, in general, is very beneficial in Women's Disorders. It also cures scurfy and scald Heads, and soon removes the Blackness from Wounds or Blows, and makes them of the same Colour with the rest of the Skin. Drank, it purges Bile downwards, and provokes Urine; but it is hurtful to the Stomach, and creates a Nausea. *Dioscorides, lib. i. cap. 62.*

The simple Oil of Lillies is probably that described by Paulus Ægineta, *lib. viii. cap. 20.*

The Oil of Lillies he says (which others call Sufinum, perhaps because it was invented at Susæ) is made of two Ounces of the dried Leaves of white Lillies put into an Italic Point of Oil, and very closely stopped, so as nothing can transpire, and set to stand three Days in the Sun. Then it is strained, the old Leaves cast away, and two Ounces of fresh ones put to the Oil, which is to stand likewise another three Days, and then to be strained and kept up for Use.

The *μύρον αἰγυπτίαν*, *Unguentum Ægyptium*, without the Addition of *λευκόν*, Album, was, according to Galen, made of the Flowers of the Acantha. He says it was called *μύρον*.

Paulus Ægineta, *lib. vii. cap. 20.* gives the Composition of the Metopium; but it cannot be the same that Galen means, because the Flowers of the Acantha are not any Part of its Ingredients.

ÆGYPTIUM LINUM. This is mentioned by Hippocrates (*de Morbis, lib. ii.*) speaking of the Cure of a Polypus

in the Nose. He advises to cut a Sponge round like a Ball, of a Size to fit the Nostril, and to involve it in Egyptian Flax, (*λίνα αἰγυπτία*) for it does not seem to mean Thread, but rather a kind of Tow.

ALUTA ÆGYPTIA. *Αργυρίδιον σκῆτος*. It is named by Hippocrates (*de Fractis*) and seems to be a soft Leather, like what we use to spread Plaisters upon.

Αἰγυπτίη ἐτυμωμένη, Egyptian Alum. See ALUMEN.

ÆGYPTIUM ANDROMACHI EMPLASTRUM. Aetius, *Tetrab. iv. Serm. iii. cap. 13.* introduces this Plaister with great Encomiums. He says it is famous for uniting the largest Sinusses, for healing Cuts that lay the Bone bare, for Distortions and Luxations of the Limbs and Joints, for Bites inflicted by Men, Quadrupeds, or Reptiles; laid on the Forehead, it stops Defluxions on the Eyes; it heals the largest and deepest Cuts with a Sword in three Days. It has an excellent Virtue for discharging, so as to disperse a Collection of Pus, unless there be a very large Quantity, without Perforation of the Skin. It mollifies and supple the Limbs, though never so stiff and hard, and brings malignant Ulcers to cicatrise. It is thus prepared:

Take of Wax, Litharge, of each one hundred and twenty four Drams; of Gum Ammoniac sixty-two Drams; of Turpentine thirty-two Drams; of greasy Wool, burnt, eighteen Drams; of Birthwort, Frankincense, Squama Æris, each eight Drams; of the Scoria of Steel eight Drams; of Myrrh three Drams; of Opoponax two Drams; of the Oil called Cicinum, or the Sicyonium, or old Oil, three Pounds. Boil the Litharge with the Oil to a Consistence; then adding the Squama, let it boil till it will no longer raise a Spot in your Cloaths. Then add first the Wax, after that the Gum Ammoniac bruised. When these are melted put in the Turpentine, and taking it off the Fire, mix in with it the Frankincense bruised, and the Ashes of the burnt Wool, and work it up with your Hands, and use it sometimes pure, sometimes diluted.

ÆGYPTIUM CROCEUM UNGUENTUM. This is an Ointment described by Aetius, *Tetrab. ii. Serm. iv. Cap. 45.* It takes the Name from *Crocus*, Saffron, that gives it the Colour.

ÆGYPTIUS PESSUS. This Pessary is described by Paulus Ægineta, from Antylus, *lib. vii. cap. 24.* It consists of Honey, Turpentine, Butter, Oil of Roses, or of Lillies, and Saffron; of each equal Parts. If the Vagina is fordid, and not inflamed, the Author says that Verdigrise may be added in a Quantity equal to half that of each of the other Ingredients. From this Addition it probably took the Name.

ÆGYPTIUM PHARMACUM AD AURES. Aetius, *Tetrab. ii. Serm. ii. cap. 83.* speaks of this as excellent for detaching fetid Ulcers of the Ears, which he says it cures, though the Patient was born with them.

Take of bitter Almonds two Drams; of white Pepper two Drams; the Inside of Egyptian Beans two Drams; of Saffron, Myrrh, Opium, Frankincense, Castor, each two Drams; Omphacium four Drams; Vitriol four Drams; Aphronitrum two Drams. Pound them in Vinegar, in which the Bark of Pomegranates has been boiled, till they come to a Consistence somewhat viscid. Dilute this with Ointment of Nard, and so drop it into the Ears.

ÆGYPTIA ULCERA. Aretæus describes a Species of malignant Ulcer of the Tonsils and Fauces, which he calls Egyptian or Syrian Ulcers, because very frequent in these Countries. The Passage is in *lib. i. de Causis & Signis Acutorum Morborum, cap. 9.*

Of all Countries, says he, Egypt is most subject to this Distemper, because of the Dryness of the Air, and the Variety of Food; for the Inhabitants live upon Roots, Herbs, acrid Seeds, and all Sorts of Garden-stuff, and their Drink is the thick Water of the Nile, or a sharp Liquor made of Barley. Syria also is infested with this Disease, especially that Part of it called Coelosyria; whence they are called Egyptian or Syrian Ulcers.

They who die of it make a miserable End. The miserable Patients labour under sharp Pains, with a burning Heat, as in a Carbuncle. Respiration is quite depraved, for they breathe forth nothing but the filthy Vapour of the Ulcer, and immediately draw in the same again; and are so troublesome to themselves, as not to endure their own Smell. Their Faces are pale or livid, they have an acute Fever, a Thirst so violent as if they were on Fire, and yet dare not drink for fear of Pain; for they are tormented beyond Measure, if the Drink runs against their Tonsils, or back into their Nostrils. If they lie down they are forced to rise; nor can they bear to sit up, for their Pain obliges them to lie down again. But for the most Part, they choose to walk about; for being incapable of Relief or Ease, they avoid all Rest, and seek to lose the Sense of one Pain by introducing another. They gasp and draw their Breath much inwards, as greedy to be refreshed with the cool Air; but

Æ O N

but breathe forth very little, because the Ulcers, which are as hot as Fire, are still more inflamed by the fervent Breath; a Hoarseness and Loss of the Voice comes on, and these Symptoms increase more and more, till the Patient on a sudden falls to the Ground, and there expires. See TONSILLÆ.

ÆGYPTIA ANTIDOTUS. The Ægyptian Antidote. Many of these are described by Nicolans Myrepsus, in his first Section, which treats of Antidotes. Their Descriptions are pretty long, and not of sufficient Importance to be inserted here.

AEICHRYSON. 'Αειχρύσον. From αἰ, always, and χρῦς, Gold. A Name of the *Sedum majus*. *Gorræus*. See SEDUM.

AEIGLUCES. *Ἀειγλυκὴς*. From *αἰ*, always, and *γλυκὴς*, sweet. A Sort of sweet Wine, that went by that Name, as though it were always Must. It is thus prepared; as soon as the Must is tunned immediately from the Wine-press, they set the Vessels under Water, to stand during Winter, that it may keep always cool; for it is only the Heat of the Must that turns it into Wine.

ΑΙΡΠΑΘΕΙΑ. *Ἀιρπάθεια*. From *αἰ*, always, and *πάθος*, an Affection or Passion. A never-ceasing Affection or Passion.

AEITHALES. Ἀειθαλής. From αἰ, always, and θάλλω, to be green. Another Name for the *Sedum majus*.

AEIZOON. *Ἀϊζών*. From *αἰ*, always, and *ζών*, Life. *Sempervivum*, *Sedum*, Houfeleek. An Herb, of which there are three Species in Dioscorides, the great, the small, and a third, called by the Greeks *ἀνδράχνη αγγρία*, by the Latins *Illecebra*. The great Sort is described as having a Stalk above a Cubit high, as big as a Man's Thumb, fat, green with Incisions after the Manner of the *Lactaria vallis*, called *χαράκις τριθύμαλος*, Wood Spurge, with fat carnos Leaves, of the Size of a Man's Thumb, like a Tongue at the Top, some turning their convex Sides toward the Ground; others standing at the Head, and so compacted together all around, as to represent the Figure of an Eye, whence it is called *ὠφθαλμός*, and *βερβαλμός*. The small *Sempervivum* has many Stalks sprouting from one Root, with slender, round, fat, sharp-pointed Leaves. The middle Stalk rises a Span high, bearing an Umbella, with a small herbaceous Flower. The two first Kinds of Houfeleek are cooling, and are also moderately drying and astringent. The third Kind has a small, thick, hairy Leaf, most like Purslane. It is of a heating, acrimonious, exulcerating Nature. *Gorræus*.

ÆLIANUS MECCIUS. A Physician that lived in the time of the Emperor Adrian. We learn from Galen that he wrote well on the Dissection of the Muscles. It is also said he was one of Galen's Masters, by whom he is recorded to have been a Physician of Abilities, and a very worthy Man.

ÆLIUS PROMOTUS. There seems to have been two of this Name, one a Disciple of Ostanes the Persian. This *Ælius* accompanied Xerxes into Greece.

The second was a Physician of Alexandria; who lived in the time of Pompey. He wrote a Treatise *περί τοξικών καὶ ἀντοξικών φαρμάκων*, of Poisons, and deleterious Medicines. Gefner and Tiracquellus say this Work is preserved in some of the Italian Libraries in Manuscript; Mercurialis and Fabricius say in the Vatican.

ÆMILIUS MACER. A Poet of Verona, who lived in the Reign of Augustus. He was Contemporary with, and somewhat older than Ovid, who speaks of him thus:

*Sape suas volucres legit mihi grandior ævo
Quæque nocet serpens, quæ juvat herba, Macer.*

From hence we learn he wrote on Birds, Serpents and Plants; but Mr. Le Clerc is of Opinion he only gave an Account of such Vegetables as were Antidotes to those Poisons as he speaks of. Seryius says the same Author wrote a Poem on Bees.

It is on Account of his Poem on Birds, Serpents and Herbs that he is numbered amongst the medicinal Authors. His Works are lost; those which go under his Name being, in the Opinion of all the learned, supposititious, and are said to be wrote by one Odoconus, who lived in the 13th Century.

ÆOLIPYLÆ. ÆOLIPILES. I do not know that this Word has any Right to a Place in a Medicinal Dictionary, it properly belonging to experimental Philosophy. However, as Castellus has taken notice of it, I would not omit it. *Æolipiles* are Vessels made either of Iron or Brass, with a small Orifice; into these Water is put, and when they are placed in a hot Fire, the Water, rarefied into Vapour, bursts out with a great Noise and Force, imitating Wind.

ÆON. *Æon.* The whole Age of a Man, from his Birth to his Death properly, but used frequently by Hippocrates to signify the Remainder of a Man's Life.

It also signifies the spinal Marrow, and it is said should be wrote at the latter End of the seventh Book of the *Epidemics* instead of *venia*. The Passage will then run thus, *ὁ τὸ αἷμα χόρτα, ἰσχυρὰς ἀνέστη, A certain Person being ill of a Tabes Dorsalis, died the seventh Day.* Erotian. Foesius. Hefychius. Varinus.

Æ Q U

AEONION. *Αἰώνος*. The *Sedum majus*, or greater House-leek is by some called thus. *GOTTAEUS*.

ÆONESIS. *ἄκονα.* From *ἀκονάω*, *perfundo*, *irrigo*, to pour upon, or to wet by pouring a Fluid upon. It signifies a moistening the external Parts by Perfusion, or Fomentation. *Erotian. Foes.*

ÆORA. *ἄνωγειν*. From *ἀνίσταω*, to lift up, suspend, or hang on high. Gestation, a Species of Exercise used by the Ancients, of which Aetius gives the following Account. *Tetrab. i. Serm. iii. cap. 6.*

Other Kinds of Exercise, says he, consist in Motion of the Body; but Gestation is compounded of Motion, and such a Disposition as much resembles Rest, in which most Parts of the Body seem to lie still, while the whole is carried along the Way in which the Gestation is directed. Hence it appears that Gestation is at once the most beneficial and most gentle Kind of Exercise, since it procures no Lassitude, and yet moves the Body after the manner of great Exercises.

All Gestation has the Virtue of exciting and ventilating the innate Heat, of dispersing the redundant Humours, of strengthening the Habit, and raising the dull and languid Powers.

There are many different Species of Gestation, some of which, in particular, are those which follow: A Gestation may be performed in a Bed, either made pensile (*perhaps like the modern Hammocks*) or moveable on the Fulcra, or Feet which support it. A second Way of Gestation is in a Litter, which is also two-fold, that is, when the Person carried either sits or lies along. A third Way is in a Chariot, and a fourth in a Ship or Boat: Riding also may be accounted a Species of Gestation.

Position in a Bed is convenient for feverish Persons, and such as have lain sick a long time, who cannot well raise their weak and wasted Bodies. It is also proper for those who begin to recover Strength after a Fever, and for such as have taken Hellebore; it is good likewise in a Phrensy, for it gently composes the Perturbation of the Spirits, and inclines to Sleep. Lethargies also, and Loss of Appetite, are relieved by it.

Generation in a Litter is proper for such as labour under a lethargic, or semitertian, or quotidian Fever; and hydropical Persons; such as are seized with a Stupor, the Remains of an Apoplexy, or Palsy; and for those who are afflicted with the Gout or Stone. Persons under a perfect Intermiffion of a Fever are carried this Way in a sitting Posture.

As for Gellation in a Chariot, there is something shaking in it, which works upon chronic Distempers; but of this Kind some are more gentle and easy, others rougher and more vehement. The first, or softer, is to be used in Distempers of the Head, and Fluxes of the Intestines; the latter, or more violent, is proper for Infirmities of the Breast or Stomach, for lax Tumors, hydropical Persons; and such as are seized with a Stupor. But vertiginous Persons, and such as have half their Head affected should sit backwards, and move gently. We have known many cured this Way, who needed no other Help; but then their Seat must be so contrived, as that they may sit in a pretty supine Posture.

Laſtly, Geſtation in a Boat or Ship, if near Land, and on a calm Sea, is proper for ſuch as have a Dropſy, or Elephantiaſis, ſuch as are ſwelled, or ſtruck with a ſudden Paſſy. This Geſtation at firſt turns the Stomach, but ſoon grows familiar and agreeable. But Geſtation upon the Sea is moſt violent, and cauſes many and great Changes, as it muſt happen where the Mind is diſtracted betwixt Hope and Sorrow, Fear and Danger, and the Ship's Crew ſometimes exulting with Joy and Alacrity, at other times ſunk into Deſpair. All theſe things put together, are of Force ſufficient to drive any old Diſtemper out of the Body, and exclude it for ever, not to mention that a Mixture of Reſt and Motion, if any thing can do it, nourishes the Body.

ÆPOS. ἄρος. It signifies in Hippocrates a steep Place, or rising Ground, of somewhat difficult Ascent.

AQUALIS. EQUAL. This, in a medicinal Sense, is applied to any thing that is consistent with itself, and always the same, or that is the same in all its Parts. In this last Sense, Pus or Matter is said to be equal, or of an equal Consistence, when it has no Admixture of Ichôr or Sanies, but is all alike.

A Temperament or Constitution is said to be equal, which is not subject to Alteration or Excesses, but is always the same.

A Pulse is called equal that keeps the same Tenor, without any Variation with respect to the time and manner of the Contraction and Dilatation of the Artery.

Urine is called equal, when it always preserves the same Appearance in regard to its Colour, Consistence, and Contents, so that what is made at one time shall be exactly the same as that made at any other time; and the Hypostasis or Sediment in Urine is said to be equal, when it is the same in every Part, and seems homogeneous.

A Disease is called equal, when it perseveres without any Variation in the Symptoms and Circumstances that attend it. The Greeks express this by *ίσους*. Hence Medicines that re-

duce to the Equality above mentioned are called *Æquantia* by some Authors, amongst which Castellus quotes Jul. Cæs. Claudinus.

ÆQUILIBRIUM. The general Signification of this Word is too well understood to want Explanation. In a medicinal Sense it is used to express a just Proportion betwixt the Solids and Fluids of the Body, which is necessary to the Performance of the animal Functions, and a perfect State of Health.

ÆQUINOCTIUM. The Equinox, of which there are two, the Vernal and Autumnal. Physicians have taken notice of these Equinoxes, as productive of certain Disorders. Thus *Ægineta*, from Diocles, *lib. i. cap. 100.* says the Vernal Equinox increases Phlegm and sweet Serosities in the Blood, till the rising of the Pleiades, which is six and forty Days. Therefore we are to feed on aromatic and acrid Aliments, and to use much Exercise. The Autumnal Equinox increases Phlegm, and thin Defluxions, till the Fall of the Pleiades, which is six and forty Days. During this Season we are to stop Defluxions by the Use of highly aromatic and acrid Food, to avoid Emetics, to use much Exercise, and abstain from Venery.

The Autumnal Equinox is placed about the twenty-fourth Day of September by Paulus *Ægineta*, *lib. vii. cap. 11.*

The Vernal Equinox is placed by Aëtius on the twenty-third of March, and the Autumnal on the twenty-fifth of September. *Aëtius Tetrab. i. Serm. iii. cap. 167.* See AER.

ÆQUIPOLLENS. Equal with respect to Strength. It has been used to express an Equality of Force in the antagonist Muscles, which move the same Part in different Directions.

AER. *Ær.* The AIR. What is meant by this Word is so commonly known, that it would be superfluous to attempt to define it. Physicians in all Ages have esteemed the Air as the grand Instrument in producing all Changes that happen in natural Bodies, and of great Importance both in producing and curing Distempers, and in destroying and preserving Health. In Medicine it is numbered amongst the Non-naturals, and is more immediately necessary to animal and vegetable Life, than even Nutrition.

Hippocrates, in his Treatise *de Flatibus*, gives his Sentiments with respect to the Air. He says the Bodies of Men and all other Animals are nourished by three things, which are called Meat, Drink, and Spirits (*anímala*); these, when within the Body, are called Wind or Flatulences (*pneumata*), but out of the Body, Air. As this Air bears a great Part in whatever happens in the Universe, the Force thereof is a Subject considerable enough to deserve Examination. The Wind is nothing but a Flux, or Effusion of Air. When therefore there is a great deal of Air, it makes a Stream or Flux strong enough to tear up Trees by the Roots, and to raise Waves in the Sea capable of elevating Ships of immense Burden to a prodigious Height, such is its Force. Notwithstanding this, it is invisible, however manifest to the Understanding by the Effects. What is there transacted in the Universe without Air? What Body is without it? Or where is it not present? All the Space betwixt the Heavens and the Earth is filled with Air (*anímalos*). By this Winter and Summer are caused; in the Winter it is condensed and cold, in the Summer mild and calm. The Sun, Moon and Stars perform their Courses by the Assistance of the Air; for the Air is the Nourishment of Fire, inasmuch that Fire deprived of Air cannot subsist; the Air being itself perennial and thin, furnishes the Sun with the means of continuing its perennial Course.

That the Sea also participates of Air is manifest; for how could Sea Animals live without it? And how could they participate of it, unless they drew it through the Water, or out of the Water itself. The Air is the Support of the Moon, and the Chariot of the Earth, and nothing in Nature is void of it. The Air therefore of all things has the greatest Influence, as has been said above.

The Air is the Support of the Life of Mortals, and the Cause of those Diseases to which Mankind is subject. And so necessary is the Air to our Bodies, that though a Man may live two or three Days or more without Meat or Drink; yet if the Passage of the Air into the Body is intercepted for a very small Part of a Day, it is certain Destruction, so absolute is the Necessity for it. Men sometimes rest from all other Actions, for Life is full of Changes, Respiration alone is perpetual in all Animals, who are perpetually employed either in Expiration or Inspiration.

I have said that there is a great Communion betwixt all Animals and the Air; I now proceed to shew that it is not probable that Diseases can be caused by any thing but the Air, as it is received into the Body either in Quantities too small or too large, if it is either too much condensed, or infected with Contagion.

I have quoted this Passage with a View, first to shew that Hippocrates had taken notice of the general Influence of the Air on Animal Bodies, which will appear more abundantly in his Treatise of *Air, Water and Climates*. Secondly, as an Instance of the Precariousness of Theory in Physic, since this great Man, whose Penetration enabled him to observe the Changes which happen

in Diseases, and describe them with the greatest Accuracy, and also to accommodate Methods of Cure to Distempers, perhaps the very best that could possibly be contrived, with the Materials Mankind had, in his Days, arrived to a Knowledge of, could not however avoid running into Puerilities and Error, when he attempted to reason about things which were not the Subjects of his Senses, and consequently out of his Reach.

That great Poet and Philosopher Virgil has been somewhat more fortunate in his Account of the Effects of the Air on Animal Bodies, inasmuch that he seems to have been acquainted with some of its Properties demonstrated since by means of the Air-Pump, and by other Experiments, which will be related under this Article.

After having given an Account of the Prognostics of the Weather, from the Changes produced in the Brute Creation, he goes on to give the Reason for it thus:

*Haud equidem credo, quia sit divinitus illis
Ingenium, aut rerum fato prudentia major:
Verum ubi tempestas, & cæli mobilis humor
Mutare vias, & Jupiter humidus Austris
Densat erant quæ rara modo, & quæ densa relaxat,
Vertuntur species animorum, & pectora motus
Nunc alios, alios dum nubila ventus agebat
Concipiunt: hinc ille avium concentus in agris,
Et lætæ pecudes, & ovantes gutture corvi.*

Upon the Whole, it will appear by the Quotations I shall give from different Authors, that the ancient Physicians were perfectly sensible of the Importance of the Air; both with regard to the Preservation of Health, and Cure of Diseases; and that they took more care than is usual amongst us, not only to correct the noxious Qualities which the Air may contract at particular Times and Seasons, and prevent the ill Effects thereof, but also to render it medicinal, and of Assistance in the Cure of Diseases.

The very Air that surrounds us is continually perverting our Temperament, while it changes to hot or dry, or cold or moist, beyond a just Degree. As to other Causes, we are not all at once obnoxious to them, nor meet with them every Day; but the Air that presses on our Bodies is circumfused around us all, and is drawn into us by Respiration. Hence the Bodies of Animals must of necessity have their Temperament affected, according to the various Alterations it undergoes. Sometimes the ambient Air acquiring an Excess of Heat and Moisture induces a pestilential Constitution, and because the Humours of the Body, which are bred of unwholesome Food, are subject to putrefy, a Foundation is laid for a pestilential Fever. *Aëtius Tetr. ii. Serm. i. c. 94.*

Oribasius, in his medicinal Collections, *lib. ix. cap. 1.* transcribes from Galen the following Passages relating to the Air.

The best Air is that which is the purest, not charged with moist and heavy Vapours from any standing Pools or Marshes, nor infected with unwholesome Damps and Exhalations from some neighbouring Caverns, like that of Sardes and Hierapolis. Air that has contracted ill Qualities from the common Shores belonging to some great City or Army, or from the Stench of putrefied Carcasses or rotten Dung of Vegetables, must needs be bad, and stands condemned. So likewise is that which is dense and foggy from some neighbouring Lake or River, or confined on every Side with high Mountains, and never stirred or ventilated by the Winds; for this last Sort corrupts and suffocates, being like the Air in Houses that are uninhabited and shut up, which contract much Filth and Mouldiness for want of airing. All these Kinds of Air are hurtful to all Ages, as, on the contrary, a pure Air is universally agreeable. Those Differences of the Air, which are in regard to Heat or Cold, Dryness or Moisture, do not affect all Persons alike. To Bodies that are in the best Temperament the best temper'd Air is most agreeable; but for such as transgress in some prevailing Quality, that Air is to be chosen which exceeds in the contrary. Thus Heat counterbalances Cold, and Dryness Moisture, when too great a Measure of one is compensated by an equal Excess in the other.

Alexander Trallianus, speaking of the House in which an *hæstical* Patient is to be lodged, We are not only, says he, to give the sick Person all the Means of Refrigeration that can outwardly be applied; but we should study, by some artificial Method, to change the Air, by producing in it a cooling Quality, that may be serviceable to our Design. If therefore it be Summer, let the Sick lie in a subterraneous Room, and let the Floor be plentifully sprinkled with cold Water, to cool the Air. Let Water also fall from one Vessel into another, which, besides the forementioned Benefit, by its moderate and equable Murmur induces Sleep. It would be yet better, and more for our Purpose, if we could so change the Air, as that it might not only refrigerate, but corroborate the Body. And this may be, in a great Measure, effected by strewing the Floor with Roses, Housleek, Brambles, Twigs of the Lentisk-tree, or Vine-

Vine-tendrils, or something of like Tendency, which has a strengthening as well as cooling Virtue. An Air thus tempered must certainly be good for all heetical Persons, but especially for those who feel their Heart and Lungs principally affected with a burning Heat, like Fire; for such Patients do not find so much Relief from a refrigerating Diet, as from the Inspiration of the cool Air; as, on the contrary, they who have their Liver, Belly, or any other Part, most sensibly disordered, receive more Benefit from Choice of Food than Change of Air. In short then, while the Summer holds, we are to alter the Air by Refrigeration; but in Winter we are not to induce a Warmth therein, because however cold it be, it never hurts the Persons we are speaking of. The Body, for the same Reason, must be moderately clothed, and not heated with a Multitude of Garments, which may cause a Faintness. *lib. xii. cap. 4.*

Paulus Aegineta, for such as have taken too violent Purges, advises, among other things, that they may be kept from Air that exceeds a moderate Degree in Cold or Heat. The first, says he, drives the Matter from the outer Parts inwards, and augments the Flux; the other dissolves the Body, and destroys the Strength. *lib. vii. cap. 7.*

The same Author, after speaking of the Alterations made on the Bodies of Animals by the Changes of the Air, in the same Terms as Aetius, before quoted, thus goes on: He who knows these things will not only be able to foretel what Distempers will naturally happen from every Constitution; but will find out Methods to prevent them, by instituting a Regimen quite opposite to the present prevailing Intemperies of the Air. Whatever Bodies then are subject, from their proper Temperament, to fall into any Disease, are easily affected and hurt by a concurring Disposition of the Air; but such as are of a Temperament contrary to that of the Air, not only receive no Injury, but find themselves better; the Measure of their Excess in one Quality compensating for that of the Air in the contrary. A wise Man, therefore, who understands these Things, will preserve his Health by opposing Contraries to one another, sometimes using refrigerant, sometimes heating Medicines, as need shall require.

To serve the first Intention, or Refrigeration, he makes frequent Use of Water, indulges Rest, eats little, and drinks plentifully; but when he has Occasion to acquire a contrary Quality, he knows by warm Cloathing, much Exercise, full Eating, and sober Drinking, to heat his Constitution as much as shall be requisite. A cold and moist Air may, in a good Measure, be remedied, and converted into the opposite Qualities of hot and dry, by making large Fires, which Acron the Agrigentine is said to have done, in order to destroy the pestilential Infection in the Air. *lib. ii. c. 35.*

This Chapter on Air is taken from Galen, and repeats verbatim what is before quoted from Oribasius, as far as that Passage which condemns Air that is pent up between high Mountains, and then goes on thus: The Air on high Mountains, and in hilly Countries, when no Wind stirs, is more wholesome, and good for asthmatic and consumptive People, and all Indispositions of the Head and Breast. But the Air of low Regions, which is pure, is best for old People, and such as are subject to Faintings. The Sea Air is beneficial in hydropical and watery Distempers, especially such as have a cold Cause; for Nerves affected by Consent of Parts, and Prostration of Appetite. The Air of rocky Places is not good; for in the Winter it is too cold, and in Summer sultry hot. Air filled with the Exhalations of Metals is bad; the Air of a clayey Soil relaxes the Stomach; but what comes from a light yellow Earth, is more drying than the former; the best exhales from a black Loam.

The Air also changes according to the Seasons of the Year. In the Spring it is hot and moist, in the Summer hot and dry, in Autumn cold and dry, and in the Winter cold and moist. Again, there are three Differences in each Season, the first, middle, and last; of these the middle bears the truest Characteristic or Temperament proper to that time; for the Extremes participate of the adjoining Seasons. Moreover the Moon causes four Changes in the Air every Revolution. The first Septenary, or Quarter, which is reckoned from the new Moon to the seventh Day inclusively, is, like the Spring, hot and moist. The second Septenary, which holds to the full Moon, is like the Summer. The third, the Moon now decreasing, resembles the Autumn; and the last, the Winter. Yet farther, every Day has its Differences of Air; for the Morning is hot and moist like the Spring, in which the Bodies both of sick and sound Persons are relaxed, so that even feverish Patients find it the most tolerable Part of the Day. The Middle of the Day may be compared to Summer, the Twilight to Autumn, and the Evening to Winter. And lastly, to conclude, the first Part of the Night is likened to the Spring, the Middle to Summer, and the rest according to Order.

By Air is understood that Fluid, which is scarcely to be perceived by our Senses, but which manifests itself by its Resistance to Bodies moved in it, and by its strong Motion against other

Bodies, when it is called Wind; and by this Resistance and Motion of the Air, we know it is incumbent every where upon the Surface of our Earth. We all live in it, we enjoy it, and are perpetually kept alive by it. The Laws of our Existence, and inevitable Necessity oblige us to inspire and expire this Air, be it what it will; inasmuch that all the Assistances of Art are vain, and all that is done for us in the common Course of Nature is fruitless, if we are deprived of the Benefit of the Air.

If we examine into the Manner in which Nature operates according to the Laws which the great Creator has ordained, we shall plainly discover, that this Air is the grand, efficacious, and necessary Instrument which Nature universally employs in almost all the Operations she is perpetually engaged in. For in this, Bodies of all Kinds are placed; in this they move, and in this they perform all their Actions, as well those which proceed from their private and particular Natures, as those which depend on their Relation to other Bodies. There is scarcely any Liquid, as appears by Experiments, which has not Air intermixed with it; scarcely any Solid, out of which Air may not be extracted by Art. So that it is scarce possible to specify any Operation of Nature, which happens without the Assistance of Air, or utterly exclusive of it. The Operations of Fire, the Loadstone, Gravity, and the particular Attraction and Repulsion of Corpuscles, may perhaps be alone excepted, as capable of being performed without it; to all others it is absolutely necessary. Whatever is performed in Chymistry is done in the Air, without any Exception, unless, perhaps, as the Alchemists will have it, that the Matter of the Philosophers Stone, rightly prepared, and carefully locked up in the Philosophical Egg, is entirely deprived of all crude Air, and is brought to its Maturity in *vacuo*; for they all are of Opinion, that nothing is so great an Obstacle to the Maturation of this beautiful Fruit as the crude Air: But this is to be understood of other Particles that are intermixed with the Air, rather than of the pure Element itself.

It is very certain, that Fire which puts all things in Motion, can neither be collected, preserved, directed, increased, or moderated without Air. Hence, then, if Air is necessary to Fire, Air is also necessary to every Operation of Fire; so that without it Fire would cease to operate, nor could it be applied to other Bodies. The Fire here meant is that which is excited and supported by inflammable Fuel, by the Means of which both Art and Nature execute their principal Purposes.

Whoever has Leisure and Inclination to take a View of the more general Classes of natural Bodies, will find, that Air is every where required to their Vitality, Growth, Vigour and Action; for if their Lives consist in the Circulation of Humours through proper Vessels, and by a peculiar Power converting the extraneous Juices they receive into their own Nature, or at least by a singular Virtue applying them to their Substance, and thus increasing in their Magnitude, it seems utterly impossible that one of these Functions can be performed without the perpetual Assistance of Air.

The Chymists, I am sensible, will be surprised, when they hear the Air named as concerned in the Oeconomy of Fossils; since the great Simplicity of the Matter of which they are formed seems to require Fire alone, in order to be capable both of acting and undergoing whatever is brought about in this Species of Bodies; but certainly those who have duly considered the Nature of things, have long ago understood that Fossils are brought forth and multiplied in the deepest Recesses of the Mines, and are thence protruded upwards, and that all this is accomplished by the great Force of a subterraneous Fire. And as this is certain, so likewise it must be allowed, that this subterraneous, vestal, and perpetual Fire is there retained, collected and applied by the Air alone. This it will be proper to set in a true Light, as it is a Point which has not been clearly treated any where else. Air then is a heavy, elastic Fluid, dense in proportion to the Weights that compress it; acts more powerfully upon the same Fire, in Proportion to its acquired Density; expands itself in the same Ratio, as it is freed from Compression; rarefies proportionably to the Intensity of the Fire that acts upon it; and insinuates itself into all things, and exerts chiefly all its Properties in those Parts which are deep, and towards the Center of the Earth. Hence, therefore, it always operates the more violently, the deeper and denser it is; and being agitated by the Fire, which by this very Attrition of the Air is collected there in greater Quantity, becomes the physical Cause of the most violent Compression, Attrition, Compaction, Depuration, and Union of homogeneous Particles; and hence the Fossils which are generated there, are of a Nature suitable to such a Cause. Without Air none of these would be produced; and perhaps this is the sole Reason why they are only formed in those Places.

What Boerhaave says here about subterraneous Fires, and the Production of Metals by Means of the Air, seems to want Proof.

Nor will it be any ways necessary to explain the Power of Air upon Animals and Plants; for some late very accurate Experiments

ments have fully taught us, that no Eggs of Animals, or Seeds of Plants, be they ever so ripe, pregnant, and the best of the Kind, and cherished with ever so kindly a Warmth, will ever bring forth the Embryo's contained in them, but will remain intirely unactive, if they are either deprived of Air, or are inclosed in stagnating Air in Glasses hermetically sealed. All small Plants likewise, even the most minute Mosses, or aquatic Vegetables, when they are kept in a Place void of Air, or when it is not renewed, presently wither and die. That the same also happens to all Animals, even to the smallest Insect, is true, beyond all Contradiction.

An accurate Knowledge, therefore, of the Air, by which its actuating Properties may be understood, is absolutely necessary for the Chymist, Physician, and Natural Philosopher; for by this means alone we shall be able to comprehend a great many Operations which are performed by Art or Nature itself, their principal Cause very often being some innate Power of the Air, that exists nowhere else.

Mean time, there is not, perhaps, any natural Body, the perfect Knowledge of which it is more difficult to arrive at, because, of itself, it scarcely affects the Organs of our Senses. This one may justly attribute to its exceeding Subtily, to which the Dulness of our Nerves renders us insensible; inasmuch, as even by the Assistance of the most perfect Microscopes, we are not able to discover any thing in it. But there is yet somewhat else in the Air, which is still a greater Obstacle to our rightly understanding its Nature; and that is, its containing so many various Kinds of Corpuscles, that in the whole Universe there is not found a Fluid compounded of a greater Variety.

It is highly necessary therefore, first of all, to consider distinctly every single Property of the Air, carefully avoiding all Confusion. This done, and each being separately examined with due Application, it remains, by making an Aggregate of the whole, that we obtain as true a Knowledge of it as the Nature of the Thing will permit.

The first Property then of Air, which offers itself to our Consideration, is its Fluidity. This is so natural to it, that there is no Experiment the Event of which proves that Air could be deprived of it. It is evident to every one's Observation, that even in the sharpest Frost, when every thing, almost, is congealed, the Air still remains liquid; even in an artificial Cold, forty Degrees greater than ever Nature has been observed to produce, the Air still retained its Fluidity, notwithstanding it was acted upon by such a prodigious Excess of Cold. If you compress the Air with ever so great Weight and Force, into the utmost Density, yet it does not then become solid by Concretion, but remains equally fluid as before; and as soon as ever the Compression is removed, it resumes its former Degree of Liquidity. Among the many Experiments I have made with respect to the Coagulations of various Liquors, I have never yet met with one single Experiment, by which it appeared that Air was coagulated into a solid Mass. I must own, that once about Noon, in a frosty Day, when the Air was very serene, I observed some very small Corpuscles floating about in it, glittering in the Sun, and, by the Reflection from their little Surfaces, sparkling with extraordinary Coruscations; but after a careful Examination, I discovered that these were nothing but little Globules of Water, which before were dispersed in the Air, but were now united and congealed, and thus appeared in Form of a very subtil Hoar-frost. If therefore Fire can concrete with other Bodies, Air certainly appears to retain its Fluidity much more obstinately than Fire itself. But, indeed, it rather seems probable, that there are in Nature two Fluids, the Elements of which will never unite with each other, nor will ever harden with any other Bodies into one homogeneous Mass: And these two are Air and Fire. In the mean time, however, I have not forgot, that the Air concretes together, and unites with every kind of known Bodies, and serves as a kind of Element in their Composition: For this is sufficiently evident from the large Quantity of Air which spontaneously makes its Way out of almost every Body, whilst it is reducing into its Principles; and this is now usually, though perhaps not altogether properly, called factitious Air. The Fact upon Examination appears to be thus: It is contained in all known Liquors whatsoever; it penetrates together with them into all the Recesses of compound Bodies; thus at last, after a Coalition of the whole, it remains locked up in the Pores of Bodies, as it were, in very minute Vessels; and afterwards, the Liquor in which it was conveyed thither being diffipated, it is left there alone. Hence then it is evident, that this Air was not concreted there, but only lay concealed, being retained by the including Body. As soon as ever, therefore, it can disengage itself from this Confinement, it rushes forth not in the least changed, and returns with Velocity to its proper Nature. But this still appears in a stronger Light, if we consider common Water, whilst freezing. There is concealed in it a great Quantity of invisible Air: As soon then as ever the Water begins to form itself into Ice, and its Particles are pressed nearer, and united together, as they are now deprived of that Degree of Fire which is necessary to keep

them asunder, and prevent their running into their natural Union, the Particles of Air, detained between the Corpuscles of Water, cannot congeal, but are pressed out of these Interstices, where being united with other Particles, they are collected in Bubbles, and become again a most fluid Air; thus evidently evincing, that this Air was in reality intercepted, but not concreted, coagulated, or altered. The same Thing being supposed in the like Manner in all other Bodies, the Fluidity of Air is sufficiently demonstrated.

The extreme Smallness of every individual Particle of Air contributes greatly to its Fluidity; for they are so exceeding minute, that no one of them can be represented to the Eye by any Microscope whatever. And yet they are far larger than those of Fire; for they can neither make their Way through Metals, Glass, Stone, or thick Wood, nor even through strong Paper. And hence, Air may be excluded from any Place. It cannot so much as pass through those invisible Pores of Bodies, through which Wine, Oils, Water, Brine, Lixivia, and acid Spirits, are able to insinuate themselves. These Observations are all evidently confirmed by the Air-pump: For if a leathern Ring is placed on the Brass Plate which supports the Receiver out of which the Air is exhausted, and the Receiver is set on the said Ring, then the Weight of the Atmosphere, when the Air is exhausted from the Cavity of the Receiver, will press the Edge of the Receiver with so much Force upon the Ring of Leather, that the external Air will not pass into the Cavity through the Ducts of the porous Leather, but will be intirely kept out; and yet, if you pour any one of the before mentioned Liquors upon the Outside of the Leather, it will be immediately imbibed, and it will soon insinuate itself under the Glass into the Vacuum; a manifest Proof, that other Fluids, though somewhat thick and tenacious, can easily pass through the Pores of Bodies that repel and keep out the Air. And the same Thing is also demonstrated by an infinite Number of other Experiments.

In the next Place, these ultimate aerial Particles are easily separated from one another, insomuch, that their Disunion may be procured by a Force so small, that it scarcely comes under the Observation of our Senses. And this Separability of the Air is such, that it does not alter the Case, whatever is the Direction of the Body that divides it, whether upwards, downwards, or sideways. This easy Divisibility every one may observe, who considers the Motion of a small polished Body through the still Air. Thus a Steel Needle moves with great Facility in the circumambient Air, which Way soever you please; and it is the same with all other Bodies. This properly, therefore, may be called the Lubricity of the Air.

However, upon a critical Examination, we discover some Tendency towards a Union between the Particles of the Air; by means of which they readily run together into a mutual Association, though a very slight one, and which may easily be destroyed: For it appears, that whenever one single Particle of Air lies concealed in any Liquid, it is not perceived; but as soon as ever a like Particle is united with it, there presently arises a Bubble from this Union, which by a certain Tenacity resists Diffipation; and if afterwards another, and another like Bubble meets with the former, there succeeds, in Proportion, a still greater Bubble, tenacious, as the former, of its Magnitude and spherical Figure. It may, perhaps, be thought, that this is rather owing to the Compression of the ambient Liquid; nor do I deny that it may possibly happen by that means: But yet, the Effort at least of the aerial Particles towards an Union with one another will be still greater than that between the Particles of Water and the very minute Particles of Air. The Attraction, however, between these Particles, I acknowledge to be very small. It may, perhaps, be said, these Particles repel each other, as the great Newton has demonstrated; and this is not to be denied. However, it remains certain, that there is a Power in these Particles, by which, when they are united in a spherical Figure, they long maintain themselves in that Form, against the Force of Bodies that surround them.

If we examine this Inclination to Cohesion more closely, we shall soon perceive, that the aerial Particles, singly and separately considered, very easily suffer themselves to be mixed with any other Liquid void of Air; and that they obstinately abide in it, quietly resting in its Interstices, in the same Manner as any Salts are dissolved in Water. Besides, it appears, that a large aerial Bubble, that is composed of many united Particles of Air, and placed on the Surface of a Liquor intirely deprived of it, will resolve into its elementary Particles; and that these, when they are thus separated, will be carried into the empty Pores of the Liquid, and never gather themselves into a Bubble again, unless by the additional Force of a stronger Cause.

And hence the Imperceptibility of the Air to our Senses may be understood; for nobody would ever have thought of this Air which we now treat of, had not some large Bodies, and principally such as contain but a small Quantity of Matter under a large Surface, been moved broadways through it. In this Case, the Air resisting the Motion with a remarkable repulsive Force, immediately

immediately manifests itself to be a hard Body. And as these Resistances, which are in reality actual Repulses, increase according to the augmented Velocities with which the Bodies are moved, or, as the Mathematicians compute, in a duplicate Proportion, hence it may happen that this imperceptible Softness of the fluid Air may become as hard as a Stone: For if one should take a very thin Brass Plate, an hundred Feet square, and attempt to move it directly forwards, erect through the Air when it was calm, with so great a Velocity that it should move through a Space of two and twenty Feet in a Second, he would then find in this Air an incredible Resistance or Hardness, easily to be computed by Mariotte's Method. And if with this Plate, erect and quiescent, any one should receive the Shock of a Wind, rushing with the greatest Rapidity, he would then likewise experience with what Hardness the Air is capable of striking, when it is moved with such Velocity.

This is to be understood of the whole Air as a Compound, in which very large and heavy Bodies are capable of floating, as appears by the Instances of Birds and Things of some Weight carried away by the Wind; not to mention those of a light Nature, as Dust, &c.

The next Property of Air, considered in the same Manner as before, is the particular Weight of its whole Bulk; for in this Respect all the Parts together, which in the Aggregate constitute this Air, press with such a Force towards the Center of the Earth, that by their Fluidity they form a Sphere around its Surface, which may properly enough be called the Atmosphere, and which, on account of the large Quantity of exhaling Vapours contained in it, has hitherto, by Philosophers, been called the Atmosphere.

The great Tuscan Geometrician Torricellius, in the Year 1643, attempted to ascertain the Weight of the Air. After him the famous Otto Guericke proved this Gravity by several sensible Experiments. That subtle Philosopher, Monsieur Pascal, afterwards cleared it farther up; and the great Mr. Boyle rendered it more complete. It was Mariotte, however, who gave the finishing Stroke to it, by the most curious Experiments of all, inasmuch, that now no Part of Natural Philosophy stands upon surer Principles than this of the Gravity of the Air; for by the Assistance of what these Gentlemen have done, the Weight of the whole gravitating Atmosphere may be obtained to the greatest Nicety, and expressed under the Denomination of common Weights.

It has hitherto, however, remained impossible to determine the exact comparative Weight of the Body of Air; it appearing that no two equal Portions of Air, taken at the same time, but at different Heights, were ever of equal Weight; but that, on the contrary, the lower Air always outweighed the higher. And this holds so universally true, that the very same Thing is observed from the Surface of the Earth to the Tops of the highest Mountains; and in the very same Place, at different Times, the specific Gravity of the Air will be different.

The Atmosphere in our Climate, where-ever it has hitherto been observed, is very considerably, and almost always wonderfully changing with respect to its Weight, which never continues long the same. This Variation is chiefly apparent whenever there is any Alteration in the Meteors in the Air, which is very frequent: For Rain, sudden great Showers, Fogs, Hail, Snow, Lightning, Thunder, Winds from various Quarters, Storms, Whirlwinds, Drought, and the Changes of the planetary Aspects, are certain Indications of the Atmosphere's becoming very soon of a new or different Weight. In this Affair the different Seasons of the Year likewise produce an incredible Variation. By means, therefore, of this successive and incessant Mutability, depending on such a Number of Causes which are continually reviving, it comes to pass that the Weight of the Atmosphere never continues long the same. And hence an infinite Number of Effects about the Earth, which almost all depend upon the Action of the gravitating Air, are in a perpetual Vicissitude and Inconstancy: So that this single Mutability of the Air, in point of Weight, is the Source of a great many Causes which produce different Events. In the mean time however, by the help of very accurate Observations, continued for the Space of above eighty-six Years, we are now come to the Knowledge of the greatest and least Gravity of Air that happens in Europe: For, upon Examination, it has been found, that the greatest Weight of the Atmosphere is in *equilibrium* with thirty Inches and a half of Quicksilver in the Barometer, but that the least would raise it only to twenty-seven and a half; so that the Difference appears to be almost a tenth Part of its greatest Weight, within which Compass the perpetual Variation of the Gravitation of the Atmosphere is included.

This daily Alteration depends on many particular, and perfectly different Causes; but yet, however, such as are intirely certain, and may be come at by diligent Observations. And whenever this shall be accomplished, then we shall be able to form a regular Judgment of this Fluctuation, which at present is looked upon as uncertain. Nicholas Kruquius, whose Genius, Learning, and indefatigable Industry, highly qualify him for the Cultivation of these Studies, and whose Meteorological Tables,

composed with infinite Diligence and Accuracy, shew us at one View all the Causes contributing to every Degree of the increased Weight of the Atmosphere, has given Reason to expect farther Discoveries. It were to be wished that the Inquiries of this great Master in Natural Knowledge might meet with Encouragement equal to their Author's Merit; lest, when he is gone, we should look in vain for another that is equally qualified for making Discoveries of this Nature.

Lastly, It has been likewise observed, that the Weight of the common Air, about our Earth, at the time of the middle Weight of the Atmosphere, and in the most temperate Season of the Year, is to that of Water as 1 to 850: But this must be understood with the Conditions mentioned above, otherwise nothing certain can be affirmed about it.

The Air resting with its whole Weight upon our Earth, presses its Surface perpetually. And this Pressure upon any particular Body is equal to a Force which would sustain a perpendicular Column of Mercury to the Height it then stands at in the Barometer; the Base of which Column will be a horizontal Plane, cutting a Pyramid, whose Apex is in the Center of the Earth, whilst its Sides touch the horizontal Limits of the Body thus pressed by the Air. Thus then may this Power be every where exactly computed, by considering the Height of the Quicksilver in the Barometer at the time the Computation is made, and the Magnitude of the Surface of the Body pressed upon. And hence it is inferred, in the second Place, that Bodies placed on the Earth are so much the more pressed by the incumbent Air, the nearer they are to its Center; for it is evidently demonstrated in Hydrostatics, that the Pressures of Liquids upon their Bases are in Proportion to their perpendicular Altitudes. Hence, therefore, if we consider the Air as a Liquid, every where homogeneous and incompressible, then the Proportion in which Bodies are compressed in every Part of the Perpendicular, from the Surface of the Earth to its Center, might be easily discovered: But as the elastic Power of the Air induces a great many very different Considerations, it will be necessary to treat of its Effects particularly. Mean time, it appears, on the other hand, that all Bodies, the farther they are raised above the Center of the Earth, the less in Proportion they are affected by the Pressure of the Air. But it must be farther observed, that Bodies in the very same Situation will be more closely compressed together, as the Weight of the Air is augmented, according to the above mentioned Observations. And, again, as soon as ever the same Air decreases in its Weight, the Pressure upon these Bodies will be proportionably diminished. Moreover, all those Bodies that are exposed to the Air are never long compressed with the same external Force, but the Compression they suffer is varying continually; with this Limitation however, that the Difference of the Pressure is never found in the same Place to exceed one tenth of the whole: Therefore, the Air itself, while by resting on all Bodies it thus compresses them with various Forces, must likewise in Proportion be repressed by them, provided they are elastic, or such as have in them an innate Effort to expand themselves, or to recover that Size which is natural to them. Hence it appears, that in all Bodies, which are situated in the Air, there is a perpetual Oscillation of their Particles, corresponding to the reciprocal Augmentation or Diminution of the Weight of the Air: This Oscillation is but small indeed, as being confined within the Limits above specified, for the Compass of its Variation; but still it is a proper Oscillation, and is almost continual. This Alteration, joined with the perpetual Change brought about with respect to the Bulk of Bodies by the Actions of Heat and Cold, must have very considerable Effects. We acknowledge, therefore, two perpetual Causes of the constant, internal Motion of all the Particles of elastic Bodies; which are Fire, and the Atmosphere. However, it must be remarked, that upon Bodies which are absolutely soft, if any there are intirely destitute of a Power to recover their former Figure, when the Force that presses them is removed; and upon Bodies, such as Water, which cannot by any external Weights be reduced into a smaller Space; upon such, I say, the compressive Force of the Atmosphere, with regard to its Increase or Diminution, has no Effect; and, consequently, upon such Bodies the reciprocal Oscillation we have mentioned will be of no Efficacy. Seeing then that Fire acts equally, and even more upon these very Bodies than on all others, it plainly appears, that the Power of Fire, on this Account, is to be regarded as far more universal than that of Air, and consequently of any other Body.

It will now be of Service to us, if, with a View to Chymistry, we take notice of those Effects which the external Air produces, considered as a Fluid and gravitating Body together; for in this Light it evidently appears, that it must rest with some Force upon the outward Surfaces of all Bodies, as has been explained above. Hence therefore, in the first Place, it will innuinate itself between the Surfaces of all Bodies, the Distances of which, from one another, leave Interstices wide enough to admit the external Air, which, by its Subtlety, or the loose Texture of its Parts, may be able to enter into these void Spaces: Hence, also, it is evident, that all the little invisible Pores

of Bodies, though, in Appearance, perfectly empty, are, in Reality, common Air. And since this Air must certainly, in those Interstices, perform all the Effects which are proper to it, hence an infinite Number of the Operations of Nature will of consequence depend upon it. Secondly, it is a curious Observation in Hydrostatics, that the heavy and fluid Air presses upon every Side of Bodies with an equal Force, whether the horizontal, vertical, superior, inferior, or oblique. This is demonstrated in that Science.

We now proceed to the Consideration of those peculiar Properties which are possessed by the Air alone.

The first then that here offers itself to our Observation, is its Elasticity. This is that singular Quality, by which all known Air, possessing a certain Space, and being confined there, so that it cannot escape, will, if it is pressed together by a determined Weight, reduce itself into a less Space, which will be always in a reciprocal Proportion to the Quantity of the Weight that acts upon it; with this Circumstance, however, always attending it, that it will constantly, by a spontaneous Expansion, recover again the Space it had lost, in Proportion as the compressive Force is diminished; and when this Force comes to be the same as it was in the Beginning of the Experiment, then the aerial Mass will always infallibly expand itself throughout the whole Space that it before took up, provided that no other Cause, in the mean time, intervenes to prevent it. If the Pressure is lessened, Air extends itself to a larger Space; if it is increased, it reduces itself into a less.

Now such a Disposition to yield so readily to such a Compression, and yet recover itself with such a Spring, I do not remember to have been observed in any other Liquid hitherto examined. It is certain no such thing is discovered in Alcohol, Oil, Water, Spirits, or any Lixivia. For though all these are contracted by Cold, and dilated by Heat, yet they are not compressed by Weight so as to take up less Space; nor being freed from Pressure, do they expand themselves. This, therefore, is the peculiar Property of Air.

This Elasticity of the Air cannot be destroyed, inasmuch as, upon Examination by every Kind of Experiment, it has always remained elastic; nor are its elastic Parts, either by long Rest, or the greatest Pressure, ever so altered as to lose their Elasticity. For Mr. Boyle and Mariotte having, with a particular View to this, kept common Air strongly compressed, and shut up in a Wind-gun, found, upon their setting it again at Liberty, that it was perfectly as elastic as it was before. And lastly, that great Geometrician Robervalius, examining Air which had been shut up for the Space of fifteen Years in the like Manner, found that it had not lost any thing of its Elasticity. See *Du Hamel, Hist. de l'Ac. Roy. des Sc. p. 368.* But it will hereafter farther appear, that even those elastic Particles of Air which are detained in the Interstices of the most internal Parts of fluid or solid Bodies, do, when they are set free from those Confinements, and are afterwards united to other Particles, exert again that Elasticity, which they seemed to have lost, to such a Degree, as not to give the least Indication of retaining it; for as soon as ever they recover their Liberty, they produce incredible Effects, which can be attributed to their Elasticity alone; and hence it evidently appears, that neither Time nor Rest, nor even their supposed Concretion with animal, vegetable, or fossil Substances, are ever able to destroy this wonderful Property of the Air. In the mean time, however, such is the Nature of Air, that its elastic Particles, when separate and by themselves, may be so united to other Bodies, by which they are intercepted, or at least may rest in them in such a Manner, as not, for Ages together, to produce any elastic Effect; and that upon being freed from those Bodies, and united with others of the like Nature, they demonstrate that they have intirely retained their Elasticity. Hartshorn, for Example, may be preserved for Ages; and yet, upon a chymical Examination of some which had been kept above fifty Years, and by this Means was grown exceeding hard and dry, it is surprising what a prodigious Quantity of elastic Air it yielded in its Resolution. Hence, therefore, it is very probable, that one single, aerial Particle is not elastic, with respect to the Increase or Decrease of incumbent Weights; but that this Elasticity then only exists, when two such Particles of Air come to touch and repel one another; and that, consequently, if these aerial Particles were so far distant from each other, as that this repelling Force should utterly cease, then this whole Fluid would, for that time, neither spontaneously expand itself, nor in the least resist any Compression; but would then only exert this Power, when by being pressed close to one another, they should begin to come within the Sphere of each other's Activity. One aerial Particle, therefore, would have nothing of this elastic Power; but it would be only the joint Effort of several. Hence then, in all Appearance, the elastic Force of Air ought to be regarded as constant and immutable.

But in what Manner, or to what Degree soever Air has been condensed by the utmost Power of Weights, it has always remained, even in that Condition, very fluid; for after it has been contracted to a great Density, it has constantly restored

itself again, so as to fill exactly the former Space; all the Particles receding from each other as readily as they before came together. Since, therefore, by every Experiment that has been hitherto made, this Property has been always found to take place, we may safely assert, that the Fluidity of the Air, in all the large Compass, from the most rarefied to the most condensed, remains without Alteration; and that therefore it is neither capable of being consolidated by the intensest Cold, or the greatest Degree of Compression we are acquainted with.

But nothing in this Elasticity of the Air appears a greater Paradox to Persons not acquainted with these Speculations, than what Mr. Boyle has evinced with much Certainty, viz. that the elastic Power which prevails in any particular Portion of the Air, can, without any greater Condensation than what is owing to the compressing Air itself, sustain all the Force of a whole Column of the incumbent Atmosphere. And secondly, that this elastic Power, in such a very small Portion of Air, can, by expanding itself, repel the Bodies which compress it with as much Force, as that which is exerted by the whole external Body of Air.

This efficacious Power of the Air the Chymists ought to have a particular Regard to, since in all their Operations performed by Means of Fire in close Vessels, this elastic Force produces wonderful and often very terrible Effects, acting with a violent compressive Force upon the Contents, often bursting the Vessels, and producing many other great Events.

A very little Portion of Air, therefore, wherever confined, is capable of producing the very same Effects as a very large Quantity in another Place; for if any Portion of common Air is contained within a Cavity that is easily compressible, it will there sustain the whole Pressure, and wholly keep out the intire Body of the Atmosphere. And whenever the Air in that Place is heated by Fire, or freed from its external Pressure, it immediately, by expanding itself, becomes so rare, as to produce such Effects as are equal to those of the greatest Body of Air.

Another Law of the Elasticity of the Air is, that when it is condensed in a certain and determinate Degree, it acquires by the Application of Heat a greater Power to expand itself on all Sides, than it had before. And this Power of Rarefaction arising from Heat, has the same Effect as if that Air had been made denser in Proportion to the Degree of Heat which it before obtained.

This Expansion by Heat is sooner brought about in Air, than any other Body, either fluid or solid, hitherto known in the Universe. In Drebbelius's Thermometer, an Increase of Heat, not perceptible without such a Contrivance, shews immediately a sensible Rarefaction of the Air.

It is farther evident from Experiments, that of all known Bodies, Air is the only one which can be expanded by Fire to so great a Degree; for Air, by the Application of Fire, becomes so rare, that neither the Measure or Limits of such its Dilatation have been yet discovered. The Heat of boiling Water expands the Air to a third Part of its Bulk. *Hist. de l'Acad. Roy. des Scien. 1699. p. 101.* In the Heat then which is capable of fusing Iron, certainly this Expansion of the Air must be immensely great.

In this Part of the History of Air Boerhaave seems to mistake; for Water is capable of a much greater Degree of Expansion by Fire than Air, so as to exert a prodigious Force, by which very large Weights are easily elevated. Now I know no Experiment which evinces clearly that it is possible to rarefy Air by the Heat of an artificial Fire, so as to make it take up more than three times the Space into which it is expanded in its natural State.

It is also found, that unequal Masses of Air, but of the same Density, are always expanded in the same Measure by the same Degree of Fire; so that these Expansions in the same Degree of Density, by a constant Law of Nature, always are in Proportion to the Augmentations of the Heat applied. Hence, therefore, if the Expansion of Air of a given Density, by a certain Degree of Heat, is once discovered, it will constantly hold good in all similar Cases. Upon this Subject let me refer you to some very curious Observations in the *Memoirs of the Royal Academy of Sciences, 1699. p. 113.* and likewise in the *Memoirs* for 1702.

But with regard to the Elasticity of the Air, this is likewise constantly observed, that the more it is condensed by Pressure, the greater elastic Force will it acquire by the same Degree of Fire, and that nearly in a direct Ratio of the Densities; which very curious Property, to the great Advantage of Chymistry, was discovered by the ingenious Monsieur des Amontons's *Hist. de l'Acad. Roy. des Scien. 1702. Mem. 155.* Hence, then, it follows, that a Portion of Air that is exceeding dense, may, by Means of a very little Fire, acquire the greatest resisting Force.

If, therefore, it were possible that common Air could in Reality be condensed into a Space eight hundred times less than what it naturally takes up, then it might, by being acted upon by the Heat of boiling Water, sustain 29600 Inches of Mercury; since common Air, by the same Degree of Heat, will elevate it

to 37; which immense Force teaches us, that if the fiercest subterraneous Fire should, in the Bowels of the Earth, be applied to Air reduced to one eight hundredth Part of its Bulk, there would thence arise a most incredible Force, vastly superior to all that we are acquainted with. This, however, is certain, that if you increase the Density of the Air, and at the same time augment the Heat that is applied to it, then the elastic Power of the Air will always be increased in a compound Ratio of both.

But, on the contrary, the less the Air is compressed, the less is the elastic Force that it acquires from the same Degree of Heat. So that Air which by any Means is rendered twice rarer, requires twice as much Heat to make it require the same Elasticity that it had before, and thus in any Degree of Rarefaction.

These things the same celebrated Author, in the Places last mentioned, has demonstrated by the most correct Experiments. And hence we understand, that the Air in the highest Regions of the Atmosphere will scarcely acquire any Increase of its elastic Force from the most intense Heat; but, on the contrary, will become almost unactive, on account of its exceeding Rarity; and this answers perfectly to Observation.

The last Law which is discovered in the Elasticity of Air is, that it is contracted into a smaller Space by Cold, as it is by an Increase of Weight. Hence its Density is always increased in Proportion to the Augmentation of the Cold.

It may be of some Importance to Chymistry to consider these Properties of Air, which I have related from the illustrious Boerhaave, who has collected every thing material which occurs in Authors who have wrote on this Subject. It will be of equal Use, with respect to Physic, to be acquainted with those Bodies which float in the Air. And these are incredibly numerous, of various Natures, and perfectly different in different Parts of the Atmosphere. We shall not therefore deviate much from the Truth, if we consider it as a Chaos, in which Corpuscles of almost every Kind being confounded together, make a Composition, consisting of the most different Things, of which it will be incumbent on us to give a particular Account, that from hence we may be enabled to make just Conclusions concerning it.

In the first Place, then, in the common Air, there is always and every where Fire, or Heat.

In the second Place, there is Water contained always in the Air, and in every Part of it, and that in such a Manner, that it does not appear possible, by any known Methods, to separate the Water intirely from it. Water is every Moment perspiring from every Person in Health, in an invisible Vapour. Sanctorius computes, that in the Space of one Night and Day, there exhales from such a Person nearly the Weight of five Pounds, much the greatest Part of which is Water. A vast Quantity of aqueous Steams must therefore be continually exhaling from the Animals of all Kinds that are scattered all over the Earth; and that all Plants likewise send forth a dewy aqueous Vapour, is a Thing that has been long confirmed by Observation. But the very industrious and ingenious Dr. Hales has lately, in his curious Treatise of *Vegetable Statics*, proved by Experiments what prodigious Quantities of aqueous Vapours exhale from Plants; not to mention the Water, that by means of subterraneous, culinary and chymical Fires, is continually rarefied so as to rise up into the Air. Dr. Halley, from the Observations which he made with the greatest Care and Accuracy, has made it appear, that from the Surface of the Mediterranean alone, in one Summer's Day, there exhales, by the Heat of the Season only, without any Assistance from the Wind, 52,800,000,000 Hogheads of Water. See the *Phil. Trans.* And the Wind and Sun elevate from the Surface of that Sea, still a much larger Quantity, *ibid.* If we compare now the Quantity of Fog, Dew, Rain, Hoar-frost, Hail, Snow, and nocturnal Moisture, that may be collected in the Space of a whole Year, with the Water which in the same Space of Time, by means of the natural Heat, has exhaled into the Air, we shall find, that in one Year there falls upon the Earth enough to cover the Surface of it to about thirty Inches high, as the industrious Kruquius has plainly proved by his Meteorological Tables. Hence it is probable, that there every Year exhales into the Air, from the whole Surface of the Earth, a Quantity equivalent to thirty Inches Height of Water. And of consequence, since the Area of the Earth's Surface is sufficiently known, it is easy to compute the immense Quantity of Water that is perpetually suspended in the Air.

And that Water is contained in every Portion of the Air, is evident to the Eye in the Air-pump; for there, as the Air, by the Action of the Pump, becomes more and more rare, and less fit to suspend the Water, the Inside of the Glass becomes clouded with an aqueous Moisture; the same Experiment thus evidently evincing, that Water does really reside in all Parts of the Air; and that as the elastic Part of the Air is rendered more rare, it becomes less capable of retaining it.

But that there is a very large Quantity of Water always and every where dispersed through the Air, appears evidently to

the Eye in dry, alkaline, fiery Fixed Salts; for if these, when they are perfectly pure, are exposed to the Air, they will spontaneously dissolve, by attracting the Water out of it. I took at nine in the Morning, two Ounces and one Dram of Salt of Tartar, dried in such an intense Heat, that it melted in the Crucible, so that no Water at all remained in it. I then placed it in a Glass Bason, made very clean, and in this Manner exposed it to the Air, in cold, dry Weather, from the 17th of January to the 20th, in a Place which was very dry. The Consequence was, that upon examining it by the Balance, it weighed three Ounces four Drams and a half; so that it increased in Weight an Ounce, three Drams and a half. But if we thus examine this Salt by a Pair of Assay Scales, we find it is every Moment gaining something in Weight. And as there appears such an Increment of Weight within the Compass of three Days, so if it is kept a considerable time in the Air, the whole of it generally dissolves into a Liquor intirely fluid, pinguious, thick, somewhat tenacious, and unctuous, which is almost three times heavier than the Salt first exposed, and this Liquor the Chymists call *Oil of Tartar per Deliquium*; besides which, there will remain at the Bottom of the Bason a very small Quantity of a white Earth. If this Liquor thus produced by the Salt and Air be put into a Glass Cucurbit, with an Alembic, and distilled to a Dryness, very pure elementary Water will come over into the Receiver, and a dry Salt of Tartar, purer than it was before, and less ponderous, will remain at the Bottom of the Cucurbit. The Salt, therefore, receives from the Air this large Quantity of Water. And here we may observe, that the Water thus communicated to the Salt from the Air, dissolves it in a very different Manner from what it would have been dissolved by pure Water poured upon it; for this Dilution in the Air being slow and successive, by the Application but of a very small Quantity of Water at a time, dissolves only the pure alkaline Salts that are easiest of Solution, and therefore separates this Part from the rest which is dissolved with more Difficulty, that is, which is somewhat more terrestrial; and this cannot be effected by any other Art. And hence, by such repeated Dissolutions and Coagulations this whole Salt is at last converted into an Earth, and a volatile Principle, which disappears, and is not perceptible afterwards. This Van Helmont knew very well, and other Alchymists had come to the Knowledge of it long before him. In this Experiment, it appears particularly surprising, that the very Moment, as it were, that this Salt is taken out of the strongest Fire, and exposed to the Air, this Humectation and Dissolution commence, and the Increase of Weight perceptible by an exact Balance is begun, and from that Instant increases every Moment. And this, which I have very often beheld with Astonishment, has happened even while the Salt has continued exceeding hot, and been kept in a Place, at the same time, which was very much heated by the Fire; so that I could not, with the utmost Care, keep the Water of the Air from uniting with the Salt. But there is yet another thing to be observed, in this wonderful Attraction of Water from the Air into a dry alkaline Salt, which, some Years ago, a good deal engaged my Attention. I wanted a very acrid, dry, fixed alkaline Salt, in order to demonstrate to some Persons, who would not believe, and even denied the Possibility of it, that there might be a Tincture produced in an Instant from that Salt, and pure Alcohol; a Truth which some famous chymical Authors have, in their Writings, mentioned as a Fiction. This Salt, then, rightly prepared, glowing hot, and as yet in Fusion, I poured into a very hot Brass Mortar, and with a very hot Brass Pestle rubbed it as fast as I possibly could, and as soon as ever it became a Powder, I put it up into a very hot and dry Glass Bottle, and immediately stopping the Mouth with a Cork, and a Piece of Bladder softened with Oil, secured it as close as I possibly could. The Consequence was this; when I came to try the Experiment, though I had frequently before met with Success, yet the Event at that time would not answer. Surprised at this, I carefully examined every Circumstance that might produce this Variation, and discovered at last, that the Surface of the Salt was a little moistened by the Air in the Bottle; and that therefore this being already impregnated with Water, the Alcohol could not immediately act upon it.

Now, when I consider this, I am clearly convinced, that in so small a Portion of Air as can be contained in a Bottle, which will hold but three Pints of Water, there is Water enough to moisten an Ounce of Salt of Tartar, and to increase its Weight. And having repeated the Experiment with the same Success, I learnt at the same time, that the Water contained in that Portion of Air, which Water is about eight hundred and fifty times heavier than the common Air, must of consequence make up the greatest Part of the Weight which is statically discovered in the Air itself: For if one eight hundred and fiftieth Part of the common Air was Water, then the whole Weight of the Air would certainly be owing to Water alone, which floats in it; and the other Parts, contained in the aerial Mass, would make nothing towards the Weight of it, and would not, perhaps, gravitate at all. Upon this Subject I had some Conversation

fation formerly with my Friend Mr. Henry Van Deventer, famous for his valuable Writings on Midwifry, who told me, he had observed the very same Thing.

If we consider all these Phenomena with Attention, we must hence infer one, two, or all three of the following Propositions. Either, first, the Air, in all still, close, and subterraneous Places, must be in a perpetual Motion, in order to be able to apply that little Quantity of Water, which is diffused through its whole Mass, to the Surface of the Salt of Tartar, so as to leave it there; for if a Cubic Foot of Air contains at the most $\frac{1}{12}$ of a Pound Troy Weight of Water, and communicates, within a Vessel close stoppt, this Water to the Salt, then it follows, that all the Air must so revolve about the Surface of the Salt, as that all its Parts may successively come in Contact with it, and thus deposite the Water they contain: Or else, secondly, we must conclude, that those Particles of Water, which at one time are dispersed throughout the whole Mass of Air, are at another time so moved through that Mass, as that they are perpetually and successively, sometimes in one Part of the aerial Space, and sometimes in another, till at last they all meet with that Salt which is placed within it: Or, in the third Place, we must acknowledge, that there is a true attractive Power betwixt a fiery, fixed Alkali, and Water; so that, like two Magnets, they reciprocally attract each other, in the same Manner as we read in *Sendiogius*, of an Alkali of the Earth, that attracts the celestial Dew, in order to Fertilization. If a mutual Attraction is the Cause of these Appearances, the attractive Power betwixt the Water of the Air and an alkaline Salt must extend to a considerable Distance, since a very little of the Salt will grow four times as heavy at it was at first, by means of the attracted Water; for an Ounce of Salt of Tartar, whilst it is converted into four Ounces of Oil of Tartar per Deliquium, must have drawn into it three Ounces of Water: But three Ounces of Water require at least two Cubic Feet and a half of Air to be diffused through it, in order to be attracted into that one Ounce of Salt; which Space, with respect to that one Ounce of Salt, is very great; but from all kinds of Experiments, it appears very probable, that all these three Causes concur, at the same time, in the Production of this Effect.

But nothing appears more extraordinary in this Affair, than that, whilst the Water is drawn into the Alkali from the Air, and thus makes Oil of Tartar per Deliquium, which in Weight is to Water as seven to five, but to Air as 1190 to 1, there should be found in it nothing of the aerial Elasticity; so that this Alkali thus separates the Water from elastic Air, and unites it to itself, but rejects intirely the aerial elastic Quality. Hence, therefore, it appears, that Air, free from Water, is very elastic; but on the contrary, when it is replete with watery Vapours, it proportionably loses somewhat of its proper Elasticity; and again, that by means of a great Quantity of fixed alkaline Salt produced on the Earth, a vast deal of Water may be drawn out of the Air.

In continued serene and very dry Weather, the Air becomes always more ponderous, the Atmosphere heavier, and the Water mounts higher in the Air; so that, in reality, there is never more Water in the Atmosphere than at that time, when, by reason of the Dryness here below, People generally imagine there is the least of all: But the Water then is far more widely distributed and dispersed; for the higher from the Earth the Water ascends in the Atmosphere, the greater are the Spaces into which it is diffused, and the farther, consequently, its Particles recede from each other; and then they exist separately, and do not immediately unite, nor afford any Moisture. But if the Barometer is very high, and at the same time thick and stinking Fogs appear, then the watery Particles almost always float below, along with gross, unctuous, and saline Exhalations; all which, at that time, are not equally mixed together. Again, when the Barometer is very low, and the Weather at the same time is very hot and cloudy, then the Water comes down to the lower Regions, but in a uniform Vapour, very moist, but not yet producing Rain. From these Observation it is manifest, that the Air, when loaded with abundance of Water, often appears very dry, bright, and perfectly clear; and that, on the other hand, when there is less Water in it, it may, by the Descent, Collection, and unequal Distribution of the Water, appear cloudy, dark, and very moist. And this is demonstrated evidently in Cucurbits, Alembics, and Glass Receivers, whilst Water is distilling in them: For if the Vessels are kept stoppt very close, whilst the Distillation is going forward, all appears bright and clear, and no cloudy Vapour is seen; but as soon as the Water in the Cucurbit, upon the Removal of the Alembic, begins to evaporate freely into the Air, the whole appears covered with watery and very thick Vapours, the equable Compressure being now removed.

But in the Summer Season, when the Weather is fair and very dry, and the Surface of the Earth has been for a considerable time parched with the Heat of the Sun, then not only the Water, but other Particles likewise less volatile, as the oily and saline, are, by the Power of the solar Rays, carried up into the Air, and fill that Part of it which lies nearest the Surface of the

Earth. And as long as these Exhalations are kept in Agitation by the Heat of the Sun, so long nothing of them appears to the Eye: But as soon as the solar Heat, which at Three in the Afternoon is the greatest, begins to remit, the Air soon after begins to grow cool, though the Earth, which retains the Heat communicated to it by the Sun a thousand times longer than the Air, being yet hot, continues to breathe out Exhalations; and hence there is collected a white, dense Vapour, which is cool above, but still continues warm below. This Vapour, therefore, appears first in Ditches, and watery or marshy Places; whence dispersing itself by Degrees, it covers the Face of the Earth in the Evening and Night-time, with a Cloud, consisting of Particles of this Sort, which in the Morning is again dissipated by the Heat of the rising Sun. And this is what we usually call Dew; which appears, from what is here said of its Production, to be a very compound Fluid; so that nothing material can be asserted concerning its Properties, which would under all Circumstances hold true: For since it is a Composition of all the Corpufcles of the Earth, which are rendered volatile by the solar Heat in Summer, exhaling and descending again, and blended and confounded together, it must doubtless appear, upon the least Consideration, to be a perfect Chaos. Moreover, in every particular Part of the Earth, it must be of a Nature intirely different, according to the various Sorts of the Bodies in the Place where it is produced. In Gravel-pits, for Instance, and in high, dry, heathy Grounds, of a large Extent, there is collected but a very small Quantity of this Vapour, and that almost intirely watery; whilst that which is collected about standing Waters, Fens, Morasses, fat bituminous Grounds, and Places abounding with the Exhalations of putrefied Fish and other Animals, is perfectly of a different Nature, and often pernicious to Mankind. It is no wonder, therefore, that the Chymists, in the artificial Resolution of Dew, have met with such contrary Principles, and written so differently upon the Subject, that you can scarcely find two of them that give the same Account of it. And as for those who expect to find the Spirit of Life, the universal Menstruum, the Mercury of the Philosophers, and the Nitre and Steel of *Sendiogius* in Dew, they scarcely seem to have read the Works of these Philosophers to any Purpose. That this, however, is a very sharp, saponaaceous, pinguous Liquid, abounding with a good deal of Nourishment for Vegetables, I do not deny. A Dew too, collected in a certain Part of the Earth, has yielded, by Distillation, a Liquor that impressed upon Glass the lively Colours of the Rainbow, which could neither be removed by Friction, an alkaline Lixivium, or Aqua-fortis: And this Liquor was inflammable, like Spirit of Wine, as appears from the chymical Experiments related in the *Republic of Letters*, tom. i. p. 590. And again, distilled Dew, digested for the Space of eight Days in a gentle Heat, and by repeated Distillation rendered six times more subtil, is said to have broke three Glass Vessels, and to have remained perfectly insipid, though it was so very thin, that it resembled pure Spirit, *ibid.* 1708, p. 152. And farther, in the *Philosophical Transactions*, Dew is described as being like Butter, of a yellowish-white Colour, soft, melting by being rubbed upon the Hand, and growing dry and hardening by a moderate Heat, of a foetid Smell in the Winter, and, in the Spring particularly, produced in the Night-time in pretty large Lumps. But the Nature of Dew is likewise surprisingly various, according to the different Dispositions of the Weather, and according to the various and successive Changes of the Meteors in the Air; for hence it comes to pass, that the very minute Seeds of small Plants, and the invisible Eggs of the smallest Insects, are mixed with it, together with an infinite Number of other Things; which being all digested, fermented, putrefied, and distilled together, yield, at different times, Principles of very different Natures, and hence lead the Chymists into very extraordinary Opinions. The principal Part, therefore, of Dew, is Water; the rest, because of their great Variety, cannot possibly be determined.

That the Clouds are produced in the Air, from Water only, scarce any body doubts; but Water, every where equally disposed, is transparent. Clouds, therefore, are collected from what is beginning to be Water, the Parts of which are circumsolved among one another with an unequal Motion, neither resting nor moving equally. If the Water that is floating about in the Air mounts higher and higher, its Particles at last obtain a Situation so far above the Earth, that they are not any longer much united together, but receding from each other, they do not then constitute Water, but only the Elements of it: But when these Elements of Water come to descend again from the upper Regions, and are contracted into smaller Spaces, they associate together, and become a kind of Water, then forming Clouds. The higher therefore the Water ascends in the Air, the more serene and dry the Weather will be, and the freer from Clouds; and the contrary. But Water is carried up to a very considerable Height in the Air; for in Carniola, in the Neighbourhood of Venice, there are Mountains 10274 geometrical Feet high, on the Tops of which there are Indications of Moisture, *AA. Lips.* 1689. p. 552. And on the highest

highest Tops of those Mountains, Nature presents to our View perpetual Snows; a certain Proof of the Elevation of Water to such Heights. And even over Teneriff, one of the highest Mountains in the World, there constantly, about Noon, hang Fogs, or little white Clouds, which are daily resolved into Water, which flows in such Plenty down the Mountains, that it supplies the Place of Showers, and waters the whole Island without Rain, *Aët. Lips.* 1691, p. 98. We are certain, therefore, that Water ascends to such a Height: But had we sufficient Observations to confirm the Account Maignanus of Thoulouse gives, in his *Treatise of Perspective*, p. 93, of the wonderful Phenomenon which he says he had observed, the Ascent of the Water in the Atmosphere would be found to be abundantly higher: For he tells us, that in a very clear Night, and that at Midnight too, there appeared, in the Month of August, an exceeding bright little Cloud, which spread itself almost as far as the Zenith, or vertical Part of the Heavens; and says, that Riccius observed the same Thing in the Neighbourhood of Rome: And, from these Observations, he infers, that Clouds may be elevated beyond the Projection of the Earth's Shadow. But this Projection, if astronomically computed from the given Time and Place of the appearing Cloud, would make it at a prodigious Distance from the Earth; and hence, perhaps, that Appearance was rather to be ascribed to some other unknown Cause, residing in the upper Regions of the Air, such a one as forms the *Aurora Boreales*, or Northern Lights; since, on the Tops of the highest Mountains there are rarely observed any Clouds; but, on the contrary, to a Spectator placed there, they appear below him, towards the Valleys.

The lower Air being full of Water, the Elements thereof begin to unite, and, by this Association, to form small Drops, which falling down, produce a light Rain, generally thick, but descending with no great Force: For the less these Drops are, the greater are their Surfaces with respect to the Quantity of Water they contain, and consequently are the less inclinable to descend with Velocity through the resisting Air.

But when the Water in the upper Regions of the Atmosphere is collected together, and becomes heavier, and begins to descend, then, by gradually falling down, it continually unites to it the other Particles of Water which it meets with in its Fall. By this means are produced those very large Drops which in Europe have been observed of three Lines in Diameter, but among the Negroes, a whole Inch, *Aët. Lips. Suppl.* i. 425; which Drops, containing a great Weight of Water under a Surface small in Proportion, rush more violently through the Air, and fall to the Earth with a considerable Force. The higher the Place is from which they fall, the larger the Drops are, and so *vice versa*; for it has been always observed, that the Rain, in the upper Part of a high Mountain, is the smallest; but that, as it gradually descends, larger Drops are formed, till at the Foot of the Mountain it produces the largest of all. Hence, the hardest Showers happen in Summer, when the Water, being driven rapidly downwards on a sudden, Thunder, Lightning, and Tempests are caused. And hence also, the Drops of Showers, in Summer-time, are usually larger than they are in Winter. Lastly, Observation has made it very certain, that Rain, in every Part of the Atmosphere, is there the smallest where it is first produced.

But when the Air, abounding with Water, and growing cold during the Night-time, is carried against the upper Parts of high Mountains, especially if they are disposed in a long Range, then this cold and dense Mass of Bodies, particularly towards the North and East, during the first Part of the Night, and towards the South and West after Midnight, stops, cools, and unites this Water of the Air, and converts it into a real Fluid, which gives Rise to a great many little Rills, which in the highest Part of the Mountain are small, but, as they descend, and are joined together, become larger, and by this Means produce a perpetual Trickling down the Mountain, and afford an incredible Quantity of Water, which runs down, and produces various Rivulets, according to the various Channels of the Mountain or the Lands about it; and when these, by subterraneous Passages, descend from a high Part of the Mountain to any Part of the Declivities, and there burst through Outlets, and so discharge their Stream, they then yield a pure Water, either falling down, or bubbling up from a Spring. And here it is very easy to conceive, that, according to the different Height of the Springs, in respect to the Outlets, the playing of the Fountains must be various. And hence, likewise, it is easy to account for the Variety of Springs, both in the Quantity of Water and every other Circumstance. And hence again it appears farther, how it comes to pass that there are no Springs but where there are pretty high Mountains; and that wheresoever these are, Springs are also observed: The Truth of which appears no where more evidently, than in the fortunate Valley of Caffimire, mentioned by Bernier in his *Description of the Empire of the Great Mogul*.

This Account of Springs may possibly be right with respect to some; but I can by no means agree with the illustrious Author, that this is the Origin of all Springs. An easy Computation will

make the contrary evidently appear. Boerhaave has shewed that the Waters exhaled from the Earth in one Year, would cover the Surface thereof to about thirty Inches high. And if this is all, the Surface of the whole World would not be sufficient to supply the Thames, Trent, and Severn, with the Quantities of Water they yearly carry into the Ocean.

Again, wheresoever there are such Mountains and Springs, there the Water, after running down from the Mountains, or perpetually bubbling from the Springs, is discharged into Rills or little Currents, continually flowing; but, for the most Part, with a gentle Course at their Origins. But, when different Currents join their Courses together, the Stream becomes stronger; and being continually augmented by Rivulets, which discharge themselves into it, in a short time a River is formed. This again, not long after, being still, as it passes, augmented in Strength and Quantity by the Accession of other Streams, forms a River still flowing with a more rapid Course, always tending from the higher to the lower Ground, and at last discharging itself into the Sea, from which it never returns again; whose Contents, however, in the whole, are by this Means never increased, inasmuch, as what it receives by the Discharge of the Rivers into it, it gives up again continually by Exhalation. Sometimes it happens, also, that the rapid Torrents of Rivers sink down into subterraneous Passages, disappear, and rise up again in some other Place. Hence, in flat Countries, where there are no Mountains or Springs, no Rivers are formed; and for this Reason the Supreme Wisdom has thus distributed Mountains throughout the whole Earth, that they might be beneficial to Mankind, by producing these Collections of Water. And hence, lastly, all the World over, the Courses of Rivers correspond with the Order of the adjacent Mountains. Upon this Subject, let me refer you to the Discoveries of the incomparable Halley, in the *British Philosophical Transactions*, which he truly has a Right to the Merit of. All these Things it concerns us to be particularly acquainted with, who are prosecuting the Study of Chymistry, in which there is almost a perpetual Necessity of considering the Variety of the Qualities of Air and Water.

But by all that has been hitherto said, it does not appear certainly how great the utmost Height is, to which Water can ascend in the Atmosphere: But this, at least, we are absolutely sure of, that on the Top of the highest Mountain on the Earth, there never is any Air without some Water in it, since the Top is always found moistened with humid Vapours. And hence it is evident, likewise, that it is not possible, by any Manner of Art, to make Use of Air in chymical Operations, void of Water. Perhaps, indeed, from a given Quantity of Air, pent up very close in a dry Glass Vessel, all the Water may be drawn out: For if some Salt of Tartar, coming as hot as possible from the Fire, is reduced to a fine Powder, and thrown very dry into this Glass Vessel, and the Mouth of it is immediately stopt close, then this exceeding dry Alkali will attract into it all the Water that is contained in the included Air: But then no-body can apply this Air to any chymical Operations, because, as soon as ever the Vessel is opened, this dry Portion of Air mixes again with the common Atmosphere, and is immediately moistened by the Water with which it was filled.

But farther, we are assured, from undeniable Observations, that the higher the Water is carried into the Air, the more its Parts are disunited, and dispersed through wider Spaces, and at the same time grow colder: For, upon Examination, it has been constantly found, that in every Part of the habitable World, the Heat is greatest at the Surface of the Earth; and that, at the very Summits of the highest Mountains, a freezing Cold preserves a perpetual Snow. This is true, even at the Equator, and in the Torrid Zones: So that there is not, in the hottest Part of the Earth, a Mountain very high, whose Top is not exceeding cold: And the Cold even increases gradually, as you ascend from the Foot to the Summit of the Mountain, in such a Manner, that the Increment of Cold is always in proportion to the Increase of Height. This is an Observation that will always hold true, if all other Circumstances are alike. When Water, therefore, ascends to such a Height in the Air, that it meets with a freezing Cold, it must necessarily be congealed into Ice, unless its Elements are so separated, that none of them touch one another; for so long as the Particles of Water are there dispersed from one another, so long there will be no Appearance of Ice: But, as soon as ever, in this high and cold Region of the Air, these Elements begin to come into mutual Contact, then they begin immediately to be congealed into little icy Globules, which float up and down through the clear Air, and falling upon the Surfaces of the Bodies they meet with in that Region, produce a very fine Hoar-frost, but otherwise are scarcely perceptible. In the Atmosphere, therefore, there is an Orbit concentric to the Earth, in which the Water of the Air, when it is carried up to that Height, is always frozen if it is united together. And the higher it is elevated above this Orbit, so much the sooner it will be frozen. But it is not, however, improbable, that when the Water arrives to such a Height, its Particles will be so much the less united,

united, and therefore will seldom be congealed; but, on the contrary, will float about separately, till some other Cause shall happen to unite them together, and by this means form them into Ice.

When the Water, therefore, in this Orbit is congealed, then by an Union of a great Weight of Water under a less Surface it must immediately become heavier; by which means it will of consequence begin to fall downwards, and thus descending into Spaces that are smaller, and are more replete with Water, will associate to itself other watery Particles, and so gradually form larger icy Concretions, which will now put on the Appearance of Snow, or small Hail. But as there may be a great Number of Causes, and those too perfectly different from each other, by Means of which, the Elements of Water that were before scattered in the upper Air, may on a sudden, and in a very large Quantity, be brought into Contact with one another in the icy Region of the Atmosphere, hence we readily apprehend, that considerable Pieces of Ice may in a very short time be produced.

But these icy Masses may be collected together; and when this happens, there will appear little Clouds high in the Air, and white, because of the Reflection of the Sun; which suddenly falling downwards with a considerable Velocity, seem to increase very fast in their Magnitude, and rushing from on high upon other Clouds of the same kind, by their Collision produce Thunder, Lightnings, Tempests, Showers of Rain and Hail, which are always the more violent, the higher the Place is from which they fall. And hence, in Summer-time, when the Weather has been long clear, the lower Air very dry, the Atmosphere heavy, and the Water therefore in it carried up to a very great Height, then the Atmosphere being on a sudden rendered lighter, the Phenomena just mentioned usually succeed, especially betwixt the Tropics, where, if a little white Cloud appears very high in the Air, it is a Sign that a terrible Storm is at hand. And it is exceedingly probable, that the Hail, which is always formed in the upper and colder Regions of the Air, as it descends by its Weight into those that are lower and warmer, is there dissolved by Heat, and produces those great Showers of Rain which accompany, follow, and put an End to the Thunder and Lightnings. But if the Hail happens to be so swiftly carried through the Air, as that, by reason of its quick Descent, it cannot be melted, it then falls to the Earth in form of icy Concretions, which often, by their Size, Weight and Motion, do a great deal of Mischief. In the Abridgment of the *Philosophical Transactions*, N. ii. p. 144. we have an Account of some of these that weighed a full Pound.

This certainly we are assured of, by Observation, that Clouds of a very white Colour, to which there presently succeeds a pitchy Blackness, terrible Thunder, Lightning, and Tempests, are always accompanied with Hail. Hence it may be questioned, whether, for producing even the greatest Thunders and Lightnings, Nitre and Sulphur are always necessary; since the very violent Collision of hard Ice suffices, perhaps, for the striking out a vast Quantity of Fire; doubtless it is sufficient for producing loud Peals of Thunder; especially if we likewise consider, that the Fire of the Sun, by its Heat, Reflection and Refraction, can act in infinitely different Ways upon the aqueous congealed Matter we are here speaking of. If this then be taken into Consideration, what Variety of Colours, what Diversity of Figures, and what Difference of Dimensions may we not suppose to happen in this aerial Ice?

This Account of Thunder and Lightning without Nitre and Sulphur seems more curious than true.

But amongst the principal Causes that are concerned in the sudden Production of such extraordinary and various Phenomena in the Atmosphere, which before was calm and serene, we may reckon the Diminution of its Weight; for the Water always begins spontaneously to separate itself from the Air when the Air becomes lighter; and thus the Water discovers itself, though before it did not appear. In the next Place, we apprehend, that the Bodies of Air which are driven from opposite Quarters, often strike against one another, and by this Collision suddenly unite together the Elements, which before were separate. Something likewise may perhaps be owing to the various Aspects of the Planets; not to mention the Efficacy of the Winds, and the Vicissitudes of Heat and Cold towards these Productions. Every one of which, separately, or all of them together, may easily enough bring about the Effects we have mentioned, with many others.

On the other Hand, if we examine into the Causes which incorporate Water with the Air, and elevate it, we shall find a great many which contribute to it. The principal, however, of these is the Sun, the Direction of whose Rays upon the Water, the nearer they approach to a Perpendicular, the more consult the Observations of Dr. Halley, which I have already cited in their proper Place. Another Cause greatly assisting the foregoing, is the subterraneous Fire, which is always in Action, never at Rest. For it has been evinced by Observations, that

in Mines sunk lowest, or in the deepest Wells, you first come to a Depth in which Water never freezes, but which continues almost always of the same Heat, without any Alteration, as the celebrated Academy at Paris observed long ago, in the Well of their Observatory; but as you descend lower, the Heat begins to grow greater, increasing gradually more and more, in Proportion to the Depth, till at last it becomes so suffocating, that unless it be tempered by the Coolness of running Water, and the Air that is thence produced, it suffocates the Miners. And we see also that in Winter, when the Water is covered with Ice, and the Earth with a hard frozen Crust, if the Ice is broke, or the Earth is opened, both the Water and the Earth smoke with Heat. Nor had the Philosophers, whom I have formerly heard discoursing on this Subject, any Grounds for asserting that this was all a Fiction, and that it was impossible that Fire should thus exist in the Bosom of the Earth, because it can neither be supplied with a proper Pabulum, or be agitated by Air; for certainly we ought to consider, that by the sole Attrition of the condensed Air, in the Bowels of the Earth, this Fire may be produced and preserved without any other Air, or any Pabulum. For should the Air, at any vast Depths under Ground, be condensed six hundred times more than the common Air, what Effects would it not be capable of producing? Incredible ones without Dispute, since Authors worthy of Credit have declared, that Air forcibly compressed in an Iron Tube has there grown warm. It is not to be questioned, therefore, but that, in the deepest Parts of the Earth, where the Bodies are compressed by the prodigious Weight of those which lie above them, the smallest Attrition must produce the greatest Heat. And hence, as the Action of this Fire is perpetual, so likewise must be the Effect of it too, that is, a continual Exhalation of Water. *The Existence of this subterraneous Fire seems to want farther Evidence, notwithstanding Boerhaave so little disputes it.*

Regard is also to be had to the very great and constantly repeated Effects of common Fires, made use of by Mankind in every Part of the inhabited World, in the Dissipation of Water, whether alone, or contained in Animals, Vegetables, or Fossils; for, doubtless, if any one computes the Measure of this exhaling Water, which such Fire carries up, and distributes through the Air, he will find it to be incredibly great.

Again, the Force of a very sharp Frost carries off from Ice every Moment a surprising Quantity of Waters, so that in a little time the Mass is consumed, being dispersed into the Air by the Cold alone, as the excellent Mr. Boyle plainly discovered by an Experiment made with the Balance. But daily Observation certainly evinces, that by the piercing Cold of a very severe Winter, all Kinds of Bodies are strangely worn away, diminished, consumed, and dispersed through the Air.

It seems probable also, that every physical Cause, which is capable of so disuniting the Particles of Water from one another, as to make every one of them exist separately, will also, by this means, make those Particles immediately acquire so large a Surface, in Proportion to their very small Weight, that they will be able to float in the Air. And indeed, this Solution of Bodies into their smallest Parts appears at last so to increase their Surfaces, in respect to their Quantity of Matter, that in every Division of them, this Aptitude to swim in a lighter Liquid is very much augmented, as the Geometricians have long ago observed. But it is farther discovered by physical Observations, that, besides the Gravity of Bodies, there is likewise a certain repelling Force, which tends to prevent the Contact of the Surfaces of different Bodies, and which, consequently, is always increased in Proportion to the Augmentation of their Surfaces. Hence it follows, that Bodies very minutely divided, descend, on this Account, with more Difficulty by the Force of their Gravity, than they would do if they were acted upon by the Law of Gravitation only. And the Action of this second Property of Bodies seems particularly to prevent the immediate Descent of all the Particles of Water out of the Air that surrounds the Earth.

It seems to be the Effect of the very same Property, that the Particles of Water may be expanded round the Air contained in them, and thus form that spherical Body which we call a Bubble. And besides, any Heat or expanding Spirit whatever, while perhaps it acts in the same Manner, may, as well as Air, be always, at last capable of rendering Water lighter; but when afterwards, the Water being so divided into very light spherical Bubbles, is carried upwards, then does every Bubble expand itself more and more continually, and so is able to ascend for a long time, and to remain aloft in the Atmosphere. And hence it is manifest, that the Particles of Water may ascend to a great Height. See Halley, in the *Philosophical Transactions*, 1692. N. cxcii. p. 468, &c.

But in the last Place, there is no Cause whatever which carries up such a Quantity of Water from the Earth into the Air as the Wind, as the same admirable Halley has elegantly demonstrated, and as I myself have learned from various Experiments, not without Astonishment; for having exposed a Copper Cylinder full of Water to the Wind in

in stormy Weather, I was surpris'd at the incredible Quantity of Water carried off in a little time; whereas, when the Wind was still, which happened presently after, but a very little Water exhaled, though the Heat of the Weather was still the same. For this Reason it seems ordered, that high Winds should follow large Quantities of Rain, that, by thus agitating the falling Water, and carrying it up again into the Air, they may prevent its stagnating and putrefying, and by this Means proving destructive to the vegetable Kingdom. All these Causes, therefore, when they conspire together, are sufficiently capable of dissipating Water into the Air, and there keeping it in continual Motion.

If we consider now the Action of this elastic Air, replete with Water, on the Body of a Man, Fossil, or Vegetable, we shall find it bring about many and very wonderful Changes; for if we reflect upon its singular Fineness, which renders it exceedingly penetrating, and that it is perpetually insinuating itself into every little void Space; and if at the same time we take into Consideration its constant Mobility, by which it is always kept vigorous and active, it is manifest that these Qualities being determined upon Bodies by the Force of Gravity, are capable of producing an infinite Number of Effects. But the Water that is distributed through the Air will also be still more efficacious, being itself agitated by the Motion of the Air, and by this Means it will more readily dissolve the Salts, and the saline and saponaceous Substances of the Bodies it is applied to. And as there are many such Parts in most Bodies, and those Parts too are the principal Instruments of their Action, hence we easily apprehend, that, by means of the Application of the Air, the proper Virtues of Bodies may be excited to Action, so far as they depend upon their Salts and Soaps. In the mean time, the principal Alteration wrought upon Bodies by the Water of the Air, is its rendering fixed Salts, and other compound Bodies, volatile. This Phenomenon was observed by all the Chymists of old, and is constantly found to hold true, that is, all native Salts, if they are rendered exceeding dry by an open Fire, and then pounded and exposed to the Air in a Glass Balon, will there, by means of the Water in the Air, be converted into a Liquid, and from the perfectly saline Part there will be separated an Earth, which did not appear before. If this saline Liquor, thus freed from this Earth, is again thoroughly dried by a clear Fire, and if afterwards the Salt is beaten, and again dissolved in the Air, it will deposit some more Earth. And if, by several Repetitions of this Solution and Infusation, you thus remove all the Earth that is every time produced, you will at last procure an incredible Quantity; but at the same time you will have nothing else remaining; for that other Principle, which before, in Conjunction with the Earth, constituted the Salt, is, by this repeated Action of the Water of the Air so disengaged from its Earth with which it was incorporated; that now, existing separately, it becomes perfectly volatile, is dissipated in the Air, nor does ever again come within the Cognizance of our Senses. Nor has the Industry of the Chymists discovered this wonderful Metamorphosis in native Salts alone, but likewise in the fixed Salts prepared by Fire from Vegetables; for by this tedious Operation, these Salts are likewise resolved into an Earth, which fixes them, and a Principle perfectly volatile, which is intimately united with it. And these Resolutions, which are very singular and wonderful, can be performed by no other Means than this very subtle Application of the Water distributed in the Air, which Art, formerly held a Secret, being now more practised, has let abundance of Light into the Art of Chymistry; though at the same time it has too often proved of Diservice to the Chymists, who being quite tired out with the Tedioufness of the Work, have lost, in the End, both their Labour and the Thing they were in search of. But again, whenever the Air abounds with Water, and is, at the same time, agitated by Heat or Wind, then this Water will relax the Parts of Bodies so suddenly and so efficaciously, as must surprise every one who is not acquainted with these Subjects. But by this Means, likewise, many Bodies are macerated, and others are thrown into Fermentation. And as for the Putrefaction of the Bodies, certainly it is scarcely more promoted by any other Cause than the Humidity of a hot Air, which, in a very little time, resolves the Bodies, which are that Way disposed, into a putrid sanious Matter. And for this Reason, the Physicians long ago asserted, that the Plague itself is generated among Animals, from an Air that has been both very moist and warm for a considerable time. In short, therefore, since it so dissolves Salts and saponaceous and saline Substances, elevates them all together, disperses them about, drives them against, and makes them penetrate into what Bodies they meet with, it is manifest, that, by this Means, it must apply the Forces of some Bodies to others, and thus bring about such Actions between Bodies, as hardly ever happen from other Causes; for what other Cause could produce the foetid Butter-like Dew, described in the *Abridgment of the Philosophical Transactions*, Tom. ii. 141? Or what else could cause the salt Rain, observed at Sea, *Journal des Sav.* 1683. 435?

Thus far we have sufficiently considered the Air, with respect to its Elasticity, and the Fire and Water contained in it. We

are now to examine it in another View. Let us then carefully enquire what other Corpuscles, besides those we have specified, float perpetually in this Air; but this is a Field of Enquiry which is boundless: For as the Earth, considered in its whole Extent, receives every thing that falls out of the Air, so, on the other Hand, the Air receives every thing again from the Earth; and thus, between these two Elements, a perpetual Revolution and Distillation of all things is carried on.

In the first Place, then, all the Parts of Vegetables perpetually changing, are dispersed throughout the Atmosphere. That the Spirits of Vegetables do always and every where exhale, and fill the Air with a continual Fragrance, nobody can dispute. And it is very certain, that the Odour of Plants dispersed through vast Tracts of Air, inform Mariners, before they discover Land, of their Approach to the Shore. It is farther known, that these Spirits spontaneously exhale out of the Bodies, in which they are generated, and are scarcely to be confined and preserved, except in Vessels stopped very close. Hence, then, it follows, that whatever odoriferous Spirits are at any time by Nature produced in Plants, all these are, at last, contained in the Air. And for this Reason it is not at all to be wondered, that these Spirits should afterwards return with the Water of the Air into the Bodies destined to receive them, and that the Air should thus yield up to the Earth what it originally received from it. In fact, we find nothing in Nature less imitable by Art, than the fragrant Spirits peculiar to each Plant. But these, when they are once freed from the Tenacity of the Sulphur or Oil that entangles and retains them, always, from their own proper Nature, become volatile, and are dispersed through the Atmosphere. How various, then, must be the Effects that are hence produced; and how wonderful the grand *Metempsychosis* or Transmigration that is, by this Means, brought about!

But again, when we consider that Vegetables, duly prepared by a proper Fermentation, yield a large Quantity of vinous Spirits, that are continually exhaling, must we not hence conceive, that all those Spirits which have ever been produced from any fermented Vegetable whatever, over the whole Face of the Earth, have at last exhaled into the Air? And in this View we now look upon this Air again as a Cloud, as it were, of Spirits of Wine. In Reality, whether Wine be drank by Men, or any other Animals, be outwardly applied by Way of Fomentation, or made use of either in Cookery or Physic, certainly all its Spirits must sooner or later exhale into the Air, there remain for some time, and thence, at a convenient Season, return to the Earth again. What Wonder, therefore, if Fermentation, which is the productive Cause of Wine, should never produce Wine, without the free Admission of the external Air. May it not, possibly, return back again to Places and Bodies the Spirits which it had before received; and must it not, for this Reason, be always called in to our Assistance, when they are to be generated again?

And finally, all those Parts of Vegetables, which the Fire divides into exceeding minute Corpuscles, and converts into a volatile Vapour, the Chymists have likewise called Spirits; but these are also elevated into the Air, and are continually floating about in it. As the Water of Vegetables, therefore, so all these Kinds of Spirits are perpetually tending upwards into the Atmosphere.

But farther, it is certain, that the native Oils of Vegetables do, in time, by the natural Heat of the Air, intirely evaporate; and that whether they remain in the Vegetable, or spontaneously exude out of it, or are forced out by Pressure; for there are but few Sorts of Wood, in which their Oils are so united with their proper Earth, that they are able to remain for Ages together in the open Air. And as for the Oils of Vegetables, which Chymistry draws from them by Fire, whether this be done with Water or without, these are far more volatile, and sooner fly off. Thus then they form pinguious Exhalations in the Atmosphere, which are very well disposed both to take fire, and to support it; for as these oleaginous Particles are now so minutely divided, that they nearly resemble Alcohol while they float in the Air, being first heated by the Attrition of the Clouds, they may be excited into a Flame by Fire, which may be produced in the Air, all these Oils, therefore, which ever were contained in Vegetables, a very few perhaps excepted, are dispersed into the aerial Chaos; whence, as Water and Spirits do, they return in their time, impregnate the Earth with a pinguious moistening Dew, and by thus circulating backwards and forwards, bring perpetually fresh prolific Supplies, and being deposited for a short time, return into the Air again. All this now happens principally in very hot Weather. For if a long Drought, with a very great Heat, has carried upwards both the Water and the pinguious Corpuscles of the Earth, then the first Fires that happen aloft with Thunder and Lightning, send down a Rain which is very different from that pure Snow that falls in a sharp Frost, and is far more acrid and more disposed to Froth. And hence Summer Rain, or Rain produced in hot Weather, is always fruitful; whereas that in cold is scarcely endued with any such Quality.

I must observe, that Spirit of Nitre rendered extremely strong and volatile, when mixed with some aromatic Oils, as that of Cloves, will explode with great Violence, and form a Kind of artificial Lightning. How far, therefore, the aromatic Exhalations from Vegetables may, by mixing with the Acid of the Air, set it on fire, and be concerned in making Thunder and Lightning, I leave to the Determination of Philosophers.

If we consider now the native, acid, austere, saponaceous Salts of Plants, and those which approach the Nature of an Alkali, which are procured by Crystallization, Fermentation, Putrefaction, and Combustion, we shall find, that all these do, sooner or later, disappear, not one of them excepted; since all these Bodies, when they are freed from their fixing Earth, ascend into the Air.

Even that very Earth too, which furnishes a fixed Element to Plants, by being reduced into small Particles, acquires such a Disposition, that it flies off, and is carried aloft: For Soot, collected at the very Top of a Chimney, from the volatile Smoke of a burnt Vegetable, yields, by a chymical Distillation, a remarkable Quantity of pure Earth. Hence, therefore, we are assured, that Smoke, which floats at Liberty through the Air, carries along with it real Earth, mounts with it aloft, and widely disperses it through the Air. Not to mention the Winds, which sweep away the Egyptian and Lybian Sands in Waves, as it were, through the Air, and carry the Ashes of Mount Ætna to prodigious Distances: Farther Instances of this are the Sparks of Vesuvius, scattered above a hundred Miles through the Air, *Phil. Transf. Abr. tom. ii. 142.* Ivy-berries, dispersed over a vast Tract of Land, *ibid. 144.* Small Fish, *ibid.* or the seminal Dust of Vegetables, *Phil. Transf. 168. p. 911.* Hence, then, from Observations it is clear, that all the Elements of Vegetables may be carried and intermixed with the Air.

But it is likewise certain, that Parts of Plants, and those pretty considerable ones, are carried into the Air to an incredible Height. Consider the Seeds of downy Plants, which are carried up to the Tops of the highest Towers, and there, as is daily seen, if they meet with a very little Earth, propagate their Species. The celebrated Tournefort has demonstrated, from Observations, that the Fungusses, which are almost all feminiferous, by Means of the Air, disperse their invisible Seeds all about, which meeting with a proper Soil, thrive and spring abundantly. Mosses, likewise, and the mucilaginous and capillary Plants, as also the *Epiphyllasperma*, or those which bear their Seeds upon their Leaves, scatter and disperse their Seeds to very distant Places. Even the small seminal Dust of the Male-Willow, being shaken from the Apices of the Flowers, and carried by the Winds into Places remote from those Trees, and afterwards, when the Wind was down, falling out of the Air, has been taken, by Persons unacquainted with these Things, for Flower of Sulphur, and afterwards believed, by the credulous Vulgar, to be a Shower of Brimstone, *Vide Phil. Transact. Abr. tom. 3.* And if such a small Dust should happen to be of a remarkable red Colour, why should not the same Vulgar, for the same Reason, have asserted, that it had rained Blood? There were Ashes thrown out of a Vulcano, and carried by the Wind, in the Year 1633, the Space of one hundred Miles, *Phil. Transf. N. xxi. p. 377.* But these are Things not to be wondered at, since that excellent Philosopher, Mariotte, in his *Treatise of the Motion of Waters*, p. 334. observed in a Cloud that poured forth a Shower of Hail, that the Air had carried this Cloud for fifty French Miles. If we reflect, therefore, upon these Things, we must believe, that there are a vast Number of surprising Phenomena in the Air, and produced by it; all which are intirely owing to a Mixture of vegetable Substances that are distributed through it.

If, in the next Place, we enquire whether the Parts of Animals are contained also in the Air, we shall find there is a great Quantity of exhaling Spirits, and those wholly peculiar to every Animal, and distinguished among Physicians by the Name of the *perspirable Matter of Sanctorius*, that are continually diffused and carried into the Air from living Animals, and adhere to other Bodies; and by these Spirits it is that Dogs, which pursue by Scent, distinguish so accurately the Animals from which they exhale, and follow them over large Tracts of Land. And how full the Air is frequently of Effluvia, exhaling from Animals, appears evident from the Infection too often observable in contagious Distempers.

The Excrements continually discharged by every Kind of Animals, are also, in so short a time, dissipated and disappear, that we are hence convinced, that the whole Quantity of excrementitious Matter will be always dispersed into the Air, hardly leaving so much as the lightest Dust behind it. In the hotter Countries, the Dung of Animals, being exposed to the open Air, becomes perfectly volatile by the Heat of one single Day: And even in our own Country, which is not so hot, the very Dunghills are quickly consumed. And as for Urine, how quickly does that spontaneously become volatile, and exhale?

But there is something in this Affair still more remarkable: For does not an intire Whale, the largest of Animals, when in hot Weather it is by the Sea thrown dead upon the Shore, quick-

ly infect the Places, to a great Distance about it, with a pestiferous Stench? And is not the whole of it resolved into volatile infectious Particles, so that at last some whitish Bones only remain, all the rest of the entire Mass being rendered volatile, and dispersed in the Air? What vast Numbers of Carcasses of Elephants, Camels, Horses, and of almost all other Animals, as well as human Bodies, that are the Carnage of War, remain from time to time uninterr'd, and are resolved into Putrefaction, become volatile, and dissipate almost all their Elements into the Air? Hence, therefore, it follows, that Bodies of Animals are, from their own natural Disposition, as much intombed in the Air as in the Earth; and those very Bodies, likewise, which are buried in the Earth, are not then preyed upon by the Worms, but are soon converted into a very light volatile Matter, which afterwards easily exhales into the Air out of the Earth itself. All the corporeal Matter, therefore, that has ever entered into the Composition of the Bodies of living Creatures, has been carried up into the Air, with this Difference only, that if the Bodies were burnt, this was brought about immediately; if left to rot in the Fields, more slowly; and still in a longer time, if they were interred: But yet, even in every Case, they have in time exhaled away. What wonder, therefore, if, from the Air, there should be returned a Matter of the same Nature or Kind with the Food of the former Animals, which is capable of affording a proper Nourishment to the Bodies, that are by this Means to spring up afterwards?

But there is yet another Thing upon this Subject, which will be worth while to take under Consideration, as the right understanding of it will keep us clear of many Mistakes. I assert then, that the very Eggs, impregnated with the fruitful Offspring of their respective Animals, are carried into the Air. For the excellent Redi has demonstrated, that all Insects, without Exception, are generated by the Copulation of Male and Female. Leeuwenhoeck has proved, that the Seed of the Male lodges the first Embryo in the Egg of the Female. And Boyle has made it appear, that pregnant Eggs will not exclude their Young, except they are in the open and fresh Air. Being furnished, then, with these Observations, I purposely took a Piece of Flesh, which had been kept a pretty while in boiling Alcohol, and was afterwards rubbed over with some bright Oil of Turpentine, and fastening it to a long small Thread, hung it up in a moist warm Air, in a Place where it was imagined there were no Animalcula, and the Consequence was, that in a little time after the suspended Flesh was full of living Maggots, which were devouring whatever of the succulent Parts remained therein. In this Case, then, the Eggs, from which these Animalcula were produced, could not possibly come at the Flesh, unless they were conveyed to it by the Air, in which it was suspended. How much do the Husbandmen experience the Truth of this to their Detriment, when, in a warm Spring, certain Winds very suddenly infect the Trees with numberless Vermin, which in an Instant, as it were, are produced from their invisible Eggs? But give me Leave to mention one Thing farther, which is still more remarkable; and that is, the Rains that frequently happen among the Negroes, which strike a Man with such a sudden Chills, that it makes him shudder. These Rains fall in Drops, of an Inch Diameter, which, if they come upon the Skin, eat into it; but, if they lodge on any Garments, produce living Worms and Moths, *Act. Lips. Suppl. tom. i. p. 425.* Many other Things of this Kind might be here taken notice of; but these may suffice, to let the Chymists understand that the new and wonderful Animalcula, which are oftentimes produced in Bodies, and even, perhaps, while they are at work upon them, owe their Being intirely to little Eggs, which are thus sustained in the liquid Air, and not to the Efficacy of any chymical Substance or Operations. Let them, therefore, be always mindful of the Nature of the Air, and its wonderful Fecundity, before they deduce the Origin of such Appearances from any other Cause. But the Knowledge of these Things, at the same time, is not less necessary and advantageous to the Physician and Natural Philosopher.

Let us now proceed to Fossils; for Fossils are likewise discoverable in the Air. For all Fossil Salts, however fixed, at last fly off into the Air, if they are dissolved in Water (especially in that which they attract from the Air) and are afterwards digested for a long time in a putrefying Heat, and are then distilled with a great Degree of Fire, and have their fixed Residuum calcined with a strong open Fire, and are then dissolved in the Air again. This is a Truth which a great Chymist communicated to the World more than an hundred Years ago. Not to mention the Distillation of these Salts, with Sand, Bole, Brickdust, Potters and Tobacco-pipe Clay, performed with the intensest Heat. Do not the Chymists, every Year, convert, by this Method, many thousand Pounds Weight of such Salts into acid volatile Fumes, which they call Spirits? And does not every such chymical Operation infect the very Air? And does not this Air destroy the Bodies that are exposed to it? The single and simple Mixture of Oil of Vitriol, Oil of Alum, or of Oil of Sulphur by the Bell, with Nitre, Sea Salt, or Sal Gem, converts in an Instant those very fixed Salts into Fumes,

Fumes, so volatile that they can hardly be confined, with which the Air is in a short Time so strongly impregnated, as to carry those Salts to great Distances all around. But infinite are the Methods by which the same Thing is effected. Before the industrious Glauber's Time, indeed, this admirable Method of thus changing Salts was not discovered. But who will pretend to determine, how many Methods lie hid in Nature, even at this Day, by which the like Conversion from a fixed to a volatile Matter may be brought about? The Vapours about Mines, which are often so fatal, that no living Creature can breathe in them with Safety, sufficiently prove, that Nature herself thus disperses Salts through the Air, and consequently has secret Methods which we are not acquainted with, for performing the very same Operations. In the mean Time, however, it is true, that this happens only in certain Parts of the Earth, that is, in those Places where there is Plenty of such a Matter, and where likewise the Means are not wanting of acting upon it after this Manner. And it is likewise as certain a Truth, that even those saline Vapours are elevated only to a certain Height in the Air, and that not a very considerable one. And upon this Foundation it was, that the Adepts asserted long ago, that the Air was divided into certain distinct Strata or Beds, each of which contained a distinct Kind of Exhalation and Vapour. Hence, then, it is evident, that by the Means of Water, Heat, Digestion, Solution, Ex-ficcation, Distillation, Calcination, Combustion, Mixture, Union, and Separation, fossile fixed Salts are rendered volatile, and are thus intermixed with the Air.

The Principles of Fossils, which go by the Name of Sulphurs, whenever Fossils are burnt, are intirely carried up into the Air, and, being intermixed with it, disappear, the saline acid Part changing into a suffocating Fume, and the oleaginous Part being attenuated by the Action of Flame, and flying off in an invisible, or a sooty black Vapour. It is certain, that hardly any Thing at all of these Parts remains in the Earth. Sulphur now itself, when alone, is carried into the Air in Form of an impalpable Flour, and is there dispersed about. But, when it is mixed with other Bodies, it often acquires a surprising Volatility. The Chymists have taken Notice of a great many Methods, both natural and artificial, by which Sulphurs are so changed, that they fly off into the Atmosphere, and carry up other Things along with them. In Mines, from Time to Time, there appear pinguious, stinking, suffocating Fumes, often very troublesome to the Miners, to which, if the Flame of a lighted Candle is applied, they instantly take Fire, not without extreme Danger to the Workmen. But it is certain, that Arsenics, Orpiments, Cobalts, Sulphur of Antimony, Bismuth, Zinc, and other Bodies furnish the Matter of these Vapours. We are also informed of the Falling of a Shower of Brimstone, attended with Lightnings, which, when it was once on Fire, could neither be extinguished by Water nor Motion. *Nov. Literar. An. 1684. P. 63.*

Metals themselves have been found to be so far changed, that even these, under the Form of a volatile Fume, have been elevated and scattered in the Air. This is universally known to be true of Mercury, which, when agitated only by a Fire of six hundred Degrees, flies off, and becomes invisible. And, if the Air, impregnated with it, surrounds, and is applied to a human Body, how wonderfully does it penetrate it, and how quickly does it raise a Salivation! But besides, while it thus flies off, it carries up and bears away with it some Part of certain Metals; as appears from the Distillation of Lead and Tin with Mercury. Even Lead, Tin, Iron, and Copper, if they are disposed in a very strong Heat, at last disappear, by Means of the Volatility they acquire, and thus far are dissipated likewise into the Air. A great Part of imperfect Metals is carried off too by Lead in the Test. But when Cobalts, Arsenic, and the like rapacious Sulphurs, are intimately united with Gold and Silver Ore, the Particles of the Ore being by this Means rendered volatile, when they come to the Fire, these noble Metals are carried away to such a Degree, that, to the great Damage of the Owner, a good Part of them is lost; which, by a gentle Calcination, and the Addition of some fixing Powders, might be intirely preserved. Hence, therefore, it appears, what an Abundance of Gold and Silver may be raised up into the Air. Nothing seems a greater Paradox than volatile Gold, and yet, we are certain, from undeniable chymical Experiments, that, if you take common Sublimate of Mercury, and rub it well with Gold reduced to Powder, and then distil it in a Retort with Regulus of Antimony, the very Body of the Gold will ascend in Form of a red Oil, and become perfectly volatile. By Sulphur, also, calcined Vitriol, and Sal Ammoniac, mixed and applied properly, almost all Metals may be rendered volatile in the Fire. No Wonder then, that, in clear Weather, there very often appear about Mines sudden Fumes, which extinguish the Light of a Torch, (see *Boyle's Works*) since even the most dense Bodies may, in the Form of a Fume, be so carried into the Air, that it can hardly be determined what

Bodies they were. But there is another Cause, which is frequently concerned in impregnating the Air with these metallic Parts; and, that is, the Air itself as it abounds with Salts and Sulphurs. For, as I have already shewn above, that the whole Air is full of Salts and Sulphurs, and, as it appears from what I have now delivered, that those Salts and Sulphurs can carry aloft even Metals themselves, when they are dissolved, it is easy to apprehend, that the Air itself can by this Means cause the Parts of Metals to be suspended and float about in it. Are not Iron, Copper, and Lead, by the Contact and Motion of the Air, always, and that in a short Time too, turned into a Calx, Flour, and Dust? And are not they hence converted into Rust, Verdigrise, and a Ceruss? And it may be observed, that when, after these Changes, they are reduced to an impalpable Powder, they fly away, and are carried through the Air by the Wind. I confess, that Silver, Gold, and Tin are less subject to these Alterations, because the volatile Acids of Nitre and Sea-salt, which are the proper Dissolvents of these Metals, are hardly ever dispersed through the Air, except about the Laboratories of the Chymists. [*I believe this is a small Mistake, for the Air is certainly furnished, and that plentifully, with an acid Spirit, which, fixing it in a proper Matrix, gives the very Essence to Nitre.* See NITRUM.]

The Air in America, indeed, is of so corroding a Nature, that it consumes the Tiles of the Houses, stony Bodies, and almost all Metals; as the English unanimously agree of the Air of Bermudas; for even Metals themselves perish there very soon. And that surprising Phenomenon, which in all Ages has been observed by Miners, seems also to be owing to the Residence of these metallic Parts in the Air, I mean that the fossile Glebes, when they are dug out of the Earth, and are exposed to the Air, are affected by it in a very extraordinary Manner. How frequent is it seen, that Marchasites, the Pyrites, vitriolic Stones, and metallic Substances that are quite exhausted, are so acted upon by the Air, that they increase, come to Maturation, are changed, renewed, and afresh impregnated, and become again enriched with a true metallic Matter. In Fact, the Air seems to be the grand universal Distributer of the Seeds of Bodies, which, being plentifully stocked with every Kind of Matter, commits to the Earth the Elements of Bodies it had before received from it, and thus generates most Kinds of Bodies, rather by Means of a Revolution, than a new Production. It is certain, that Dew, being changed by Distillation, has yielded a Liquor, which stained Glass with the Colours of the Rainbow, penetrating so deeply in it, that it could neither be removed by Aqua fortis, Oil of Tartar, or a strong and long continued Friction; and yet, at the same Time, the Liquor itself was so subtle, that it burnt in the Fire like Alcohol: *Republic of Letters, T. 1. P. 590.* Certainly this Effect is very like that of a metallic Tincture upon Glass. *Philosophical Transactions abridged, T. 2. P. 143.*

Thus, then, the few Things I have specified are sufficient to instruct us in our chymical and medicinal Enquiries, what Ideas we ought to form of the Air. In Reality, it is to be considered as a true Chaos of all Things intermixed and compounded together; for in it the attenuated Particles of all Bodies whatsoever float. And, since these little Corpuscles are always in Motion, they may, by meeting in this aerial Space, produce all those surprising Operations of Nature, which are owing to the Efficacy of particular Bodies: But these are almost infinite. So that it is not at all to be wondered at, that there are produced and appear, in this Scene of the Atmosphere, such extraordinary, and frequently such terrible Events in Nature, as never happen any where else; I mean, the Meteors. In this Air there doubtless must be Bodies that are endued with a magnetic Virtue, which, by their mutual Attraction, Repulsion, Cohesion, Rarefaction, and, by infinite other Methods, must every where excite stupendous Phenomena. Of this the following Experiment may serve as an Illustration: Take in one Hand a small open glass Vial, in which there is an alkaline Spirit of Sal Ammoniac, and in the Left another, in which there is Spirit of Nitre. Whilst these Bottles are kept at a Distance from each other, nothing at all appears extraordinary; but, as soon as they are brought gradually so near each other, that the Vapours, issuing from the two Bottles, begin to meet with each other, there immediately appears a little Cloud, arising from the Concurrence of the Alkali and Acid in the Air. If an Amalgama, prepared with Tin and Mercury, is distilled in a Retort, with Spirit of Sea-salt, it yields a Liquor, which, if it be kept in a close Vessel, produces no Effect; and yet, if it is exposed to the open Air, though many Years after its Preparation, it immediately goes off in a very thick Smoke. But Nature is every where full of these Instances. We know not what other hidden Salts there may be besides in the Air, that we are not acquainted with, or with what Virtues they may be endued; nor are we less ignorant, what Spirits and Oils may float in it; though in the mean Time, from the particular Nature of those unknown Salts, Spirits, and Oils, such stupendous

Effects may be produced, as are never observed to proceed from any other Causes. If the distilled Oil of Sassafras happens to meet with Glauber's Spirit of Nitre; what a terrible Effect is produced in an Instant, an Effect hardly to be exhibited by any other Experiment! This Experiment will be given under the Article NITRUM.

If at any Time, now, a Number of Particles, endued with the like Properties, should happen to get into the Air, and these should be there mixed together, very strange and surprising Appearances must necessarily follow. Certain Times, it is evident, present to us with Phenomena, that are never seen at any other. To the Production, now, of these rare and very extraordinary Effects, it is possible, that the Comets, Meteors, various Aspects of the Planets, and, perhaps, the Influence of the Stars themselves, may contribute; those Actions may be very considerable, on Account of their Attraction, and Repulsion, of their Heat, Light, and Cold, and of the Effluvia which they generate and emit.

In Consequence of all the Things here mentioned, Air is of a quite different Nature in different Places; first, on Account of the Land or Soil, or the Part of the Earth which the Air under Consideration hangs over: For, according to the various Bodies with which the Earth abounds in any particular Part, the Exhalations and Vapours, that arise from it, will possess as various Qualities, and for this Reason the Air in that Part will be full of Corpuscles, that are not to be met with any where else. The Truth of this has always been confirmed by numberless Examples. And hence, in such particular Parts of the Air, certain Experiments may be made, that will never succeed in any other. In the second Place, a great Diversity is here observed, in Respect to the Soil, in different Places, according as Men inhabit it, and keep Animals there, and according as they dung and turn up the Ground, and exercise various Occupations there, and by this Means raise up almost all Kinds of Bodies into the Air: On which Account again, an infinite Number of Changes are observed to happen, which are not to be effected elsewhere. A certain Chymist, for Instance, in his Laboratory, where he was daily employed in the Distillation of large Quantities of Vinegar, exposed to the Air some pure, dry, alkaline Salts of Tartar on a glass Plate. The Air, of Consequence, being full of acid Vapours, dissolved the Salt into an Oil of Tartar *per deliquium*, and at the same Time so closely united the acid Parts of the volatile Vinegar with the Alkali of the Tartar, as at last to convert the saturated Mass into a Tartarus Regeneratus, or regenerated Tartar, which melted in the Fire like Wax, and yielded a very noble Remedy for resolving of viscid tenacious Humours, in almost all Diseases. He was mightily pleased therefore with this Production, for he thought he had now discovered the Secret of the Alchemists for incrating, according to the Language of those Artists, a fixed alkaline Salt: But when afterwards he attempted to repeat the Experiment in another Place, where there was not so great and constant a Quantity of Vinegar in the Air, he did not meet with the former Success. The same Thing might be farther made appear by a vast Number of Instances. Consider then, how prodigiously the Air may be changed in any particular Country, when a great Earthquake has occasioned Exhalations to arise there, very different from those which before usually arose in the same Place. And this is again confirmed by History, which informs us, that certain Parts of the Earth have become uninhabitable, by Reason of the abominably foetid Vapours, with which they have been infected, after Earthquakes. But again, Inundations by Rain, Overflowings of Rivers, and the Breaking in of the Sea, make such Alterations in the Atmosphere, by Means of humid Vapours, and Exhalations from putrefied Substances, that the whole Nature of the Air, in those Places, is intirely changed. The Winds also must always carry along with them something from the Places from whence they began to blow, and consequently are thus always varying the Contents of the Air, continually carrying off from particular Places the Matter peculiar to them, and supplying them again with what they just brought from some others. From which Cause, likewise, there must necessarily happen, in chymical Operations, a remarkable Diversity. And as for the Influences of the Heavens, particularly with Respect to the various Aspects of the Sun and Moon, their Accessions, Recessions, perpendicular or oblique Radiations, Conjunctions, and Oppositions, what Changes must these produce in the Air, by their Attraction, Repulsion, and the Heat and Cold that depend upon them? What Variation must they cause in the Vapours and Exhalations that are carried up from the Earth into the Air? But there is one Thing farther on this Subject, which ought to be taken-particular Notice of; and that is, the Vicissitude of the Seasons of the Year, which is here of such Efficacy, as is wholly incredible. Thus, if the Sun on the tenth of March, in a certain Altitude, and with a certain Degree of Heat, exerts its Power on the Earth, it then acts on a Body, which during the preceding Winter, being locked up by the Cold, has

kept in, and accumulated, under an icy Crust, its own proper Exhalations, and, at the same Time, has received and retained whatever it was furnished with by the Air. Hence, as soon as it begins to dissolve, and the Earth is resolved into a loose Mould, the first succeeding Heat of the Sun acts upon this fertile pregnant Body, and immediately fills the whole Air with Vapours; on which Account a vernal Heat hardly ever succeeds a Frost of long Continuance, but there presently follow Showers, Thunders and Lightnings, and a Sprightliness appears in all Animals and Vegetables, and in the whole Creation; but now, when, on the tenth of September, the Sun, at the same Altitude, and with the same Degree of Heat, acts upon the Earth, it then finds it parched up, and exhausted by the Heat of the preceding Summer, and not yet moistened with autumnal Showers; for which Reason, neither the same Heat in the Earth, or Air, will produce the same Effects, nor will excite this Vigour in Animals and Vegetables, as it does in the Spring. These few Things then will be sufficient to let us easily see the Variety there is in the Atmosphere, according to the Diversity of the Season of the Year, as far as it arises from this Cause; a Speculation very useful both in Chymistry and natural Philosophy. And, it is plain, the Chymists had some Knowledge of this long ago, when they attributed to the vernal Rain a Virtue so much superior to that of the autumnal, produced in the very same Degree of Heat; for they found that this Lixivium of the Air brought along with it very different Vapours and Exhalations, according to the Diversity of the Season, in the Manner just now explained.

Before we leave the Examination of the various Bodies that are contained in the Air, and of the different Powers which prevail in it, we must take under Consideration that Quality of it, which renders it salutary, and necessary to the Life of Animals and Vegetables; a Quality which has not been yet accounted for from any Property of the Air, but by a diligent Enquiry, however, we may possibly, hereafter, come at the Knowledge of it. Whether this latent Virtue of the Air is actually drawn out of it by Animals and Vegetables, and hence is in a short Time exhausted and consumed; and whether, when it does thus fail, the Animal dies, no-body is, I think, at present able to determine. This, however, is certain, that if a small Bird is put into a large Receiver, full of common cold Air, and the Receiver is then very closely stopped, the Bird will grow sick and vomit, within a Quarter of an Hour, and die in the Space of half an Hour after. Boyle, *Of the Air*, 184. A Fish, kept in Water in a Vessel well closed, without renewing the Air, dies in a short Time. Fish likewise die in Ponds, that are every where frozen, and quickly perish in Water out of which the Air is exhausted, *Hist. de l'Acad. Roy. des Scien.* 1699. 240. 1701. 46. and *Mem.* 224. Flame, and a red-hot Coal, quickly go out in Air that is close pent up. The little Eggs of any Insect whatever, being accurately stopped up in glass Vessels, do not produce their Young, though assisted by a kindly Warmth. The Seeds of Plants likewise duly moistened, and sowed in the best Earth in close Glasses, do not grow, or give any Signs of Life, though excited by a due Degree of Heat. On the other Hand, the upper Surface of Blood, that is exposed to the Air, is of a bright Scarlet Colour, whilst, in every other Part which the Air does not come at, it grows as black as the Blood of the Cuttle-fish; and yet, as soon as ever this black Part is laid open to the Air, the black Colour is immediately changed again into a Scarlet. All these Experiments then make it appear, that there is in the Air a certain hidden Virtue, which cannot be accounted for from all the Properties of the Air, which have been hitherto discovered. Sendivogius maintained it openly, that there lies hid in the Air the occult Food of Life, and other Chymists have asserted the same. But, what that is, or how it acts, or what is the proper Effect of it, is a Matter still in the Dark. Happy the Person that shall discover it! Thus far Boerhaave.

This vivifying Principle in the Air, so necessary to the Support of Flame and Fire, as well as animal and vegetable Life, seems by every Phenomenon to be the universal Acid distributed through the intire Atmosphere in a certain Proportion, inasmuch that no Portion of Air seems to be without it. This, though not perceivable by the Senses, is however very manifest by its Effects. It is this Acid that corrodes the baser Metals in a very short Space of Time, and even Gold and Silver are not intirely free from its Influence. By this Acid the Calx of Vitriol, of Alum, and the Earth from which Nitre has been procured, are again replenished in such a Manner, as to be capable of producing acid Spirits afresh. We may conclude, that Flesh, exposed to the Air for some Time, contracts a Redness from the Influence of this Acid, because Nitre has the very same Effect in producing the same Colour. Vegetable aromatic Oils also are changed by the Acid of the Air red, for, if a Vial is filled with certain aromatic Oils, and close stopped, it will preserve its original Transparency; but, if a Part of the very same Oil is inclosed in a Bottle not quite full, the small Portion of Acid, in the Air contained in the Vacancy, will

will change the Oil red, as Hoffman informs us. Hence there is Reason to suspect, that Flowers, which are all, more or less, furnished with an aromatic Oil, are obliged to the Acid of the Air for their beautiful Colours, which it strikes upon them variously, as the Oil, or Sulphur, which it meets with on the Petals determines it to one Colour or another; and the Chymists have long since discovered, that Sulphur, as they call Oil, is the Parent of Colours. It is remarkable that Scarlet-dyers cannot strike their Colours without the Assistance of an Acid. Hence the Phenomenon of the Surface of Blood, when exposed to Air contracting a Redness, may be in some Measure accounted for. And indeed, all those concerned in the Business of Dying observe, that a cloudy moist Air very much interferes with the Beauty and Vividness of their Colours; and that, on the Contrary, a serene Sky exalts them, and makes them more elegant. Now it is known, that in this State of the Air an Acid abounds much more than when the Weather is cloudy, and full of Vapours. Flowers are also liable to the same Influence of the Air in different States, for their Colours are never so much exalted as when the Air is serene and clear, that is, when it abounds with an Acid.

Every body, concerned in Medicine, knows, that all antimonial Preparations will contract an emetic Quality from Acids, and it is also certain, that the same Medicines will prove emetic, if they are exposed to the naked Air; hence it is very probable that an Acid is communicated to them from the Air.

Nitre also borrows its Acid intirely from the Air. See NITRUM.

Upon the Whole, I am convinced, that the Acid of the Air finds some Way of mixing with the Blood of Animals, though I cannot determine the specific Manner in which this Union is accomplished. But I am inclined to believe, that this grand Operation is performed in the Lungs, because Air is insufficient for the Purposes of Respiration after repeated Inspirations, unless a free Intercourse is maintained with the external Air. Hence it should appear, that something contained in the Air is wasted, of which it stands in Need of a fresh Supply, in order to render it capable of maintaining Life. Now if we consider, that the Blood most certainly acquires a red Colour in the Lungs, and at the same Time, if we reflect on what was observed before, with Respect to the Power of Acids, in producing this Colour, when mixed with Sulphurs, it will be a Step, at least, to the Confirmation of this Sentiment. Add to this, that Asthmas, which prevent the Air from being taken regularly into the Lungs, are productive of Dropsies, the Blood loses its Colour as well as Texture, and becomes pale and watery. Girls also, in a Chlorosis, have a temporary Asthma, and hence, perhaps, their Blood is always pale and thin, sometimes even as white as Milk or Chyle.

I know that I am singular in this Sentiment, as the Modes of Philosophy now stand, and that Boerhaave, for whose Judgment I have the greatest Deference, is of the contrary Opinion. But I see no Reason, why so exceeding subtle and penetrating a Body as this Acid of the Air may not as well enter the Pores of the Vessels of the Lungs, during Inspiration, as a more gross and even visible Halitus, or Vapour, exhale thro' the same Pores in Expiration. We know the Particles which constitute the Blood are large enough to be visible in Microscopes, but those which compose the aerial Acid are so extremely minute, as not to be discoverable to the Sight, by any Art whatever. Hence then it appears very plain, that Vessels may admit the Acid above-mentioned, from without, and yet easily retain the Blood circulating within.]

From this Account of the Air, its Properties, and Contents, many curious Appearances, relating to the animal Œconomy, may be understood.

First then, Air, as a fluid Body, is the Vehicle of the Effluvia of all odorous Bodies to the Organs of Smelling, and, as a ponderous Fluid, it presses them on the Nerves of these Organs with a Force sufficient to make them sensible. It also impresses sapid Substances upon the Organs of Taste, and renders them observable by the Senses. It is also the Instrument of Sound, for the Undulations caused in it, by Bodies moved in various Manners, strike upon the external Ear, which, by a singular Mechanism, communicates this Notice to the Nerves expanded upon the internal Ear. This Weight of the Air too, by pressing upon the Surface of Animals and Vegetables, prevents a Rupture of their Vessels, from the Force necessary to circulate their Juices, to which it is, as it were, a Counterbalance. All these Things are evident, because on the Tops of high Mountains, where the Air is very rare, the Senses of Smelling, Tasting, and Hearing, are very languid; it is said, that on the Pico of Teneriffe, Pepper, Ginger, Salt, and Spirits have no sensible Taste, and that nothing affects the Organs of Taste, except Canary Wine, which, it is supposed to do in these Circumstances, by Reason of its Oiliness, which makes it adhere to the Nerves of the Palate. On the Tops of Mountains also the Blood-vessels are very subject to burst, whence frequent Hæmorrhages happen to those who travel to their Summits.

The Air also, in Virtue of its Elasticity, contributes greatly to the Solution of the Aliment in the Stomachs of Animals. For, when that which is contained in every Part of the Food is rarefied and expanded by the Heat it meets with in the Stomach, it destroys the Cohesion of the component Particles, and assists in reducing it to a State of Fluidity. At the same Time, as it is confined in the Stomach, all its Action must be determined to the Aliment, which it must therefore act upon with great Force, in this rarefied State.

Respiration, so necessary to the Continuance of animal Life, is performed by Means of the Air. For, when the Air is expelled out of the Lungs, the pulmonary Vessels through which the Blood circulates, from the right Ventricle of the Heart, and by which it is returned to the left Auricle, collapse, and are no longer pervious, till the Air, rushing into the Branches of the Aspera Arteria upon the Elevation of the Breast, distends the Lungs, and thereby opens not only the Air-vessels, but also the Branches of the pulmonary Vein and Artery, which accompany, every where, those of the Aspera Arteria. Here the Air, as a heavy Fluid, acts upon, compresses, and comminutes the Blood, and, as it is elastic and dilatable by Heat, the Action of it upon the Blood in the Lungs is by this Property rendered greater. If also, as I have supposed, the aerial Acid, or vital Spirit, is communicated to the Blood in the Lungs, from the Air, some Effects of great Importance to the animal Œconomy must necessarily arise from hence.

And, indeed, if we consider the Air in all Lights, we shall find, that every Alteration it undergoes, must induce some great Change on the animal Machine, if I may so call an animal Body. Thus, when it is very heavy, it must press upon the Surface of our Bodies, and the internal Parts of the Lungs, with a greater Force than when it is light. It has been proved by curious Observers, that the Difference of Weight, with which our Bodies are pressed, by the Atmosphere, in the greatest Degree of its natural Gravity, from that which we sustain when it is the lightest, amounts to 3982½ Troy Weight. Now, as this Difference is very great, the Effects of it must also be considerable.

The different Degrees also of Heat and Elasticity in the Air must have Effects proportioned to the Causes upon the Bodies of Animals. The various Contents also of the Air must of Course induce great Changes, as it some Way or other finds Means to communicate the Qualities it borrows from them to the Blood and Juices of Animals. Hence it becomes the Vehicle of Contagion, and the Propagator of Diseases, both epidemical, and endemial, which admit of infinite Variety, because the Alterations of the Air, with Respect to its Properties, and to the innumerable Combinations of Bodies contained in it, are infinite.

However, we may venture to conclude, that the most healthful is that which is serene and dry, and consequently ponderous, and replete with the acid vital Spirit. A gravelly Soil is most likely to be furnished with such an Air, because from such a one few or no oily Particles can exhale to infect it. Countries also, where there is a Variety of Hills and Vallies, with swift Rivulets of Water running through them, are productive of a good Air, because such Situations cause a Circulation of the Air, and such Currents of Water always produce one in the Atmosphere.

I must not dismiss the Subject of the Air, without taking Notice of a great Error, which many inconsiderately run into with Respect to Exercise; it is, that they esteem Motion only conducive to Health, and this Sydenham seems to give into, when he attributes the Advantages of Riding to repeated Succussion. However, we find by Experience that the same Degrees of Motion or Succussion by Exercise in a House, or under Covert, come far short in Point of Efficacy in curing Diseases, and preserving Health, of that performed in the fresh Air, especially when it is pure, and not abounding with Vapours and Exhalations. The Reason of this is very plain, for, when an Animal is moving forwards, he is perpetually respiring Air, which has not, by repeated Inspirations, been robbed of the vital Principle, be that what it will, so necessary to the Support of Life, and Preservation of Health. Hence, Sailing even upon calm Rivers, an Exercise much recommended by the Antients in the most obstinate Distempers, though attended with a very small Degree of Succussion, is nevertheless efficacious, by Reason of a perpetual Change of Air.

Vitruvius, sensible of the Efficacy of the Air in preserving or destroying Health, lays down the following Rules for chusing a proper Situation for a new City, which ought to be regarded in every new Settlement, and should not be neglected even in building a Farm-house. His Philosophy, however, is not always the best; but the Reasons for his Rules will appear by the preceding Pages, inasmuch that the Reader will not be at a Loss to account for what he asserts.

In erecting Walls we are to proceed on these Principles: First, a healthy Situation is to be chosen; such a one must be raised above the Annoyance of Fogs or cold Dews, and must regard,

regard, or face, not the cold or hot, but the temperate Quarters of the Heavens. Our next Care must be to avoid the Neighbourhood of a Marsh; for in such a Situation the gross Vapours exhaling with the rising Sun, and condensed into a Fog, together with the poisonous Spirits of the Animals inhabiting the Fens, are wafted with the Morning Breeze to your new City, and disperse their unwholesome Blasts on the Inhabitants, so as to cause a Pestilence. If your Walls run along by the Sea, facing the South or West, the Place will not be healthy. For, in the first Case, the Southern Air is heated by the rising, and burns with the meridian Sun; and in the latter Situation, it is warmed by the rising, heated by the meridian, and burns with the declining Sun; so that the Inhabitants suffer very much in their Bodies by these great Vicissitudes of Heat and Cold. We are taught this Reflection even from inanimate Things. In your close Wine-cellars, none opens a Light to the South or West, but always to the North, because that Quarter is subject to no Changes from any Season, but remains for ever firm and immutable. From the same Cause the Granaries, which any Ways face the Course of the Sun, are soon corrupted; and Provisions, or Apples, laid in a Place that is not turned from the Sun, will not keep long. For Heat, by perpetually rarefying, destroys the Firmness of the Air, and, by continued Attacks of fervid Vapours, draws forth its natural Powers, and dissolves, or softens and enfeebles them by its quick and penetrating Quality. We perceive the Effects of Heat on Iron, which, though hard by Nature, yet, when thoroughly heated at the Forge, becomes so soft and ductile, as to be capable of all Manner of Forms. Let the same Iron, when soft and sparkling red, be refrigerated, by dipping it in cold Water, it shall revert to its former Nature, and resume its original Hardness. This will be further illustrated, if we consider, that in the Summer all Bodies, as well in healthy as unhealthy Regions, grow weak with Heat; but, in Winter, the most pestilential Countries become healthy, because Bodies are at that Season consolidated and strengthened by Refrigerations. For the same Reason, Bodies, removed out of cold into hot Regions, cannot endure the Heat, but are dissolved; whereas, on the contrary, transported from a hot Climate to the cold Northern Countries, they are so far from being injured by the Change of Place, that they are strengthened and hardened by it.

It appears from these Considerations, that, when we would raise our Walls, we are to appoint them a Situation proper to guard against those Regions, whence hot and unwholesome Blasts may proceed, and scatter their baleful Influence over the Bodies of Men. For, all Bodies are constituted of Elements, which the Greeks call *συνχρημα*, namely, Heat, Moisture, Earth, and Air; of a due Mixture of these Elements, according to the Order of Nature, are all the Animals of the World, with their specific Properties, composed and tempered. Hence, where Heat is the predominant Principle, it destroys the rest, and dissolves that Body by its Fervor. And this is the ill Effect of an hot Blast from certain Quarters, which, being received into the open Pores, overpowers the other Principles, and proves too hard for the Constitution. In like Manner, if Moisture fills the Veins, and overflows the Body, and by that Means destroys the Equilibrium, the other Principles are corrupted by the redundant Liquid, and all the Virtues and Powers of that Composition are dissolved and washed away. Bodies are also sometimes injured by Refrigerations of Moisture from fresh and cooling Gales. No less do the other two Elements that enter the Composition of the natural Body, which are Earth and Air, by their Excess or Defect, weaken and subvert the rest; the Earth, for Instance, by oppressing Nature with Plenitude of Food, and the Air by an overcast and gloomy Sky.

But, for the more evident Demonstration of these Things to the Senses, we need only watch the Steps, and observe the Operations of Nature, in Birds, Fishes, and terrestrial Animals, by which Means their different Temperature will come under Consideration. For the Kind of Birds are of one Composition; the Fishes of another, and terrestrial Animals of a third, widely different from them both. Birds have less of Earth and Moisture, but much of a temperate Heat and Air; so that, being constituted of lighter Elements, they may the more easily make their Way in the Air. Fishes, whose Nature requires Water for Existence and Motion, are temperate as to Heat, and chiefly composed of Earth and Air, but have very little Moisture, the less of which Principle they have in their Composition, the better qualified they are to subsist in it. Hence, when they are cast on Land, they lose their Lives with their Water. In terrestrial Animals, the Elements of Air and Heat are clogged with Earth and Moisture, so that, because the humid Parts abound in them, they cannot live long in Water.

Now if the Case be thus as we have represented it, and that we are convinced by our Senses, that the Bodies of Animals are constituted of these Elements, or Principles, and labour under Excesses and Defects of these Constituents, and are subject to Dissolution, we cannot doubt of the Importance of

our chusing and making the best Advantage of the most temperate Quarters of the Heavens, when we propose to ourselves an healthy Situation of the Walls we are about to erect. And here I cannot help wishing again and again, for the Custom of the Antients. Our Forefathers used to examine the Livers of the Cattle they offered in Sacrifice in those Places where they built a Town, or pitched their Camp; and if the first were livid, or corrupt, they offered others, because they doubted whether the Defect were owing to some Distemper, or to the Badness of their Food. After they had proved, by many Experiments, the Goodness of the Water and Forage, from the Soundness and Solidity of the Livers, there they erected Fortifications, and projected Settlements. But, if the Livers were found defective, they concluded, that the same Food and Water would work a like Effect on human Bodies, and so occasion a Pestilence. Therefore they speedily decamped, and went in Search of better Air and Diet, preferring Health above all Things.

That we are beholden to the Soil for the Goodness and Wholesomeness of Provisions, both for Man and Beast, is demonstrable from the Lands of the Cretans, which lie along the River Pothereus, between the two Cities Gnosos and Cortyna. Sheep and black Cattle graze to the Right and Left of the said River; but those which feed next to Gnosos are not without a Spleen; on the other Side, those next to Cortyna have no Appearance of any. Whence Physicians, inquiring into the Cause of this Phenomenon, discovered an Herb, which the Cattle had eaten, and by its Virtue washed away their Spleen. They gathered this Herb, and from that Time made Use of it to very good Purpose, in Disorders of the Spleen; for which Reason the Cretans gave it the Name of *Αντισπλην*. This Example shews us, that the natural Wholesomeness or Unwholesomeness of a Place may be known from the Food and Water it affords.

If the Walls be erected in a Marsh, which lies along by the Sea, and facing the North, or between the North and the East, and those Marshes be higher than the Sea-shore, there seems to be Reason for chusing such a Situation; for by digging Canals an Outlet may be made for the Waters to the Shore, and, at every tempestuous Swelling of the Sea, the salt Waters, overflowing and mixing with those of the Marsh, will hinder the Generation of those noxious Animals that breed in standing Lakes and Marshes, and such as swim from higher Grounds towards the Shore are killed by the Saltness of the Waters, to which they are not accustomed. We have Instances to this Purpose in the Cities of Altinum, Ravenna, and Aquileia, and other Towns situated by the Marshes of Gallia, which, by the Means aforesaid, are very healthy Places. But a Town seated by a Marsh or Lake of standing Waters, that have no Outlet either by Canals or by Means of a River running through them, must of Necessity suffer in Point of Health, for such Waters putrefy by Standing, and send forth noisome and pestilential Exhalations. For Example, the old Town of Salapia which was built by Diomedes, in his Return from Troy, or, as others write, by Elphias the Rhodian, had the Misfortune of such a Situation. The Inhabitants, being yearly visited with an epidemical Sickness, addressed themselves by public Petition to M. Hostilius, and intreated him to survey and chuse for them a commodious Place, whither they might transfer their Habitations. He immediately undertook the Affair, and, having first well examined the Nature and Reason of his Undertaking, purchased a Tract of Land near the Sea, in a healthy Place, and then preferred a Petition to the Senate and People of Rome, that the Salapians might have Leave granted them to remove their Habitations, and build a new City. This obtained, he erected Walls, plotted out the Ground, and allotted to every Freeman his Possession in Fee-simple, paying only a single Sestertius [a Piece of Silver worth about Two-pence]. Matters thus settled, he opened a Way for the Lake to discharge itself into the Sea, and, in so doing, made of the Lake a Port to the new City. And thus are the Salapians, by a Remove of four Miles from their old Town, now established in a healthy Situation. *Vitruvius, L. 1. C. 4.*

I shall add to this Account of Air the Sentiments of the famous de Villa Nova, which are in the general extremely just, and from which many excellent Hints have been taken by Boerhaave, in the foregoing Treatise on this Subject. Some small Allowances must be made on Account of the Time in which the Author wrote.

A clear, subtle, and pure Air clarifies, subtilises, and refines the Blood and Spirits. Of Consequence, therefore, it makes the Heart glad, the Mind serene, the Body lightsome, and accelerates Digestion throughout all the Members. On the contrary, a cloudy, gross, and turbulent Air darkens the Heart, disturbs the Mind, makes the Body heavy, and retards and hinders Digestion, so that the Superfluities, at least such as are fuliginous and vaporous, cannot soon be resolved by the Body. The Air is influenced from external Causes, as from the Stars, from Minerals, Plants, and Animals, or other insensible Powers, which most effectually alter the Body; so that at some

some Seasons and Places it becomes poisonous and pestilential; at others so pure and salutary, and, as it were, theriacal, that no Venom can there find Place to hurt the Body, or but very little, as in Ireland, and the adjacent Islands, in some of which, even dead Bodies, exposed to the Air, will not corrupt. And so remarkable are the Effects of the Air upon human Bodies, at some Seasons, as to attemper and illuminate the Brain and Spirits to such a Degree, that they are elevated, in an extraordinary Manner, to the Contemplation of occult Intelligences, and the Speculation of Futurities, and to an expedite Performance of all the Acts of Reason. At other Times, on the Contrary, such Disturbances in the human Frame are wrought by the Air, that Reason receives infinite Damage thereby, and is either totally lost or suspended. The accidental Effects of Air are innumerable, according to the various Dispositions of the Body in the different Stages of Life: As, for Instance, a cold Air comforts the digestive Faculty, and corroborates the Body, where the Viscera abound with Spirits, by compressing and repelling the natural Heat inwards; a warm Air, by its contrary Operation in drawing it outwards, has a contrary Effect. A Physician, therefore, ought to know the Causes of the Changes that are wrought in the Air. It is altered by the Influence of celestial and elementary Bodies. By the first it undergoes a Multiplicity of Changes, the most obvious of which are those made by the Sun in the four Seasons of the Year, and the Moon in her four Quarters. The common and natural Disposition of the Air in these four Seasons is best observed in the Middle of each; for in their Extremities they coincide with one another. In the Spring, for Instance, according to the common Course of the Sun, the Air is temperate as to the four Qualities [Heat, Cold, Dryness, Moisture] and therefore it is called a temperate Season. Such a one it must be, which maintains the Body in a middle Disposition, not altering it by any manifest Quality, neither causing it to sweat or burn with Heat, nor shake, shiver, or shrink with Cold; neither hardening, withering, furrowing, or wrinkling it with Dryness, nor softening, benumbing, or loading it with Rheumatisms by excessive Moisture. The Predominancy of Heat and Dryness is most evident about the Middle of Summer, especially while the Sun passes through Leo, and is in Conjunction with the Dog-star. In the Middle of Autumn, the Air is moderately cold, and manifestly inclined to Dryness; in the Middle of Winter cold and moist. But in these very Seasons the Air is liable to Alterations from its usual Disposition from accidental Causes. In the four Quarters of the Moon, the Changes of the Air are most evident in the Intention and Remission of Coldness and Moisture.

The Changes, caused in the Air by elementary Bodies, are either made by Fire actually working on inferior Subjects, from Water, Earth, or their Contents, or from Vapours resolved and exhaling [which are Effluvia or Exhalations] from them.

Fire heats and dries, and sometimes overcasts it with Smoke; now, if the Air of an Habitation, where are several Ovens, or Furnaces, and great Fires often made, should be naturally warm and dry, it will be excessive in those Qualities, when the Fires are kindled. But, if the Air naturally incline to the opposite Qualities, it will be purified, and the Excess of Cold and Moisture corrected.

Waters of themselves cool and moisten the neighbouring Air, and fresh Waters more than those which are salt. But from the Refulgency [Reflection] of the Sun's Rays that strike upon them, they double both the Heat and Luminousness of the Air; for, whenever the Sea, or a great Body of Waters, lies between the Sun, especially when it is in the Meridian, and an Habitation, the House is the hotter, and the Air so luminous, that, in a Summer's Noon, the Inhabitants, especially those who have tender Eyes, have no Use of their Sight.

The Earth influences the Air by its Qualities and Situation; first, by its Qualities, for, if it be a fat clayey Soil, it renders the Air moist and thick; if dry and sandy, it makes a dry and dusty Air; but dry and stony a dry and pure Air. The Situation of a Portion of Earth is fourfold; on a Hill, on its Declivity, in a Valley, or in an open Champagne. The Air on the Top of Hills, compared with that of the circumjacent lower Regions, is very thin, free from Vapours, and cold. In Vallies, surrounded by Hills, the Air must be gross and impure, and hot; compared with that on the Hills, because of the Reflection of the Rays, especially in Summer. But in the Winter, if the Mountains be extraordinary high, the Air is coldest in the Valley, because it is overshadowed. The Air on the Declivity of Hills is of a middle Substance, and moderately pure, unless it be accidentally influenced, as by Vapours ascending thither from some neighbouring Marsh, and reflected by the Tops of the Hills, by which Means the Air is considerably thickened, so as to be sometimes warmer, sometimes colder than on the Top, sometimes it is of a middle Quality; for, if the Declivity lies to the North, it is coldest when shadowed by the Top; if to the South, it is the warmer

for reflecting the Noon-tide Rays, and being sheltered from Northern Blasts. If the Declivity faces the East or West, it will be hot or cold in a moderate Degree. An open Champagne, or Field, lies out of the Reach of any Shadow from Hills, but receives the whole Benefit of the Sun's Course. The Air in such a Situation is moderate in all its Dispositions.

The Contents of the Earth and Waters cause Alterations in the Air, but those of the Waters more seldom. For the Contents of Waters in constant Agitation, as is the Sea, make no sensible Change of the Air; but standing Waters, like the Carcasses of Animals, or rotten Plants, infect it with their hurtful Qualities. But the Things, contained in the Earth, very often influence the Air; some of these are natural, others artificial. Of the Natural, some are Minerals, some Plants, and some are Superfluities generated from Animals.

Minerals operate according to their natural Properties. Thus Mines of Sulphur and Arsenic heat and dry the Air; Marchasites and Antimony cool and dry it; and so of the rest. Mines of theriacal Stone, such as those which the Arabians call Bezabar, make a theriacal Air, opposite to all Poisons.

Plants alter the Air, by their Quantity and Quality. In Quantity; for high Trees, especially if they stand thick, as in Woods, obumbrate the Air, and hinder its Ventilation, whence it grows thick and heavy, therefore a House situated within a Thicket of Trees is no healthy Habitation. If a Wood lie on the North-side of your Mansion, it defends it from the cold Winds that blow from that Part; if to the South, it moderates the sultry Heat of Summer. Plants influence the Air also by their Qualities. The Aromatics temper it with their aromatic Sweetness and Purity, and the foetid ones, with their noisome and disagreeable Effluvia, and so of other Qualities. Hence the Brain and Spirits are much damped and clouded by sitting under a Tree of a sharp and bitter Taste, as the Fig-tree, the Walnut, and Pomegranate-trees, but especially a Tree of a rank or foetid Smell, as the Elder: The same is to be said with Respect to the Cuttings of Plants that are strewed in Houses.

The Superfluities, generated of Animals, are either such as proceed from them while alive, or their Remains after Death. Among the first only the Excrement evidently causes an Alteration. All Excrements heat the Air, and some dry it, as does that of a Dove; others, as that of a Cow or Hog, thicken and moisten it; only Man's communicate to it a foetid Quality. Dead Carcasses manifestly change the Air by their Putrefaction.

The Things resolved [that fly off] from the Earth, and the Water, and their Contents, are Vapours: That the Particles resolved [Effluvia] from the Contents of the Earth and Sea, cause an Alteration, is evident from what has been said; and indeed they have so great an Influence as to corrupt its Substance, and render it pestilential, and inclined, by its poisonous Qualities, to vitiate and putrefy the Blood and Spirits in the Heart and Arteries, especially in such as are infirm or predisposed to Putrefaction. Such are Vapours from dead Carcasses and Intestines of Animals, and Multitudes of Sick in great Armies, especially in a hot, close, still Air. The Vapours which exhale from Water infrigidate and moisten the Air, and if very dense, as in a Mist, render it gross and inactive.

Vapours that fly off from the Earth cause a manifest Change in the Air, as well as the Winds. Of these there are four principal ones, according to the four Cardinal Points, and all of them by Nature dry. But passing over Seas, or very watery Regions, drive the humid Vapours before them into remote Countries: Whence the South-wind brings Rains, and a moist Air; to those who live North of the Mediterranean Sea, but Heat and dry Weather to those who live to the South of that Sea. The North-wind is the Reverse of the other; and the same Judgment is to be formed of the East and West-winds, which are moist in one Country and dry in another, for the above-mentioned Reason. But the South-wind is hot in itself, and the North-wind cold; the rest are temperate. Yet all of them, in passing over the intervening Regions, may acquire accidental Qualities; for Instance, Cold in their Passage over black and snowy Countries, or Heat in blowing over burning Sands and Deserts. But their Impression is most felt, when they blow through the Straits of Mountains into narrow Vallies.

Air may also be changed artificially by human Industry; as, in Mansions, according to Matter, Form, Situation, Quantity, and Residence. As to the first of these Particulars: A House built all of Stone, or Earth, or Bricks and Mortar, makes the circumjacent Air cold, but one erected with Wood, and thatched with Straw, heats the Air, or if the Floor of the House be paved with Stone, or Brick, the Air will be the purer but much the colder; but an earthen Floor renders the Air dusty and offensive to the Lungs.

Secondly, the Form, as well as the Matter, or Materials of a House, influences the Air, as in the Abundance or Defects of Spiracula, that is, Windows and Chimnies; for the Multitude of these ventilates and purifies the Air, though it renders it less still and quiet. Windows towards the North cool the House,

as those towards the South warm it; those towards the East and West are indifferent. If a House want Spiracles, like a Shell, or have them stopped, the Air becomes gross and impure, and difficult to breathe. If it be very much frequented, it is soon heated, and grows sultry, as in Stoves, and where sick Persons are lodged, in which Places, from Nastiness and Putrefaction of Humours, it is soon corrupted. Whence it follows, that under Tents and Pavilions, erected in the open Field, the Air is purer and freer, for it vents itself every Way through the thin Cloth. But it is not safe, for all that, to lodge in the open Air, because of its sudden Alterations, and the perpendicular Incidence of the celestial Rays, which have the greatest Force. Therefore the Pavilions, which are covered with good thick Leather from the Top to the Middle, are most commodious to sleep in.

In the third Place, a House may be situated on the Superficies of the Earth, or below it. On the Superficies the Earth is certainly purer and finer; a subterraneous Room has a thick and impure Air, very cold in Summer, and hot and smoaky in the Winter, and disposing to Rheumatisms, at all Seasons.

In the fourth Place, the Quantity of an House may be considered with Respect to the Whole, or the Parts. A large and lofty Mansion has the purest and always the coldest Air, the Opposite to this, the warmer Air, but less pure. That which has the thickest Walls, and is covered most towards the South, is the colder, but if its thickest Walls and closest Covert stand towards the North, it is so much the warmer. If the Fences be thin on both Sides the Impressions from either of these Qualities, Heat or Cold are the more easily felt.

Fifthly, if the House be constantly inhabited, the Air in the same will be warmer, and purer, and also drier, for it is warmed and purified by the Heat of the Body, and by Fire; but, if it remains long without any Inhabitants, the Air grows cold and moist, and is corrupted, especially if it be close pent in, subterraneous, want Vent-holes, or the Space under Cover contain many Ditches and Caverns. *Arnaldus de Villa Nova*.

I cannot omit inserting in this Place the celebrated Treatise of Hippocrates, *περί αἰσῶς, ὑδατός, τόπου*, because the preceding Pages will assist us in accounting for, and explaining many important Assertions of its admirable Author, besides that if I have made it intelligible in our own Language, it will afford many agreeable Speculations.

HIPPOCRATES of AIR, WATERS, and SITUATIONS.

Whoever has an Inclination to pursue a right Method in his medicinal Enquiries, should observe this Order: First, he should study the Seasons of the Year, and learn, what Effects each of them is capable of producing; for they are in no Respect alike, but differ exceedingly, both in Regard to each other, and to the various Changes, which happen in each respective Season. Next the Winds should be regarded, the hot as well as the cold; principally those which are common to all the World, and afterwards those by which particular Regions are chiefly affected. The Qualities of Water should also be considered, because each of these differ not less in their Effects than in Taste and Gravity.

Upon these Accounts, when a Physician arrives at a City, with which he is not acquainted, he should inform himself well of the Situation, learn what Winds principally affect it, and remark how it lies with Respect to the rising Sun; for the Influences of a North or South-wind, the Morning or Evening-sun, upon the Place, cannot be alike. These Circumstances therefore must be diligently considered; nor must the Water pass unregarded, for it is of Importance to know whether the Place is supplied with soft Water from Lakes, or by Currents from Hills or Rocks, with that which is hard; as also whether the Water is salt, heavy, and difficult to boil, or the Contrary.

It should also be considered, whether the Country be naked and dry, or covered with Woods and damp; and whether it be a Valley, and for that Reason subject to suffocating Heats, or elevated, and consequently cool. Observe, moreover, the Diet to which the Inhabitants are in general addicted; whether they indulge themselves in Excesses of Eating, Drinking, and Inactivity; whether, on the Contrary, they are inured to much Exercise and Labour; or, lastly, whether their Intemperance consists more in Eating than in Drinking. For from these Circumstances we are to form a Judgment of their Diseases, and of the Things best adapted to relieve them; insomuch that a Physician, perfectly well acquainted with all these Particulars, or, at least, the greatest Part of them, when he arrives at a City to which he was an utter Stranger, cannot be ignorant of the endemial Distempers of the Country, or the Nature of the Inhabitants; and hence the Investigation of sure and infallible Methods of Cure will not be difficult, which without this previous Knowledge would be less easy. Besides, he will be able to foresee, whether particular Seasons,

or the Year in general, will be sickly, or healthful, and to foretell what epidemical Distempers will prevail, either in the Summer, or in the Winter; and also what Kinds of Diseases particular Persons will be in Danger of incurring, from an Alteration in their Diet. [*I suppose the Author means that Alteration of Diet, which the Seasons necessarily induce.*] Thus being acquainted with the Seasons, and the Risings and Settings of the Stars, as they happen in Order, he may know what Sort of Year is likely to ensue; and these Enquiries into the Nature of the Seasons will enable him to form a right Judgment of particular Cases which occur, will contribute to make him successful in Practice, and to preserve him, as much as is possible, from Error.

If any one should disregard these Things, as barren meteorological Speculations, he may readily learn, if his Obstinacy does not interfere, that Astronomy is of no small Importance to Medicine, because the Changes of the Seasons constantly induce an Alteration in the digestive Organs of Men. But in what Manner the above-mentioned Particulars should be considered and explored, I shall proceed to specify.

Whatever City is exposed to and frequently affected by the hot Winds, which are those that blow from betwixt the Rising and Setting of the Winter-sun, but is sheltered from the North-winds, is plentifully furnished with Water of a saltish Taste, and which is not very subject to evaporate, being also hot in Summer, and cold in the Winter. *

Cities which enjoy a better Exposure in Regard to the Sun and Winds, and which use good Waters, are less sensible of the following Changes; but Cities which are obliged to make Use of stagnating and marshy Waters, and which have a worse Situation with Respect to the Sun, and Winds, are yet more subject to the Influences of the Alterations in the Seasons.

If the Summer is dry, Diseases are of shorter Duration, but if rainy, they continue longer; on this Occasion also, Ulcers are very inclinable to grow phagedenic from slight Causes.

If the Winter is cold, Men are subject to Rheums in their Heads, and to Diarrhoeas, caused by Phlegm falling from the Head upon the Intestines. They also seem relaxed, and neither eat with Appetite, nor drink plentifully; which last is not to be wondered at, because weak Heads are not likely to bear much Drinking, and besides are considerably affected by a Debauch.

The reigning Diseases are as follows: First, the Women are unhealthy and subject to Rheums, and many are unfertile, not on Account of any natural Infirmary, but for Want of Health; and are subject to frequent Miscarriages. The Children are often afflicted with Convulsions, and Asthmas, which are esteemed productive of the Epilepsy, a Disorder frequent among Children. The Men are affected with Dysenteries, Diarrhoeas, Fevers, attended with perpetual Shiverings, obstinate, wintery Fevers, frequent Eruptions, and the Piles. But Pleurifies, Peripneumonies, burning Fevers, and those Distempers, which generally go by the Name of Acute, are seldom heard of; and indeed it is not likely they should, when the Habit is so inclined to be laxative. Besides these, moist Inflammations of the Eyes, which are slight, and of no long Duration, are common, unless some general Distemper rages epidemically, on Account of Alterations in the Season. Men above sixty, being subject to Defluxions from the Brain are infested with Palsies, especially if they expose their Heads suddenly to the Sun, or to the Cold. These are the Diseases to which such a Southern Situation is principally subject, unless some epidemical Distemper from the Change of Seasons prevails, of which the ordinary Diseases participate.

Cities which have an Aspect directly contrary to the above-mentioned, that is, which are exposed and much accustomed to Winds, which blow from the Points betwixt the vernal Rising, and Setting of the Sun, and which are sheltered from the South-winds, and vernal Gales, are thus affected: First, it is remarkable, that their hard and cold Waters are generally sweet. The Inhabitants are necessarily strong, dry, and generally difficult to purge, and costive; but vomit, however, more readily, and are more affected by Bile, than Phlegm; their Heads are healthy and hard; and they are subject to frequent Ruptures of the Vessels. Their usual Distempers are Pleurifies, which are very common, as well as all those Diseases which are esteemed Acute. And indeed it cannot happen otherwise, by Reason of their habitual Costiveness; they are also liable to Suppurations on very slight Occasions, on Account of the Tension of their Fibres, and extraordinary Costiveness; but their Dryness, and the Coldness of the Waters, incline the Vessels to Rupture. These People must of Course be great Eaters, and but moderate Drinkers; for it is scarcely possible for the same Person to indulge himself in Excesses both of Eating and Drinking at the same Time. They are subject to violent and acute Inflammations of the Eyes,

* The Words *μὴ μωρὸν* have embarrassed the Interpreters a great deal, and it has generally been translated in such a Manner as to embroil the whole Passage not a little. I believe the Author means here by *μὴ μωρὸν* the same as by *ἀνυπόμωτον*, that is, not easy to boil, or to be elevated. But I will not be positive I am right in this Case.

Eyes, which endanger the Rupture of the Part; and those under thirty, to copious Hæmorrhages from the Nose, in Summer. Epilepsies are not very common, but vehement, when they happen; and these People are more likely to arrive at a greater Age than most others. Moreover, they are but little afflicted with cold corrosive Ulcers; and as to their Manners, they have a greater Tendency to the Savage, than to the Polite. Such are the Diseases of the Country, which principally infect the Men, when no unusual Alteration in the Seasons introduces an epidemical Disease.

As to the Women, they are contracted, and of tense Fibres, in the general, because the Waters are hard, difficult to boil, and cold. The Catamenia are not regular, but faulty, both in Quantity and Quality; add to these, that their Labours are difficult; that they are not very subject to Miscarriages; and that they cannot always give Suck to their Children, when born, because the Hardness and Intractability of the Waters dry up their Milk. Many fall into Consumptions after Lying in, the Violence of their Labour causing Ruptures of the Vessels, and Convulsions. The Children, whilst little, are subject to contract Dropsies in the Scrotum, which, as they grow up, disappear; and they arrive at Puberty very late in a City thus situated. Thus it is with Respect to the hot and cold Winds, and to the Cities subject to their Influences.

As for Cities which are exposed to those Winds which blow from betwixt the Risings of the Sun in Summer, and in Winter, or to those which blow from the opposite Quarters, they are thus affected by their Situation. Those which face the rising Sun are likely to be more healthful than others, which are either subject to the Northern Blasts, or exposed to the sultry Southern Winds, though at no greater Distance than a Furlong from each other; both, because here the Heat and Cold are more moderate, and because Waters which spring toward the rising Sun, are necessarily clear, sweet, soft, and agreeable to the Inhabitants of the Place; for the Rays of the rising Sun purify the Waters, and prevent Intemperatures in the Air, by clearing it of Vapours. The Inhabitants are, as to Complexion, well coloured and florid, unless any accidental Disease interferes with their natural Habit; their Voices are clear; their Passions are more regular, and their natural Parts and Understandings better, than those of the People who live exposed to the North; and indeed all the natural Productions are generally brought to greater Perfection.

A City, thus situated, enjoys, as it were, a perpetual Spring, in Regard to the Temperature, being neither immoderately hot, nor excessively cold; and the Diseases, affecting the Inhabitants, are neither so frequent, nor so violent as in other Places; and they are of the same Kinds with those by which Cities exposed to the warm South-winds are affected. The Women here are extremely fruitful, and have very easy Labours. Such are the Advantages of this Situation.

Cities which have an Exposure towards the Setting of the Sun, and are sheltered from the Winds which blow from the Sun Rising, but are open to the hot Winds from the South, and the cold ones from the North, have undoubtedly the most unhealthy Situation of all others. For, First, the Morning Fogs are a long Time retained, which, mixing with the Waters, render them turbid, for the Sun does not shine upon them, till it has acquired a considerable Altitude. Besides, in the Summer, the cold Breezes blow, and the Dews fall upon them. As to the rest, the Inhabitants are parched by the declining Sun, and hence they must probably become pale, and sickly; hence also they partake of all the above-mentioned Diseases, having nothing to protect them against them; their Voices are moreover likely to be deep, and hoarse, because the Air they respire, is generally impure, and unwholesome, being very little ventilated by the North-winds, which do not frequently blow upon them; and those Winds, which principally affect them, being of all others the most moist. Add to this, that the Western Winds, to which such a Situation is exposed, make the Temperature resemble that of Autumn, with Respect to the Alterations of the Weather, which happen on the same Day, for there is a great deal of Difference betwixt the Morning, and Evening Air. Thus it is in Regard to the Healthfulness and Unhealthfulness of the Winds.

I shall next consider the Waters, distinguish those which are unwholesome, from those which are wholesome, and specify the Advantages and Disadvantages which attend the Use of each Sort. For this is of great Importance to Health.

Stagnating Waters of Marshes, and Fens, must of Necessity be warm, muddy, and stinking in Summer; and, moreover, for Want of Motion, and because they are perpetually supplied by the Rains, and warmed by the Sun, they must of Course be white, bilious, and unwholesome. In the Winter, as they are frozen, and cold, and turbid with Snow and Ice, they are productive of Phlegm and Hoarsenesses. Those who drink them have their Spleens large, and much obstructed; their Bellies hard, thin, and hot; and their Shoulders, Necks,

and Faces wasted; for, as the Spleen enlarges, the Flesh dissolves; and hence they are emaciated. These have great Appetites both as to Eating and Drinking. Their Stomachs and lower Bellies are extremely dry, and hence they require stronger Vomits and Purges; and this is habitual to them both in the Summer and Winter. They are subject to frequent and fatal Dropsies; and, during the Summer, to Dysenteries, Diarrhoeas, and very chronic Quartans, which, as they continue long, in such Constitutions bring on Dropsies, by which they perish. Thus it happens to them in the Summer.

In Winter the Younger are subject to Peripneumonies, and phrenetic Disorders; the Elder, to burning Fevers, by Reason of their Costiveness. The Women contract Tumors and oedematous Disorders, incline to Sterility, have difficult Labours, bring forth large and bloated Children, and which, in their tender Years, have a Tendency to waste and become unhealthy; their Purgations after Delivery also are not well performed. The Children are much afflicted with Ruptures, and the Men, with Varices, and Ulcers in their Legs. Hence it is plain, that People with such Constitutions are not calculated for a great Age, but that they must early in Life contract the Infirmities of old Age. It is farther remarkable, that the Women frequently imagine themselves with Child, and, when the Period of Delivery approaches, the Fulness of the Belly disappears. This is caused by the hydropical Humours which are determined to the Womb. Such Waters, as the above-mentioned, I esteem improper for all Manner of Uses.

The next, in Degree of Unwholesomeness, are those which spring from Rocks, for these are necessarily hard, those whose Sources are warm, or which are impregnated with Iron, Brass, Silver, Gold, Sulphur, Alum, Asphaltus, or Nitre (*not what we call now by this Name*); for all these are produced by the Force of Heat; therefore Waters from such Strata cannot be good, but, on the contrary, hard, and heating, difficult to pass the urinary Glands, and inclining to Costiveness. The very best are those which spring on elevated Places, and loamy Hills; for these are sweet and clear, and a very small Quantity of Wine communicates to them both Colour and Taste. [*The Author mentions this as an Instance of their Lightness and Simplicity.*] In Winter they are warm, in Summer cool, and this, because their Reservoirs are at a great Distance from the Surface of the Earth. Those, however, whose Fountains face the Sun-rising, especially its Rising in Summer, are much the best; for these are necessarily the most limpid, sweet, and light. But those which are salt, not easy to boil, and hard, are not fit to drink. There are, however, some Diseases, and Constitutions, which I shall hereafter specify, where these are properly given as a Medicine. Thus it is with Regard to these Waters.

Fountains, as I observed, afford the best Water, which face the East; next to these, such as have an Aspect towards any Point betwixt the Rising and Setting of the Sun in Summer (*reckoning towards the North*) those especially, which incline most to the East; and the third Degree of Salubrity may be allotted to those Waters, whose Sources regard the Quarters lying betwixt the Settings of the Sun in Summer and in Winter. The very worst are those which spring towards the South, or which face some Point betwixt the Rising and Setting of the Sun in Winter (*that is, betwixt the South-East and South-West*). These, however bad, are not so pernicious to Inhabitants of a Northern, as those of a Southern Climate.

As to the Use of these Waters, the following Rules are to be observed:

He that is in a perfect State of Health, need be under no Restrictions, but may use any that presents indiscriminately; but if a Person that is ill will confine himself, on that Account, to that Sort which is best adapted to the Circumstances of his Disease, he will thereby much forward his Recovery.

Those whose Bellies are hard, and inclinable to be heated, find Advantage from those Waters which are sweetest, lightest, and most limpid. On the contrary, Waters which are very hard, not easily boiled, and somewhat salt, are better suited to others, whose Bellies are soft and moist, and abound with Phlegm; for these Waters will help to dry up the redundant Humours. Whatever Waters boil best, and soonest, are most likely to dissolve, and liquefy the Belly. But those which are heavy, and hard, and the least easy to boil, are drying and astringent. For it is a popular Error, founded on Want of Experience, to imagine, that salt Waters promote Stools, whereas, in Fact, they powerfully restrain them; and this, because, for the same Reasons that they are difficult to boil, they are also not easily subdued by the digestive Powers, and hence they produce Costiveness instead of liquefying the Belly. And this is the true State of the Case, with Respect to Fountain Waters. I will now proceed to explain the Natures of Rain and Snow Waters.

Rain Water is of all others the most light, sweet, thin, and limpid. For the Sun exhales only the lightest and thinnest Particles of Water. That this is true, is evident from the Nature of Salt, which, consisting of the most dense and heavy Particles, remain and become salt, whilst those which are most

light

light and thin are attracted by the Sun, and elevated into the Atmosphere, because of their Lightness. Nor does the Sun raise Vapours from Lakes only, but it exhales them also from the Sea, and from whatever contains Moisture, with which every Thing more or less abounds. Amongst other Things, thus influenced by the Sun, is the human Body, from whence the thinnest and lightest of the Fluids are attracted, as appears by the following Instance. Let a Man walk or sit in the Sun with his Cloaths upon him; that Part of his Skin exposed to the Sun will not appear to sweat, because, before the Moisture is visible in the Shape of Sweat, the Sun causes it to evaporate; mean Time, the Parts covered by Garments, or by any other Thing, will sweat. Thus the Sun forces out the Moisture from the Body, which being defended from the Sun by something that covers it, becomes visible. But, upon retiring into the Shade, it perspires equally at the Parts covered and uncovered, because it is not then subject to the Influence of the Sun.

These Properties of Rain-water render it more subject to Putrefaction than others, and incline it to contract a disagreeable Smell, to which also the different Exhalations of which it is composed, and the various Substances with which it is impregnated, contribute greatly; add, that when these heterogeneous Particles are drawn up, and elevated, and are carried about in, and mixed with the Air, what is the most turbid, and dark, separates from the rest, and forms Mists, and Clouds, whilst the thinnest and lightest Particles remain, are digested, and, as it were, boiled by the Heat of the Sun, and are thus rendered sweet; for all Things grow sweet by Boiling. So long, therefore, as they remain dispersed, and rarefied, they are carried to the superior Part of the Atmosphere; but when they are collected together, and condensed suddenly by Winds blowing in opposite Directions, the Cloud, thus formed, breaks in that Part where it is most dense. And indeed, it is most likely to happen thus, when the Clouds, not permitted by the Winds to preserve any fixed Station, but agitated and hurried along in the Air, are suddenly dashed against another Cloud, brought by an opposite Wind; it is on this Occasion the Condensation begins in the first Vapours that meet, which is continued amongst those that succeed, till growing dense, black, and too heavy to be longer suspended, they break, and fall down in Showers. Hence it appears, that such Waters must be the best; but they require to be boiled, and filtered, otherwise they are subject to contract a disagreeable Smell, and to affect such as drink them with a Hoarseness, and Roughness of Voice.

Waters from dissolved Snow and Ice are all bad, for, after being once frozen, they never recover their original Nature; for the limpid, light, and sweet Particles are separated, and evaporate, whilst the most turbid and heavy remain. The Truth of this is evinced by the following Experiment: Take a Vessel in Winter, and fill it with a certain Measure of Water, then expose it to the Air, so that it may be frozen, the next Day place it in a Heat sufficient to thaw it, and, when it is dissolved, measure it again, and you will find it has wasted considerably; now this Waste must be of the lightest and thinnest Particles, for it is impossible the most ponderous and dense should evaporate first. It is for these Reasons that I esteem the Waters of dissolved Snow and Ice, and all that bear any Resemblance to them, the very worst of all others, for any Uses whatever.

Men who drink habitually a Mixture of all Sorts of Waters, as those of large Rivers, which receive a great many smaller in their Courses; or Waters of Lakes, into which many Currents, consisting of different Sorts of Waters, flow; or who are obliged to use Waters carried to them from a considerable Distance, are much subject to the Stone, to nephritic Disorders, to Stranguries, to ischiadic Complaints, and Tumors; for it is not probable, that one Water should exactly agree with another in Qualities; thus some will be sweet, others salt, or aluminous, whilst others are impregnated with hot Ingredients; now, when several of these are mixed together, an intestine Motion is produced, till the strongest Quality prevails; the same Quality is not, however, always most prevalent, but sometimes one, and sometimes another; and it is very possible, that the Winds may in this cause an Alteration, the North-wind increasing one Quality, and the South another, and the same may be said in Regard to the other Winds. Hence Mud and Sand must of Necessity subside to the Bottom of Vessels containing such Waters; and Men, who constantly drink them, must be subject to the Distempers above-mentioned; that these Effects are not, however, universal, I shall proceed to shew.

The Bladder of those whose Belly is naturally inclined to be soluble, and healthy, is not subject to be heated, nor is the Orifice thereof contracted; hence they make Water freely, and consequently no condensed Sediment remains in the Bladder. On the Contrary, those whose Bellies are inclined to be hot, have their Bladders necessarily affected in the same Manner, and the Orifice thereof subject to be inflamed.

Hence the Urine passes with Difficulty, and, being retained, is digested, and heated in the Bladder, where the lightest Particles are separated from the more gross, and the most pure are discharged, whilst the most thick and turbid are retained, and form a Concretion, small at first, but which afterwards increases; this, being perpetually surrounded by the Urine, adapts to itself the most dense Particles, increases, and in Time forms a Stone, which is forced upon the Orifice of the Bladder, by the Efforts to make Water, where it obstructs the Passage of the Urine, and causes violent Pain; this makes Children afflicted with the Stone handle and extend the Penis, where it seems to them that the Cause of the Obstruction is situated. That the Case is thus, is manifest from the Urine discharged by People who labour under the Stone, which is always extremely limpid, the thickest and most bilious Part remaining, and concreting. This is the most general Way of contracting the Stone. But Milk gives Children sometimes the Stone, when it is unwholesome, hot, and very bilious, for then it heats the Belly, and the Bladder, and consequently the Urine, whence a Stone is formed. I am therefore of Opinion, that Wine, very much diluted, should be preferred before such Milk for Children, because it heats and dries the Vessels less. With Respect to Females the Case is somewhat different, for their urinary Passages are shorter, and larger, so as to permit an easy Discharge of the Urine; nor are they tempted to rub the Pudenda, like Males, nor to handle the urinary Passage, which in them opens within the Pudenda. And, because the Urethra is larger, they can drink more than Males. This I take to be a just Account of Waters, or very nearly approaching it.

As to the Constitution of the Year, it may be foretold by the following Observations, whether it will be healthy, or sickly. If the Rising and Setting of the Constellations are followed by their natural and usual Effects; if the Autumn be rainy, and the Winter moderate, that is, neither too mild nor too hard; if the Spring and Summer be tempered with seasonable Showers, we may conclude that a healthy Year will succeed. But if the Winter be dry, and attended with frequent Northerly Winds, and the Spring rainy and warm with the South-wind, the Summer must necessarily produce Fevers and Inflammations of the Eyes. For on the sudden Approach of sultry Weather, at the same Time that the Earth is moistened by vernal Showers, and relaxed by the South-winds, a double Degree of Heat is excited, by the Moisture and Warmth of the Earth, and the Influence of the Sun concurring to produce it, whilst the Belly continues relaxed, and the redundant Moisture of the Brain is not yet dried up; in such a Spring the Body and whole Habit must, of Necessity, abound with Humours, so as to make very acute Fevers epidemical, especially in phlegmatic Constitutions; and to produce frequent Dysenteries, particularly in Women, and Men of moist Constitutions.

If the Rising of the Dog-star be attended with Rain and wintery Weather, and the cool Etesian Breezes (*from the North-East*) blow as usual, we may hope that the prevailing Distempers will cease, and that the Autumn will be healthy; but, if the Contrary happens, there is great Danger of Mortality amongst Women and Children, whilst old People are less in Danger, and those who recover of Fevers contract Quartans, which at last terminate in Dropsies.

If the Winter be much affected with South-winds, rainy, and mild, and the succeeding Spring rendered cold by the Northern Blasts, dry, and wintery, first, Women that happen to be pregnant, and expect to be delivered in the Spring, will be in Danger of Miscarriages; or, if these do not happen, the Children which are born will be weak and sickly, so as to die immediately, or, if they survive, to be thin, weakly, and unhealthy. Thus will such a Season affect Women. The rest will be troubled with Dysenteries, and dry Ophthalmies, and some will be subject to Defluxions from the Head upon the Lungs. Men of phlegmatic Constitutions, and Women will be afflicted with Dysenteries, the Phlegm flowing from their Brains, because of their natural Humidity. Bilious Constitutions will be subject to dry Ophthalmies, because of the Heat and Dryness of their Habits. People advanced in Years will be affected by Catarrhs, on Account of the Rarity and Relaxation of their Vessels, inasmuch that some will die suddenly, whilst others will be seized with a Paraplegia either on the right, or left Side. For, when the Winter has been moist, and warm, and in Consequence of this, neither the whole Habit, nor the Vessels competently firm, if the succeeding Spring happens to be dry, cold, and much influenced by the North-winds, the Brain, when it should be relaxed by the natural Mildness of the Spring, and purged of those Humours, which cause Distillations from the Nose, and a Hoarseness, is, instead of that, braced, and contracted, so that, Summer coming on suddenly, the great Heat, and the Change from one Extreme to another, are the Causes of the above-mentioned Diseases, which, as they disappear, are succeeded by Lienteries and Dropsies, the Humidity of the Viscera not being easily dried.

If the Summer be rainy, and hot South-winds blow, which continue till the latter End of Autumn (*περοναια*) the Winter must, of Consequence, be sickly. Phlegmatic People, and those above forty, will be seized with burning Fevers, and the Bilious, with Pleurifies and Peripneumonies.

But if the Summer be dry, and much ventilated by the North-winds, and the whole Autumn rainy and much affected with Southern Blasts, the Winter will probably introduce Head-aches, and Sphacelations of the Brain, and, moreover, Hoarsenesses, Colds, Coughs, and, in some Constitutions, Consumptions. But if the Autumn be dry, and rendered cold by Northerly Winds, and there be no Rain, neither about the Rising of the Dog-star, nor of Arcturus, the Season will be favourable to phlegmatic, and moist Constitutions, and to Women, but very bad for the bilious, because it dries them excessively, and brings on dry Ophthalmies, and acute Fevers of long Continuance, and inclines some to Melancholy. For, the moist humid and diluted Part of the Bile being consumed, there remains only the thickest and most acrid Part; as it happens also in the Blood; hence the Diseases above-mentioned are immediately produced, whilst this Constitution of the Season is favourable to the Phlegmatic, because they are dried by two succeeding Seasons, and arrive at the Winter without any superfluous Humidity.

If the Winter be infested with North-winds, and dry, and the succeeding Spring affected as much by South-winds, and rainy in the Summer, violent Inflammations of the Eyes will be epidemical; as will Fevers amongst Women and Children.

Whoever examines and considers these Things, will not be at a Loss to prognosticate most of those Events which these Changes naturally produce.

It imports us most of all to take especial Notice of the great and remarkable Changes of the Seasons, that we may not at such a Juncture prescribe Purging without urgent Necessity, nor make Incisions in, or cauterise the Parts about, the Abdomen, till ten Days or more are past, but ten Days are of the greatest Moment. The two Solstices are very dangerous Seasons, especially the Summer Solstice; and so are the Equinoxes, principally the Autumnal. Besides, we are to regard the Risings of the Constellations, especially those of the Dog-star and Arcturus, and to observe the Setting of the Pleiades; for these Days are particularly critical to Distempers, and either carry off the Patient, or give a favourable Turn to the Disease; and, indeed, all other Things alter their Forms and Constitutions, upon these great Changes. And thus it is with Respect to the Seasons of the Year.

My Design also is to shew how different Europe is from Asia in all Respects, and how various Nations differ from each other, in Regard to Form, and every other Circumstance. This Subject would engage me in too long a Discourse, were I to enter into Particulars: I shall therefore content myself with giving my Sentiments; as to the most essential and important Points wherein this Difference consists.

Asia remarkably differs from Europe in the Nature of Plants and Men; for all Things are produced more beautiful and large in Asia than in Europe. The Climate is more temperate than ours, and the Manners of the People more polished and civilised. The Cause of these Things is the good Temperature of the Seasons; for Asia is situated towards the East, in the Middle of the Sun's Risings, and remote from an Excess of Cold. Now, what most contributes to the Growth of Things, and Mildness of Manners, is a well-tempered Climate, in which no violent Quality predominates, but every Thing is equable and temperate. But all Parts in Asia are not in all Respects alike. But that Part which lies between the Extremes of Heat and Cold, is the happy Region which abounds with all Sorts of Fruit, which is covered with Trees, which enjoys an excellent Air, and, besides sufficient Refreshments of seasonable Rains from Heaven, it is plentifully supplied with such Waters as the Earth affords; which is neither scorched by Heat, dried for Want of Moisture, nor hardened and stiffened with Frosts, but opened and cherished by the warm Breezes of the South-wind, and moistened and refreshed by Showers, and kindly Snows. Hence it must of Necessity produce all Kinds of Fruit, seasonably and in Perfection, not only those which the Earth brings forth spontaneously, but such as are planted and sown by Man, who eats of them, and makes Use of them after having by Culture rendered them mild, and subdued their Wildness by Grafting and Transplanting. All Flocks of Sheep, and Herds of Cattle, prosper better in these Climates, than in any other Region; they bring forth Young more frequently, and feed better. The Men also are of a better Habit of Body, more graceful, of a larger Size, and better shaped, and hardly differ from one another in Form and Stature. It is probable therefore that this Climate approaches nearer than any other to the most temperate and natural Constitution. But it is impossible that Strength, Hardiness, Vigour, and personal Courage should belong to such Constitutions; nor can they be supposed to be regular in their Affections for their own, or a different Species. They are given up to sensual Enjoyments; and hence it is, that we see so many

Monsters among the very Brutes. The same may be said of Egypt and Lybia.

As for those People who inhabit the Countries to the Right of the Sun's Rising in Summer, as far as the Pajus Mæotis, which separates Europe from Asia, they are more different from each other than those I have described, because of the different Changes of Seasons, and the Nature of their Country, which, as well as that of the Inhabitants, varies according to these Changes; for, where these Changes are most frequent and sensible, the Country is most savage and irregular. There you find many Mountains and Forests, and sometimes Plains and Meadows. But, wherever these Changes are least felt; the Country is more uniform, and even; and the Case is the same with Men, if they are strictly observed. The Natures of some Men bear a Resemblance to Mountains, Forests, and unwatered Deserts; others to light and well watered Soils; some to Meadows and Marshes; and others to Plains, which are dry, and naked. Seasons, which change the natural Forms of Things, are various, and as they differ from one another, their Effects are no less different.

Of the MACROCEPHALI.

I shall say nothing of those Nations where the Difference is inconsiderable, but confine myself to those among whom the Varieties, whether they proceed from Custom, or Nature, are most sensible, and begin with those People whom they call Macrocephali, because they have very long Heads, there being no Nation in the World equal to them in that Respect. Here Custom alone was first of all the Cause of that excessive Length; but now Nature acts in Conformity to Custom. These People esteem a long Head as a Mark of Distinction, and hence a Custom arose, as soon as a Child was born, while its Head was yet tender, to fashion it with their Hands to as great a Length as possible, and by Application of proper Bandage and other Arts, to destroy as much as possible the spherical Figure of the Head, and force it to increase in Length. Thus, what at first was nothing but Custom, became by Degrees Nature, which in Time no longer wanted the Assistance of Custom. The Seed comes from all Parts of the Body, and partakes of the Affections of the particular Part from whence it proceeds, whether they are sound, or distempered; if therefore the Children of bald Fathers are also generally bald, and those who have grey Eyes beget grey-eyed Children, and Parents with distorted Eyes procreate a squinting Off-spring, and if this holds true with Respect to all other Imperfections of the Body, what should hinder a Macrocephalus from begetting a Macrocephalus? At this Time indeed they are not born with so long Heads, which is owing to their Negligence, in letting their antient Custom grow into Disuse. Such are my Sentiments concerning these Affairs.

Of the PHASIANS.

In Regard to the Inhabitants about Phasis, the Country is marshy, hot, moist, and abounding with Woods, and frequent and heavy Rains fall there at all Seasons. They live in Marshes, where they build their Houses with Wood and Reeds; in the midst of the Waters. They seldom exercise themselves by going to the City, or the Market, but ply here and there about their Canals, of which there is a great Number, in small Boats, which they make out of a single Trunk of a Tree. Their habitual Drink is warm, stagnating Water, which is corrupted by the Sun, and supplied by the Rains. The Phasis itself is the stillest of all Rivers, and flows the slowest. The Fruits which grow in the adjacent Parts are all effete, afford little Nourishment, never arrive at Perfection, and are insipid. The Country, moreover, is much subject to Fogs, by Reason of the neighbouring Waters. On these Accounts, the Phasians are in Person different from all Mankind. For they are of an excessive Bulk, and prodigiously bloated. Neither Joint nor Vein are to be discovered upon their Body. They are pale like those who are affected with a Jaundice. Their Voice is more deep and hoarse than that of any other People, because of the Grossness and Humidity of the Air they respire; they are excessively lazy and indolent; the Change of Seasons is insensible with them, either as to Cold or Heat; all their Winds blow from the South, except a Wind which is peculiar to them, and which is sometimes very violent, troublesome, and hot, and this they call *Cenchron*. The North-wind never reaches them, or, if it comes so far, is so weak and languid, as to be hardly sensible. And thus it is with Respect to the Natures, Differences, and Forms of the Inhabitants of Asia and Europe.

With Regard to the Effeminacy and Cowardice of the Asiatics, who are far inferior in Courage to the Europeans, but exceed them in Delicacy of Manners, the Cause hereof is to be attributed, principally, to the Seasons, which, with the People of Asia, never change from one Excess to another, either as to Heat or Cold, but are always in a State of Equality. Upon these Accounts the Inhabitants never suffer any great Trans-

ports of Mind, nor undergo very violent Changes in their Bodies, which are the two moving Causes that excite the Passions, and are more likely to render the Imagination lively and warm, than if such Excesses and Alterations were never to happen. Changes, however, there are, either greater or less, in all Things, and these stimulate the Passions, and disturb the Sedateness of the Mind. Besides these Reasons for the Cowardice of the Asiatic Nations, which appear to me very probable, another may be deduced from Custom. Most of the Asiatics are subject to the Tyranny of absolute Kings. And wherever Men of Sense are deprived of Liberty, and the Power of acting conformable to their own Inclinations, but are Slaves to others, it is Policy in them to avoid all Appearances of Courage, and to dissemble Cowardice. For, under these Circumstances, the Danger is disproportioned to the Motives of Valour. Thus they are obliged to fight, undergo Fatigues, and to die for the Sake of their Lords, and this at a Distance from their Children, Wives, and every Thing they hold dear; whilst all their Fortitude and Bravery serves only to increase the Power of their Tyrants, and rivet their own Fetters the faster, all their Recompence being Dangers and Death. Besides, such a Country must in Time become desolate, since the wisest and bravest Men equally detesting such Motives for War, and Inactivity, will abandon an arbitrary Government, so little suited to their Genius.

A sure Confirmation of this Truth is, that all the Greeks as well as Barbarians in Asia, who are their own Masters, and independent of Kings, are incomparably more warlike than the others; for they labour for themselves, they run no Hazards but on their own Account, and they reap all the Fruits of their Bravery, as they suffer all the Inconveniences of their Cowardice. You will, however, find even amongst the Asiatics considerable Differences, some being better, and others worse, and this Variety is to be attributed to the Mutability of the Seasons, before taken Notice of. And thus is the State of Asia.

Of the SAUROMATÆ.

There is in Europe, about the Palus Mæotis, a Scythian People, called Sauromatæ, which differ from all others. Their Women mount on Horseback, draw the Bow, throw the Dart, and fight Battles, while they are Virgins. They are obliged to preserve their Virginity, till they have killed three Enemies, and are not allowed to approach their Husbands, before they have offered a certain Sacrifice by Law appointed. The married Women are discharged from mounting on Horseback, and going to War, except the whole Country is obliged to take up Arms on some very urgent Occasion. They have but one Breast, which is the left, for their Mothers take Care to burn off the Right, while they are very young, with an Instrument of Brass, made on Purpose; so that, this Breast ceasing to grow, all the Strength and Nourishment go to the right Arm and Shoulder.*

Of the other SCYTHIANS.

As for the rest of the Scythians, they are like one another in Form, but have no Resemblance to any other People. The Case is the same with the Egyptians, with this Exception, that they are as much oppressed by the excessive Heat, as the Scythians are by the extreme Cold.

What they call the Desert of Scythia, is a vast Plain, quite bare of Wood, but interspersed with Meadows, and pretty well watered. It has also large Rivers, into which the Waters of the Plains discharge themselves. It is here that those Scythians live, whom they call Nomades, because they have no Houses, but live in Waggons, the smallest of which have four Wheels, and the others six, but all covered, and closed with large woollen Carpets, and made like Houses, with three Floors one above another, which secure them under Covert from Snow and Rain, and defend them against the Violence of the Winds. These Waggons are drawn by two or three Yokes

of Oxen, which have no Horns, because of the extreme Rigour of the Cold. The Women live in these Waggons, but the Men are generally on Horseback, followed by their Sheep, Cattle, and Horses. They remain in one Place so long as it will afford them Subsistence for their Cattle, but, when that fails, they remove to another Place. They feed upon Flesh boiled, and drink the Milk of their Mares, and eat Hippocrene; as they call Cheese made of Mare's Milk. Such is their Way of living, and such are their Customs, in which, as well as in their Climate and Persons, they differ from all other People; but they all resemble each other, as do also the Egyptians. They are of all People the least fruitful, and the Country produces the fewest Animals, and those the smallest of all others. They live under the Bear and the Riphean Mountains, whence the piercing Northern Winds blow. The Sun never approaches them but towards the End of its Summer Periods, and then warms them but for a very short Time. Few Winds from the warm Quarters reach them, and those weak and of short Continuance. But they are perpetually exposed to the Northern Winds, which the Snow, Ice, and Water render extremely piercing, and which, blowing perpetually from those Mountains, render them uninhabitable. These Plains are subject to frequent Fogs, during the Day, so that they are obliged generally to respire a moist Air. Their Winter is perpetual, but their Summer continues but a few Days, and has even then but very little Influence; for these Plains are elevated, bare, and sheltered by no Mountains, but altogether exposed to the North.

The Animals of this Country are very small, because the Severity of the Seasons would destroy such as are too large to retire for Warmth into Holes made under the Earth; for there are neither Woods nor Coverts to preserve them from the Cold, nor Sun to warm them. There are no very great or sensible Changes of the Seasons, which are always equal, or have but little Variation. Hence the Inhabitants are all like each other. They eat the same Food, and wear the same Clothes, in Summer and Winter; they breathe in a thick and moist Air, and drink nothing but dissolved Water of Snow and Ice. For these Reasons they are neither remarkable for bodily Strength, nor the Faculties of the Soul; for it is impossible there should be either in Perfection, in a Climate not subject to violent Changes. Hence, the People are fat and carnosous, and their Limbs moist and relaxed; their Bellies abound with Moisture, and are in general more laxative than those of other People; and it is impossible it should be otherwise in such Constitutions, inhabiting such a Country, and subject to the Influences of such a Climate. The Tendency these People have to grow fat, and the universal Smoothness of their Skins, produce an extraordinary Similitude in their Persons, inasmuch that Men can scarcely either be distinguished from each other, or one Female from another, of the same Sex; and this because the Seasons being always equal and uniform, there can happen no Consumption, or Irregularity in the original Formation of the Fœtus, unless by Disease, Violence, or Accident.

That I may give abundant Proof of their excessive Humidity, I must remark, that most of the Scythians, and all the Nomades in general, are burnt in their Shoulders, Arms, Wrists, Breasts, Hips, and Loins, on no other Account but that of their excessive Moisture, and Softness of Contexture, which enervates them to such a Degree, that they have neither Strength to draw a Bow, or throw a Dart; but after they are burnt, and the Humidity of their Joints is dried up, their Bodies grow robust, more firm and nervous, and of a better Habit. The first Thing which inclines them to be lax, and spread in Bulk, is their Neglect of swathing their Children, as they do in Egypt; and this Negligence Custom has established as a Law, with a View of enabling them to keep a firmer Seat on their Horses. A second Cause of their Relaxation, and enormous Increase in Flesh, is, their sedentary Way of Living, for the Males, so long as they are incapable of mounting on Horseback, scarce ever stir out of their Carriages,

* The Women amongst many of the Tartarian Nations are at this Day extremely warlike. Bernier, in relating a Conversation which passed betwixt him and some Ambassadors from the Kan of the Usbec Tartars, tells the following Story, which, notwithstanding some Exaggerations, proves the Valour of their Women.

Then, says he, they proceeded to commend the Strength and Valour of their Women, which they described to me quite otherwise than the Amazons; telling me very wonderful Stories of them, especially one, which would be admirable indeed, if I could relate it with a Tartarian Eloquence, as they did: They told me, that, at the Time when Aureng-Zebe made War in their Country, a Party of twenty-five or thirty Indian Horsemen came to fall upon a small Village; whilst they plundered, and tied all those whom they met with to make them Slaves, an old Woman said to them, Children, be not so mischievous, my Daughter is not far off, she will be here shortly, retreat if you be wise, you are undone if she light upon you. They laughed at the old Woman and her Advice, and continued to load, to tie, and to carry away herself; but they were not gone half a Mile, but this old Woman, looking often backward, made a great Outcry of Joy, perceiving her Daughter coming after her on Horseback; and presently this generous She-Tartar, mounted on a furious Horse, her Bow and Arrows hanging at her Side, called to them at a Distance, that she was yet willing to give them their Lives, if they would carry back to the Village all they had taken, and then withdraw without any Noise. The Advice of this young Woman affected them as little as that of her old Mother; but they were astonished, when they found her let fly at them, in reverse also. But she kept herself at that Distance from them, that none of them could reach her. She laughed at all their Efforts, and which was of another Temper than theirs. So that after she had killed half of them with her Measure from the Strength of her Arm, she came and fell upon the rest with her Sabre in her Hand, and cut them all in Pieces.

Carriages, and walk but very little, and this on Account of their frequent Transmigrations, and rambling Way of Life. The Corpulency of their Females is surprising. The Complexion of these Scythians is usually dark, and fallow, because of the Cold, for the Sun has very little Influence upon them; the Whiteness therefore is affected by an Excess of Cold, as it is in hot Countries by an Excess of Heat, and the Sallowness of their Skins is produced in its Stead.

It is not likely that, under these Circumstances, the People should be very prolific. For the Men have no strong Inclinations to Women, because of the Moisture of their Constitutions, and the Relaxation and Coldness of their Bellies, all which tend to disable them from propagating their Species; besides, their habitual Exercise on Horseback is no inconsiderable Cause of Imbecillity. These are the Reasons for the Infecundity of the People, so far as the Men are concerned; but with Respect to the Women, their Obesity, and the Moistness of their Habit, prevent Conception; for these Reasons the Uterus cannot attract, and retain the Male Principle of Generation; the Catamenia are moreover neither sufficient as to Quantity, nor regular as to the Periods; and the Orifice of the Uterus, being obstructed by Fat, does not readily receive Impregnation from the Male. Add to these, that the Fibres of the Women are not braced by Exercise, and that their Bellies are cold and relaxed. On these Accounts the Scythians are necessarily the most unfertile of all People. That these are the Causes of their general Infecundity, is evident from their Maid-servants, who no sooner admit of a Man's Embraces, than they conceive, because their continual Exercises keep down their Flesh, and render them lean.

It is farther remarkable of these People, that many amongst them become Eunuchs, and this to such a Degree as to act, and even talk like Women, they perform all the Functions of Women, and speak like them; they are called the Impotent (*ἀνδραπίστis*). * The Inhabitants of the Country believe, that this Disease is inflicted by the Anger of the Gods; for which Reason they pay a particular Respect to, and even worship those who are thus affected, with a View of averting the same Misfortune from themselves. For my Part, I believe that this, as well as all other Distempers, proceeds from the Gods, and that there is nothing more Divine, or more human in one than in another, all Diseases coming alike from the Gods; not but every one has its proper Cause, for there is nothing in Nature that is not an Effect of some Cause. As to the Distemper which is the Subject of our present Inquiry, I shall give my Opinion how it is produced:

As the Scythians are always on Horseback, and have their lower Extremities perpetually in a depending Situation; these are much subject to receive a Flux of Humours, which renders them lame, and, as the Disorder grows inveterate, the Joint of the Thigh becomes immovable. For a Cure they have Recourse to the following Method: When they begin to be disordered, they open the Veins behind their Ears, and, when the Blood has flowed sufficiently, they fall asleep through Faintness. When they awake, some find themselves relieved, and others not in the least better. Now it seems to me, that this very Remedy destroys their Virility; for behind the Ears are Veins, which, if a Man suffers to be cut, he loses his generative Faculty, and these appear to be the very fame which they open. When therefore they approach their Wives, and find their Virility fail, they are not much concerned at it the first Time, but betake themselves to Rest; but, when after several Essays they find the same Inability continues, they no longer doubt but they have offended the God, who they imagine inflicts this Punishment upon them. They then put on Women's Clothes, and make no Secret of their Infirmary; they live like Women, and do all Female Offices. But this Misfortune seldom befalls the poorer Sort, but only the Rich, and those of Distinction amongst the Scythians, because these never stir but on Horseback, whereas the Poor are less subject to it, because they walk on Foot. Now if this Disorder in particular was sent by the Gods, it would visit one Sort as well as another, or the Poor rather than the Rich, because the Poor pay much less Honour to the Gods, if it be true that the Gods take Pleasure in being honoured by Men, and that they reserve their Blessings to reward their Worshipers. Indeed, they are the Rich who offer frequent Sacrifices to them, and load their Altars with Gifts, which the Poor are unable to do, but instead of honouring the Gods are more frequently guilty of accusing their Justice, because of the unequal Distribution which they make of Riches. The Punishment for all these Crimes ought then rather to fall upon the Poor than the Rich. But, as I observed before, this Disease is of Divine Origin-

nal equally with all other Distempers, for they are all produced by natural Causes; amongst which this Distemper of the Scythians is brought upon them in the Manner I have specified; and indeed the same Cause produces the same Effects in all other Countries; for much Riding on Horseback renders a Person subject to Tumors of the lower Extremities, to Sciaticas, and Gouts, and is a great Enemy to venereal Commerce, and this it is that renders the Scythians of all Mankind the most impotent. Besides, their Custom of wearing perpetually a particular Sort of Breeches, together with their Posture on Horseback, which is almost continual, prevents them from touching and warming the generative Organs with their Hands, when they require it; hence overcome by Cold and Fatigue, they think of nothing less than venereal Enjoyments, inasmuch that a Deprivation of Virility is, in their Circumstances, no great Misfortune. And this is the Case with Respect to the People of Scythia.

All the other Europeans are very different from one another, both in Person and Stature, and this is owing to the Variations of Seasons, which are great and frequent among them; for they have severe Winters, and insupportable Summers, great Rains, great Droughts, and high Winds, which produce many very considerable Changes, and these Changes must affect the tender Principles of Generation, in the original Formation of the Foetus, which are not always alike in the same Persons, being quite different in Summer from what they are in Winter, and in a dry Season from what they are in one that is rainy. And this I imagine to be the Reason why the Europeans resemble one another less than the Asiatics, and why we find such a Difference in the Stature of People even in the very same City amongst us; because there happen many more Alterations, with Respect to the Principles of Generation, in Countries subject to those frequent Changes of Seasons, than where they are almost constantly equal. The same Reason will also account for the Difference in Manners; Rusticity, Unsociableness, Intrepidity, are produced by Climates much subject to Changes; for frequent and sudden Turns, and Alterations, in the Spirits beget Roughness of Manners, but extinguish Meekness and Delicacy. On the same Accounts I esteem the Inhabitants of Europe to be more courageous than those of Asia; for a perpetual Equality of Seasons produces Indolence; whereas frequent Changes stimulate both the Body and Mind to Action. Whence Cowardice is the Off-spring of Sloth and Indolence, but Courage is maintained by Exercise and Labour; for these Reasons the European Nations are more warlike than those of Asia, because of their Government, for they are not subject to Tyrants like the Asiatics; and it may be laid down as a Maxim, to which there is no Exception, that Slaves are necessarily Cowards, as I observed above; because, by their Subjection, they contract a Meanness of Spirit; besides, it is not probable, that they should voluntarily expose themselves to Dangers, in Support of another's Tyranny. But the Europeans, who enjoy their Freedom, rush with Alacrity upon the most difficult, and dangerous Enterprizes, because the Hazards they run are purely for their own Sakes, and they themselves reap the Advantages of their Victories. In this Manner does the Constitution of a Government affect the Courage of those who live under it. And such is the general State of Asia and Europe. There are, however, in Europe Nations which differ in Stature, Person, and Strength from each other; but the Cause of this Difference proceeds from what I have explained already, and shall endeavour farther to illustrate.

All such as inhabit a Country which is mountainous, rough, elevated, and dry, and are subject to very considerable Changes of the Seasons, are consequently of a large Size; and well suited to Fatigue, and manly Exercises, and their Constitutions incline them to be rustic and savage. On the contrary, those who inhabit a low Country, abounding with Meadows, and suffocating, because exposed more to the Influence of the hot than of the cold Winds, and where they drink warm Waters, can neither be large as to Size, nor muscular, but spread into infirm Flesh, and are inclined to be fat; their Hair is black, and they are rather of a black than fair Complexion; they are moreover less subject to be phlegmatic than bilious; such Constitutions therefore are not likely to be remarkable for Courage and Strength, though the Nature of their Laws and Government may effect even this. If their Country is furnished with Rivers, to convey away the stagnating and Rain-waters, they may be healthful, and of florid Countenances; but if they have no Rivers, but are obliged to drink the stagnating and stinking Waters of Ponds, they unavoidably contract Diseases of the Stomach and Spleen.

The

* This Disorder of the Scythians is mentioned by Herodotus, who informs us, it was inflicted on them by the Goddess Venus, as a Punishment, because, in some of their Wars, they pillaged her Temple. Herodotus calls it, as I remember, the *ἄλυσος νόσος*, and Longinus quotes the Expression as an Instance of a beautiful Periphrasis. The Commentators on Longinus have taken a great deal of superfluous Pains, to explain away the obvious Meaning of this, and to extract either Filthiness or Obscenity from a Passage where no such Thing could possibly be intended.

The Inhabitants of an elevated open Country, exposed to the Winds, and well watered, are large of Size, upright, are much alike, and of mild Tempers. Those who live in a Country which is barren, not well watered, open, and not subject to great Changes, are likely to have dry Habits, and tense Fibres; and their Complexions more inclinable to be yellow than black; as to their Manners and Passions, they are subject to be arrogant, and opinionated. For, wherever the Changes of Seasons are very frequent, and considerable, there we shall find the Inhabitants very different from each other, with Respect to their Persons, Manners, and Constitutions.

These are the principal Causes which operate so as to induce a Change in the Natures of Men; and to these may be added the Soil, and Waters of each particular Country where a Person is bred; for you will find, that Men generally, both in Person and Manners, are affected by the Country they inhabit. Thus, wherever the Soil is fat, soft, and furnished abundantly with Waters, which are ponderous, and consequently hot in Summer, but cold in Winter, and the Seasons are subject to no remarkable Alterations, there the Inhabitants are full of Flesh, enervated, moist, incapable of undergoing Fatigue, and of corrupted Morals; they are indolent and sleepy, have no Genius for Arts and Sciences, and are wanting in Point of Vivacity, and Quickness of Apprehension.

But whatever Country is naked, and destitute of Woods, and Coverts, barren, exposed to the Inclemencies of Winter, and the scorching Heats of the Summer, there the People have elastic Fibres, are lean, nervous, strong, and hairy; they are also ready and dexterous at any Sort of Work, and vigilant. As to their Manners and Passions, they are daring and opinionated, and participate more of Rusticity than Delicacy; they are ingenious, and quick at learning or improving Arts, and their Genius is warlike. And in the same Manner, whatever is produced by the Earth is much affected by the Parent Soil. And thus it is with Regard to the great Differences we observe in the Natures, and Persons of Men. And these Considerations will lead us into a Knowledge of many other Things, of great Importance in the Art of Healing. *Hippocrates.*

AERA. *Ἀῖρα.* The Greek Name for Cockle, or Darnel. See **LOLIUM**.

AERDADI. A Name given to certain Spirits by Paracelsus, which he has imagined to be Inhabitants of the Air, and says, they enjoy a very long Life. He mentions these *Aerdadi* in his *Treatise de Vita longa*, L. 4. C. 3. amongst a great many other imaginary Beings.

ÆREOLUM. A Weight of about two Grains. It is also called *Chalcus*. The Name seems derived from the Metal of which the Weight was made.

AERIFICATIO. It is the producing of Air from other Bodies, or rather converting them into Air.

AERITIS. *Ἀἰρίτις.* The same as *Anagallis*, which see. *Gorræus.*

AEROLOGICE. That Part of Medicine which treats of Air, and explains its Properties and Uses in the animal Economy, and its Efficacy in preserving or restoring Health. It is derived from *ἄῖρ*, Air, and *λόγος*, a Word, Dissertation, or Treatise.

AEROMELI. *Ἀἰρομελί.* Honey. It seems to have gained this Name from Virgil, who calls Honey *Aerial*:

*Protinus aerii Mellis, caelestia dona
Exequar.*

Manna is also called by this Name. *Gorræus.*

AEROPHOBI. From *ἄῖρ*, Air, and *φόβος*, Fear. *Cellius Aurelianus, Acut. Morb. L. 3. C. 12.* says, some Phrenitics are afraid of a lucid Air, others of that which is obscure. These he calls *Aerophobi*. So that this *Aerophobia* is a Symptom of a Phrenitis.

AEROSIS. An imaginary Resolution of the Blood into Vapour, supposed necessary to the Support of the vital Spirits, and said to be brought about by the Ventilation of the Air during Inspiration, in the Manner that the Flame of Fewel is kindled by blowing it.

As it does not appear there is the least Foundation for this Conceit, it would be superfluous to say more about it. Those who desire to be farther informed, may consult Charlton's *Exercitationes Physico-Anatomicae*.

ÆRUGINOSUS. Of the Colour of Verdigrase. Green. It is frequently applied to what is discharged by Vomit of that Colour. See **VOMITUS**. And to the Bile. See **BILIS**.

ÆRUGO. Rust of any Metal, particularly of Copper, called Verdigrase. See **ÆS**.

ÆS. Copper. This is called **CUPRUM** in Latin, *Χαλκός* in Greek, and *Venus* by the Chymists; is one of the ignoble Metals, softer than Iron, sonorous, of a red Colour, shining when polished, fusible and ductile to a very great Degree. It is sometimes found pure in the Mines, in Form of small Rods, Branches, Globules, or Masses of other Figures; but

most commonly it is contained in a Kind of Pyrites, or particular Ore. This Pyrites is in some Mines of a shining Gold-colour, but is not on that Account to be esteemed more rich, because that Colour is owing to a combustible Sulphur. Other Copper-ores are yellow, violet, or purple, and some are blackish, and mixed with Gold-coloured Sparks, or Veins, intermingled with green. Copper is seldom found alone, but is generally accompanied with some other Metals, such as Silver, Iron, or Lead, and with a large Quantity of combustible Sulphur, very difficult to be separated from it. Copper-ore is differently managed, according to the Substances mixed with it. If it abounds with Sulphur, it undergoes repeated Calcinations, till all the Sulphur is consumed. The Copper-ore of Goslar in Germany is first broke into Pieces of the Size of a Man's Fist, then burnt in an open Fire, made of Wood and Charcoal mixed together, and, being afterwards broken into smaller Pieces, it undergoes two Torrefactions more. Afterwards it is melted into a stony red Substance, called *Lapis Cupri*; which having suffered another Torrefaction, and being after that melted again, becomes black Copper; which, after a fifth Torrefaction, becomes quite free from its Sulphur, but still contains Silver. This Silver is extracted in this Manner: They mix with the Copper about four Parts of Lead, more or less, according as the Lead they use is more or less free from Silver.

These Metals thus mixed are melted together by a vehement Heat, and then poured out into Moulds, where they harden into a Kind of flat Cakes. These Cakes, covered with Charcoal in a proper Furnace, are heated with a gentle Fire, till the Lead and Silver melt, and, leaving the Copper, fall down into a Vessel set to receive them. The Copper remains unmelted like a Sponge or Honey-comb; and in this State it is termed *Æs pauperum*, and is by repeated Fusions brought to be malleable. In this last Operation, some Scorix appear, which are specifically heavier than the Mass consisting of Copper, Silver, and Lead. These Scorix are afterwards melted with a Mixture of Litharge, and by that Means the several Metals it contains are separated.

There are some Springs of Copper-waters, of which Vitriol is made by Boiling, and Copper may be precipitated from them, by Means of Iron, which has made some Persons imagine, that these Waters turned Iron into Copper. There is a famous Spring of this Kind near the Carpathian Mountains on the Confines of Hungary, the Waters of which corrode Iron thrown into it, and in Place thereof substitute Copper; so that a Horseshoe that has lain several Days in this Water shall, when taken out, appear not to be Iron, but Copper.

The richest Copper-Mines are in Sweden and Germany. Copper is softer than Iron, but harder than Lead or Tin. It ignites or becomes red-hot in the Fire before it melts. Its specific Gravity is to that of Gold nearly as Four to Nine. When exposed to Moisture, it contracts a Rust of a green Colour, which, when handled, has a very disagreeable Smell, and an austere, sharp, nauseous Taste. A Solution of Copper by acid or fixed alkaline Salts is green, but, when made by urinous Salts, it is of a beautiful blue Colour. Filings of Copper, thrown into the Flame of a Candle, burn and emit a greenish Flame, but do not sparkle; when melted with Nitre, they flash a little. If we mix one Part of Filings of Copper with something above two Parts of corrosive Sublimate, and distil them in a glass Retort, the Quicksilver disengaged from the Salts comes over in running Mercury; but the Copper remains at the Bottom intimately united to the Salts, in Form of a yellowish or reddish Rosin; sometimes transparent, sometimes opaque, which by the Flame of a Candle may be melted, and set on Fire; the Flame it gives is of a green Colour. Copper, calcined long by a very strong Fire, till it loses all its Sulphur, turns to reddish Ashes, which being exposed on a Tile to the Focus of a great Burning-glass, turns to an intensely red Glass almost opaque. If this Glass be melted on a Piece of Charcoal, in the Focus of the same Glass, it recovers its Form of Copper. From these Things we may conclude, that Copper contains a large Quantity of combustible Sulphur, though not so much as Iron, and that the metallic Substance is a red vitrifiable Earth. Copper, exposed to the Fumes of Quicksilver, or of Arsenic, acquires a Silver-colour, which is not permanent; melted with Lapis Calaminaris, or Zinc, it turns of a yellow, or Gold-colour; the different Ways of doing which are related in the Articles *Cadmia* and *Zinc*. See **CADMIUM**. See **ZINC**.

Copper, because of its great Ductility and shining Colour, is much employed in domestic Uses; but is never used inwardly as a Medicine, unless in Tincture, because this Metal, and especially its Rust, are reckoned Poisons; and any Kind of Food, or even Water, that has stood long in Copper Vessels, is pernicious. The Symptoms, produced by this Poison, are Pains in the Stomach and Intestines, excessive Vomitings, Irritations to Stool, Ulcers in the Intestines, sometimes Difficulty of Breathing, and spasmodic Contractions of the Limbs, and lastly Death itself, if the Quantity of the Poison be great.

The

The Remedies proper in such Cases are, first, to take a great Quantity of Milk, Oil, or melted fresh Butter; then to drink warm Water till the Patient vomits plentifully. Clysters made with Oil, Butter, or fat Broths, are likewise proper, and lastly strengthening Cordials, and a Milk-diet.

Various Recrements of Copper were prepared by the Antients, and employed in Medicines such as *Ærugo*, *Flos Æris*, *Æs Ustum*, *Squama Æris*; of which the *Flos*, *Squama*, and *Ærugo* are mentioned by Hippocrates; but the *Ærugo*, or Verdigrease, is the only Recrement now much in Use. It is a green Rust, raised on Copper-plates; the Method of making it is thus: The Husks, Stones, &c. of Grapes, being first dried, and after dipped in some strong Wine, are laid for nine or ten Days in wooden or earthen Vessels, till they begin to ferment. Then being squeezed together with both Hands, they are formed into Balls, which are put into proper earthen Pots, and Wine is poured upon them, till about half is covered; the Vessels have a straw Lid thrown over them, and are set in a Wine-cellar, where the Balls are left in Maceration for twelve or fifteen Hours, being turned every four Hours, that the Wine may penetrate every Part of them. After this the Balls are raised about a Finger's Breadth above the Surface of the Wine, and set upon wooden Bars; the Vessels are then shut again, and left in that State for ten or twelve Days more. After which Time, the Balls emit a strong and penetrating Scent, and are then fit for dissolving Copper. For this Purpose they are broken and bruised with the Hand, that the outer Part of them, which is driest, may be exactly mixed with the inner, which is still moist with Wine; then they are stratified with Copper-plates in the same Vessels upon wooden Bars, the Plates making always the lowest Stratum, and the Balls the uppermost. The Plates are four Inches long, and three broad; and, if the Copper be new, they must be previously buried for twenty-four Hours in Verdigrease, and then heated a little in the Fire. The Vessels being filled in this Manner, and shut close, are left without any farther Management, till the Verdigrease is made, which happens sooner or later, according to the Nature of the Copper. Some Copper yields its Rust in six or seven Days; some requires twelve or fifteen Days. The Verdigrease thus compleatly extracted, the Plates covered therewith are taken out of the Vessels, and their Edges moistened with the strongest Wine; they are then wrapped up in linnen Cloths, dipped in the same, and laid in a Wine-cellar for three Weeks. By this, the Makers tell us, the Verdigrease is nourished, and then it is separated off from the Plates with Knives, and kept for Use.

Verdigrease is used by Painters and other Artists, but is seldom prescribed inwardly by Physicians. It is often used outwardly to deterge and dry Ulcers, and to eat away fungous and callous Flesh. It is the principal Ingredient in the *Unguentum Ægyptiacum*. *Geoffroy*.

The Directions of Oribasius from Antilius, with Respect to the Use of Verdigrease in Plaisters, is, that it must not be added to the other Ingredients, whilst boiling, but the Verdigrease must be put into a Mortar and rubbed with Vinegar, and the other Ingredients are to be poured upon it, and mixed with it.

Verdigrease is reckoned among Emetics, by Oribasius, *L. 7. C. 26*. And amongst Cicatrifiers, *L. 14. C. 57*.

Acturius recommends it for ficious and callous Disorders of the Eye-lids.

Verdigrease shews its acrid Quality by the Taste. It discuses, takes off, and consumes hard as well as tender Flesh. A little of it, mixed with a good Quantity of Cerate, makes an extorsory Medicine without Mordacity. *Paulus Ægineta, L. 7. C. 3*.

Oribasius says the same Thing in nearly the same Words. *L. 2. C. 1*.

The natural Verdigrease is a greenish Marchasite, like the Drops of Iron, and is found in Copper Mines, and is of no Use.

The greatest Part of the Authors who have treated of Verdigrease tell us, that it is made with Vinegar, which is not true, for the best Wine is not too good for it; and this is so true, that there is scarce any but Languedoc Wine that will make good Verdigrease. It is in and about Montpellier that the greatest Part of the Verdigrease, used in France and other Countries, is made, and it is a Commodity very difficult to make, and to hit right, although it seems as if nothing were more easy; for, if ever so little happens to be wrong, it grows greasy and black, and good for nothing, and will never come to a true Consistence.

There are some Authors, who say, that one may make Verdigrease, by putting Plates of Copper in a Crucible, with Salt, Sulphur, and Tartar, which being calcined and cooled, the Plates are converted into a very good Verdigrease; but these Operations, supposing them to be true, are at present of no Use, because all the Verdigrease we sell, is made in the fore-mentioned Manner.

We have two Sorts of Verdigrease from Montpellier, the one in Powder, the other in Cake: If it is good, it must be dry, of a beautiful deep Green; and with few white Spots. Verdigrease is a Merchandize that loses a great deal by drying, and this makes those who deal in it mix several Things with it, and render it so moist, that the Merchant loses much by the Waste, besides the Skin which covers it, for which they pay as much as if it were Verdigrease. Therefore they who use it should consider its Goodness, and not stand upon the Price; for I can affirm, that there is no Cake of Verdigrease, such as they send from Montpellier, that weighs twenty-five Pounds, but, after it is dry, has lost a third Part; so that the Verdigrease that cost twenty Pence, when soft, will be near twenty-eight Pence, when hardened.

Verdigrease is a Drug much demanded, and the Quantity of it that is used is almost incredible, not only in Physic, but by Dyers, Skinners, Hatters, Farriers, and Painters; but it is remarkable, that Verdigrease alone, ground with Oil, cannot be used; so that it is absolutely necessary for Painting, to add white Lead to it, for otherwise, instead of being green, it would be black. As for the Properties of Verdigrease, one of them is Eating off dead Flesh. They who colour Paper green, make Use of Verdigrease and white Tartar to give it that Colour.

The Apothecaries who have Occasion for Verdigrease in the afore-mentioned Compositions, and others, instead of the Powder, may dissolve it in Vinegar, and strain it through a fine Sieve, and so avoid, in reducing it to Powder, the Effects of the ill Quality of the Dust flying from it. *Pomet*.

It deterges powerfully, consumes proud Flesh, attenuates and resolves, and is used only in external Medicines; it is sharp and digesting, and cicatrises Ulcers, being mixed with Oil and Wax.

It is of good Use in the Gout, being dissolved in fair Water, and used warm to the Part.

It cures Diseases of the Eyes, and effectually takes off Pearls and Films. But before you use it for the Eyes, or for Wounds or Ulcers, you must purify it after this Manner: Powder it, and put upon it Spirit of Vinegar, six or seven Times its Weight, digest till the Vinegar is tinged very green, which decant, and cast away the Fæces; then evaporate the Vinegar in a brass Vessel, and so you will have an excellent Verdigrease at the Bottom, of which one Ounce is worth ten Ounces of the other.

Take of this fine Verdigrease, a Dram; Spirit of Sal Ammoniac, half an Ounce; Alcohol of Wine camphorated, two Ounces; mix them for a Collyrium to wash the Eyes. Take the White of an Egg, beaten well with Spring-water, four Ounces, and add to it Saccharum Saturni, ten Grains; white Vitriol, six Grains; and so many Drops of this Collyrium as may make it of an azure Colour, with this wash the Eyes two, three, or four Times a Day.

This fine prepared Verdigrease being made into an Ointment with Honey, Juices of vulnerary Herbs, Vinegar, and absterive Sulphur of Vitriol, is applicable to weeping Wounds, Ulcers in the Joints, &c. *Lemery*.

OF VERDIGREASE CRYSTALLIZED:

The crystallized Verdigrease, or Crystals of Verdigrease, or as it is called by Merchants and Painters, calcined or distilled Verdigrease; is Verdigrease dissolved in distilled Vinegar, and afterwards filtered, evaporated, and crystallized in a Cellar. These Crystals are of some small Use in Physic, to consume dead Flesh. They are likewise used by Painters to make a green Colour, especially in Miniature Pictures.

All the Crystals of Verdigrease that are sold in Paris, come from Holland or Lyons, and are not unlike Sugar-candy, except in Colour, especially to that which is on Sticks: These Crystals, if good, are beautiful, clean, and transparent, very dry, and free from Sticks. It must be observed, that the Verdigrease which the Apothecaries make is reduced to Crystals by the Means of a Cellar, whereas that which comes to Paris is made after the Manner of Sugar-candy, as I have been informed.

I cannot tell what has induced the Merchants to call these Crystals distilled or calcined Verdigrease, seeing it is neither distilled nor calcined, but made after the Manner above-mentioned.

They likewise make Crystals of Verdigrease by dissolving Copper granulated in Spirit of Nitre, and afterwards evaporating to a Pellicle, and setting it in a Cellar to crystallize.

If you would reduce these Crystals to a Liquor, after having dried them, you must carry them back to the Cellar, to resolve them into a Fluid; and this Liquor is called by the Apothecaries and Chymists, the Liquor of Copper, or Venus, and the Crystals, the Vitriol of Venus, or Copper. *Pomet*.

OF *ÆRUGO SCOLECIA*.

There are two Sorts of *Ærugo Scolecia*; one is a Fossile, the other factitious, and made after the following Manner:

Put a Quarter of a Pint of strong White-wine Vinegar into a Mortar of Cyprian Copper, which has a Pestle of the same Metal, and rub it about till it grows viscid and ropy; then put to it a Dram of round Alum, and the like Weight of transparent fossile Salt, or the whitest solid Sea-salt, or at least Nitre; beat them well in the Sun, during the Heat of the Dog-days, till they take the Colour of Verdigrease, and become of a ropy Substance; then draw it out, and make it up in the Form of Worms, such as breed on Rose Bushes, and keep it for Use. It acquires the more Virtue, with a very fine Colour, if two Thirds of stale Urine be mixed with one of Vinegar, and the rest managed as before. Some take their *Ærugo Rasilis* that was spoiled or damaged in working, and make it up with Gum, and sell it; but have a Care of the Cheat. The Goldsmiths also make a Sort of Verdigrease, to solder Gold, of a Boy's Urine, with a Copper Mortar and Pestle.

All these Sorts of Verdigrease answer the Purposes of the *Æs Ustum*, but more effectually. Among them the *Fossile Scolecia* is the most esteemed, the *Rasilis* takes the second Place, and the *Factitious* the last, which is the most biting and astringent; but the Goldsmiths Verdigrease answers to the *Rasilis*.

They are in general of an astringent and heating Nature; they eat away and attenuate Cicatrices in the Eyes, excite Tears, check phagedenic Ulcers, preserve Wounds from Inflammation; mixed with Oil and Wax, they bring Ulcers to cicatrise; boiled with Honey, they deterge foul and callous Ulcers; applied as a Collyrium (See COLLYRIUM) with Gum Ammoniac, they consume the Callosities of Fistulas; they help Swellings and Excrescences of the Gums; mixed with Honey, they mightily reduce the Swellings of the Eye-lids that are anointed therewith; but then, after Anointing, they are to be fomented with a Sponge dipped in warm Water; compounded with Refine of Turpentine and Copper, or Nitre, they cure the Leprosy.

Whatever Sort of Verdigrease you use, must first be burnt in the following Manner: Having broken it into very small Bits, set it over burning Coals in an earthen Pot, and stir it about till it turn to a Sort of an Ash-colour; then take it off, and when it is cool set it aside for Use. Some burn it in an earthen Pot never burnt before, but then it does not always take the same Colour. *Dioscorides*. L. 5. C. 92.

OF *ÆRUGO RASILIS*.

Ærugo Rasilis is prepared the following Ways: Put some of the strongest Vinegar into a Firkin, or such like Vessel, and set over it a Copper Pot, inverted, well scoured, and without a Vent-hole; it is best if the Pot be bellied, but a cylindrical one will serve the Turn. After ten Days, remove the Cover, and you may scrape off the Verdigrease that sticks about it. Or, hang a Copper Plate in the Vessel over the Vinegar, so as not to touch it, and after the same Space of Time scrape off the Verdigrease, or put one or more Lumps or Plates of Copper into stale Husks of Grapes that are growing sour, and turn them in like Manner. Verdigrease may also be made of Filings of Copper, or Plates on which Gold is hammered into Leaves, by sprinkling them with Vinegar, and turning them three or four Times, till they contract a Rust on all Sides. It is said, that two Sorts of Verdigrease are produced in the Mines of Cyprus; one that sticks upon the Stones which have a Mixture of Copper in them, and another Sort that in the Dog-days distils from a Cave in a Rock: The first Sort, it seems, is excellent, though but little in Quantity; the other, though plentiful and of a fine Colour, is vitious, being mixed with much stony Matter.

Verdigrease is adulterated many Ways, especially the following: Some mix with it Pumice-stone, others Marble, or Vitriol. But you may find out the Pumice-stone and Marble, by wetting your left Thumb, and with the other rubbing on it a little of the Verdigrease; for this will dissolve and run, but the Marble and Pumice-stone remain undissoluble, and with continued Rubbing and Wetting grow white. Or you may discover this Defect by biting it, for the pure Verdigrease feels smooth, without the least Roughness under the Teeth. But the Vitriol is discovered by the Fire; for if you rub a Plate of Metal, or Tile, with this vitiated Sort, and set them on hot Embers, or Coals, what is mixed with Vitriol will turn red, because Vitriol burnt naturally takes that Colour. *Dioscorides*. L. 5. C. 91.

Oribasius transcribes this literally from *Dioscorides*,

OF BURNT COPPER.

The *Æs Ustum*, or burnt Copper, is made of red Copper cut into Plates, and put into a Crucible with Sulphur, and a little common Salt, Stratum super Stratum, and put into a fierce Charcoal Fire; and when the Sulphur is burnt away,

and the Copper taken out, it is of an iron Colour without, and of a reddish one within, shining, and very brittle.

The *Æs Ustum*, if it be good, should be inoderately thick, and of the Colour before-mentioned; and, being rubbed, should make a Red like that of Cinnabar, which it cannot do, unless some Salt be put to it. This is the Secret of the Dutch, whereby they make it better than they do, in other Places.

The *Æs Ustum* is of some small Use in Physic, because it is deterfive; but they who make Use of it, make it red-hot in the Fire nine Times, and quench it as often in Linseed Oil; and, reducing it to Powder, use it for eating off dead Flesh; and they call this Powder of the *Æs Ustum* so prepared, *Crocus*, or Saffron of Copper. *Pomet*.

Good Burnt Copper is red, and, when rubbed, takes the Colour of Cinnabar; the Black is burnt too much. It is prepared of the Nails taken out of Ships that are broken up. These Nails are laid in an earthen Pot never baked, with Sulphur and Salt in equal Quantities strewed under them, and laid Stratum super Stratum. The Pot being covered, and the Lid well closed around with Potters Clay, is set in the Furnace, till it be thoroughly baked. Some, instead of Sulphur and Salt, use Alum; others burn the Nails laid in the Pot, without Salt or Sulphur, for several Days together; others, again, burn them with Sulphur only, but then the Nails are stained with a sooty Colour. Some anoint the Nails with Icifile Alum, and, with an Addition of Sulphur and Vinegar, burn them in an earthen Pot never baked. Lastly, others sprinkle the Nails with Vinegar, and burn them in a Copper Pot three Times over, and then lay them by.

The best Burnt Copper is made at Memphis, the next in Cyprus. It is of an astringent, drying, attenuating, repelling, drawing, cleansing Quality, and brings Ulcers to cicatrise, wastes Excrescences on the Eyes, consumes luxuriant Flesh, and restrains spreading Ulcers. Drank in Hydromel, or taken in a Linctus, or mixed with Honey, it gives a Vomit. It is washed like the Cadmia, changing the Water four Times a Day, till no Froth arise. The Scoria, washed after the same Manner, acquires the same Virtue, but in a less Degree. *Dioscorides*. L. 5. C. 87.

OF THE MOUNTAIN, OR SEA VERDIGREASE.

The Mountain or Hungarian Verdigrease, is a Sort of greenish Powder in Grains, like Sand, which is found in the Mountains of Kernaufen in Hungary, and comes from Presbourg to Poland. It is found likewise in the Mountains of Moravia; and some will have it, that what the Antients call Flowers of Brass, was made by throwing Water, or rather Wine, upon Rose Copper, whilst red, that is to say, as it comes out of the Furnace; and that this Flower, or Mountain Verdigrease, is gathered and found sticking to other Plates of cold Copper, which they place over them, in small Grains like Sand; and that this is made by Vapours which arise, when they throw Water or Wine upon the hot Copper, and that it is this which makes, what we call Rose Copper, to be so unsmooth, and to be full of little Figures. Others affirm, that this green Powder was Plates of Copper dissolved in Wine, which was made almost after the same Manner as Verdigrease; but as I know no more of it, I shall only say, that such is to be made Choice of as is dry, of a high Colour, well granulated, that is to say, like Sand, which is the Mark of natural Mountain Verdigrease, and makes the Difference betwixt that and the artificial, which some make by pulverizing Verdigrease, and putting a little white Lead amongst it.

The Verdigrease of the Mountain is of no other Use but in Painting, principally for making a Grass-Green; and therefore it is that most of the green Painting we see in Gardens is done therewith.

As it is a dear Commodity, and comes from several Parts, so there are different Sorts of it, and different Prices; therefore they who use it should regard the Qualities of it, rather than the Cheapness. *Pomet*.

OF THE FLOS *ÆRIS*.

Flos Æris Officinar. is nothing but Copper reduced to small Grains like Millet-seed; which is done by pouring cold Water upon melting Copper, which thereupon immediately flies every Way into Grains, which are collected and kept for Use. *Geoffroy*.

The *Flos Æris*, which some of the Antients called the *Offal* [Fiqua] of the Nails, is best when it is friable, of a deep Yellow when rubbed, like a Grain of Millet, small, ponderous, and moderately shining; which is not intermixed with Filings of Copper, with which it is often adulterated. The Fraud is discovered by the Filings giving Way, and dilating under the Teeth. The *Flos* is obtained, when the Copper, after Fusion, runs from the Furnace to the Receiver, through the Strainers of the Pipes that belong to it: For, at that Time, the Overseers of the Works for refining of Metals pour fair Water upon it, to refrigerate it. The Metal by this sudden Check condenses, concretes, spurts, and, as it were, spues out the *Flos*.

It has an astringent Quality, and restrains Excrefcences. It clears the Pupil of the Eye of Things which darken the Sight, but is of a very corrosive Nature. Given to the Weight of twelve Grains, it expels gross Humours. It consumes fleshy Excrefcences in the Noftrils, and in the Anus. Taken in Wine, it restrains Eruptions. The Powder of the white Sort, blown into the Ear through a Pipe, helps an inveterate Deafness; and applied with Honey, represses Tumors of the Uvula and Tonsils. *Dioscorides, L. 5. C. 88.*

Pliny takes his Account of the *Flos Aeris* from Dioscorides.

Of the SQUAMA AERIS.

Squama Aeris Officin. is little different from *Aeris Ustum*, being only the Particles of burnt Copper that fly off while it is hammered. These *Squamae*, or instead thereof, the Filings of Brass, mixed with Sulphur, and the Powder of Florentine Orrice, and wore in the Shoes, cure stinking Feet; but this Practice may be attended with great Inconvenience, for, by checking suddenly that stinking Sweat, Diseases of a worse Kind may ensue. *Geoffroy.*

The *Squama* produced in the Cyprian Copper-Works, which is thick, and goes by the Name of *Helitis*, is of a good Kind. But what comes off in the Working of white Copper, being thin, and of little Substance, is accounted of no Value. Therefore, rejecting this, we are to chuse what is thick; of a deep Yellow, and will rust with the Sprinkling of Vinegar.

It represses, attenuates, stops the Progress of eating Ulcers, suppurates, and cicatrises. Drank in Hydromel, it purges Water. Some give it made up in Meal in the Form of Pills. It has a Place also among the Collyria or Medicines for the Eyes, for it takes away the Roughness of the Eye-lid, and dries up Rheums.

The Washing of it is thus performed: Put half a Pound of dry *Squama Aeris* cleaned into a Mortar with Water; stir it well about with the Hand till the *Squama* subside. Fling away what swims at the Top, and, pouring off the first Water, put in a small Glass-full [$\frac{1}{2}$ of a Pint] of Rain-water, and with your flat Hand rub the *Squama* in the Mortar, as if you would reduce it to Powder. When it begins to grow viscid, pour in now and then a little Glass of Water, till it amount to six Glasses, or half a Pint, rubbing strongly all the while. Then take the *Squama* in your Hand, and rub it well against the Side of the Mortar; and, there strongly pressing it, receive all the Moisture that comes from thence in a Box of red Copper. This is, as it were, the *Flos Squamae*, being full of Virtue, and most effectual in Distempers of the Eyes; what is left is of little Value. However, you may continue to wash it, till it will grow no longer viscid, and then cover it with a clean Cloth, and lay it aside for two Days, after which, letting the Water that stands upon it run off, when it is sufficiently dry, keep it in a Box for Use. *Dioscorides, L. 5. C. 89.*

The most usual Medicines, prepared with Copper, are the *Green Precipitate*, described among the Preparations of Mercury, and the *Eus Veneris* of Mr. Boyle, which is made in this Manner:

Take of Colcothar, made of blue Hungarian, or Copper Vitriol, well calcined and washed, two Drams; of Sal Ammoniac, four Drams; mix them well, and sublime the Flowers three Times, by cohobating them on the *Caput Mortuum*. The Dose is from one to six Grains. These Flowers are much commended by Boyle in the Rickets, and are said to be a powerful Remedy in a virulent Gonorrhoea.

The *Tinctura Caerulea*, or *Collyrium Caeruleum*, is made from Copper, Sal Ammoniac, and Lime-water. It is used for Diseases of the Eyes, to stop Gonorrhoeas, and to deterge and dry Ulcers. *Geoffroy.*

Thin Plates of Copper infused all Night in Lime-water only, or in Lime-water mixed with volatile Salt, or Spirit of Sal Ammoniac, make an admirable *Collyrium* for the Eyes, to wash with against Mists, Clouds, Films, Pearls, Suffusions, &c. *Lemery.*

The Chymists dream, that a red Sulphur is contained in Copper, called by Helmont, *Ignis Veneris*, and *Sulphur Philosophum*, which, he says, prolongs Life. They try to extract this Sulphur for two Reasons; first, to obtain thereby a sovereign Remedy in all Diseases, and a present Anodyne in all Pains: Secondly, To deprive Copper of its red Colour, and make it a white Metal, resembling Silver. But I can find no other Sulphur in Copper, except that bituminous inflammable Substance common to all Metals, and, indeed, to all combustible mixt Bodies. In giving such large Encomiums to this Sulphur, the Chymists therefore only shew their own Ignorance; for the red Colour of Copper is owing to the Earth, not to the Sulphur contained in it; and it is perfectly vain to pretend to extract a fixed Sulphur from that Metal; for these red Tinctures are only the Copper itself divided into very small Parts, and suspended in different Menstrua, as appears by precipitating these Particles. They have likewise vainly endeavoured to rob Copper of its red Coat, as they term it; what they call white

Copper, does not owe that Colour to the Loss of its red Sulphur, but to the Addition of a white Earth, found in the fixed alkaline Salts, which they make Use of. This Becher has very well observed. *Geoffroy.*

The Solution of COPPER in distilled VINEGAR, from *Boerhaave.*

Take a large glass Body, cut so as to have a very wide Mouth, with an alembic Head answering to it; in this Head put thin Plates of Copper, so as to stand somewhat erect, without falling, all around the hollow Part of the Ledge. Put Vinegar into the Body; set it in a Sand-heat, put on the Head with the Copper-plates, apply a Receiver, and distil with a gentle Fire for twelve Hours, the Vinegar then comes over green, and, if the Operation is continued for a sufficient Length of Time, the whole Substance of the Copper will be dissolved. The Liquor thus procured filtered; and inspissated with a moderate Heat, acquires a green Colour, like that of an Emerald; but of a disagreeable nauseous Smell, and the very smallest Drop of it proves instantly emetic. The Plates, being dried, yield an *Aerugo*, or Flower of Copper, but not the true Verdigrase of Copper, which is made only at Montpellier, in the Manner above described.

If the common Verdigrase of the Shops be boiled in a tall Bolthead with pure distilled Vinegar, till a Tincture is extracted, and if that is poured off, and fresh Vinegar added, and boiled again, and these Operations repeated, till the last Vinegar by boiling will be tinged no longer, there will then remain a good deal of indissoluble Matter at the Bottom; and this demonstrates something is mixed with the common Verdigrase, and that it is adulterated. If all these tinged Liquors are depurated by Filtration, and are then distilled till there remains only one fourth Part, they make a strong Liquor of Copper.

From this Process, we learn the great Solubility of Copper, and the Origine of Verdigrase; and, because Copper so readily grows green with Acids, this furnishes us with a Method of discovering this Metal (which has a surprising emetic and purgative Quality) when it lies concealed in Silver. If watery, lax, sanious, virulent Ulcers are touched with this Liquor, it helps to quicken, contract, dry, and cleanse them.

The Solution of COPPER by SAL AMMONIAC.

With one Part of Filings of the purest Copper, mix three of Sal Ammoniac, pour upon it four Parts of clean Water, in a Cucurbit cut for the Purpose, and, with a moderate Fire, dry the Paste, and then suffer it to dissolve again in the Air. Repeat this Resolution and Exsiccation many Times, and you will at last obtain almost an intire Solution of the Copper. Boil this Mixture in Water, filter it, and inspissate it a little, and a blue Tincture will be procured; and if, according to Art, you bring this to crystallize, you will have some beautiful Crystals of Copper.

This Process shews how Copper and Salts act upon each other. This Liquor is the famous Anti-epileptic for Children. If a few Drops of it are given to them fasting in Mead, it operates by Stool, excites a Nausea, and has a considerable Effect upon their languid, tender Stomachs, which it stimulates, and brings away any Water, or Mucus lodged therein, and in the Intestines, and destroys Worms. By this, therefore, some bad Habits of Body, and some Kinds of Epilepsies, are cured.

The Solution of COPPER in AQUA FORTIS.

To common *Aqua Fortis*, or Spirit of Nitre, in a clean glass Vessel, add a small Quantity of very fine Filings of pure Copper. Upon this there will arise a prodigious Effervescence with red Fumes, and in an Instant the whole Liquor will acquire a beautiful green Colour. Proceed in this Manner till the last Portion thrown in will no longer increase the Greenness. When the Liquor is depurated by standing quiet, and filtered, evaporate it to one half.

Here we see the Effect of the Acid of Nitre upon Copper. This Tincture proves an Emetic in the very smallest Quantity. It kills all Insects, and hence, if it is diluted with a good Deal of Water, it expeditiously destroys Fleas, and Lice, both the common Sort, and the flat ones that breed upon the Pubes. It has the same Effect upon Ulcers as the Vinegar of Copper; but must be used with Caution.

The Solution of COPPER in AQUA REGIA.

Into *Aqua Regia*, or Spirit of Salt, throw Filings of Copper, and proceed as in the former Process, and the Effect will be just the same.

Hence it appears, that *Aqua Fortis* and *Aqua Regia* dissolve Copper alike. There is no Ground, therefore, for the Opinion of those Chymists, who, from an imaginary Diversity in them, have pretended to give the Reasons why one dissolves Gold only, and the other Silver. This certainly arises purely from the singular reciprocal Disposition of Bodies to one another, nor can we come to the Knowledge of it, but by Experiments. And for the same Reason, they argue as unreasonably concern-

ing the Resemblance of Metals, from their being dissolved by the same Menstruum. Sound Chymistry proceeds very cautiously in Things of this Nature, and is afraid of Universals, unless when collected from certain Observations.

The Solution of COPPER in a volatile ALKALI.

Upon one Dram of Filings of Copper in a clean glass Vessel, pour twelve Times as much of a good alkaline Spirit of Sal Ammoniac. Stop the Vessel, shake it about frequently, and you will have a Tincture at first of an Azure, and afterwards of a violet Colour, which will be very beautiful. Pour off the Tincture; upon the Residuum put fresh Spirit, and by this Means almost all the Copper will be gradually dissolved, and converted into a Tincture.

If Filings of Copper are moistened with three Times the Quantity of Oil of Tartar *per Deliquium*, and then digested, dried, and dissolved, and this is often repeated, and then the Matter is boiled, filtered, and inspissated, by this Means such another Liquor, but of a fixed Nature, will be obtained.

This volatile alkaline Tincture contains the Substance of the dissolved Copper. If a Person takes it fasting in a little Mead, and walks gently after it, beginning at first with three Drops, and afterwards doubling the Dose every Morning, till the fourth Time, and then repeating the last Dose for some Days, it opens, attenuates, warms, and proves an exceeding powerful and speedy Diuretic. By the Help of this alone, Boerhaave says, he cured a perfect *Ascites*, such a prodigious Discharge of Urine being excited, that it was discharged as if it ran out of an opened Cock, upon which the Integuments of the Abdomen became so loose, that they might be wrapped over one another. He then only ordered a dry restorative Regimen, and the Patient recovered perfectly, and enjoyed a good State of Health many Years after. This, as it happened in his younger Days, he says, gave him great Encouragement; but, upon trying the same Medicine afterwards in the like Cases, its Inefficacy gave a Check to his Vanity, and taught him, that Nature has a great Hand in these happy Events. He adds, I am convinced, that among the various Kinds of Dropsies, some may be cured by different Methods, and some not at all. In acid, watery, weak, cold, mucous, pituitous Disorders, the same Tincture, however, is often used with Success. The Solution of Copper, in all acid, alkaline, and compound Salts, either latent or open, appears by every Kind of Trial to be very easy; for even the expressed Oil of Olives, and the distilled Oil of Turpentine, and others, which always contain a latent Acid, will, by being digested with Copper, acquire a green Colour, and at the same Time be rendered fit for some surgical Uses. *Boerhaave's Chymistry.*

I have been thus particular with Respect to Copper, that no Body, whose Duty it is to be acquainted with every Part of the *Materia Medica*, may be subject to the Imputation of being ignorant of these Preparations, which Pliny casts upon the Physicians of his Age. This Author, speaking of the Recrements of Copper, says, that Physicians are not acquainted with them, few knowing them, even by Name, so far are they from understanding how Medicines ought to be prepared, which is properly the Province of Physicians. But now, instead of this, when they meet with any Thing in Books, which they have an Inclination to try, at the Hazard of the miserable Patient, they trust to the (Sepulchre) Preparers of Medicines, who corrupt them by all Manner of Adulterations, and content themselves with stale Plaisters, and Collyria, and the very Refuse of Drugs.

Every Body, who is in any Degree acquainted with the Education and Learning of our own Country Physicians, will know this Character is not in the least applicable to them. And I know many Apothecaries that have had proper Opportunities of Information, who, I am convinced, deserve no Part of this Inveective.

In the Days of Pliny, the Physicians at Rome must have been infected with the general Corruption of the Times, or else the Author must have been very malicious to those of the Profession that were his Contemporaries, perhaps on Account of some personal Enmity against one Man.

ÆSALO. *Ἄισαλος.* The Name of a small Hawk, called also *Merillus*, or *Smerillus*, mentioned by Aldrovandus, and by Aristotle. I don't find that any medicinal Virtues are attributed to it, nor can I tell why Castellus has inserted it. It is one of the Birds which the Jews were forbid to eat.

ÆSCHOS. *Ἄισκος.* Deformity of the Body in general, or any particular Member. *Constantine. Castellus.*

ÆSCHRION. The Name of a Physician of the Empiric Sect. All that is farther known of him is, that he was very well versed in the *Materia Medica*, and was one of Galen's Masters, who describes a Remedy he learned from him, against the Bite of a mad Dog, which he esteems of considerable Efficacy. The Medicine is this:

Take of the Ashes of Cray-fish burnt alive, in a red Copper Pot, ten Parts, of Gentian five Parts, of Frankincense one Part. Let the Patient take a large Spoonful of this in Water forty Days together. But if Application be not made for a

Cure, till some Days after the Bite, the Dose must be doubled. At the same Time apply to the Wound a Plaister made of Pix Brutia, Opopanax, and Vinegar, compounded according to the Rate of Pix Brutia one Pound, an Italian Pint of the strongest Vinegar, and three Ounces of Opopanax. Galen says, that he very much confided in this Medicine, because not one of those who used it died. *Æschion* burnt his Cray-fish after the Rising of the Dog-star, when the Sun was passed into Leo, and on the eighteenth Day of the Moon [the third Day after the Full Moon].

ÆSCHYNOMENOUS Plants, [of *Ἀισχynomένους*, of *αἰσχύνωμαι*, Gr. I am ashamed.] Those Plants are commonly called *Sensitive*, or *sensible* Plants; as giving some Tokens of Sense: They are such whose Frame and Constitution is so nice and tender, that on the Touch, or least Pressure of one's Hand, they will contract their Leaves and Flowers, as if sensible of the Touch. *Miller's Dictionary.*

ÆSCULAPIUS. The History of this great Physician, for such he appears to have been, is so involved in Fable and Romance, that it is impossible to extricate the Truth with any Certainty. Tully says, there were three of the Name. The first was the Son of Apollo, and the same that was held in great Veneration by the Arcadians: He was the Inventor of the Probe and Bandage.

The second *Æsculapius* was Brother to the second Mercury. This is he that is reported to have been struck with Thunder by Jupiter, and is said to lie buried at Cynosura in Peloponnesus.

The third was the Son of Arfippus and Arfione. He invented Purging, and Drawing of Teeth.

Monsieur Le Clerc is of Opinion, however, that there never was more than one *Æsculapius*, and that he was a Phenician, or rather a Nephew of Chanaan, which last he apprehends to be the same as Hermes. Or at least, if there was an *Æsculapius* amongst the Greeks, that he borrowed not only the Name, but the Character of the Phenician.

The Egyptians relate, that *Æsculapius* was taught Medicine by Hermes, whom they represent as the Inventor of the Art. And if the Account given by Sanchoniathon is true (See *Eusebius*) *Æsculapius* and Hermes were nearly related, for Misor, the Father of Hermes, had a Brother, whose Name was Siduc, or Sadoc. This last had seven Sons, called *Dioscures*, *Cabires*, or *Corybantes*, and an eighth, which was *Æsculapius*, by one of the Daughters of Saturn and Astarte. By this Genealogy, it appears, that Hermes and *Æsculapius* were first Cousins, and it renders the Egyptian Account, that *Æsculapius* learned Medicine of Hermes, the more probable. Upon the Whole, the intire Family seems to have been concerned in making Improvements in, or inventing Medicine, for the Sons of the Cabyres or Corybantes are by the same Sanchoniathon represented to have employed themselves in discovering the Virtues of Plants, and Remedies against venomous Bites.

The Oriental Authors relate, that *Æsculapius* was a Disciple of Edris, who is the same as Enoch; and the Oriental Christians have a Tradition, that Enoch, or Edris, is the same as the Hermes of the Egyptians, called TRISMEGISTUS.

This *Æsculapius*, according to the Accounts given of him by the Eastern Writers, gave the first Rise to Idolatry, in this Manner: After the Death of Edris, or Enoch, *Æsculapius*, by the Instigation of the Devil, made a Statue in Honour of his Master and Patron, whom he represented, holding a Branch of Althæa, or Marsh-Mallows in his Hand, and, being constantly before it, seemed to pay it extraordinary Honours. This was afterwards imitated by his superstitious Countrymen, till at last it rose to Idolatry.

This is the Sum of what is related, with respect to the Egyptian, or Phenician *Æsculapius*. The Accounts we have of the Grecian *Æsculapius* are much more ample, but equally uncertain, and perhaps more fabulous, it having been the Custom amongst the Greeks, to rob the Egyptians of their Mythology, and to disguise the allegorical Meaning with Fictions of their own.

The Mother of this *Æsculapius* was Coronis, a Daughter of Phlegias, King of the Lapithæ in Thessaly; or, according to some, Arfioce, Daughter to Leucippus of Messenia. This Lady, being clandestinely with Child by Apollo, was delivered of her Son on a Mountain in the Territory of Epidaurus, during a Journey with her Father into Peloponnesus, where the Child was left. A Peasant of those Parts, missing a she Goat and his Dog, went in Search of them, and found the Goat giving Suck to the young *Æsculapius*, and the Dog mean-While guarding them.

Others give a different Account of his miraculous Birth. They agree, that Coronis was with Child by Apollo; but say, that Apollo having discovered that the Nymph granted the same Kind of Favours to a young Arcadian, which she had bestowed on him, in a Fit of Jealousy, sent his Sister Latona, to spread a Plague in the City where his Mistress lived, of which she died. But, as she was on the Funeral Pile, the God came, and took his Son away, out of the Midst of the Flames, and conveyed him to Chiron the Centaur, who undertook the Charge of his Education. *Pindar.*

Other fabulous Accounts are given of the Birth of *Æsculapius*, and many Countries dispute for the Honour of producing him, as was usual amongst the Greeks, with respect to their eminent Men. But it is agreed on all Hands, that he was bred under the Tuition of Chiron the Centaur, and that, by his Instructions, and the Assistance of his Father Apollo, he arrived at a very extraordinary Knowledge in Physic, which gained him a Place amongst the heathen Divinities, after he had rendered himself agreeable to Mankind, by curing those who stood in Need of his Assistance, of Ulcers, Wounds, Fevers, and painful Disorders, by Means of Incantations, lenient Potions, Incisions, and external Applications. It was on Account of his extraordinary Skill in all Branches of Physic, that he was chosen by the Heroes concerned in the Argonautic Expedition, to accompany them in that hazardous Enterprize.

The Greeks, much used to Exaggeration, when the Honour of any of their Countrymen is in Question, relate, that *Æsculapius* could not only recover People from dangerous Distempers, but also knew a Way of restoring Life to those that were dead; and of this they give many Instances, among which, the last was Hippolytus. Upon this, they say, Pluto made a Remonstrance to Jupiter, that, if *Æsculapius* was suffered to proceed in this Manner, the Regions under his Jurisdiction would in Time become desolate. Upon this Complaint Jupiter struck *Æsculapius* with a Thunderbolt, and with him Hippolytus, whom he had raised from the Dead; but at the Request of Apollo he was afterwards placed among the Stars by the Name of *Ophiucus*.

He left two Sons Machaon and Podalirius, of whom Homer makes honourable Mention. The Wife of *Æsculapius* was called *Epione*, or according to others *Hygiea*, or *Lampetia*. His Daughters were *Egle*, *Panacea*, *Jaso*, *Reme*, and *Aceso*. He is also said to have had a Sister called *Eriopis*. All these are said to have been concerned in improving the medicinal Art.

After the Death of *Æsculapius*, a great Number of Temples were built in Honour of him in Greece, and the Grecian Colonies. Schulzius reckons up from Pausanias, and other Authors, sixty-three; to which People from all Parts resorted, in order to be cured of their Distempers, which were probably performed by common Means, but were attributed to the miraculous Influence of the God by the Address of his Priests.

The Romans did not fail to imitate the Greeks in every Species of Superstition and Idolatry. Accordingly they built a Temple to *Æsculapius* in the Island of Tiber, upon the following extraordinary Occasion, according to the Account Aurelius Victor gives of it.

Rome, at that Time, and the adjacent Territories, were ravaged by a Plague. Upon this Occasion an Embassy, consisting of ten, with Q. Ogulnius at their Head, was dispatched to Epidaurus, in order to invite the God *Æsculapius* to Rome. When these Ambassadors arrived at Epidaurus, as they were admiring the extraordinary Statue of *Æsculapius*, a large Serpent came from under the Altar, and passing from the Temple to the Roman Ship, went into the Apartment of Ogulnius. The Ambassadors rejoiced at this Prodigy, immediately set sail, and arrived safe at Antium with their Charge, but being detained there some Days by the Tempestuousness of the Seas, the Serpent got out of the Vessel, and lodged himself in a neighbouring Temple dedicated to *Æsculapius*, but as soon as it was calm, returned, and then the Ambassadors pursued their Voyage; but when they arrived at the Island of Tiber, the God in the Shape of a Serpent quitted the Ship, and went on Shore, where they built him a Temple, and the Plague immediately ceased.

Pliny says, this Temple was built there out of some Disrespect which the Romans had for the Art over which *Æsculapius* presided. A very childish Reason; as if that wise People would have been at the Trouble to have sent a solemn Embassy to Epidaurus for the God, in order to affront him.

Plutarch, in the Opinion of Le Clerc, has given a better Reason. This Author seems to think, that both the Temple at Rome, and the other Temples in Greece, dedicated to *Æsculapius*, were built in open and high Situations, that the Sick which resorted to them might enjoy the Advantage of a good Air.

There can be no Doubt, but that the Romans built this Temple to *Æsculapius*, at a Distance from the City, in Imitation of the Greeks. And there is a better and very obvious Reason, why the latter chose such Situations for these Temples, I mean, because they intended to prevent contagious Distempers from being brought into their Cities, by the Sick which resorted to the Priests of *Æsculapius* for their Cure, and from being bred in the close Air of a populous Place by a Concourse of diseased People.

The Statue of *Æsculapius* at Epidaurus, made by Thrasy-medes, the Statuary, was remarkable for the Size, the Workmanship, and the Materials, which were Gold and Ivory.

In this he was represented sitting on a Throne, with a Staff in one Hand, and leaning with the other on the Head of a large Serpent, with a Dog at his Feet. Pausanias says, the Dog was placed there, because he guarded *Æsculapius* in his Infancy. Le Clerc rather thinks this Animal an Emblem of that Sagacity which is necessary to a Professor of the Art over which this God presides.

From the same Pausanias we learn, that he was sometimes figured holding a Pine-cone in his Hand. And that a large brown Serpent, peculiar to the Country of Epidaurus, was sacred to him. This Sort of Serpent was esteemed harmless, and some of them were always kept in his Temple at Epidaurus. In most of his Figures this Serpent is drawn twisted round the Staff he holds in his Hand.

Sometimes a Cock is placed at his Feet to represent Vigilance; sometimes an Eagle, an Emblem of Discernment or Longevity, on his right Side, and a Ram's Head on the left, which is said to be expressive of Dreams and Divinations.

Upon some Medals *Æsculapius* is accompanied by a little Figure of a Youth, clothed in a Habit which covers his Head; this, Mr. Spon says, was the Emblem of Sicknes, the Object of Medicine, because amongst the Antients the Sick covered their Heads, whereas those that were in Health went bare-headed. This little Figure was called by the Names of *Telesphorus*, *Acesus*, *Evamerion*, or, as Mr. Le Clerc remarks, *OB*. What the last-mentioned Author adds upon this Occasion, is too curious to be omitted. With that, therefore, I shall conclude the fabulous Accounts of *Æsculapius*.

Monsieur Patin gives an Account of a Medal struck in Honour of the Emperor Adrian (perhaps on Account of his Knowledge in Physic) where on one Side *Æsculapius* is represented accompanied with *Hygiea*; on the other *Telesphorus* with this Inscription round it:

ΠΕΡΤΑ ΕΠΙ ΚΕΦΑΛΑΙΩΝΟΣ.

And just before *Telesphorus* the Letters *OB*. Mr. Patin explains the first Words *Pergamensurum sub Cephallione*, adding in Italics, *Telesphorus*. He afterwards adds, from Pausanias, that *Telesphorus* was a Divinity of the Pergamenians, who was so called by the Directions of an Oracle, and that some translate the Word by *Familiar Spirit* (Devin) or *Ventriloquist*. This, says Mr. Le Clerc, made me imagine that *TELESPHORUS* and *OB* were the same, having found *OB* in other Places also translated *Familiar Spirit*, or *Ventriloquist*.

Selden tells us, that the Word *OB* was usually translated *Python*, or *Magician*. This *OB* was a Spirit, or Demon, that gave Answers which seemed to come from the Pudenda, the Head, or the Armpits, but in a Voice so low, that it appeared to proceed from some deep Cavity, as if a dead Person spoke in a Tomb, inasmuch that those who consulted it, sometimes did not hear it at all, but formed in their Imaginations what Answers they thought proper. Selden adds, See the History of *Samuel*, whose Figure was represented to Saul by a Woman, from the Pudenda of whom *OB* either spoke, or was imagined to speak. The Scripture, in the first Book of *Samuel*, Chapter 38. * calls this Woman *Pythonesse*, or *Ventriloqua*, as it is translated, a Woman who had *OB*; hence Saul addresses her thus, *Prophecy to me, I pray you*, by *OB*, which the Septuagint translate, *Prophecy to me by VENTRILOQUUS*. *OB* therefore was a Spirit which was supposed to speak from the Belly.

Thus far Mr. Le Clerc, and as the Hebrew Word is אבוב; *OB*, which in the Septuagint is translated, *εγγαστριμυθος*, and our Translators render *Familiar Spirit*, I think there can be no Dispute of his being right.

Buxtorf renders the Hebrew Word *OB* by *Pytho*, one who, in giving Answers by diabolical Arts, seduces Men from God, *Levit. XIX. 31. XX. 27.* The Word also, as he observes, signifies *Bottles*, *Job XXXII. 19.* Hence *Pytho*, according to Aben Ezra, means one who uttered Oracles from a swollen Belly, as from a Bottle, whence the Person was called *εγγαστριμυθος*.

I must remark farther, that there have been People in our Days, who were Masters of the Art of managing their Voice in such a Manner, as to make it in Appearance proceed from any Part about them, or even near them, and that in much such a Tone as that of *OB* described by Selden. There was a Fellow about Town about twenty-five Years ago, called the speaking Smith, who was a great Master in this Way, and who, instead of being ambitious of the Character of a Conjuror, employed this Talent in frightening Porters, Drawers, and other People, who were not acquainted with the Trick, and whom their Friends contrived to bring into the Smith's Company, on Purpose to be teased and terrified. About ten Years ago there was another who possessed this Art, though in a less Degree of Perfection. I have been several Times in his Company in the Country, where he used to travel as a Rider, so far as I remember, to a Tobacconist. And a Woman who begged

X x

about

* See the Passage.

b See the Septuagint.

c Regard not them that have *Familiar Spirits*, אבוב, *Oboth*, neither seek after Wizards.

d A Man also or Woman that hath a *Familiar Spirit* אבוב, or that is a Wizard, shall surely be put to Death,

e Behold my Belly is as Wine that hath no Vent, it is ready to burst like new Bottles באבוב.

about the Country, was said to excel them both in this Way, being able to carry on a seeming Conversation betwixt several People, whom, she told the Ignorant, were her Husband and Children that had been long dead. It is not to be disputed, but these would have had it in their Power, with a little Artifice, in the Days of Ignorance, to have been esteemed conversant with familiar Spirits; and they might even have surprised a more enlightened Age, if they had been artful and designing enough to have guarded the Secret.

As to the History of *Æsculapius*, without having any Regard to the fabulous Accounts of him in the Grecian Theology, I am inclined to think he was a Phœnician, who having made very successful Searches into Nature, especially that Part of it that related to Pharmacy and Medicine, had gained great Reputation and Honour among his Countrymen.

His true original Name, I imagine, is lost to us in that, which the People that had experienced his Skill and Abilities in Physic, had given him by Way of Eminence and Distinction; for it was a Custom in the Eastern Nations, when any Person appeared among them of singular Talents, to honour him with an Appellation declarative of his Merit, after the Manner of the Agnomen among the Romans. Hence it was, that Hermes, the Restorer of the Egyptian Learning, was called *Trismegistus*, or rather by the Egyptian Name that answered that Meaning, for *Trismegistus* was the Greek Translation of the Egyptian Original; this Man's true Name was *Siphoas*, as Sincellus informs us out of Manetho. Σιφωας; ὁ ἑγύπιος.

As the Egyptians distinguished Hermes by the Name of *Trismegistus* for his great Learning, so the Phœnicians, according to the Taste of those Times (for *Æsculapius* is supposed to be cotemporary with *Trismegistus*) gave him likewise a Name of Distinction, on Account of his Skill in Physic and Medicine. They called him אב אשכל, *Haskel-ab*, the *Father of Knowledge or Skill*, which last Word, by-the-by, seems to take its Original from the Hebrew-Phœnician Word שכל, *Sekel*, *Knowledge or Understanding*.

It was an usual Phrase amongst the antient Orientals, where they would describe a Person that had been beneficial to Mankind, by some useful Invention or Discovery, to call him the *Father* of it. For Instance, this Hebrew Idiom is used in Holy Writ, with Regard to Jubal, Gen. IV. 21. where he is called *The Father of all such as handle the Organ and Harp*, from his first inventing Music. Tubalcain also, from his first Invention of fabricating Iron by Fire, was called אב אשח, *Ab Esta*, or *The Father of Fire*; from whence the Greek formed their Ἡφαιστος; as the Latins did their *Vulcan* from *Tubalcain*; in like Manner the Phœnicians from the Skill in Medicine, that they found in the Person the Subject of this Enquiry, called him *Ashkel-ab*, the *Father of Skill* (in Medicine) which the Greeks afterwards corrupted into *Æsculapius*.

What Mr. Le Clerc in his *History of Physic* observes, that *Æsculapius* was a Phœnician, and that the Original of his Name was to be sought for there, is undoubtedly true. But I am afraid that cannot be said of the Etymology he gives of it; he derives it from Is CALAPHOT, *A Man of the Knife*; supposing him to be so called from the Use of the *Knife* in chyrurgical Operations, in which Case it is much to be suspected, if the Use of the *Knife* was then so much known, as would be necessary to support the Etymology of this learned Man.

By all the fabulous Accounts of the Grecian *Æsculapius* it appears that he was a considerable Benefactor to Mankind. It remains that we endeavour to come at the Reality of his Person and Character, and to extricate Truth out of a Multitude of Fables. And in order to do this, it is reasonable to make Use of the Testimony of medicinal Writers, who, it is to be supposed, are best acquainted with what relates to the Patron of their Art. Amongst these Celsus is the first, who in his Preface says thus: As the End of Agriculture is to supply the Body with Aliment, that of Medicine is to procure it Health. No Part of the World has been without some Share of Knowledge in this Art; for the most barbarous Nations were acquainted with the Virtues of Herbs, and other obvious Remedies, for their Wounds and Diseases. However, it was cultivated in Greece more than in other Nations, not however originally, but a few Ages before it flourished among us, for *Æsculapius* is celebrated for being the first Inventor of it, who was deified, because he reduced the Science, before his Time rude and empirical, to a more regular Art.

We find something more particular with Respect to *Æsculapius* in Galen, who has in a great Measure avoided the Exaggerations usual amongst his Countrymen, though he speaks of the national Divinity of the Place where he was born.

Æsculapius, the Deity of our Country, prescribed entertaining Songs, Buffoonery, and some Sorts of Music, for such as by the too vehement Motion of the Mind had rendered the Temperament of their Body hotter than was consistent with Moderation: To others, and those not a few, he enjoined Hunting, Riding, and Exercises at Arms, and directed the Kind of Motion they were to be employed in, and the Arms in which

they were to exercise. He did not think it enough to teach in general, how the Mind, when sunk, might be raised, without ascertaining the Measure of it from the Idea of the Exercise. Galen, *de Sanit. tuenda*, L. 2. C. 8.

True Medicine forms Conjectures concerning the Nature or Constitution of the Patient, which the Generality of Physicians call *Idiosyncrasy*. But this is by all confessed to be incomprehensible; therefore all ascribe the true Art of Medicine to Apollo and *Æsculapius*. Galen, *Metb. Med.* L. 3. C. 7.

The Greeks ascribe the Invention of Arts to the Sons, or near Kindred of the Gods, by whom they were communicated. On this Account it appears, that *Æsculapius* was the Inventor of Medicine, in the Knowledge of which he was first instituted by his Father Apollo, and afterwards delivered the same to Mankind. Before his Time the Art of Healing was unknown, though the Antients had some Insight into the Virtues of Medicines and Herbs; such as Chiron, the Centaur, among the Greeks, and the Heroes under his Tuition. They had also, it seems, by what is ascribed to Aristæus, Melampus, and Polyidus, made some Experiment that Way. That the Egyptians had some Notion of other Remedies besides Herbs, seems evident enough from Homer.

Besides, the first Physicians must have learnt many Things in Surgery and manual Operation from the Opening of Carcasses, which it was the Custom to do, in order to embalm them. Some Inventions are imputed to Chance, as Couching for a Cataract to the casual Observation of a certain Goat, who, labouring under that Defect, recovered its Sight by impressing its Eye on a sharp-pointed Rush. The Use of a Clyster also, they say, is derived from the Bird Ibis, who, making the Skin of her long Neck serve instead of a Bladder, fills it with the Water of the Nile, or Sea-water, and by the Help of her Beak introduces it into her Body through the Anus. And Herodotus, the Historian, writes, that it was an antient Custom to bring out their Sick into the Street, and most frequented Places, to receive the Advice and Prescriptions of such Persons, as had laboured under the same Distempers, and had been cured; and so, by this Means, was Medicine at length established, being raised into an Art from the Multitude of Facts and Experiments. But all this while Reason was wanting to assist and perfect Experience, and *Æsculapius* alone was the first Inventor of true and rational Medicine, and such as, on all Accounts, deserved that Name. His Successors, the Asclepiadæ, delivered it down to Posterity, as it were, by hereditary Succession. Among them Hippocrates was the most eminent by many Degrees, and was the first among the Greeks who perfected the Art of Medicine. *Galen's Introduction.*

If we reflect upon the fabulous Accounts related of the Grecian *Æsculapius* above, and join with these what is said by Celsus and Galen, we may perhaps have Reason to believe the following Conjectures, in Regard to the true History of this *Æsculapius*, to be not very distant from the Truth.

He appears therefore to have been the illegitimate Son of some Lady of Distinction, who exposed him on a Mountain in the Territory of Epidaurus, to avoid the Reproaches usual on such Occasions. In this Situation he was probably found by the Means of the Dog of some Shepherd, or Goatherd, for it is usual with these sagacious Animals to apprize their Masters of any Thing uncommon that occurs, by staying near it and barking; and, if this was the Case, a very small Degree of Superstition, joined with a strong Imagination, would furnish him with a Goat for his Nurse, whilst under such a Distress.

When he was once found, it is not unlikely that his Mother might privately take Care to have him delivered to Chiron, a Man in those Days eminent for the Education of Youth.

We may very reasonably suppose that the young *Æsculapius* had very extraordinary Parts, for which a great many natural Children, both amongst the Antients and Moderns, have been remarkable, and that upon this Account his Tutor Chiron took more than ordinary Pains in the Instruction of his Pupil. Add to this that the Youth, finding he had nothing to depend on but his own Genius and Diligence, might be prompted by his Ambition to an extraordinary Application, that he might sometime make a Figure in the World, equal to that of his Fellow Students, who were Sons to People of Condition, thus supplying the Disadvantages of Birth by Industry. This Supposition will appear less chimerical, if we reflect, that those who have in all Ages made very extraordinary Progresses in Sciences, have generally been such whose Circumstances have obliged them early to take uncommon Pains.

Æsculapius, thus furnished with a Capacity, would not fail to lay hold of the Opportunities of Improvement which presented, and to pursue the Way to Eminence by the Road to which he was directed by his Genius. His favourite Study therefore being that of Physic, when he arrived at such a Degree of Knowledge in the Art, as to excel his Contemporaries in the Cure of Diseases, his Countrymen, or perhaps Chiron himself, might give him the honorary Appellation of *Æsculapius*, a Name borrowed from the Phœnician Inventor of Physic, with the

the History and Character of whom the Greeks had at that Time been made acquainted.

The Circumstances of his Birth, added to his Eminence in Medicine, would give his superstitious Countrymen an obvious Hint to call him the Son of Apollo, and a national Vanity might at last make him a God.

This appears to me the most real and genuine Account of the Greek *Æsculapius*, for I can by no Means agree with those Authors who are of Opinion that there never was such a Person amongst the Greeks. Hippocrates is said to be a Descendant from him, and a regular Pedigree is produced; by which it appears that he was the eighteenth from *Æsculapius*, inclusive. Now if this was not real, the *Asclepiadæ* could never have been guilty of so impudent a Fiction, attended with a great many Circumstances that might have been disproved, which, however, it does not appear to have been ever attempted; even by the Physicians of the Cnidian School, who, as it seems, were no great Friends to Hippocrates, and who maintained a Spirit of Emulation against the Physicians of Cos. This Pedigree will be given with the Life of Hippocrates; mean Time it may suffice to remark that the Posterity of *Æsculapius*, by Podalirius, reigned Kings of Caria, till the Time of Theodoros the Second of that Name, who was obliged by the Heraclidæ to retire from their Country, and settle in Cos, an Island not far from Caria.

I shall end this Account of *Æsculapius* with remarking, that if the Art of Healing had not been very much advanced before the Time of Hippocrates, it would have been impossible for any one Man to have made Observations sufficient to establish those universal Rules, laid down by that extraordinary Man; Rules which, at the Distance of more than two thousand Years, are confirmed by every Case that occurs in the Practice of Physic, inasmuch that it may be truly said, that if the Writings of Hippocrates had been lost so far, that later Writers in Physic could not have borrowed his Sentiments, Medicine which, though far from being perfect, is nevertheless beneficial to the World in an eminent Degree, would have been scarce worth regarding, and of little Importance to Mankind. This I venture to affirm, because I am certain that every Physician in Europe, who is acquainted with this Author, and knows his Profession, will agree to it.

ÆSTAS. The Summer. This is too well known to want Explanation.

Some Remarks have been made on this Season by Authors, which deserve Notice.

Whence comes it that Lippitude, or Soreness of Eyes, more frequently happens in this hot and dry Season, than another? For it seems reasonable to imagine, that the natural Dryness of this Time of the Year should put a Stop to all De-fluxions, and yet we are not sensible of the Benefit we might expect with Respect to Eyes, from that Constriction and Denfation which are the natural Effects of Heat. I answer, that, granting these to be Consequences of the Season, yet the extraordinary Splendor of the lucid Air, which dazzles the Sight; is very offensive and hurtful to the Eyes, which cannot be doubted, since every uncommon Degree of Whiteness is wont to disturb and dissipate the Senfes. For this Reason, when we are prescribed Rest, we seek out a dark Retreat, where we may avoid all Causes of Motion. It is plain then, that the Frequency of Lippi, or People troubled with sore Eyes in the Summer, is owing to the Radiancy of the Sun-Beams. *Cassii Problem. 16.*

Diseases, which the Summer produces, are continual, burning, or tertian Fevers, Vomitings, Looseness, Pains in the Ears, Ulcers of the Mouth, cancerous Sores, especially in the Pudenda, and whatever Distempers waste a Man by Sweating. *Celsus, L. 2. C. 1. from Hippocrates.*

To these Distempers Aetius adds Inflammations of the Eyes. *Tetr. 2. Serm. 3. Cap. 12.*

In the Summer the Pulse beats quicker, because of the Heat of the circumambient Air. *Philanatus de Pulsibus, Cap. 6.*

In this Season, Rest is convenient, and a Diminution of Exercise and Aliment.

The Food ought to be of a colder Nature, and Drinking is to be indulged, and all Things done in order to refrigerate and moisten. *P. Æginetæ, L. 1. C. 53. Oribas. Euporist. L. 1. C. 10.*

In Summer eat and drink often, but little at a Time, for the Body wants frequent Refreshment. For this Reason it will be convenient to make a Dinner; Flesh and Greens are proper Food. Drink ought to be very much diluted, that it may quench the Thirst, without Inflaming; cold Bathing, Meat roasted, Aliment of a cold or refrigerating Nature are to be used. *Celsus, L. 1. C. 3.*

With Respect to the Summer, it is worthy of Observation, that the Digestion is not so strong, and that the Appetites of most People are not so great as in Winter, for the very same Reasons that the Inhabitants of warm Climates eat less, and digest solid Food with more Difficulty than those of cold.

The Case seems thus: In warm Weather, and hot Climates, Heat relaxes the animal Fibres in general, and consequently impairs the Elasticity of those which form the Organs of Digestion, the unavoidable Consequence of which is, that the Appetite, and Power of changing the Aliment, that is, of Digestion, must be diminished. Hence the Inhabitants of hot Climates are weak, and People who live in the same Climate are not so strong in Summer as in Winter. In warm Countries therefore, and in Summer, Providence has provided Food suitable to the Climate and Season, I mean Fruits; and it is remarkable, that Rice, produced in such Plenty in Southern Countries, as to be the usual Food of the Inhabitants, is an Astringent, which their Situation in Regard to Laxity from Heat seems to require. These warm Climates also are well stored with Aromatics, which are known by Physicians to promote Appetite and Digestion, by increasing the Elasticity of the Fibres which compose the Organs subservient to both, and of these the Inhabitants make considerable Use.

On the Contrary, Cold contracts the animal Fibres, and increases their Elasticity; thence People during Winter are stronger, eat more, and digest better than in Summer; and hence the Northern Nations produce a Race of Men more robust, and suited to bear Fatigue, than those who live nearer the Line. Their Food, for these Reasons, consists principally of Animal Flesh, which they are enabled to digest, and Providence has not thought it necessary to furnish the cold Climates with many aromatic Vegetables, because they are of little or no Use to the Inhabitants.

It is remarkable that our own Countrymen who change this Climate for one that is very hot generally fall into some very dangerous Distemper; but we do not find the same Complaints arise from removing from a hot Country into one that is cold. The Reason appears plain from what has been said of the Effects of Heat and Cold. In the first Case, our People are obliged, by Necessity, whilst on Ship-board, to eat Flesh hardened by Salt, and rendered still harder by the Vinegar it is usual to eat with it; or else farinaceous Vegetables unfermented, both which are very difficult to digest, especially when the Organs of Digestion are perpetually growing weaker, by Reason of the Heat, and a proper Degree of strong Exercise, which in all Climates and Seasons ought to accompany strong Aliments, cannot be used. Others by Inclination pursue the same Method of Living in Jamaica or Barbadoes which they have been used to in England, without considering that the Powers of Digestion are altered.

The Case is just the Reverse, when a Man removes from a warm Country into one that is cold; for, though he is obliged by Necessity, or makes it his Choice, to live on Aliment not so easily changeable by the animal Actions, yet as the Fibres grow daily stronger as he approaches the Tropic, by Reason of the Increase of Cold, the bad Effects specified in the other Instance are prevented, at least in a considerable Degree.

Hence appears the Reasonableness of those Rules laid down by the Antients with Respect to Summer.

ÆSTATES. Freckles on the Face. Pliny, *L. 28. C. 12.* says, these are to be taken away by Calves-dung mixed with Oil, and Gum Arabic.

ÆSTHESIS. *Ἀίσθησις.* Sensation, or the Faculty or Power of Sensation. *Constantine.*

ÆSTHPHARA. Incineration, or Burning of the Flesh, or any other Part of the Body. *Cæstilius from Dorneus.*

ÆSTUARIUM. The Name of many Instruments, contrived to convey Heat to the whole, or particular Parts of the Body, in English properly called Stoves. Blancard explains it a Vapour-bath, which is but one Species of *Æstuarium.*

ÆSTUATIO. It signifies in some Authors the Boiling up of Liquors, which effervesce, or ferment, when mixed together. But it is not classical in this Sense.

ÆSTUS. Heat of any Sort, whether raised by Fire, Distempers, Medicines, Effervescence, or Fomentation.

ÆTAS. Age. Different Ages are subject to Distempers, which do not so frequently happen in others. Thus, according to Hippocrates, *Aph. 24. L. 3.* new-born Infants are subject to Aphthæ, or Thrushes, Pukings, Coughs, Want of Sleep, Startings in their Sleep (*Φόβοι*) Inflammations of the Navel, and Running of the Ears.

It is remarkable that Celsus has translated this Passage, *L. 2. C. 1.* literally, except that he has omitted *Φόβοι*, which I have translated as above, Starting in the Sleep. *Φόβοι* signifies Fear, or the Causes of Fear, and no Distemper that I know of.

When Children arrive at the Age of breeding Teeth, they are affected with Pains and Exulcerations of their Gums, Fevers, Convulsions, Diarrhoeas, especially when they breed their Fore-teeth, which are called *Canine*. These are very dangerous, especially to those who are of a costive Habit. *Hipp. Aph. L. 3. 25. Celsus, L. 2. C. 1.*

In a more advanced Age, they are subject to Inflammations of the Tonfils, Distortions of the Spine (as Celsus translates the Passage) Difficulty in Breathing, round Worms, and Ascarides, Warts, Tumors of the parotid Glands, Stranguries, King's Evil, and many other Tumors, but especially those above-mentioned. *Hipp. Aph. L. 3. 26. Celsus, L. 2. C. 1.*

I have translated *Σαρκώματα*, Tumors of the parotid Glands, in Deference to the Judgment of Heurnius, tho' I suspect it signifies an Achor, or scald Head; it cannot signify a Satyriasis, because Children are not subject to it; the other Signification of the Word is a Leprosy, which Children are not often affected with. Now, as Children are very often troubled with scald Heads, which is something like a Leprosy, it seems not unlikely that Hippocrates may mean an Achor, especially as that is not otherwise taken Notice of in this Catalogue of Distempers to which Children are subject. Celsus omits it.

As Children approach to Puberty, they are afflicted with many of the Disorders above-mentioned, with long Fevers, and Hemorrhages from the Nose. *Hipp. Aph. L. 3. 17. Celsus, L. 2. C. 1.*

The Lives of Children are most endangered from Distempers about the fortieth Day, others at the seventh Month, others at the seventh Year, and others again at the Time of Puberty. And whatever Disorders Children are affected with, which do not cease in Men at the Time of Puberty (Celsus adds, or at the first Coition) and in Women at the Eruption of the Menfes, are usually very obstinate, and continue a long Time. *Hippocrates, Aph. L. 3. C. 28.*

This Passage I have translated according to the Explication of Celsus, *L. 2. C. 1.*

Youth is particularly subject to Spitting of Blood, Consumptions, acute Fevers, Epilepsies, and the like Disorders. *Hipp. Aph. L. 3. 29. Celsus, L. 2. C. 1.*

They who are advanced beyond Youth are most liable to be affected with Asthmas, Pleurisies, Peripneumonies, Lethargies, Phrenisies, burning Fevers, chronical Diarrhoeas, Cholera Morbus, Dysenteries, Lienteries, and Piles. *Hipp. Aph. L. 3. 30. Celsus, L. 2. C. 1.*

Old People are afflicted with Shortness of Breath, Coughs from Catarrhs, Stranguries, Dysuries, Pains in the Joints and Kidnies, Vertigos, Apoplexies, Cachexies, Itchings all over the Body, Want of Sleep, too much Moisture in the Intestines, Eyes, and Nose, Dimness of Sight, Glaucomas, and Thickness of Hearing. *Hippocrates, Aph. L. 3. 31.* To these Celsus adds, that such as are lean, and thin, are principally affected with Loosenesses, Distillations (Catarrhs) Pains in the Viscera, and of the Sides; but they who are fat, are more subject to acute Distempers, and Difficulties of Breathing, of which they frequently die suddenly, and which seldom happens to those that are thin. *L. 2. C. 1.*

Celsus makes also the Observations following on the different Ages:

The Differences of Age, as to Health, are thus considered with Respect to the four Seasons of the Year. Children and Youth bordering upon Childhood are in their best Health in the Spring, and are safest in the Beginning of Summer. Old Men are most vigorous in Summer and the first Part of Autumn. Winter agrees best with young Men and the Middle-aged. Winter is most prejudicial to old Age, as Summer is to Youth. *Celsus, L. 2. C. 1.*

Middle Age is the safest, because it is in no Danger from the Heat of Youth, nor the Coldness of old Age. *Celsus, L. 2. C. 1.*

Aetius lays down the following Rules for the Management of People in different Ages:

An Infant ought to be nourished by Milk, till it has acquired a Firmness; after which it may be fed with Crums of Bread in Wine mixed with Honey, sweet Wine or Milk, and, after a little while, with a poached Egg; for Food which requires Chewing is filled with Saliva in their Mouths. The Drink must be diluted Wine. When you can safely venture to give Food made of Corn (which is commonly about the twentieth Month) by Degrees, and in an artful Way disuse it to the Breast. If it falls into a Distemper after Weaning, put it to the Breast again. When the Disease is gone, use your best Care to nourish and restore it, and then set about Weaning it as before. *Aetius, Tetrabib. 1. Serm. 4. C. 28.*

Weaned Infants must be diverted and recreated all Manner of Ways, and their Aliment must be light, and of good Juice. But the Child who has a good Temperament of Body must not be suffered to drink much Wine, for, in hot and moist Bodies, Wine fills the Head with Vapours. Nor is it my Opinion that they should be forbid cold Water; for, in hot Weather especially, and the Intervals of Eating, I allow them the Drinking of it, provided it be good.

At seven Years old let them be taught the Elements of Literature, and put into the Hands of Masters of known Mildness and Humanity. From fourteen to twenty-one is their proper Time to exercise themselves in the Study of Philosophy. They are to be forbidden the Use of Venus. Wine is to be

drank sparingly, and their Exercises are to be increased. When they have attained to Manhood, and are in full Vigour of Age, a more remiss Way of Living, and Relaxation of Regimen, with Respect to Body and Mind, agree best with them. But when natural Heat begins to lessen, and the Principle of Cold to operate on the Habit, their Exercises of Body, of what Kind soever, are to be slackened by Degrees, and their Proportion of Food by little and little is to be diminished. *Aetius, Tetrabib. 1. Serm. 4. Cap. 29.*

The REGIMEN for OLD AGE.

Natural old Age is a cold and dry Temperament of Body, the Effect of Longevity. For when the essential Parts of the Body, with the native Heat, waste away by Degrees, and the Organs grow drier than is convenient for Service, both the Actions are performed in a more languid Manner, and the Animal himself sinks in Bulk, grows little, lean, and extenuated. As Dryness comes on more and more, Rugosity succeeds Leanness, with Weakness of Limbs, and a tottering Motion. Whoever then understands the Theory of Coldness and Dryness, will make a proper Physician for an old Man. He knows that these Qualities are to be corrected by such Things as heat and moisten; such are warm Baths of sweet Waters, drinking good Wine, and Aliments which warm and moisten at the same Time, and moderate Frictions with Oil in the Morning, then Walking, or Gestation, within the Bounds of Laffitude. An old Man must eat often, but little, for an Excess in Quantity hurts him much. He is allowed to eat three Times in a Day; about the third Hour let him break his Fast, on good Bread, and the finest clarified Honey. At the seventh Hour, after Friction, and such Exercises as are proper for old Men, let him wash, and sit down to Dinner.

And here let his first Dish consist of such Things as mollify the Belly, such as, Garden Salads of Beets and Mallows, after that he may eat Sea-fish, and such as live about the Rocks; after this Meal let him repose a While, and then use some moderate Motion. At Supper let him abstain from Fish, let his Meat be of good Juice, that will not easily corrupt, such as a Puller, or other Fowl, boiled in pure Water only, and without Sauce. Wine is very beneficial to old Men, not only as it diffuses a Warmth throughout the whole Body, but also as it purges the Serum of the Blood by Urine, which is needful for most of them, because they abound with aqueous Superfluities. *Aetius, Tetrabib. 1. Serm. 4. C. 30.*

ÆTHALE. *ἄθρον.* Soot. It is sometimes wrote *ἄθρον.* See **FULIGO.**

ÆTHALES. From *ἄθ*, always, and *ἄλως*, to be green. a Name for the Sempervivum, Houfelleek.

ÆTHER. A Word much used by natural Philosophers, to signify an extremely fine Fluid, that pervades all Bodies, of which nothing is known, not even so much as its Existence.

But the Name of *Æther* has been given to an extremely light and penetrating Fluid, made of Spirit of Wine deprived of its Phlegm by Distillation with Oil of Vitriol, of which we have the following Account in the *Philosophical Transactions*:

The *Æther* of Plants appears to be almost destitute of all gross Air, from placing it under the Receiver of the Air-pump; for, exhaust the Air ever so accurately, this *ætherial* Liquor remains unmoved, nor does it emit any Air-bubbles which immediately arise in other Liquors, and according as their Quantity of intrinsic Air is greater, so much the sooner are such Liquors put into Agitation, and emit also more Froth, and more vehement Ebullitions in Proportion to their Viscidity. Hence it follows, that this *Æther* may be preserved best (because without any Diminution) under the Receiver in Vacuo, whereas, on the contrary, exposed to the open Air, its Parts soon evaporate, and its whole Bulk vanishes.

This Experiment failed remarkably, as we learn from a Note in the *Abridgement of the Transactions*. But I am well informed it would have succeeded, if the Spirit made Use of in the Preparation of the *Æther* had been concentrated upon the Flowers of Zinc.

A little of it, poured on the Surface of the Hand, affects it with a Sense of Cold, equal to that from the Contact of Snow, and blow upon it but once or twice with your Mouth, immediately your Hand becomes dry. Beware, however, of approaching a lighted Candle with your Hand thus wet, lest it take Fire and burn you. This Experiment succeeded.

It causes such a Stridor and Hissing, being poured upon hot Water, as is frequently occasioned by a Piece of hot Iron thrown into it. Take a Lump of Sugar, let it imbibe some of this *ætherial* Liquor, and put it into a Vessel full of hot Water, the Sugar will indeed sink to the Bottom, but the *ætherial* Liquor rushing violently forth, excites a great Ebullition in the Water. If one Spoonful of this *Æther* be poured into a Copper Pot full of boiling Water, without any Sugar in it, and you approach immediately with a Candle, or lighted Paper, instantly there issues from the Water very great Lightning. The Handle of the Spoon, as well as the Tongs for holding and applying the lighted Paper, must be of a proper Length, that

the Effusion of the *ætherial* Liquor upon the hot or boiling Water, and the Application of the lighted Candle, or Paper, may be performed at the same Time; otherwise the *Æther* is immediately dissipated, without any such Effect. There is therefore Need of an Assistant, or of both Hands, and also of a Room where Entrance may readily be given to fresh Air, proportionable to the Magnitude of the Flash of Lightning which so rarefies the Air, as to endanger the Stoppage of Respiration. This Experiment succeeded.

Hence it appears, that this *Æther* is both Fire and a very fluid Water, but so volatile that it soon evaporates, and that it is the purest Fire, inasmuch that, if kindled in a thousand Times the Quantity of cold Water, it burns unextinguishable. Therefore, if you take an earthen Vessel of any Magnitude, whose Mouth or Orifice may be one or two Yards wide, but the inferior Latitude of the Vessel may contain six hundred or six thousand Gallons of Water, the Experiment will be the same, pour on the Top but one Ounce, or a small Vial full of this *Æther*, and apply to it a lighted Wax Candle, it takes Fire immediately, burns placidly, is so far from being extinguished by the most profuse Superaffusion of common Water, that it much increases the Vehemence of the Flame, and lasts till the subtle Parts of the *Æther* are consumed and ventilated by the Flame. This Experiment should be made in a large and lofty Room, not in Danger of taking Fire.

The Sense of Touch does not manifest the least Oiliness or Fatness in this *ætherial* Liquor, notwithstanding that it is the true, natural, and only Dissolvent, or Menstruum of all Fat, Oil, Rosin, and Gum whatsoever: By Means whereof all Sorts of Fat, and every Kind of Fire or Flame is extricated by a speedy, safe, and pleasant Operation. On these Accounts it is, that this *ætherial* Liquor will not unite with any Kinds of Salts whatsoever, but all Sorts of Oils, Pitch, Turpentine, Opobalsams, Camphire, Wax, Ambergris, Sperma Ceti, Mastic, Musk, Copal, and the like, it dissolves most readily, and with the greatest Ease extracts their best Essences.

And indeed a wonderful Harmony is observable betwixt Gold and this *Æther*, even greater than between Gold and Aqua Regia; inasmuch as from hence Gold appears to approach nearer to the Nature of Oils than of Earths. If a Piece of Gold be dissolved in the best Aqua Regia, and upon the Solution, cold, be poured half an Ounce, or what Quantity you please of the *ætherial* Liquor, shake the Glass carefully, and all the Gold will pass into the *ætherial* Liquor, and the Aqua Regia, robbed of all its Gold, will presently deposit the Copper at the Bottom of the Vessel as a white Powder, which, turning of a green Colour, contains the Portion of Copper wherewith the Gold was adulterated. The *Æther* will swim like Oil on the Surface of the corrosive Waters. This Experiment deserves the utmost Attention; for here the heaviest of all Bodies, Gold, is attracted by this very light *Æther*, or (whereas the Air, which with a common Force presses alike all Bodies, is here excluded, and the *Æther* itself encompasses and touches the Surface of the Water) the Gold, by the Force of its Gravity, as by an Impulse, would descend from thence; or, lastly, this Phenomenon is owing to a certain Harmony and Similitude of both of them. This Experiment was shewn and succeeded.

Æther then is certainly the most noble, efficacious, and useful Instrument in all Chymistry and Pharmacy, *ubi enim ignis potentialis, ibi actuali non opus est*, inasmuch as Essences and essential Oils are extracted by it immediately, without so much as the Mediation of Fire, from Woods, Barks, Roots, Herbs, Flowers, Berries, Seeds, &c. from Animals, and their Parts too. Thus from Castor, by a certain Manufacture, may be prepared an Oil, sweeter than that of Cinnamon, and also the true Oil of Saffron, and all by this particular Encheiresis, without the Help of Fire or Distillation. For an Example of our Method, take Mint, Sage, or Orange-peels, Cinnamon, &c. or all these together; cut and bottle them; pour upon them a Spoonful or two of the *ætherial* Liquor, and, after it has stood an Hour in a cold Place, fill up the Bottle with cold Water, and you shall see the essential Oil, swimming upon the Water poured upon them, easily separable by the Funnel. Of this essential Oil, one Drop only upon a Lump of Sugar manifests to the Taste, &c. the medical Virtues of the Plant, exquisitely drawn out, comprehended in this Essence, deservedly named COS, as containing the Colour, Odor, and Sapor, or Taste, of the Plant, or Plants. In like Manner the essential Oils of Exotics are easily prepared. This succeeded. It is not however a true essential Oil, but an excessive strong Tincture, which you may call the Essence.

Of the like Use it is in the animal Kingdom, where it produces an essential Oil of Phosphorus; as likewise in the mineral Kingdom, though not so immediately, because the Resolution of Earths must proceed. Moreover, it is easily proved, that the same Liquor extracts the purest Gold, or every Part of the golden System from any, or all the baser Minerals, and that this Gold, thus extricated, is by this one

Operation better and sooner purified than by Fusion of Minerals with Antimony.

This our Water is neither corrosive nor joined with apparent Corrosives; wherefore fill as many Bottles with *ætherial* Water as there are Sorts of Salts, and into the first Drop by Drop distil Oil of Vitriol; put into the second Spirit of Sea-salt; into the third, Spirit of Nitre, or of Alum; or of Sal Ammoniac prepared with Water, or the Lixivium of Tartar, or rectified Vinegar, all the Salts immediately sink to the Bottom: Besides, it is the lightest of all Liquors; for, fill any Vessel with twenty Ounces of Oil of Vitriol, the same, emptied, will contain but seven Ounces of *Æther*. It is the very Ens, or Being, most pure of Flame; wherefore neither Soot nor Ashes are ever found upon its Deslagration. This succeeded.

Thus far Dr. Frobenius; but to make this Paper more than a mere Harangue, it is absolutely necessary to subjoin two Paragraphs out of a Paper of that excellent Chymist Mr. Godfrey, Dr. Frobenius's Fellow-labourer, in these Experiments which he delivered in when this *Æther* was made public before us.

Feb. 19, 1738. That this Liquor *Ætherius* was formerly very much esteemed and enquired into, doth clearly appear by an Experiment I made formerly for my worthy Master, Esquire Boyle, by the Means of a metallic Solution, namely, by the Solution of crude Mercury united with the Phlogiston Vini, or other Vegetables, and this *Æther* swam on the Top of the Solution, which I separated per Fritorium. Note, This is what I have done formerly in Esquire Boyle's Laboratory, and Sir Isaac Newton was very well acquainted with it too; which by Reason of Shortness of Life was not brought to a full End, to do it so readily in Quantity. But when Dr. Frobenius, by Experiments on this in my Laboratory, did produce it in greater Quantity, he wanted to see how Sir Isaac Newton had gone on with it in his Book. There we saw that great Man's Application in Fol. 330. that he had done it *cum Ol. Vitr. & Sp. Vini*.

This of Sir Isaac Newton is the *Sp. Vini Ætherius*; only there is a Difference in the Process. The Liquor *Ætherius* is made with equal Parts in Measure, not Weight. The upper yellow Liquor is separated from the inardent sulphureous per Tritorium. The inferior Liquor is thrown away, and the superior yellow is put into a Retort to be distilled with the most gentle Heat; and the Extraction of the *ætherial* Liquid continued so far until the superior Hemisphere feels cold, and the Retort being clapped in the Hand, there is found in the Receiver a Vino-sulphureous Gas very *ætherial*. Let the Sulphur be precipitated by adding an Alkali, and gently throwing it in till all Ebullition ceases, and the Liquor will not farther strike itself against the Hand, but will strangely attract it. Then the Alkali will go to the Bottom of itself, or precipitate itself in the common Water. *Abridgement of the Philosophical Transactions*, Vol. 8. P. 744. ad P. 747.

ÆTHERIA HERBA. Eryngo. *Calis Aurelianus*.

AETHES. *Arabis*. From a Negative, and *Ar*, Custom, unusual, not according to Custom. The Word *Arabis* is applied to the Spittle, Hippocrates, *Prædict. Lib. 1. 122.* but Foësius alters the Reading to *Arabis*, with the greatest Appearance of Reason.

ÆTHIOPICUM CUMINUM. *Æthiopic Curamin*. See CUMINUM.

ÆTHIOPICUS LAPIS. The *Æthiopian Stone*, affirmed by Oribasius to be of more Virtue than the *Hæmatites*, the *Melinites*, the *Galactites*, or the *Schistos*. It is brought from *Æthiopia*, and is of the Colour of greenish Jasper. It is resolved into a Juice of a milky Colour, but of a biting Taste. *Oribasius*, L. 15. C. 1.

Æthiopsis, Offic. Ger. 634. Emac. 779. Chab. 435. Raii Hist. 1. 543. *Æthiopsis Multis*, J. B. 3. 315. *Æthiopsis foliis sinuosis*, C. B. Pin. 241. *Scalaria vulgaris lanuginosa, amplissima folio*, Tourn. Inst. 179. Elem. Bot. 148. *Scalaria Æthiopica, frons Æthiopsis, laciniatis, & non laciniatis foliis*, Park. Theat. 57. *Horminum Æthiopicum incanum foliis sinuosis*, *Æthiopsis dictum*, Herm. Hort. Lugd. Bat. 318. Volck. Flor. Nor. 214. *Horminum Æthiopicum foliis sinuosis*, Hist. Oxon. 3. 392. **ÆTHIOPIAN CLARY.** *Dale's Pharmacologia*.

Æthiopsis has Leaves like those of Mullen, very hairy and thick, and standing in a Circle about the Head of the Root. The Stalk is quadrangular, thick, and rugged, like that of Baum, or the Woolly-headed Burdock, beset with many Branches. The Seeds are of the Size of bitter Vetches, and two in a Cell. It shoots forth many long, thick, and clammy tasted Roots from one Head, which blacken as they grow dry, and harden so as to look like Horns. It grows plentifully in Messenia and about Mount Ida. *Dioscorides*, Lib. 4. C. 103.

This Description is repeated Word for Word by *Oribasius*, L. 11.

It first comes up with Leaves of the Breadth of a Hand, and not much longer, and covered on both Sides with Plenty of soft Down as it were Lint, otherwise not much unlike the
Y y common

common Garden-clary, channelled in some Plants, some jagged, others not. From the Midst of these shoots up a square Stalk, hairy in like Manner, and surrounded with Leaves like the former, but often lesser, and thick beset with Branches, on which at the Joints stand the Flowers in Whorles.

They consist of two Leaves, forming a close Empalement like those of common Clary, of a snowy White, one of them which is raised and gathered like a Woman's Hood, producing from its Bosom, which is concave, like the Lip of May-weed, yellow Clusters, and a Silver-coloured Pointal. The Flower-cup is oblong, cut into five Divisions, and almost hid by the Thickness of the Down. It has the stinking Smell of Archangel, or the Hedge-Nettle. The Root is fibrous; the Seeds are four in a Cell, not two only, as C. Bauhinus, and Parkinson from him, have related, like the Seeds of Clary, of a dark Brown, and triangular. It grows plentifully in Greece and Illyria. There are two Species of this Herb; one with jagged Leaves, and another whose Leaves are whole and even round the Edge. *Raii Hist. Vol. 1.*

It is cultivated in Gardens, and flowers in Summer; its Root is the Part in Use. *Dale.*

The Decoction of the Root, drank, relieves the Sciatica, Pleurisy, Spitting of Blood, and Hoarseness. It is taken with Honey in the Form of a Linctus. *Dioscorides, Lib. 4. Cap. 105.*

The same is repeated, after Dioscorides, by Paulus Aegineta, *L. 7. C. 3.* and *Dale* in his *Pharmacologia*.

Ethiops is an Ingredient in a Drosaton, against Coughs and Pleurisy, described by *Myrepsus, Sect. 8. Cap. 54.*

Pliny relates, that the Magicians boasted, that the *Ethiops* would dry up Rivers and Ponds, if only cast into them, and open every Thing that is shut at a Touch. But he laughs at these monstrous Accounts, *L. 26. C. 4.*

ÆTHIOPS MINERALIS. *Ethiops Mineral.* This Medicine takes the Name from the Colour, which is very black. It is made either with or without Fire. The Process for that made with Fire is thus:

Take an unglazed earthen Vessel that will bear the Fire, put into it what Quantity of Sulphur you please, let it melt over the Fire, and, during the Fusion, mix with it, by Means of an iron Spatula, an equal Weight of Mercury revived from Cinnabar. Set the Mixture on Fire, and when the Sulphur is burnt away, the remaining Mass, which is black, friable, and heavy, is the *Ethiops Mineral*.

The Dose of this Medicine is, according to Lemery, betwixt eight Grains and two Scruples, but it may be given in much larger Quantities. It is recommended in an Asthma, Epilepsy, Rheumatism, Venereal Disorders, and King's Evil. *Lemery.*

The *Ethiops Mineral* without Fire is made by rubbing equal Parts of crude Mercury and Flowers of Sulphur together, till they are intirely incorporated, so as the Mercury intirely disappears, in a glass Mortar, according to the Directions of the *London and Edinburgh Dispensatory*, but according to Wilson, in one of Iron. It requires much Labour to mix the Mercury and Sulphur intimately together, but a great deal of this may be saved by warming the Mortar over a gentle Fire, during the Trituration, for then they unite readily, and the Medicine cannot be worse for it.

The *Ethiops Mineral* does not mix with any other Substance without Difficulty. The Dose is from ten Grains to a Dram, but a much larger Quantity may be taken.

Various are the Accounts given of this Medicine by Authors. Some recommend it in all Foulnesses of the Skin, old Ulcers, and every Species of the Venereal Disease, and I think every one agrees that it is effectual in destroying Worms. Some have affirmed, that it will give a white Colour to Gold carried in the Pocket, and that a great deal of it has been found upon the Plaisters which have laid on the Ulcers of those that have been under a Course of it. One great Advantage which attends it is, that there is no Danger of a Salivation from its Use, if well prepared, but I do not think this any Evidence of its Efficacy.

But Boerhaave is of a very different Opinion with Respect to the medicinal Virtues of *Ethiops Mineral*. He affirms, it cannot enter the Lacteal Vessels, but is discharged out of the Intestines as it goes in; however, if it is attended with great good Fortune, he says, it may possibly kill Worms, and that this is all the Effect it can possibly have. He farther also throws out a Suspicion, that so ponderous and unactive a Mass may do a great deal of Mischief in the tender Intestines of Children. This great Man appeals to Reason, and his own Experience, for the Truth of what he asserts. As to Reason, it is difficult to conceive, that the intimate Union of two such penetrating Substances as Sulphur and Mercury, should make a third Body utterly unactive. And if his Experience did not furnish him with any Evidence of the Efficacy of this Medicine, he must have been very unlucky in this Instance, for it has certainly done great Services in other Hands; but to confess the Truth, it requires a long Perseve-

rance, in order to have any great Effects, except in the Case of Worms.

On the other Hand I believe, those who have been very lavish in the Praise of this Medicine, have done it without any very good Foundation, for it has the least Efficacy of all the Class of Mercurials.

Upon the Whole *Ethiops Mineral* has had the Fate of most other Medicines. When one considerable Man spoke well of it, this was sufficient to make all those concerned in the Practice of Physic, who have neither Character nor Ideas of their own, to extol it beyond all Bounds of Credibility. And the Disapprobation of another great Man, however ill founded, has been sufficient to sink it into its present Disrepute.

The Proportion of the Mercury to the Sulphur, in this Preparation, is different in different Authors. Boerhaave directs three Parts of Sulphur to two of Mercury.

Somewhat in Imitation of this is a Medicine of much greater Efficacy, described first, I believe, by Dr. Cockburn, in his Treatise on a Gonorrhœa, and now generally called

ÆTHIOPS ANTIMONIALIS. It is thus made: First flux equal Parts of Antimony and Sea-salt in a Crucible for an Hour, then let the Matter cool, break the Crucible, and knock off the Scoria, then rub equal Parts of the Regulus made in this Manner, and Mercury together, till they are incorporated. This requires more Labour than the *Ethiops Mineral*, but largely repays the Trouble by its great Efficacy, for, I believe, there are few Medicines in Use of equal Virtue. It will cure most chronical Disorders of the Skin, and is admirable in all Sorts of Obstructions. Hence it becomes serviceable in the King's Evil, and the most obstinate glandular Diseases, and many chronical Distempers that are out of the Reach of other Medicines. I do not give a great deal of Credit to Accounts that may be found dispersed in medicinal Authors of Cures performed on cancerous Patients, but I have the greatest Reason to attribute the Cure of two Tumors, that were esteemed cancerous by every Body that examined them, to a long Use of this Medicine, and Holt Waters, which in these Cases were drank at a great Distance from the Spring. In Venereal Disorders of a long Standing, I have often been a Witness of such Effects as I have not seen from any other mercurial Medicine whatever. This, like all Antimonials, will contract an emetic Quality by being exposed to the Air, which is probably owing to the Acid it imbibes. It may be given in the Quantity of a Scruple, or more in some Constitutions, but I have learnt to begin its Use in a smaller Quantity from an Instance I once saw of its proving a strong Emetic, when there was no Reason to expect such an Effect, and when the Dose was only eight Grains. The Case was that of a young Lady, who had complained some Time of shooting Pains in a Tumor of her Breast. The very same Morning another Lady took fifteen Grains of the same Medicine, and from the same Apothecary, and, as I was well informed, out of the same Vial, and, notwithstanding this, in the last Instance it had no visible Operation, though it acted with so much Violence in the first.

ÆTHNA. Rulandus and Johnson explain this, that subterraneous, invisible, and sulphureous Fire, which calcines Rocks in the Bowels of the Earth. Hence they call igneous Meteors that appear about burning Mountains in different Shapes, **ÆTHNICI**, which they seem to think the Spirits of Men.

ÆTHOLICES. *Ἀθήλιες*. From *ἄθω*, to inflame. Superficial Pustules of the Skin, raised by Heat. They seem to mean Boils.

ÆTHYA. *ἄθυα*. A Sea-fowl, called by the Latins *Mergus* or *Fulica*. A Coot.

ÆTHYIA. *ἄθυια*, signifies a Mortar.

ÆTIA. *ἄττια*. The Cause of a Distemper. Hence

ÆTIOLOGIA. *ἄτιολογία*. *Ætiology*, that Part of the Theory of Physic, which explains the Causes of Diseases and their concomitant Symptoms.

ÆTITES. The *Eagle-stone*, thus distinguished by Authors:

Ætites, *Aquila lapis*, *Offic. Ætites*, seu *Aquilinus lapis*, Worm. 77. Charlt. Foss. 31. *Ætites*, Schrod. 345. Schw. 361. Kentm. 34. Aldrov. Mus. Metall. 580. *Lapis Ætites*, Boet. 375. De Laet. 114. Matth. 1389. *Ætites*, Gefn. de Lap. 10. p. 9. Geoff. Prælect. 68. *Ætites*, *Ochreo ferreus*, Wodw. Att. Tom. 2. P. 1. pag. 9. **EAGLE-STONE.** A Stone, big, as it were, with another Stone rattling in its Womb, of a dark, russet, or Ash-Colour, and commonly of an oval Figure. The Oriental is accounted the best. *Dale.*

The Stone *Ætites*, being shook, sounds as if it were pregnant with another Stone. Tied to the left Arm, it retains the Fœtus in those Women who are subject to miscarriage: But, in Time of Labour, it must be taken from the Arm, and tied to the Thigh, and the Woman will be delivered without Pain. Mixed with Bread, it finds out Thieves, for a Thief will never be able to swallow it, after he has chewed it. Boiled with Victuals, it is said to work the same

Feat,

Feat, and that a Thief cannot eat of any Thing boiled with it.

Bruised, and applied with Cyprian or Gleucine Cerate, or any other heating Composition, it is very effectual in Gouts and Palfies. *Actius, Tetrabib. 1. Serm. 2. Cap. 32. P. 69. F.*

Dale having cited Shroder for the same Virtue which Aetius above ascribes to this Stone in retaining the Foetus, and facilitating Labour, with this Addition, that after Delivery the Stone must immediately be removed from the Thigh, for Fear it should draw the Womb to it, subjoins the following Remarks from Amman :

The natural Effects of the *Eagle-stone* are commonly magnified on Account of the Traces of some Signature, while it is believed to be of Service in Time of hard Labour, and to facilitate Delivery. This I do not deny ; but this natural Effect of the Stone was by Galen, Pliny, and others, immediately blended and overlaid with Superstitions. For who will prove, (1) that an *Ætites* tied to the Arm prevents Miscarrying ? Which too is an Effect contrary to the former. (2) That the *Ætites* has such an attractive Power, as to make the Womb fall out ? Wormius, *P. 72.* and Valeriola produce their Observations as to this last. But, in my Opinion, these Observations are not well grounded. For we know by Anatomy, that the Uterus is held fast in its Situation by Ligaments formed by Nature for that very Purpose. How then can this Stone work such an Effect ? Indeed, unless a Power of relaxing, or breaking these Ligaments, be ascribed to it by the forementioned Authors, we cannot admit the Observation of Valeriola, which he makes on a Woman of Valentia, unless we suppose the Uterus to be drawn out of its Place, by the violent and unskilful Hands of the Midwife, which has sometimes been the Case. And yet too many such Absurdities are inserted among anatomical Observations. (3) There is no Proof that ever this Stone discovered if Poison were mixed with any Thing, as is reported. (4) That it finds out Thieves, being pulverised and mixed in their Bread, by their Incapacity of swallowing it, is a precarious Assertion, depending on a fallible Mark, for Deglutition may be hindered by other Causes. (5) It neither procures Love, nor increases Riches, which it is said to do. (6) Therefore if we ought to speak the Truth, let us content ourselves with allowing the *Ætites* the same Virtue as the sealed Earth, in malignant Distempers, against Poisons, &c. *Dale.*

AETIUS. There appears to have been three Physicians of this Name, who all made themselves enough known to be recorded by the Learned.

The first was *Actius Sicanus*, out of whose Writings, together with others, the Book, *de Atra Bile*, ascribed to Galen, is said to be collected. *Fabricii Biblioth. Græc.*

The Second was *Actius* of Antioch, a Man remarkable for changing his Profession several Times, and for being a great Patron of the Arian Heresy. He was originally bred to the Cultivation of Vines, which he quitted, and took up the Trade of a Gold and Silversmith. After this he got into the Service of one Sopolis a Physician, and then being supplied with Money by a certain Armenian, he applied himself to Letters, and, upon the Credit of having been a Servant to a Physician, set up for one himself ; but changed once again his Way of Life, and entered into holy Orders, where he seems to have succeeded somewhat better than in Physic, for in or about the Year 361. we find he was made a Bishop.

This *Actius* appears to have been extremely zealous in propagating the Arian Heresy, which he carried to a greater Length than even the Author of it himself ; it is for this Reason that he has incurred the Scandal of being an Atheist, which however must be malicious, for it is not probable that a Man who was an Atheist, would be very solicitous in establishing any Modes of Belief with Respect to the Christian Religion.

Different from this, in the Opinion of the Learned, was *Actius* of Amida, whose Works are preserved. He is said to have lived in the latter End of the fourth, or Beginning of the fifth Century. All that we know of him for certain is, that he travelled into Egypt, where he probably studied, and into Cælo-Syria.

He was undoubtedly a Christian, as appears from two Passages in his Works. One in *Tetrabiblos 2. Serm. 4. Cap. 50.* where he gives the Method of extracting any Thing that happens to stick in the Throat. When other Ways fail, he advises the following as the last Refuge, and on which he seems to lay some Stress : Turn, says he, to the Patient and bid him attend, then say, Bone come out (if it happens to be a Bone) as Jesus Christ brought Lazarus out of the Sepulchre, and as Jonas was brought out of the Belly of the Whale. Then, laying hold of the Throat, say, Blasius the Martyr and Servant of Christ says, Either come up or go down.

The next Passage I would bring for a Proof of his being a Christian is in *Tetrabib. 4. Serm. 1. Chap. 11.* where speak-

ing of the Stings of Wasps and Bees, he says, that the venerable and vivifying Image of the Cross, engraved upon an iron Seal and pressed upon the Part stung, is of great Service, preventing all Manner of Inflammation. To this Prescription of *Actius*, I must add, and I hope without Danger of any Imputation of Superstition, that the Remedy he advises has great Effects in the Cases he mentions, generally taking off the Pain and preventing Inflammation. But for Fear I should mislead my Readers, I must remark, that an iron Seal without the Figure of the Cross, or even the Blade of a Knife, will do as well.

These Passages prove *Actius* a Christian, but at the same Time such a one as brings very little Credit to the Faith he professed, since a small Degree of Evidence was sufficient to influence his Belief ; for, though the Truth of the Christian Religion admits of all the Proof that a reasonable Man could require, yet these Fooleries, the Effects of a mistaken Zeal, which he seems to give Credit to, are not in the least countenanced either by Reason or Revelation.

Upon the Whole *Actius* appears to have been a very credulous Man in many Instances, and was far from giving the Composition of Medicines which had acquired a Character, with a Design to expose them, as Dr. Friend thinks, for in the very Instances that are brought to prove this, I mean the Collyrium of Danaus, and the Antidotum Isotheos, the Author does not seem to dispute the Reality of the Virtues attributed to them, but mentions their great Price in all Appearance with a View to increase his Readers Opinion of their Value.

Notwithstanding the Credulity of *Actius*, he is a very valuable Author, and has preserved many Things considerable with Respect to the Practice of Physic in his Collections from Authors whose Works are now lost. Of this frequent Instances will occur in the practical Part of this Work, for which Reason I shall omit taking Notice of them in this Place.

Fabricius and Friend relate, that in some Manuscripts he is stiles *Καμης Ὀψιμας, Comes Obsequii*, which the last-mentioned Author explains, *The chief Officer of those who used to go before the Emperor as his Attendance and Harbingers.*

His Works are at present divided into four Tetrabiblos, and each of them into four Sermones, which are again subdivided into Chapters. This Division appears not to have been made by *Actius* himself, but was probably the Work of some Copyist, that transcribed his Writings since the Time of Photius, for in his Days they were divided into sixteen Books, the Number of Sermones which the four Tetrabiblos contain.

Photius says, that *Actius* did not only make his Collections from the same Authors that Oribasius extracted his from, which he dedicates to Julian, Eustathius, and Eunapius, but also from the Therapeutic Tracts of Galen, and from Archigenes, and Rufus, and besides these from Dioscorides, Soranus, Philagrius, Philomenus, Posidonius, and some others who had made their Names famous for their Skill in Physic.

He begins his Works (says our Author) with the Virtues of simple Medicines and Aliments, which he abbreviates from Galen, and closes with the Sixteenth Book, which treats of the Diseases of Women ; to which he adds some Chapters containing Medicines to clear the Face, and cleanse the Skin, with the Preparation of Oinantharia [*Sweet Ointments made with Wine and Lilies*] and other Things of the like Kind. So the Work begins and ends ; but, to be more particular,

The First Book treats, in a summary Way, of the Nature of simple Medicines and Aliments. This is the first Sermon of the first Tetrabiblos, according to the present Division of his Works.

The Second speaks of the Virtues and Use of metallic Substances, and of Animals, both whole, and their Parts, in a compendious Manner. And this may be reckoned to contain no inconsiderable Part of the Materia Medica. This is the second Sermon of the first Tetrabiblos.

The Third Book treats of Gymnastics and its Preparatories. Then, after speaking of insensible Evacuations, he discourses largely on Phlebotomy, distinguishing the different Ways of Section, and directing the Form and Bigness of the Incision, with the Time and Measure of Evacuation. He goes on to the Section of an Artery, prescribes a Medicine to stop the Bleeding of an Artery, speaks of Cupping, Scarification, and the Choice of Leeches. From thence he proceeds to treat of Cathartics, and the different Preparations of purging Wines, of purging Meads, and medicated purging Wines, of Absinthaton, Rosaton, Honey of Roses, and Oxy-mel, purging Garum, Honey, Metheglin, and Oxygarum, of emollient Broths, Milk, and purging Olives. Concerning all these he gives Directions ; and proceeds to compound Oxy-poria, and different Sorts of Cathartics, to purging Loaves, and Troches. He describes the purging Medicines prepared of Aloes, and also of Salts [*Αλωνδάρια ης άλάρα*] with the five Hieras.

He prescribes Help for those who have taken Purgatives which will not work, or, on the Contrary, evacuate too much; gives his Advice concerning Emetics, shews the Virtues of Hellebore, and the Persons for whom it is proper, and who are qualified to take it; how to make Experiments of the Strength of Hellebore, and how the Patient is to prepare himself for the taking of it; of the various Uses of Hellebore, and the different Ways of administering it, and the Care that ought to be taken of those who have drank it. He proceeds to purging Epithems, and takes Notice of those Parts of our Bodies which may be purged, as the Eyes, Ears, and the rest in Order. Of Suffumigations producing the same Effect, and of Medicines evacuating the small Intestines, and the concave Part of the Liver and its Appurtenances; of the Air, Winds, and Significations of the Stars; of Waters, of Baths natural and artificial; of cold Bathing [ψυχρῶν] of Baths of Oil [τῶν ἐν ἔλαιον ἐμβάσεων] of pouring Water on the Face [τῶν ἐπὶ τὸ πρόσωπον ἐκχυσμάτων] of Perfusions, Injections, Irrigations, and dry Fomentations [πυρρῶν]. Moreover the Book treats of the various Kinds of Cataplasms; of the Dropax, Pication, Sinapism, Rubification [φωσφύρε] and metasympcritical Remedies [μετασυνκριτικαὶ συνδύσεις]. This is the third Sermo of the first Tetrabiblos.

In his Fourth Book he discourses on Regimen, or the Method of preserving Health. Here he begins with the Nature of Infants, describes their Diseases, and gives Remedies. Then he prescribes a proper Regimen for all Ages and Conditions of Life; tells when we are to exchange Flesh for a thinner Diet; treats of Lassitude from Exercise, and its different Kinds; of Lassitude from Venery; of that Species which arises from no manifest Cause, and which they call *spontaneous*; of the Care we ought to take of Concoction; of Perspiration stopped, and its Cure; of burning Heats [ἐνθαλάσεις] and seasonable Friction; of Indigestion, Crapula [καραιδνός] and equal Dyscrasies [ἐπαλῆς δυσκρασίας]. How to know the best Temperament; gives us the Characteristics of a hot Temperament, and of others, both simple and mixed, and that not only of the whole Body, but of the Head, Brain, Belly, Lungs, Heart, Liver, and Testicles; and prescribes Remedies for all their Disorders. This is the fourth Sermo of the first Tetrabiblos.

The Fifth is a Treatise of Diseases. Here first he recommends the Study of Hippocrates, and discourses on Fevers, their Signs [σημείους] Prognostics and Diagnosticks, with their Cures, and whatever else belongs to this Branch of Medicine, in a very exact Manner. What is to be accounted the Beginning of Distempers, and that the same is threefold; what we are to understand by Paroxysm [παροξυσμῶ] and Remission, the Height and Declension [ἀνὰ καὶ παρακμῆν] of the Paroxysm, either affecting the whole Body, or some Part of it. What are the Signs of Death or Recovery to the Patient, and which of them portend quick or slow, or in a middle Way, Destruction or Delivery. Of the Signs of Pulses, and Diagnosticks by Urines, and what is to be learnt by them; of the Marks of Excrements, with the Signs and Prognosticks of Vomiting; of an Hæmorrhage, from the Nose, and of the Catamenia; of the critical Signs of Sweats and Abscesses, and what may be gathered from the Spit. That a skilful Physician will know when a Disease is past a Solution, and when it only seems to be so, and can foretel the Day and Hour when the Sick will die. He goes on to treat of general, epidemic, and pestilential Distempers, of such as, on some Occasions, are seized with Faintings, and of Lipothymies and their Causes; of Pain in the Head, Ears, and Eyes; Want of Sleep, and Dulness of Sight attending a Fever; of such as under a Fever are seized with an Hæmorrhage, and their Cure, and what Care ought to be taken of feverish Patients. Moreover, it treats of the Bladder, of Difficulty of Urine, Pains in the Loins, Exulceration of the Parts about the Os Sacrum, of the Testicles and Anus, Breakings out of Pustules [ἐκθύματα] over the whole Body, or some Part thereof; of Tremors and Convulsions, and gives a Detail of Medicines which are both agreeable and effectual. This is the first Sermo of the second Tetrabiblos.

Actius, in his Sixth Book, treats of the Disorders incident to the Head and Brain universally, and not only describes them, but shews a Way to cure them. He proceeds to speak of those who are bit by a mad Dog, of the Apoplexy and Palsy; of the Resolution of the Eye-brow, Eyelid, Tongue, vocal Instruments, and Oesophagus; and prescribes Cures for them all. Thence he goes on to the Spasmus Cynicus, and shews how to cure a Resolution of the Bladder, Penis, and Intestinum Rectum, the Leg, or any other Member; treats of a Tetanus [τετανός] and of the different Sorts of Headaches, from whatever Cause they arise, of a Cephalgia [an intense Pain in the Head] and a Hemisrania [a Pain confined to one Side of the Head]; prescribes a Cure for the Alopecia, and Defluxions of the Hair, and for bald Eyebrows; gives Receipts for dying, curling, eradicating Hair; to make it fine, and to prevent its shedding; and teaches the Making of Psilothra [Ointments to fetch off Hair]; speaks moreover, of the Pituriasis [a Sort

of Scurf] Phthiriasis [lousy Disease] Achores, and those Pustules [ἐκθύματα] which rise about the Head without any manifest Cause; for all these and the like Distempers he gives us a Cure; also for those various Indispositions from different Causes, to which the Ear is incident; for an Hæmorrhage from that Part, and for the Parotides. Thence he passes to the Nose, and its Distempers, when he treats of Sternutatories, and how to suppress immoderate Sneezing. This is the second Sermo of the second Tetrabiblos.

In the Seventh he proceeds to consider the Nature of the Eye, and those manifold Disorders to which it is subject, whether they proceed from an internal or external Cause. He instructs us in the Section of an Artery, in scarifying the Sinus [πρωκισμῶ], the Edition of Photius's *Bibliotheca at Rome*, 1653, has it *πρὸ σκελετῶ*, which Error has passed into the Latin Translation] and the Forehead, in the Method of Bleeding; among the rest he gives us Prescriptions for Ointments, Cataplasms, and various Sorts of Collyriums; and all this with no small Accuracy and Judgment. This is the third Sermo of the second Tetrabiblos.

In the Beginning of the Eighth he has something to say about adorning and setting off the Eyebrows; then speaks of a black Eye, how it comes, and how to cure it; teaches us to defend the Face from Burning, either by Sun or Wind, to preserve the same from Wrinkles, to alter a black Colour, with other additional Beautifyings, and to diffuse a good Scent over the Skin. Hence he passes to consider at large the Distempers incident to the Face, Mouth, and Tonsils, whether from an internal or external Cause. He treats of the various Maladies to which the Teeth are liable, and prescribes a Cure; also those of the Tongue, Uvula, and all that are comprised within the Compass of the Mouth. Among this Number are the Cynanche and the Synanche, which have their Seat in the Jaws; the Tonsils also have their Place among the rest. He shews a Way to revive those who are strangled, but not dead; discourses on the Diseases of the Arteries, and their Remedies; of Coughs also, and Catarrhs, where he prescribes Anodynes for the Cough, with Suffumigations and Epithems. After these he considers those who are afflicted with Asthma, Difficulty of Breathing, and Palpitations of the Heart; and having first treated of the Diseases of the Breast and Lungs, he closes the Book with a Discourse on the Pleurisy, the real and the reputed one, describes them both, and shews a Method of Cure. This is the fourth Sermo of the second Tetrabiblos.

The Ninth Book begins with the cardiac Passion, and proceeds to speak of those who have their Stomach affected with Atrabilis, or the Mouth of the Ventricle any Way disordered, describing the Cataplasms, and other Remedies for the various Distempers of the Stomach. Here he considers the Case of those who suffer Convulsions of the Stomach, after the Manner of epileptic Patients; treats also of Want of Appetite, of the canine Appetite, of Indigestion, and their Cures. Then he shews how to cure a Surfeit, and prescribes a Remedy for Costiveness; treats moreover of Flatulencies, the iliac Passion, and the Colic, of Fluxes of the Belly, and what is called a Disposition to the Colic, of Colliquations, of Worms, round and broad, of those called Ascarides, and of the Affections of the Intestines. He prescribes a Remedy for those who have swallowed Gold, Brass, or any such Thing; as also for such as labour under a Dysentery, to be taken at the Mouth, or injected beneath, such as Pustils, Suppositories, Ointments, Epithems; and at last ends his Book with treating of a Lien-tery. This is the first Sermo of the third Tetrabiblos.

He begins his Tenth Book with the Liver, its Weakness, and other Disorders, and prescribes Medicines for them. Then proceeds to consider the Affections of the Spleen, and its various Disorders, such as Inflations, Inflammations, Scirrhoties, preternatural Tumors, and Hardness, and shews how to cure them; after these, of the Jaundice, Cachexy, and Dropsy; shews you whence every one of these Distempers proceeds, and puts you in a Way and Method how to cure them. This is the second Sermo of the third Tetrabiblos.

The Eleventh Book treats of a Diabetes, and the lax Tone of the Reins, of bloody Urine, of Stone in the Kidnies and Bladder, of Inflammation, Hardness, and Suppuration of the Kidnies; of Dysury, Strangury, and Ischury; of Resolution of the Bladder, of such as cannot hold their Water in Sleep, of the Inflammation, Hæmorrhage, Clots of Blood, Tubercles, and Ulcers in the Bladder; also of the Flux and Itch of the same Part; of a Satyriasis, Priapismus, Gonorrhœa, and venereal Dreams. To all these Distempers, as far as possible, he assigns proper Causes, and subjoins the necessary Cautions, and Cures. At the End of this Book he prescribes Exercises and Medicines for Impotency. This is the third Sermo of the third Tetrabiblos.

In his Twelfth Book he considers the Sciatica, and the Gout, and examines into the Causes, both general and particular, of these Distempers, and prescribes Variety of Remedies for them, and for other Disorders consequent upon them. He

recounts

recounts the several Ways of Evacuation, the Chrims, Emollients, Anointings, the Acopa, and the Ointments, as also the proper Cathartics, and Antidotes, and Abundance of other Things proper to give Relief under these Diseases. This is the fourth Sermo of the third Tetrabiblos.

His Thirteenth treats of the Bites of Animals, what Alterations and Symptoms they produce in the Subject bitten, and how to remove and cure them. He makes the like Observations on Animals that ejaculate their Poison, and points out those Plants and Herbs which are venomous and destructive, with singular Care and Diligence. He discourses on Fungi, Bull's Blood, and Milk clotted in the Stomach; informs us what metalline Substances are hurtful to an Animal, when taken inwardly; explains how drinking of cold Water or Wine may be hurtful; makes Observations on those who are strangled, drowned, or precipitated from some high Place; of Precaution and Foresight in Brute Animals, especially domestic ones. He then discourses of the Theriaca Andromachi, of Vipers, gives its Preparation, Uses, Seasons of using it, Ways to try it, the Dose, and the Distempers in which it is properly administered; also the other Theriaca, particularly the Antidotus Mithridatica, or Mithridate, its Preparation, Use, and in what Cases it is to be administered. To this he subjoins other Antidotes, and to them the two Cyphi [precious Ointments]. From thence he proceeds to write of the Elephantiasis, of pruriginous Eruptions [*αἰματώδης ἐκσυσπιδίων*] Psyraces, and Pustules arising from Sweat [*ὑδατώδης ἢ ὑδαρῖδης*] ulcerous Eruptions [*θλαστώδης ἢ βλαστωδῆς*] in the Legs, Scars from Ulcers which blacken and deform the Body. He proceeds to treat of the two Species of Alphas [*ἄλφα*], a Kind of Leprosy and of the Leuce [*λευκή*], a white Sort of Leprosy and lastly of the Leprosy; shews their Original and Causes, and prescribes their Cures. This is the first Sermo of the fourth Tetrabiblos.

In the Fourteenth Book *Aetius* treats with great Accuracy of the various Diseases incident to the Anus, of Warts [*ὄνυχες*] and Fissures in the Pudenda, of a Phlegmon, Carbuncle, phagedenic Ulcers, and such as have their Seat in the urinary Passages; of a scabbed Scrotum, of an Inflammation in that Part and the Testicles, and the Species of Hernia; of the Composition of Plaisters, and the Way of preparing the Ingredients. He treats moreover of wounded and bruised Nerves, of Buboec, and Phlegmons in general; also of Abscesses, and hollow Ulcers, declaring their Nature, and prescribing Remedies for all, and also for Worms bred in Ulcers, and against the Spreading, Putrefying, and Bleeding of the same. He carries on his Discourse to a Sinus, Fistula, Gangrene, Sphacelus, cancerated Tumors, Carbuncles, Erysipelas, Herpes, Terminthus, and Pustules, specifying their Causes and Cures. He prescribes healing Medicines for such as are burnt with Fire, scalded with Water, or scourged with Whips; for Abrasions, Galls, Contusions, where the Flesh is whole or broken [*σπασμένη ὁλοκήνη ἢ ἐκσυσπιδίον*] for Convulsions, Contorsions, Luxations, and Chilblains, not omitting Excrescences over the Nails, Whitlows [*καρτερύχων, καρτερύχων*] Nails crushed, bloody, loose, or rotten; also to make fresh Nails grow out in the Room of those which are fallen off, to get off Rings that are grown into the Flesh, to cure Corns and Chaps in the Feet, and also Varices. The Book concludes with the Management and Cure of the Dracunculi in the Arms and Legs. This is the second Sermo of the fourth Tetrabiblos.

The Fifteenth Book contains the Theory and Cure of oedematous, emphysematous, indurated, and incysted Tumors, of Strumæ, Bronchocele, Melicerides, Steatomata, Ganglia, Aneurisms, Favi, and Hydrocephalus. Of all these you have the Origin, and Causes, with the chirurgical and other Methods of Cure, and the Preparation of many and various Sorts of Plaisters. This is the third Sermo of the fourth Tetrabiblos.

In the Sixteenth, and last, the Author treats of the Situation, Structure, and Magnitude, of the Womb, with the Seasons of its Purgation and Semination. Of Conception, of the Marks of Fecundity, and having actually conceived, and of the Symptoms peculiar to pregnant Women. Of the great Care that is to be taken of them; who are qualified for easy Labour, and who are unhappy in that Respect. Of hard Labours, and preternatural Births, of the Cæsarean Section, and Extraction of the Scundines; what are the Causes of Infecundity in Man or Woman. For all these fore-mentioned Evils, Remedies are provided in this Book; as, for Instance, Potions, Pessaries, and Suffumigations are prescribed to promote Conception. Hence he goes on to the Diseases of Womens Breasts, which he treats of in a skilful Manner, explaining their Origin, Essence, chirurgical and other Methods of Cure. After this, he enquires into the Causes of the Obstruction of the Menfes, of their too plentiful Efflux, both the red, and the white; of Hysterics, and a Fluor albus, with excellent Prescriptions in these Cases. He proceeds to treat of other Distempers of the Uterus; as Abscesses, oedematous Tumors, Moles, Dropsy, Ulcers, &c. and other Things of the like Kind, not forgetting to speak of the Phimosis, and Imperforation, and other like Incidents, with their proper Remedies; also

of the Section of the Nymphæ, Cercosis, the Hernia varico-sa, Thymi, and such like; and how to cure them. To all these he subjoins some Smegmata [a Sort of Wash-balls] for the Face, and other Parts of the Body, with Prescriptions for the Composition of some precious Ointments, with which he closes his Treatise of the Art of Medicine. This is the fourth Sermo of the fourth Tetrabiblos.

This Work of *Aetius*, in my Opinion, excels the Synopses of Oribasius, I mean those dedicated to Eustathius and Eunapius, on all Accounts; for he does not only give us the Definitions, the Causes, the Diagnostics, and Prognostics, in a more perspicuous Manner, but is more full and copious in the therapeutic Part. And he is not only his Superior in those Respects; but even in what he has epitomised from Galen, both in Perspicuity, and Extensiveness, as comprehending more Diseases. But, perhaps, there is no Comparison between this Work and that of Oribasius, which takes up seventy Books, because our Author has not only omitted Anatomy, which Oribasius has explained, but has said nothing about the Use of the Parts, which indeed more properly comes under the Consideration of a Philosopher than a Physician. On these Accounts, perhaps, it will be thought inferior to the fore-mentioned Epitome of Galen's Works. But, to speak my Mind freely, in this negligent Age, which minds nothing less than the Sick, I would recommend this Collection above all other Works of that Kind, especially to those who do not care to search into the Depth of the Theory of Medicines; but have the Health of Mankind more at Heart. They will here find Remedies in Abundance, and an ample Recompence for all their Pains and Study on this valuable Piece of Medicine. *Photii Biblioth.*

This is the Character Photius bestows on *Aetius*, and Cornarius agrees with him so exactly, that he seems to transcribe him.

Of the Works of *Aetius*, only the two first Tetrabibli, or eight first Books, have yet been printed in Greek, and these only once in Folio, at Venice, 1534. The rest are said to remain in Manuscript in many Libraries.

Johannes Baptista Montanus, a Physician of Verona, was the first who published a Latin Translation of all his Works, at Basil, 1535, in Folio.

In 1542, Janus Cornarius published his Translation of all the Works of *Aetius* at Basil in Folio. This has been several Times reprinted, and is published amongst the *Medicæ Artis Principes*, by H. Stevens.

AETOI PHLEBES. *Ἀετοὶ φλέβες.* Eagle-veins. According to the Report of Rufus Ephesius, Philistio, an Italian Physician, who wrote in the Doric Dialect, which was spoken in that Part of Italy where he was born, called certain Veins which ascend through the Temples to the Head by this Name: *Rufus Ephes. L. 1. C. 33.*

ÆTOLION. *Ἀετὶον.* The same as *Gramen Cnidium*. *Gorræus.* See *CNIDIA GRANA.*

AETOMA. *Ἀετομα.* The Roof of a House. This Word is used by Hippocrates, in his Treatise *de Articulis*, and for that Reason claims a Place here.

AETONYCHUM. From *ἄετις*, an Eagle, and *ὄνυξ*, a Claw, or Nail. The same as *Lithospermon*, so called from the Hardness of the Seeds. See *LITHOSPERMON.*

AFFAX, AFFARX, or AFFARIS. *Ἄφαξ.* *Rulandus.* *Johnson.*

AFFECTIO, or AFFECTUS. An Affection. This is expressed in Greek by *πάθος*. It signifies a Disorder that all, or any Part of the Body is affected with, or suffers. Thus *Affectio Colica* is the Colic; *Affectio Melancholica* is Melancholy. And in this Manner by adding an Adjective to *Affectio*, or *Affectus*, most Distempers, to which the Body is subject, are expressed.

AFFENICUM. The Soul. *Rulandus.*

AFFEOS. The same as *ἄφρος*, Spuma, Froth, or Foam. *Rulandus.*

AFFIDRA. *Ἀφιδρά.* *Rulandus.*

AFFION. A Name for Opium. A particular Sort of Electuary also prepared in Bantam; in which Opium is an Ingredient, is thus called. It is famous for exciting Courage and venereal Vigour. *Castellus.*

AFFLATUS, or, as it is sometimes wrote, ADFLATUS. A Vapour, or, as the Country People call it, a Blast, preserving the Analogy of the Latin Word, which affects the Body with some sudden and dangerous Distemper. It is used to express such violent Effects of something contained in the Air, or of the Bites of Serpents, and is often applied to Inchantments, with a View to which Horace says:

velut illi
Canidia affasset pejor serpentibus Aëris.

AFFLICTIO. AFFLICTION. I do not know that this has been admitted into the Catalogue of Distempers, but it is certainly productive of a great many, and those often fatal. For, according to the vulgar Way of expressing it, many People

ple die of a broken Heart; and for Reasons that appear very obvious.

It is known, that those Passions of the Mind, which increase the Velocity of the Blood, augment the Stricture, Tenuity, or Elasticity of the animal Fibres. This Effect these Passions have in common with every other Cause which makes the Heart contract with greater Force, and expel the Blood from it with more Strength. Because, under these Circumstances, the Blood acts with a greater Force; or, as the Mathematicians call it, *Momentum*, upon the solid Parts, and the reciprocal Action of the Vessels on the Blood is also increased; hence, with Respect to the Solids, the Application of Part to Part is brought about with more Force, or, in others Words, what is supplied by Nutrition is more firm. With Respect to the Fluids, these, being pressed upon by the Solids with an increased Strength, are more compacted together, and consequently contain an equal or perhaps a greater Quantity of Matter under a less Surface. The Secretions also are performed with more Vigour, and a great Part of the watery Particles is separated from the Blood, and carried off by the proper Emunctories. Hence the Fibres are rendered hard, elastic, and rigid; and the animal Strength is in general increased. But if this State is carried beyond a certain Point, various Diseases are thence produced, as Madness, Inflammations, Gout, Stone, and malignant Ulcers.

The Passions, usually said to produce these Effects, are Anger, Envy, and Hatred. Thus Achilles, the strongest Man of the Grecian or Trojan Army, is represented as extremely passionate; and thus the envious Man is said to grow lean in a literal Sense at the Prosperity of his Neighbour.

But, on the Contrary, those Passions which diminish the Velocity of the Blood have an Effect directly the Reverse; for the reciprocal Action betwixt the Solids and Fluids, being lessened, neither can be so compacted as in the other Case. The Secretions also must be carried on with less Vigour, and many Particles which ought to be discharged as of no Use to the Economy of the Whole, are retained; hence the Muscles become relaxed and flabby, the Glands obstructed, and the whole Habit bloated, and weak.

The Passions which induce this Alteration, are Fear, Grief, and those also which cause a great Complacency, as Joy and Delight. Hence Fear and Grief are observed to bloat those affected much with either; and Prosperity to make People fat, which are both Degrees of Relaxation.

It will be difficult to specify the Manner how the Passions either increase or diminish the Force of the Heart, till such Time as the Action of the Soul upon the Body is better known. Instead therefore of attempting this, I shall give a remarkable Instance of the Effect of Afflictions from the *History of the Royal Academy of Sciences*.

A Lady of Dauphiny, aged Forty-seven, being seized with a violent Sorrow on Account of the Death of her only Son, in September, 1729, began, from that Time, to fall into a very languishing Condition; and a Leanness that still grew upon her. At the End of nineteen Months, M. Patras, Doctor of Physic at Grenoble, who obliged the Academy with this Relation, found her under a slow Fever, and felt a hard Tumor in the Hypogastrium; of the usual Bigness of the Uterus, three Months and a half after Conception; and, indeed, he thought it was the Uterus itself. This Lady, since her Misfortune, had lost her Menfes for some Time past.

The Disease grew more and more considerable, the whole Abdomen swelled, the Water was felt in its Cavity, and Tapping was resolved upon, which was performed twice at her Seat in the Country, the Autumn of 1731. At the first Operation there came some Drops of Water; at the Second nothing at all.

As this Swelling of the Abdomen, which continually increased, caused a violent Oppression on the Breast, M. Patras was for another Tapping, but in a different Place. The Physician, who had directed the first, had no Concern or Thought of any Thing but the Ascites, which was visible before him, not dreaming of the Tumor in the Hypogastrium, which M. Patras then privy to, and which was then hid by the Dropsy. M. Patras then chose another Place for the Tapping; but, to his great Astonishment, there came out nothing but some Drops of Blood. Notwithstanding this, the Fluctuation of the Waters in the Abdomen was very sensible, inasmuch that M. Patras thought himself obliged not to be discouraged by those hitherto fruitless Attempts of Tapping, since all other Remedies had no Effect. In short, the Operation was renewed, and there came forth just nothing.

After this the Legs of the Patient broke without any Assistance, whence in the Space of fifteen Days issued out Abundance of Serosities, which, at least in Part, belonged to the Abdomen, for the Oppression on the Breast was considerably diminished; but this Relief was the only good Consequence. The slow Fever still continued, and M. Patras, who could then easily perceive the Tumor in the Hypogastrium, found it very much augmented. Besides this, it was accompanied

with a raised Border, in Form of a Girdle, which went across it from one Side to the other. This Girdle was of a soft Consistence, and bore out about half an Inch.

At last, the Patient, quite exhausted of Strength, and frightfully lean and extenuated, could no longer take any Substance, but died the first of May, 1732.

The Body being opened, to pass over the Difficulty of disentangling the Parts, which had hardly preserved any Thing of their natural Disposition, M. Patras very plainly perceived, that the Tumor of the Hypogastrium which he had first touched, and which he thought had been the Uterus, was indeed the left Kidney, so prodigiously increased in Bulk, that it weighed thirty-five Pounds. Its natural Structure was altered, in Proportion to that Augmentation of Bulk and Weight. What looked like a Girdle, whose Bearing out might be felt, was the Colon, which passed above the Tumor, and had stuck thereto.

It is now no longer to be wondered, that the Waters were felt floating in the Abdomen; and yet that the Tapping got none of them out. For these Waters only floating in the Spaces left void by that enormous Mass of the Kidney; there was not a sufficient Quantity found in the very Places where the Trocar had penetrated. Perhaps a little too went off, and took another Situation, so that when the Instrument was taken out, and the Caniula came to be applied, it met with nothing but a Mass too solid for its Purpose. What is most worthy of Observation in this strange Accident, is the Power of great Afflictions in changing, to such an excessive Degree, the very Structure of the Human Body. *Hist. de l'Acad. Roy. des Sciences, Année 1732.*

AFFODIUS. A Sort of Serpent, according to Castellus, the same as the *Hæmorrhous*, or very like it.

AFFORMAS. *Glass.* *Rulandus.*

AFFRENGI. *Red Lead.* *Rulandus.*

AFFRODINA. The same as *Venus.* *Rulandus.*

AFFRONITUM. See *APHRONITUM.*

AFFROTON. *Frathy.* *Rulandus.*

AFFUSIO. *Affusion.* The Pouring a Liquor upon any other Substance. Sometimes it signifies the same as *Suffusio*, a Catarrh.

AFRA. An *Ostrich.* See *STRUTHIOCAMELUS.*

AFRAGAR. *Verdigrease.* *Rulandus.*

AFRICANUS FLOS. *African Flower.* There are many Species of this Plant; the fourth mentioned by Gerard is thus distinguished:

Othonna; Offic. Othonna; Tagetes Indicus; Flos Africanus. Chab. 358. *Tagetes Indicus minor simplicis flore, sive Caryophyllus Indicus, sive Flos Africanus,* J. B. 3. 98. Raii Hist. 1. 343. Boerh. Ind. A. 114. Tourn. Inst. 488. Elem. Bot. 390. *Flos Africus minor simplicis flore;* Ger. 611. Emac. 750. *Flos Africanus minor simplex,* Park. Parad. 304. *Tanacetum Africanum sive Flos Africanus minor,* C. B. 133. *Chysanthemum Africanum: Tanacetii folio procumbens, sive minus flore simplici,* Hist. Oxon. 3. 16. *Tlapalcotli Coaxochitl, Caryophyllus Mexicanus,* V. Hern. 156. *Tagetes minor flore luteo-rubescens,* Act. Reg. Par. An. 1720. 315. **AFRICAN MARYGOLD.**

Gerard mentions four Sorts of this Plant, the first he calls:

FLOS AFRICANUS MAJOR POLYANTHOS. *The great African double Marygold.*

This, he says, hath a great, long, brown, reddish Stalk, crested, furrowed, and somewhat knobby, dividing itself towards the Top into other Branches; whereon grow Leaves composed of many small Leaves, set upon a middle Rib by Couples, much like unto the Leaves of white Valerian, bearing at the Top very fair and beautiful double yellow Flowers, greater and more double than the greatest Damask-Rose, of a strong Smell, but not unpleasant. The Flowers being past, there succeedeth long, black, flat Seed; the whole Plant perishes at the first Approach of Winter.

The Second differs not much from the First, only that this Plant is less, and brings forth more Flowers, we may therefore call it, **FLOS AFRICANUS MINOR MULTIFLORUS.** *The small double African Marygold.*

The Third he calls, **FLOS AFRICANUS MAJOR SIMPLICI FLORE.** *The great single French Marygold.*

It hath a thick Root, with some Fibres annexed thereto; from which riseth up a thick Stalk chamfered and furrowed, of the Height of two Cubits, divided into other small Branches; whereupon are set long Leaves, compact or composed of many little Leaves, like those of the Ash-tree, of a strong Smell, yet not very unpleasant. On the Top of the Branches grow yellow single Flowers, composed in the Middle of a Bundle of yellow Thrums hard thrust together, paled about the Edges with a Border of yellow Leaves; after which cometh long black Seed. The whole Plant perishes with the first Frost, and must be sown yearly as the other Sorts must be.

The Fourth is called:

FLOS AFRICANUS MINOR SIMPLICI FLORE. *The small French Marygold.*

The common African, or as they vulgarly call it, *French Marygold,*

gold, hath small, weak, and tender Branches, trailing upon the Ground, leaning every Way, beset with Leaves consisting of many particular Leaves, indented about the Edges, which being held up against the Sun, or to the Light, are seen to be full of Holes like a Sieve, even as those of St. John's Wort; the Flowers stand at the Top of the spriggy Branches, proceeding from long Cups, or Husks, consisting of eight or ten small Leaves, yellow underneath, on the upper Side of a deeper Yellow, tending to the Colour of a dark Crimson-Velvet, as also soft in handling; but to describe the Colour in Words, it is not possible, but this Way; lay upon Paper with a Pencil a yellow Colour, called Masticot, which, being dry, lay the same over with a little Saffron steeped in Water, or Wine, which setteth forth most lively the Colour. The whole Plant is of a most rank and unwholesome Smell, and perisheth at the first Frost.

The unpleasant Smell, especially of that common Sort with single Flowers (that stuffeth the Head like to that of Hemlock) doth shew, that it is of a poisonous and cooling Quality; and also the same is manifest by divers Experiments; for I remember, saith Dodonæus, that I saw a Boy, whose Lips and Mouth, when he began to chew the Flowers, swelled extremely; as it hath often happened to them that playing or piping with Quills or Kexes of Hemlock, hold them a While between their Lips; likewise, he saith, we gave to a Cat the Flowers with their Cups, tempered with fresh Cheese, she forthwith mightily swelled; and a little While after died; also Mice that have eaten of the Seed thereof have been found dead. All which Things declare, that this Herb is of a venomous and poisonous Faculty; and that they are not to be hearkened to, that suppose this Herb to be a harmless Plant. So to conclude, these Plants are most venomous and full of Poison, and therefore not to be touched or smelled unto, much less used in Meat or Medicine. *Gerard's Herbal.*

Miller reckons up thirteen Species of these Plants.

The fourth Species, mentioned by Gerard, is called OTHONNA, as is taken Notice of above. But it does not appear certain, that it is the *Othonna* of Dioscorides and Pliny, of which they give the following Account:

Some assert the OTHONNA to be the Juice of the greater *Celandine*, others of the *Glaucium*; some will have it to be the expressed Juice of the *Papaver corniculatum*, while others pretend to assure us that it is a Mixture of the Juices of female *Pimpernel*, *Helenbane*, and *Poppy*; and to name no more, some affirm it is the Juice of a troglodytical Herb, called OTHONNA, which grows in that Part of Arabia, which borders upon Egypt. Its Leaves are most like those of Rocket, full of Holes, as if they were Moth-eaten, dirty, and few in Number; so that some have taken it for a Species of *Anemone*.

The Juice expressed is proper for the Eyes, in Cases that require Cleansing; for it has a biting Quality, and absterges whatever may dim or cast a Mist before the Pupil of the Eye. It is said, that a moist Substance distils from the Herb, which, after it is washed and cleansed from Gravel, is made up into Troches, for the Purposes aforesaid. But some will have this to be an Egyptian Stone, that is found in the Province of Thebais, of the Colour of Copper, and of a hot biting Taste, mixed with an Astringency. *Diosc. E. 2. C. 213.*

OTHONNA grows in Syria; it is like the Rocket, having its Leaves perforated in many Places, and a Flower like that of Saffron, for which Reason some have called it *Anemone*. Its Juice is good in Collyria, for it gently stimulates and dries, and has an astringent with its drying Quality. It clears the Eye of Cicatrices and Nubeculae, and whatever else incriminates it. *Plin. Nat. Hist. L. 27. C. 12.*

AFROB. Rulandus explains this by *Plumbum nostrum*, *Corpus immundum*. I suppose he means Alchymistical Lead, which is ANTIMONY.

AGA CRETENSIMUM. This, according to Ray, is the *Silybum minus* *Bæticum* of Parkinson. *Cardus lacteus peregrinus* *Camerarii*, J. Bauh. *Albis Maculis notatus*, C. Bauh. The small Spanish Milk Thistle. See *SILYBUM*.

AGALACTIA. *Ἀγαλακτία*. From a Negative, and γάλα, Milk. A Defect of Milk in Childbed. Hence *ἀγάλακτος*; *agalaktos*, an Epithet given to a Woman that has no Milk when she lies in by *Hippocrates*.

AGALLOCHUM, is a Sort of Wood, which is exported from India and Arabia, like the *Thya*, marked with Spots, odoriferous, of a bitterish astringent Taste, with a thin skinny Bark, and somewhat mottled.

Chewed, or the Mouth rinsed with the Decoction, it makes the Breath sweet; dried and powdered, it serves as a Diapasm [Perfume] for the whole Body, and is used in Suffumigations, instead of Frankincense. The Weight of a Dram of the Root, drank, cures the excessive Humidity, Laxness, and burning Heat of the Stomach [usually called the Heart-burn]. Drank in Water, it relieves those who are afflicted with Pains in the Side or Liver, or labour under a Dysentery, or the Gripes. *Dioscorides. Lib. I. Cap. 21.*

Ἀλόν, an Indian Tree, whose sweet-scented Wood is called *ἑλάνθη*, and is the same with *Agallochum*. Ἀλόν is an Herb,

as much Indian as the other; but growing also in other Countries, whose Juice is recommended among the principal Cathartics, chiefly on Account of its Bitterness. Hence we see that most Authors, both antient and modern, have confounded the aromatic with the purging Aloe. *Agallochum* is from the Hebrew *אבלח*, *Abalstb*. The Masculine *אבלח*, *Abel*, whose Plural is *אבלים*, *Abalim*, is found, they say, to bear the same Signification. Thence come the Greek *ἀλόν*, which was very much in Use among the later Greeks, who also say *ἑλάνθη*, whereas the Antients more frequently used *Ἀγρόδον*; and yet the Septuagint were not ignorant of the aromatic *ἀλόν*. The cathartic *ἀλόν*, in Syriac, is *עלר* *Olar*. Hence that Word came to be adopted by the Greeks. The Arabic has its *Cebat*, *Sebat*. In an antient Græco-Arabic Glossary, we find written, *סבט, ἢ ἀλόν*. In the printed Serapion, *Laber* is injudiciously put for *Saber*. A very antient Latino-Arabic Glossary interprets Aloe by *Seru*; and *Seru* is the Cypress-Tree, in the same Book. And *Seru*, by an antient Interpreter of Avicenna, is taken for the same Tree. I am of Opinion, that the Author of that old Glossary put this *Seru* for the aromatic Aloe. A manuscript Copy of Dioscorides, of great Antiquity, with Arabic Notes, under the Word *ἀλόν*, subjoins, with an Article [the Arabic Article *Al*] *Alcebar*. Hence comes the Spanish *Acera*.

As for the aromatic Aloe, or *Agallochum*, the later Greeks, who are beholden for it to the Arabians, make two Species of it, *Ἀγρόδον Ἰνδικόν* [*Agallochum Indicum*] and *Ἀγρόδον Σινί* [*Agallochum Sinhi*]. So I find it in Charito, the Physician. In Serapion's Interpreter, *Seifi* is wrongly put for *Sens* or *Sinfi*; from an Indian Island, called *Sinf*: For there is a Difference between the *Sinfi*, and what they call the Indian *Agallochum*. The latter is so denominated, rather from its Colour than its Country, for they call the Black by this Name, which is the most valuable Sort. So of the various Kinds of Myrobalans, which are all Indian, only the Black is honoured with that Name. And in other Things I have observed the Appellation of *Indian* bestowed on the blacker Sort. The Indian *Agallochum* is also mentioned by Avicenna, under the Letter *A*, where he enumerates the several Kinds that come from different Parts of India, as the Mundalic, the Cumeric, those which come from Calay and China, and others. In that Chapter, he renders *Haud* by an Arabic Word, which signifies Wood in general. *Haud* also with them signifies a Flute; and we [the French] too call a Flute Wood, *Hautbois*, which, perhaps, is compounded of the Arabic Word and its Interpretation. But *Agallochum* was called *Haud* *καὶ ἑλάνθη*, by Way of Eminence; and this was its proper Name among the Arabians. Garcias ab Horto relates, that in Decan, and Guzarate, which is thought to be the Country of the antient Gedrosii, the *Agallochum* is called *Ud*, which Word he supposes derived from the Arabic. Perhaps the Arabic was derived thence. In the Writings of the Portuguese, it is called *Udo*; doubtless the same as *Haud* in the Arabic Pronunciation. It is better, therefore, to render what the Arabians call *Haud*, *Heud*, by *Agallochum Indum*, than, as learned Men do, by *Lignum Indum*. In the Exposition of Andreas Alpagus, the Author is wrong in reading *Heudem*, i. e. *Lignum Aloes Indum*. Read *Heud Hen*, or *Haud Hend*, which is from *Haud Hendi*. In Greek I read *ἑλάνθη* [*Eudchento*]; as *καμαρχέντι* [*tamarcenti*] for *tamarhendi*. So *Haud alumeri*, in the Arabian Geographer, is not the *Lignum Comaricum*, but the *Agallochum Comaricum*; as the *Ἀγρόδον Σινί* in Charito is *Haud Sinfi*. It is otherwise called by the Arabians *Agalugi*, which is a Corruption from the Greek *Ἀγρόδον*; and in Avicenna it is read *Agallugun*. The modern Greeks most commonly call it *ἑλάνθη*, *Xylaloes*, having no Regard to the Meaning of the Arabic Word, but only to distinguish it from the other Aloe, which stands recommended on Account of its Juice, and not for its Wood. *Salmasius de Homonym. Hyl. lair. Cap. 6.*

The *Agallochum* is thus distinguished by Authors:

1. *Agallochum*, *Xylaloes*, & *Lignum Aloes*, Offic. *Agallochum* & *Xylaloes*, Offic. Geoff. Tract. 309. *Agallochum sive Lignum Aloes*, Park. Theat. 1564. *Agallochum Officinatum*, C. B. Pin. 393. Raii Hist. 2. 1808. *Agallochum verum*, Ephem. Germ. Dec. 11. Ann. 3. p. 74. *Agallochum Lignum Aloes*, *Xylaloes*, Chab. 35. *Agallochum Officinatum*, alius *Lignum Aloes*, Johnf. Dendr. 460. Sinkoo vulgo *Japonum Kavoriki*, i. e. *Lignum seu arbor fragrans, Siamensis Kiffina*, Latinis *Arbor Aquilæ* & *Aloes dicta, cujus fragrans Lignum appellatur Agallochum*, Kempf. Amoen. Exot. 903. *Lignum Aloes vulgare*, Ger. Emac. 1622. *Lignum Aloes, vel Xylaloes*, Ind. Med. 67. *Lignum Aloes, Agallochum, Xylaloes*, Morit. Exot. 7. *Lignum Aloes Officinatum, & Agallochum plerisque putatum*, J. B. 1. 477. WOOD OF ALOES. Dale.

It is an Indian Wood, like the *Thya*, sweet-scented, and chewed in the Mouth makes a sweet Breath. *P. Eginet. Lib. 7. Cap. 3.* from *Dioscorides*.

It has an astringent mixed with a bitterish Taste; its Bark is like Leather, and of various Colours. *Oribas. Lib. 11.* from *Dioscorides*.

AGALLOCHUM. This is a Wood brought to us from the East Indies, and is said to grow in China, and there to be called Calambac: But we have no certain Account or Description of the

the Tree, whose Wood it is. It is brought over in small Pieces, we seldom seeing those of any great Length or Bigness: It is of a hard, solid Texture, firm and ponderous, of a yellowish brown Colour, with several black or purplish resinous Veins interspers'd; of a bitterish hot aromatic Taste, of no very strong Scent till it is burnt. Though several Authors set it down as a principal Note of the Goodness of this Wood, that it will swim in Water, yet I have never met with any but what would sink in it, notwithstanding it had all other Characters of true Lignum Aloes.

This Wood is heating and drying, cordial, and strengthening the Nerves, revives the animal Spirits, comforts the Heart and Brain, prevents swooning Fits, and Disorders of the Womb; it is frequently put among Cordials, Species, and Powders. *Miller. Dale.*

Dale seems to esteem the two following Woods near a-kind to *Agallochum*.

2. *Aspalathum*, Offic. Geoff. Tract. 310. Mont. Exot. 7. *Lignum Aspalathum*, Pharmacop. *Aspalathus*, Ind. Med. 15. *Agallochum præstantissimum*, Johnf. Dendr. 460. C. B. Pin. 393. CALAMBAC WOOD.

This Wood also is brought from the East Indies in Pieces that are thicker and less solid than the Lignum Aloes, of a paler Colour, and fainter Smell, bituminous, fat and resinous, and of a bitterish Taste.

Its Virtues are the same with those of the preceding (for which it is often sold) but weaker.

3. *Lignum Aquile*, Ind. Med. 67. EAGLE WOOD.

It is used in the Shops at Paris, instead of *Aspalathum*; but seldom met with among us.

Most Botanists take the *Agallochum* of the Antients to be the Lignum Aloes of the Shops; others suppose the *Aspalathum* of the Antients to be the same. Again, others, especially the Arabians, make several Kinds. Garcias knew but one Indian Species. The Shops, as Clusius observes, can shew us two Kinds of Lignum Aloes. Caspar Bauhinus divides it into three Sorts. The first he calls the finest *Agallochum*, which is reserved for the Use of the Indian Kings. The second Kind is what is sold in Shops, and the third is the wild *Agallochum*. There are only two Sorts to be met with in the Shops, as we said before. And, it is assured, that we have the true *Agallochum*, or Lignum Aloes, brought to us from China, called *Calambac*. This is a tall Tree, described by none, that I know of; for what Garcias ab Horto writes of is not the same, but the *Aspalathum*, abovementioned, as some skilful Botanists, who have travelled in the East Indies, assure us.

Why *Agallochum* is called *Lignum Aloes*, says Paulus Ammanus, many are at a Loss. *Hoffmannus*, Lib. 2. Cap. 25. says, "Perhaps 'Αλν, in the Indian Tongue, signifies a Perfume." *Bontius ad Cap. 16. Garc. ab Horto*, p. 43. derives it from *Savour*. "This Wood of Aloes, says he, has a peculiar aromatic and bitterish Taste, whence, perhaps, it took the Name of Aloes." I would have none think the Aloes of the Shops to be the concrete Juice of this Tree, as Wormius makes it, p. 272. For this is a peculiar tall Tree, but the Juice of Aloes comes from a Plant of the same Name.

The Lignum Aloes, exported from Manilam in Cochin-China, is of three Sorts. 1. *Sokbio*, which seems to be the outer Part of the Trunk; it is not ponderous, is of an Ash-colour, with Veins of Black, a very little bitterish, moderately fragrant, not gummy. 2. *Thimbio*, is to be had at the Shops. This is of a blackish Colour, solid and ponderous, intersected with Veins and Channels, gummy, bitter, very fragrant, swimming in Water, called by the Spaniards, *Calamba*. 3. *Gilam-bio*, which is of an Ash-colour, inclining to pale, soft, and very fragrant.

There is another Sort brought from *Kalapa*, of a darker Colour than the *Thim-bio*, and more ponderous, sinking in Water. The Chinese export a very black Wood, moderately fragrant, which they call *Kai-bio*; and another reddish Sort, of an extraordinary Fragrancy, called *Chi-tua*.

An Account of the LIGNUM CALAMBAC, and LIGNUM ALOES, sent by Mr. Cunningham to Mr. Petiver.

The true *Calambac* is known by its fragrant Smell, its bitterish and aromatic Taste, and its Softness, like Wax or Mastich, receiving Impressions from the Teeth or Nails. There are several Degrees of Goodness in it; for in the Kingdom of Cochin-China, or Annam, the chief, if not the only, Place of its Growth, it is sold from 10 to above 50 Tael an English Pound. In Respect of Colour, there are three Kinds, viz. 1. The mixt-coloured, or black-purple, like a Duck's Head, as the Natives make the Comparison. 2. The spotted, like a Tiger. 3. The yellow, like the Yolk of an Egg. What falls of itself, without felling, is for the most Part of a Variety of Colours, and most valued. The *Calambac*, in the Annamic Tongue, is called *Kenam*. The Chinese Merchants of Fokien pronounce it *Kelam*, whence perhaps is derived the Word *Calambac*. *Lignum Aloes*, boiled in the Decoction, or Juice of

Calambac, is sold, by some, for the true *Calambac*; but left a while to dry, it loses its Fragrancy, Softness, &c.

The nearer the *Lignum Aloes*, or *Agallochum*, approaches to *Calambac*, the better it is. But the former is, for the most Part, harder, and feels dryer, and, as it were, like Dust in the Mouth; and is not so fat, but weaker in all its Qualities. A Pound of it is worth from 5 Mas. to 6 Tzel. *Lignum Aloes* is called by the Portuguese *Pao Agula*, by the Natives *Keang*, that is, *fragrant*. The Chinese in the Mandarin Language call it *Tchin-hiang*, that is, *the fearful or sinking Fragrant*; but the *Calambac* they call *Suk-hiang*, that is, *the fat Fragrant*. Some tell you that the *Lignum Aloes* is produced by several Trees: But all agree, that the *Calambac* is the Product of a Tree that bears Fruit (some of which I send you) supported by a *quinquesfid Calyx*, almost in the Shape of a Pear, covered with a Down, of the Size of a Citrine Myrobalan, with a thick ligneous, or fungous Coat, cleaving in the Middle, and containing on each Side a Kernel, shaped like a Top, and supported by membranous Appendices. The Fruit pulverised is an excellent Remedy for the Gripes. *Dale.*

A Tael is the Value of six Shillings and eight Pence Sterling; and a Mas, the tenth Part of a Tael, that is, eight Pence.

A Dram of the Powder of the Root, drank, cures the too great Humidity and Laxness of the Stomach; it is good also in Distempers of the Liver, Dysenteries, and Pleurifies. *P. Eginet. Lib. 7. Cap. 3.*

Of all the Woods sold in the Shops, we have none more precious, more valuable and rare, than the true Wood of Aloes or Xyloaloes: Upon which Account it is very little known, and every one is liable to mistake the Wood, which makes it easy to be counterfeited; so that it is a difficult Matter to know it positively, it being described so differently, by different Authors.

There are several Sorts of it, but the best is the *Agallochum* of India, which comes from Calcut. The finest is the black Kind, of a changeable Colour, full, heavy solid, and thick, which cannot be whitened, and is difficult to set on Fire.

There are others which pretend to affirm, we cannot have the true Wood of Aloes, and that it grows not in this terrestrial Paradise, it having been swept away by Deluge: And others will not allow it us, because it is not produced among us, except in Deserts, and upon inaccessible Mountains; not only from their Height, but because of the wild Beasts that inhabit among them, as the Lion, the Tiger, the Panther, and the like; besides a Thousand other idle Stories, that are told about this Wood: To confute all this, I shall only tell you, that the Ambassadors from the Kingdom of Siam, brought of this true Wood to present to the King of France now reigning, as well wrought as unwrought; among the rest, a Basin with its Salver, proper to wash the Hands in, made at Siam, after the Mode of that Country. This Basin, though of Wood, is more esteemed than if it had been of massy Gold, because made of the Tree of the true Aloes Wood growing at Bantam and in China, and which is of the Size and Shape of the Olive-Tree, having Leaves something after the same Sort; upon which grows a little round Fruit like our Cherry. They bring a Quantity of it from Surat, but the most resinous of it is most valued, and it is distinguished into larger and lesser Pieces.

It is observable, that the Trunk of this Tree is of three Colours; the first Wood, which lies immediately under the Bark, is of a black Colour, solid, heavy, and almost like black Ebony; and by Reason of its Colour, the Portuguese call it Eagle-Wood. The Second which is a light veiny Wood, like rotten Wood, and of a tanned Colour, is what we call Columbac or the true Wood of Aloes. The third Sort, which is the Heart, is a precious Wood of Tambac, or Calambac: I shall say no more of it, having never seen any of it, but that it is very scarce and dear. *Pomet.*

The Arabians say, that on a Mountain of Comorin, grows the most precious of all Woods, which is that of Aloes, called by the Greeks *Xylaloe*, and by the Arabians *Ud*, and *Al Ud*, that is to say, *The Wood*, by Way of Eminence. It grows plentifully in that Place, and excels all that is imported from other Countries. *Herbelot, Bibl. Orient. Art. Cameron.*

All the Eastern Geographers agree, that this Wood, whose Smell is exquisite, grows only in those Countries of India which lie under the first Climate. The most valuable Sort of this Wood is in the Island called Senf, which lies in the Indian Sea, and the Passage to China. They call it *Al Oud Al Senfi*, to distinguish it from what they call *Al Oud Al Comari*; because it grows in another Island called Comar, not far distant from Senf, but whose Wood is far inferior to that of the other.

However, several Authors are of Opinion, that the Wood of Aloes of Camnon, or Comron, which is Cape Comorin, is the best. And this is what the King of India presented Noufchirvan with, to the Weight of ten Quintals, which ran and blazed in the Fire like Wax.

Some Geographers remark also, that the greatest Quantity of Wood of Aloes, comes from the Isle of Semender, which we call

call Sumatra, and the Sheriff Al Edriffi says, that it is found also in the Isle of Serandib, called by us Zeilan. *Herbelot.*

This Nouchirvan is the same as Khosroes the first of that Name, King of Persia. This Prince, when he had finished his great Conquests, retired to his Capital, to spend the Remainder of his Days in Peace. All the bordering Princes sent Ambassadors to him, loaded with rich Presents. Amongst these were a Female Slave, seven Feet high; a Carpet made of the Skin of one Serpent, of an extraordinary Size, and as soft as Silk. A third great Rarity was the *Abes-wood* mention'd above, sent him by the King of Indostan.

AGARICOIDES. A Sort of Fungus thus distinguished. *Agaricoides parvum, album, lamellis subulatis. Fungus parvus, lamellatus, peduncululi forma, alno adnascens,* Raii Syn. Vaill. 70. Dr. Martyn has found it in Woods, as in Bishop's Wood near Hampstead, and in Madingley Wood. *Tournefort by Martin.*

AGAPE. *Ἀγάπη.* Love. It also signifies an Afternoon or Evening Meal of Victuals.

AGAR. Calx. Lime. *Rulandus.*

AGARICUS. *Agaric* was mistaken by some of the Antients for a Root, as we learn from Dioscorides, who gives the following Account of it:

Agaric is said to be a Root like Silphium, though not of a close Surface and Contexture, like the Silphium, but all porous and spongy. There are two Kinds of *Agaric*, the Male and the Female; the latter is the best, and is distinguished by the strait parallel Veins that run within it. The Male is round, and every where uniform: However, they taste alike, that is, sweet at first, while they diffuse a Bitterness that stays on the Palate. *Agaric* grows in a Country of Sarmatia, called *Agaria*. Some affirm it to be the Root of a Plant; others say it is bred like Mushrooms, of Putrefaction, in the Trunks of Trees. It is produced also in Galatia, a Country of Asia, and in Cilicia, on the Cedars; but very thin and friable.

It has a warming and astringent Quality, and is effectual against the Gripes, Crudities, Fractures, and Bruises from Falls. The Dose is six Grains, in Wine mixed with Honey, if the Patient be free from a Fever; but if feverish, it is given in Water mixed with Honey. But for those who are affected with Distempers of the Liver, an Asthma, yellow Jaundice, a Dysentery, the Gravel or Dysury, Hysterics, or an ill Colour [*κακὸς χροὸς*] the Weight of a Dram is prescribed. To consumptive Persons, it is administered in sweet Wine [*γλυκύος*] to the Splenetic in Oxymel. By those who are troubled with four Belchings, or other Infirmities of the Stomach, it is chewed and swallowed raw, without any liquid Vehicle. Half a Scruple, taken in Water, stays Vomiting, or Spitting of Blood. The like Quantity in Oxymel is useful in the Sciatica, Gout, and Epilepsy, provokes the Menes, and is good for Inflammations in the Womb. Given before the Fit of an Ague, it takes off the Shaking. A Dram or two taken in Water, mixed with Honey, purges the Belly. A Dram of it taken in Wine, diluted with Water, is an Antidote against Poisons; and half a Scruple, in a Draught of Wine, cures the Bites of venomous Reptiles. In short, it is adapted to all internal Maladies, administered with Regard to Age and Strength, to some in Water, to others in Wine, to this Person in Oxymel; to another in Water mixed with Honey. *Dioscorides, Lib. 3. Cap. 1.*

The Root *Agaric* grows from the Trunk of a Tree, of a lax Consistence, compounded of an airy and earthy Substance. It has the Virtue of dissolving and incising gross Humours, and powerfully opening Obstructions of the Viscera. It has the Property of Colocynthis, working slowly, and not much disturbing the Stomach. It is given to the Weight of two Drams, in Honey and Water. Chuse what is whitest, very friable, and least ligneous and worm-eaten. *P. Aeginet. Lib. 7. Cap. 3 & 4.*

Agaric purges Flegm and Bile, and not violently. The Dose is two Drams in Honey and Water, or Oxymel. *Oribas. Med. Collect. Lib. 1. Cap. 17.*

The Root of *Agaric* tastes sweet at first, but soon after bitter, and at last leaves a Sort of Acrimony, and light Astringency on the Palate; whence it is evident, that this Medicine is compounded of an airy and earthy Substance, which is attenuated by Heat. But it participates least of an aqueous Essence. For these Reasons, it has the Faculty of digesting and incising gross Humours, and clearing the Viscera from Obstructions. *Oribas. Med. Collect. Lib. 15. Cap. 1. from Galen.*

By its digestive and incisive Qualities, it cures the yellow Jaundice, when it arises from an Obstruction of the Liver; the Epilepsy; takes off the cold Fits of an Ague, which arise from thick and glutinous Humours. *Oribas. Virt. Simpl. Lib. 2. Cap. 1.*

Agaric is thus distinguished by the Moderns:

Agaricus, Ger. 1183. Emac. 1366. Sterb. 245. Tab. 27. C. *Agaricus, sive Fungus Laricis*, C. B. 375. Elem. Bot. 441. Tourn. Inst. 562. *Agaricus ex Larice*, Park. 249. *Agaricum*, J. B. 1. 268. Raii Hist. 1. 107. **AGARIC.** *Dale.*

There are two Species of *Agaric*: The Female *Agaric*, which is white, light, friable, and tender, sweet at first to the Taste,

but leaves a Bitterness behind, and is of a penetrating Smell; this is the best Sort. The other, called the Male *Agaric*, is yellow, compact, heavy, and tenacious; and this is good for nothing.

It is of the Class of the Fungi, and grows on the Trunks and largest Branches of many Sorts of Trees, especially the Larch and the Oak. It consists of a fistulous Wood: If it be beaten with a Hammer, and a Spark afterwards light upon it, it becomes all in a Blaze; whence it is called *Ignarius*. *Boerhaave.*

It does not shoot up in a Night, like the rest of the Fungi, but requires a whole Year for its Perfection. *Dale.*

If *Agaric* works not downwards, it is apt, in some, to cause a Tremor and Resolution. *Aetius Tetr. 4. Serm. 1. Cap. 81.*

It is ranked among the poisonous Roots, Thapsia, Aconite, Ilias, white Hellebore, and Ephemeron. *Ibid. Cap. 45.*

The poisonous Sort is called *Black Agaric*, by *Aetius*; *Metb. Med. Lib. 5. Cap. 12.* and *P. Aeginet. Lib. 5. Cap. 64.*

AGARIC is a woody, fungous Excrescence, that grows on the Body of old Larch-trees; outwardly it is covered with a hard, tough, brown Crust or Bark; which being pared off, the *Agaric*, is of a white Colour: That which is very light and friable, easy to cut, and without Knots, of a pure white Colour, is to be preferred. The Marks of the best *Agaric*, according to Dale, are contained in this Distich:

*Res frangi praesto pretiosus Agaricus esto;
Candidus et splendens, bonus in libra leve pendens.*

It is of a bitter, nauseous Taste, with an ungrateful Sweetness, which makes it rarely given by its self, but mixt with other purging Medicines.

It is accounted a strong Purger of watery and bilious Humours; useful in the Gout, Rheumatism, Dropsy, and Jaundice, and to cleanse the Lungs of tough Flegm, and is of Use in Epilepsies, and obstinate Head-achs. The best *Agaric* comes from Barbary; what comes from Russia, is not so good. What comes from the Woods near Trent, and those Parts near the Alps, is accounted the best, says Dale.

Official Preparations, are *Pilula de Agarico*, & *Agaricus Trochiscatus*. Miller, Bot. Offi.

It is corrected with Ginger, Clove Gillyflowers, Sal Gem. Crystals of Tartar, &c. *Dale.*

Agaric is an Excrescence, that is found upon the Trunks, and large Branches of several Trees; but chiefly upon the Larch-tree, called by the Latins *Larix*, and upon several Sorts of Oaks; but the best of all ought to be such as is white, light, tender, brittle, and of a bitter Taste, pungent, and a little styptic. And this is the *Agaric* the Antients used to call the Female. As for that which is termed the Male, it is usually heavy, yellowish, and woody, which ought intirely to be rejected from Physical Uses.

The best *Agaric* is that from the Levant, it being abundantly better than what comes from Savoy or Dauphiny. We have likewise some brought from Holland, that is rasped, and blanched, on the Outside, with Chalk. In short, none is fit for Use but the Levant *Agaric*.

Agaric was a Medicine so familiar to the Antients, that they made Use of it, not only for purging Flegm, but likewise in all Distempers proceeding from gross Humours and Obstructions; such as Epilepsy, Vertigo, or Giddiness of the Head, Madness, Melancholy, Asthma, and Distempers incident to the Stomach, and the rest of that Kind; yet they complained, that it weakened the Bowels, and purged too churlishly; upon which Account, Galen steeped the Powder of it with Ginger, and gave it, to a Dram, in Oxymel, or Honey of Squills, it is prescribed, tho' rarely, from a Dram to two; but in Decoction, or Infusion, from two Drams, to half an Ounce.

By a chymical Solution, it passeth almost all away into Oil. It yields no volatile Salt, but abounds with a Sort of scaly Earth, and an acid Flegm, from whence the Infusion of *Agaric* makes blue Paper of a purple Colour. Hence it clearly appears, that it ought to be corrected with Cloves, Cinnamon, Mace, Mint, Worm-wood, and others of this Kind. Its Slowness in Working may be helped or promoted with Scammony and Calomel; or it may be wetted in some purging Decoction, made of Asarabacca, Sena, and other Purgatives, and then dried again, and formed into Lozenges, adding Balsam of Peru, or Oil of Cinnamon.

We must not forget to take Notice that Lusitanus admonishes us to make Use of the Treches of *Agaric*, or Lozenges, while they are fresh, and new made, lest their Virtue be weakened by long Keeping. *Pomet.*

Agaric appears to have been in high Esteem with the Antients, however, disregarded by the Moderns, for good Reasons. It is very slow in Operation, and, by its long Stay in the Stomach, excites Vomiting, or, at least, insupportable Nauseas, followed by Sweats, Faintings, and long Weakness, with a lasting Aversion for all Kinds of Food. Very likely

the Antients, who had not so great a Choice of Purgatives as we have, were not so delicate.

Agaric is a Kind of Fungus, that grows upon the Larch-tree. Some take it for an Excrescence, or Tumor, produced from a Disease in the Tree: But M. Tournefort makes no Scruple to place it with the other Fungi among the Plants. 'Tis supposed, that what is brought to us from the Levant, which is the best, comes from Tartary. We have it also from the Alps, the Mountains of Dauphiny, and from the Trentine. There is a bad Sort of *Agaric*, which does not grow upon the Larch-tree, but upon Oaks, Beeches, &c. whose Use would be very pernicious. To proceed, *Agaric* is divided into Male and Female. The Male is of a rough and uneven Superficies, its inner Substance very fibrous, ligneous, not easily separated, ponderous, and of various Colours, excepting white. The Female, on the contrary, has a fine smooth Superficies, of a brown Colour, and under that a white friable Substance, easily reduced into a Meal, and consequently light and porous. Both of them taste sweet at first upon the Tongue, but leave a Bitterness, and Acridness behind them, especially the Male, which is never used in Medicine; and perhaps this is what never grows upon the Larch-tree.

M. Boulduc made Experiments upon the Female *Agaric*, with the two grand Dissolvents, the Sulphureous and the Aqueous. He extracted, with Spirit of Wine, a resinous Tincture, of an intolerable Smell and Taste. A Drop of it, put upon the Tongue, raised a Vomiting, and caused a Disgust to every Thing for the whole Day. Two Ounces of *Agaric*, yielded six Drams and a half of Tincture. The Residuum, which weighed but nine Drams, would afford no more; it was nothing but a Mucilage, or a Sort of Mud.

Upon this, M. Boulduc began to suspect, that this useless Mucilage, which was in so great a Quantity, might come from the farinaceous Part of the *Agaric* after it was thus moistened and macerated, and the resinous Tincture only from the superficial or cortical Part. He assured himself of this by Experiment, for having separated the two Parts, he extracted all his Tincture from the Outer, and hardly any from the inner Substance; which shews, that the former is the only Cathartic, and all of it that is useful, supposing it be used, for it is always very disagreeable, creating great Nauseas, and must be mixed with other Cathartics, to diminish its ill Effects.

The aqueous Dissolvents had no extraordinary Success upon the *Agaric*, more than the other. Water, by itself, extracted nothing: Nothing came off it, but a thick Mucilage, with a Dirt, and no Extract. Water with the Help of Salt of Tartar, the alkaline Salts of Plants, usually dissolving their resinous Parts, produced another Mucilage, which, after some Days Settlement, shewed its upper Part transparent, in form of a Jelly, and very different from the Bottom, which was very close and dense. From this upper Part, separated from the other, M. Boulduc drew, by Evaporation, in a gentle Heat, an Extract of a pretty good Consistence, which ought to contain all the resinous and saline Parts of the *Agaric*, one extracted by the Water, the other by the Salt of Tartar. Two Ounces of *Agaric*, with half an Ounce of Salt of Tartar, yielded an Ounce and half a Dram of that Extract. It purges very well, without Nausea, and much more gently than the resinous Tincture, extracted by the Spirit of Wine. As to the under Part of the Mucilage, it does not purge at all, being no more than the Earth of *Agaric*.

M. Boulduc having used distilled Vinegar, instead of Salt of Tartar, and after the same Manner, he obtained an Extract in all Things like the other, and of the same Virtues, but in a less Quantity.

The Distillation of *Agaric*, yielded M. Boulduc, a good Quantity of volatile Salt, and a little essential Salt. There was very little fixed Salt in the *Caput Mortuum*.

The Male *Agaric*, which M. Boulduc calls False *Agaric*, with which he would not have troubled himself; but that he was willing to neglect nothing in this Affair, has very few resinous Particles, and still fewer of volatile or essential Salt: Whence it seems to proceed only from old rotten Trees, who have undergone a Resolution or Diffipation of their active Principles.

The Infusion of this *Agaric*, in Water, turns it as black as Ink, when mixed with a Solution of Vitriol. The Use of Male *Agaric* is to dye Black, and hence we see a good deal of Agreement between it and the Gall, which is an Excrescence of a Tree. *Histoire de l'Academ. Royale*, 1714.

Lemery says, the Dose of *Agaric* is from half a Dram to a Dram and a half in Infusion.

Agaric is so variously described by the Antients, and with Characters so different from those of the modern Drug of that Name, that I am forced to believe they are not the same. What it was, or whence it came, was not thoroughly understood by the Antients themselves. You may learn its Country by its Name; for Dioscorides would have it called *Agarikon*, because it grows in *Agaria*, in *Agaria*; and yet he tells us, that it is generated in *Agria*, in *Agria*, a Country

of Sarmatia; but then its Name would not be *Agaricum*, but *Agrium*, or *Agriacum*. The foregoing is rendered wrong, by some Interpreters, *In incultis & agrestibus Sarmatia, In the wild and uncultivated Regions of Sarmatia*. The *Agriai*, *Agriai*, in Stephanus, are a People of Pannonia, between Hæmus and Rhodope; and Strabo places the *Agri*, near the Palus Mæotis, which would be more to the Purpose, for their Country would then be called *Agria*, *Agria*. But still the Nomen *Agria* [Name formed from that of the Country] would be *Agria*, *Agria*, not *Agarikon*, *Agaricum*, which requires that the Country from whence it is called be named *Agaria*, *Agaria*. But where is this *Agaria*? Ptolemy mentions the River *Agarus*, and the *Agarian* Cape in European Sarmatia. The Sheep of the same Place are called *Agaricæ*, *Agaricæ*, in an Epigram of Crinagoras among the Anecdotes. It describes a strange Kind of Sheep that came from *Agaria*, which it seems to make a Country of Armenia, situated upon the River *Araxes*:

Τὸς αἰὲς γὰρ μὲν Ἀγαρίων, οὗτος Ἀγρίων
Ἰδὼν ἀνδροφόνος ὠμίαν Ἀγαρίων, &c.

But the Incoherence of the Sense proves, that there is something wanting in the Beginning of this Epigram, which we are to supply by saying, that the Breed of these Sheep were brought from *Agarica*, a Country of Sarmatia, into Armenia. The old Scholiast on this Epigram remarks, that this Kind of Sheep were found not only in Armenia but Scythia. I make no Doubt but the *Agri*, of Strabo, L. II. ought to be read *Agaric*, *Agaric*, and the *Agria*, *Agria*, of Dioscorides is put by Mistake for *Agaria*, *Agaria*. From thence comes *Agaricum*, and *Agria* in Crinagoras, who doubled the *Rho* for the Sake of the Metre, as we read *Agria*, and *Agria*. Well then *Agarikon*, *Agaricum*, comes from the *Agarians*, a People of Sarmatia, and being so far fetched, I do not wonder that the Antients knew so little of it, but should much wonder, if the Moderns were better acquainted with it. Nay, we may conclude, from what has been said, that what is now sold for *Agaric*, is not *Agaric*, if it be fetched no farther than the Mountains of Trent, or Tyrol, and the Country of the Grisons, where Larch-trees abound; for they say it is produced from no other Tree but the Larch-tree. But had the Antients found that *Agaric* grew so near their Doors, and on so common a Tree, they had not been at so great a Loss, about its Nature as well as the Place of its Growth. Dioscorides doubts whether it be a Root, but takes it on Report. *Agarikon ἔστι φέρονται σφόδρα ὑψηλῶς*. "*Agaric* is said to be a Root resembling Silphium." The Root of Silphium, according to Theophrastus, is a Cubit long, and has a tuberous Head, which appears above Ground. If the modern *Agaric* be compared with this Description, it will hardly stand the Trial, for it is a mere Fungus of the Larch-tree, of that Sort of Fungi which grows and adheres to the Trunks of old Oaks, and served the Antients instead of Tinder, to light their Fires. The later Greeks call it *ῥοκας*, that is to say, *Escas*, *Baits*. Had the *Agaric* of the Antients been thus qualified, they could hardly have questioned its being a Root not unlike the *Laserpitium*. But Pliny plainly signifies *Agaric* to be a Fungus, growing chiefly on glandiferous Trees in Gallia. "It is, says he, a white Fungus, odoriferous, medicinal, growing on the Tops of Trees, shining in the Night, whence it takes its Characteristic, which is to be gathered in the Dark." Dioscorides says not a Word of this Sort of *Agaric*. As for Pliny, I do not question, but a Piece of Wood, putrefied to the Degree of shining by Night, was imposed upon him for *Agaric*. I have often seen the like in Burgundy, and held it in my Hands. It is a Piece of Oak, putrid, white, and odoriferous. It smells like a Sort of Mushroom, commonly called *Potirones*, and shines by Night at such a Rate, that it frightens those who are just awoke from Sleep, and know nothing of the Matter, with its wonderful Lustre. The Peasants call it *Shining Wood*. It is indeed of a fungous Nature, and a thin Contexture, as Dioscorides describes his *Agaricum*; and hence Pliny, or he from whom he borrowed it, suspected it to be a Fungus. But this Rareness of Contexture is not natural but adventitious; for it is a Wood which becomes thin and fungous by Putrefaction. Besides, it has strait Veins within its Substance, as Dioscorides relates of the Female *Agaric*. Lastly, he tells us, from the Opinion of others, that *Agaric* is generated by Putrefaction, and grows on certain Trees; and this too is true of our *Shining Wood*. The Words of Dioscorides, in which he recounts the various Opinions concerning the Rise and Generation of *Agaric*, are written in a very antient Copy, which is widely different from the Vulgate, after the following Manner: *Ἀγρίων δὲ αἰ μὲν φασὶ ἔχειν, οὗτος δὲ ἐν σκίνοισι δίδρασι κατὰ σὺν γένεσιν. καὶ ἄλλοι δὲ μὲν τινος ὑψηλοῦ, i. e. Some say it is the Root of a Plant; others that it is generated from Setime-trees by Putrefaction, after the Manner of Fungi.* The Passage, as it stands thus, is much to be preferred before that in our Edition. Mark his Words: He does not say it is a Fungus, but is generated, like a Fungus, from a Tree, suppose an Oak, or another Tree.

Tree. Now the common *Agaric* is plainly a Fungus of the Larch-tree. And indeed, if *Agaric* were a Fungus, it could never have entered into the Heads of the Antients to fancy it the Root of a Tree, especially when it is reported to resemble the Root of *Laserpitium*, which, they say, is above a Cubit long, and of a competent Thickness.

Let us now inquire what are those *Setine-trees* from which Dioscorides writes that *Agaric* is generated by Putrefaction; for so are the Words in that forementioned choice Manuscript, which is written in larger Letters than ordinary, τὴν δὲ ἐν στήναις, &c. as before; whereas our Editions have it: τὴν δὲ ἐν τοῖς τριχύναις τῶν δένδρων, i. e. others say in the Trunks of Trees. As Decay begets *Agaric* on Trees, so Corruption, rather than Correction, begot this Reading. We know that Avicenna read στήναι δένδρα in Dioscorides, by his Version of the same; for he translated that whole Chapter of Dioscorides concerning *Agaric*, and rendered στήναι by *corrofas*, *corroded*, as if it were στήναι. Nay, in the Beginning of the Chapter, he cites Dioscorides by Name, in the Arabic Edition, not the Son of Mesue, as it is in the Latin Version. Serapion also reads Dioscorides after the same Manner, for, after mentioning him, he quotes all his Words, and renders this Passage thus, according to the Latin Interpreter: *Et quidam dicunt quod generatur in putrefactione Arborum, quando corroderentur, sicut generantur fungi.* Some say it is generated in the Putrefaction of Trees, when they are corroded, as Fungi are generated; where it is plain, that he takes στήναι, *setina*, for στήναι, *setobrota*, *corroded*.

This Depravation of the Text in Dioscorides is of such Antiquity, that all the Copies I have seen, except that most ancient one, agree with the Vulgate, in reading ἐν τοῖς τριχύναις τῶν δένδρων, in Trunks Arborum, in the Trunks of Trees. But the Original was not altered in the Days of Avicenna and Serapio. They had however the Misfortune to make a wrong Interpretation of a right Reading; for, I believe, none who understands Greek will acquiesce in their Exposition of στήναι, *setina*, by *corrofa*. For, in the first Place, the Greeks do not call those Worms which corrode Wood, στήναι, *Setas*, but θρίπας, *Thripas*, and σκώληκας, *Scolecus*. Hence they call σκώληκώβροτα δένδρα, *Scolecobrota dendra*, and θρίπώβροτα, *Thripobrota*, *Worm-eaten Trees*. Σὺν στήναι, *ses*, properly signifies a Worm, or Moth, that lives among Garments; hence στήναι ἱματίων, *setecopa himatia*, *Moth-eaten Clothes*. Again, I think, that στήναι, *setinon*, can by no Means, according to the Greek Idiom, be put for στήναι, *Setobrota*, or στήναι, *Setacopon*; and all that are well versed in the Greek will agree with me. For who ever found σκώληκον, *scolecium*, to signify what is corroded by Worms? At this Rate of Etymology, a Man bitten by a Dragon must be said to be δρασίνων, *Dracontinus*; one stung by a Viper, *Viperinus*; and another, devoured by a Serpent, *Serpentinus*. Lastly, *Agaric*, indeed, springs from a Decay by Putrefaction in Trees, but not from their Corrosion by Worms. For the Fungi, which have the same Principles of Growth, as owing their Rise to Putrefaction, yet delight to grow on whole Trees. A little after, Dioscorides adds, that it grows in Galatia and Cilicia on Cedars, but does not say that these Cedars were Worm-eaten.

It remains therefore for us to conclude, that στήναι, *Setinum*, is the Name of a particular Sort of Tree, on which *Agaric* grows, according to the Report of those from whom Dioscorides had it, for no other Interpretation, but what is false, can be given of the Word in this Place. And after all my curious and diligent Enquiry, I could find no Tree among the Greeks, that would agree with this Name and Place, except that celebrated one, so often mentioned in *Holy Writ*, where we read that this and that Utensil or Structure was made or fabricated of Wood of *Setim*, for the Ark of the Covenant, and the Tabernacle with most of its Vessels, were made of this Wood. They call it עֵשֶׂב שִׁטִּים *Sittim*. It was otherwise written, שִׁטִּי, *Setim*, as the vulgar Version has it *Ligna Setim*, *Wood of Setim*, and it was commonly understood to signify the finest and choicest Sort of Cedar. From this שִׁטִּי, I could almost swear, some Hellenistical Writers formed their στήναι δένδρα, *setina dendra*, to signify Cedars. So from Φοινῖς, *Phonix*, comes Παλαιστίνος, *Philisti eim*, *Palastini*, and from Χερύβει, *Cherubini*. The Arabians also say *Cherubin* for the Hebrew *Cherubim*; and Σήναι δένδρα, *Setina dendra*, is said after the Manner of Κέδρα δένδρα, *kedra dendra*, *Cedrina leucina*, *dryina*, *dendra*, in the same Dioscorides, *de Bryo*, Lib. 1. Cap. 20. It was very natural therefore for the Hellenist Writers, to put στήναι δένδρα, *setinon dendron*, *setine Wood*, for the Hebrew שִׁטִּי, *Sittah*, or *Sittah*, which is of the singular Number, and makes in the Plural *Setim*. It is put for a Kind of Tree, *Isai*. XLI. 19. where some erroneously join it with הָדָס, *Hadas*, a *Myrtle*, in Nature of an Adjective. Others combine it with the preceding Name of a Tree, which they interpret the Cedar, עֵץ שִׁטִּי, *erez sittah*, which they would have to be the best Sort of Cedar. But there are three Kinds of Trees reckoned up in that Place, *Erez*, *Sittah*, and *Hadas*; if then *Erez* be a Cedar, *Sittah* will be another Sort of Tree. And, indeed, the Arabians call the Cedar by the Names of *Erz* and *Erza*; but most take *Sittah* for the choicest Kind of Cedar, which Opinion of theirs seems confirmed by this Place, where the στήναι

δένδρα, *setina dendra*, are κέδρα, *Cedrina*, *Cedar-wood*. The Septuagint for *Wood of Setim* constantly render ἀσπίς ἕβρα, *incorruptible Wood*; now Incorruption is a Property of the Cedar, which is not sensible of Age or Rottenness. "The Matter of it," says Pliny, lasts to Eternity, therefore the Images of the "Gods were made of it." The incorruptible Nature of the Cedar is also celebrated by Theophrastus. What Dioscorides writ about *Agaric*, he collected from different Authors; so that when he found in one that *Agaric* grew ἐν στήναις δένδρων, on *Setine-trees*, and in another, that it flourished ἐν κέδραις, i. e. upon Cedars, he concluded they were different Trees; whereas they who asserted that *Agaric* grew on *Setine-trees*, and the others, who would have it to be generated from the Cedar, said both the same Thing, for the *Setine-tree* is the Cedar.

But if *Agaric* grows on Cedars, I do not see how it can come from Scythia or Sarmatia, where are no Cedars. But it took its Name from *Agaria Sarmatica*. Let others examine into the Reason of that. Theodotion translated *Setim*, a *Thorn*, ἀκανθῶν; and indeed, there is a thorny Kind of Cedar, which the Greeks call ὀξύκεδρον, *Oxycedrum*, which grows plentifully in Lycia and Cilicia; and there *Agaric* also is very common, as Dioscorides writes from bare Report. But Theodotion meant quite another Thing than the *Oxycedrum*, or thorny Cedar. Jerome expounds it to be a Tree that grows in the Wilderness, like the white Thorn, whose Wood is incorruptible, and the smoothest (ῥαβδωτός) of all Woods, and for Strength, Solidity, Brightness, and Beautiffulness, as far exceeding them. This is very applicable to the Egyptian Thorn, which the Greeks call ἀκανθῶν, or ἀκανθα, the *Thorn*, by Way of Eminence. It grows in the Desert, is incorruptible and everlasting, and remarkable for its Firmness and Brightness. By saying it is like the white Thorn, Jerome means the *Oxyacanthus* of the Greeks, which we also call white Thorn at this very Day. It is called white Thorn by Columella also. And the Comparison is not amiss between the Egyptian Thorn and this white Thorn. For the Egyptian Thorn is not very tall, nor does the white Thorn grow to a Tree of any considerable Height. Theophrastus makes two Kinds of Egyptian Thorn; the *White* and the *Black*. The *White* is of no firm Substance, but Subject to Putrefaction; the *Black* is solid and incorruptible, therefore its inner Substance, or Heart, is used in Ship-building. Pliny, speaking of the Trees peculiar to Egypt, says, "Nor is the Thorn of this Country less worthy of Notice, that is, the black one, for it endures under Water incorrupted, whence it is very useful in building the Sides of Ships." Of this Thorn must Theodotion be understood, when he renders *Setah* and *ligna Setim*, by ἀκανθα, *Acantha*, and ἀκανθίνη, *Acanthina*; the Name will suit with nothing else. For the Arabians call this Tree *Seitan*, or *Saten*, which may also be read *Sitan*. It is that Thorn from which they gather the Gum Arabic, and make the *Acacia*. Alphagus, in his *Index* to Avicenna, says, "Alcharad; or Alchara, or Alchrath, is the Fruit of the great thorny Tree; which grows in the Country called Bassera in Egypt, and is called by the Egyptians *Setan*." Prosper Alpinus says, it is called *Sant*. "Acacia, which the Egyptians call *Sant*, grows in those Parts of Egypt, which are most remote from the Sea."

The Fruit of the Egyptian Thorn is called in Arabic *Karath*, from the Greek κάρατος, which signifies a *Husk*; with the Article *al*, *Alkarath*, for its Fruit is a *Husk*, according to Theophrastus. I make no Doubt, but the *Sittah*, or *Setah*, of the Hebrew is the same with the *Setten* of the Arabians, which is the Egyptian Thorn that grows in the Desert, and is rightly translated by Theodotion ἀκανθα, *Acantha*. For in the Place of Isaiah above quoted, *Setah* is manifestly distinguished from the Cedar, which the Arabians, as well as Hebrews, call *Erez*. Besides the Name all their Characters agree. Yet the Hellenist Authors, from whom Dioscorides borrowed his Information, that *Agaric* grew on *Setine-trees*, seems to have taken them for Cedars, as that Word is generally interpreted; for it was the prevailing Opinion that *Agaric* was generated on Cedars.

Many other Things did Dioscorides borrow from Hellenist Writers, who translated foreign Words into their own Greek Idiom; as when he says of *Cancamum*, that it was a Tear, ἄρβυκος ἕβρα, *Arabic Ligni*, for ἄρβυκος δένδρα, *Arabic Arboris*; which is according to the Syriac Idiom, and quite remote from the Greek. So in his Account of the Palm-tree, he tells us that the unripe Date, while it is yet in its Husk, is called ἑλάτης, *Elates*, and by some βόρσος, *Borassus*; which is purely Hebrew, only transposed for βόρσος, *Borassus*; for בֹּסֶר, *Bofer*, is a *four Grape*. The Arabians also call an unripe Date *Besser*, which the Greeks, who adopt the Arabic Terms, name *Betré*. An ancient Interpreter of Avicenna has it *Bussurum*.

Pliny, Lib. 16. Cap. 8. will have *Agaric* peculiar to Gallia; and a Fungus of glandiferous Trees; but, in Lib. 25. Cap. 9. he says it is generated like a Fungus on the Trees about the Bosphorus. These are very different Accounts; and yet in this last he mentions the Gallican *Agaric*, which, he says, is thought to be of a weaker Kind. Perhaps he was led into an Error by the Homonymy of the Words in the Name *Galatia*, which with the Greeks signifies both *Gallia* and *Galatia*. Dioscorides always calls this last Γαλατίας τῆς κατ' Ἀσίαν, *Galatia which is in Asia*;

to distinguish it from the other Galatia, that is in Gallia, which in another Place he calls *Galatia* *zari* *Agaricus*, Galatia, in which are the Alps, L. 3. C. 28. But, to come to a Conclusion, the Gallican *Agaric* of Pliny seems quite different from the Galatian *Agaric* of Dioscorides. The latter grows on Cedars, like a Fungus. Pliny's *Agaric* is a Fungus peculiar to glandiferous Trees, and shines by Night, which are the very Characters, as I said, of the putrefied Wood, most commonly Oak, which so remarkably glitters in the Dark. Dioscorides, in his Description, has divided *Agaric* into Male and Female, and takes no Notice of the Distinction into White and Black. But in another Place, Lib. 5. he mentions black *Agaric* among the Poisons, and reckons it in the List of venomous and deadly Roots, which, according to his Account, are Hellebore, Ixias, black *Agaric*, and the Ephemeron, which some call Colchicum. I wonder, he says nothing of it in his Chapter of *Agaric*. I suspect the Male *Agaric* was the black and the poisonous Sort, though he says no such Thing there. "But the Male Kind is not good, but hard and black," says Avicenna. The two Kinds are made to differ very much in Form and Substance, according to Dioscorides; and yet their Tastes, he says, are alike. The Moderns set the highest Value on that *Agaric* which is most friable. Dioscorides depreciates the Cilician and Galatian *Agaric* on that very Account, because it is of a weak Contexture, and very friable.

All these Things considered, I am almost persuaded that the *Agaric* of the Antients was not the same with that which now passes under that Name. I read in Isidore, that *Agaric* was the "Root of the White Vine." Hesychius tells me, that *Agaric* was "an Herb so called by Physicians." He terms it an Herb, because others had made it a Root. Galen, L. 7. Περὶ δυνάμεως, after he has named *Agaric*, and declares its Virtues, begins, as it were, again, with mentioning the Root of *Agaric*, in these Words, which are corrupted. Ἀγαρικὸν ῥίζα τὸ ἐν τῷ κορμῷ τῆς ξύλου. i. e. "The Root is what grows to the Stock of the Tree." They seem an Interpolation, except you read them thus: Ἀγαρικὸν ῥίζα τὸ ἐν τῷ κορμῷ τῆς ξύλου, i. e. "That is accounted the Root of *Agaric*, by which it grows to the Trunk or Body of the Tree." The Arabians have nothing about *Agaric*, but what they learned from the Greek Books. The Name they have for it is purely Greek, viz. *Garicon*, and in an old manuscript Translation of Dioscorides into Arabic, you have the Word kept intire, viz. *Agaricon*. *Salmas. de Homonym. Hyl. Iatric.*

There are several of the Fungi which are also called *Agarics*, as:

Agaricus digitatus maximus, ex luteo, coccineo, & nigro colore elegantè variegatus.

Agaricus villosus tenuis, inferne lævis, C. Giff. 193. *Fungus arboreus villosus*, inferne planus, Doody Syn. 2. App. 335.

Agaricus membranaceus sinuosus substantia gelatinæ, C. Giff. 194. *Fungus membranaceus parvus aureus*, Sterb. P. 242. Spec. 113. T. 26. Luteus Sambucino similis, colore suo manus inficiens, Genista vulgari spinosæ adnascens, Merr. Pin. putridus arborum ramis inhaerens, plurimis simul coherentibus, C. B. Pin. 372. 2. *Fungi dicti spongiae lignorum perniciosi*, J. B. 3. 841. F. perniciosi, Gen. 24. Species 3. Clus. H. 288. Syn. 2. 19. 40. On rotten Wood in England and Ireland. Observed by Dr. Sberard and Mr. Dale.

Agaricus mesentericus violacei coloris, C. Giff. 194. *Fungus arboreus purpureus corrugatus*, Doody Syn. 2. App. 336.

Agaricus Lichenis facie variegatus, Inst. R. H. 562. *Fungus salignus Lichenis forma variegatus*, C. B. Pin. 372. 7. *Quartus perniciosus*, Clus. H. 277. *Depictus*, Sterb. 240. T. 26. A. *Fungi Salicium*, colore varii, perniciosi J. B. 3. 842. Nec lamellatus, nec porosus est. A. D. Sberard observatus.

Agaricus pedis equini facie, Inst. R. H. 562. *Fungus durus sive ignarius*, Park. 1323. (fig. mal) in caudicibus nascens, unguis equini figura, C. B. Pin. 372. 3. F. arborei ad ellychnia, J. B. 3. 840. Touchwood or Spunk.

Agaricus intybaceus, Inst. R. H. 562. *Fungus intybaceus*, J. B. 3. 839. Syn. 2. 14. 21. *Arboreus maximus porosus*, diversimode se dividens & protrudens, Doody Syn. 2. App. 336.

Agaricus officinali similis, C. Giff. 192. *Agarico similis Fungus diversarum arborum caudicibus adhaerens*, C. B. Pin. 375. 2. *Fungus arboreus albidus maximus*, seu *Agaricus spurius*, Doody Syn. 2. App. 335.

Agaricus porosus rubens carnosus, hepatis facie, C. Giff. 192. *Fungus hepatis facie & colore*, Merr. Pin. *Arboreus rubens carnosus, hepatis facie*. Doody Syn. 2. App. 340.

Mr. Doody found it near Hally in Kent, and since received it very fair from Mr. Chaplin, gathered in Suffolk, as you go from Sir Robert Dillington's House to the new Church in the Isle of Wight. Merr. Pin.

Agaricus multiplex porosus, C. Giff. 193. *Fungus circulum gradatim perficiens*, cujus diameter quandoque triginta vel plures pedes conficit, Merr. Pin. In montosis pascuis non infrequens, referente Merret. Memorabilis est magnitudinis & plures juxta se oriri solent, qui satis latum spatium ambitu suo complectuntur.

Agaricus porosus ignarius Fagi, superne candicans, inferne fuscus, C. Giff. 193. *Fungus pedem equinum referens, subtus foraminosus*, Dood. Syn. 2. App. 336. Ad arbores. Ignarius dicitur, quod ca-
ro ejus in fomitem igni concipiendi idoneum præparari queat.

Agaricus porosus ignarius Carpini, C. Giff. 193. *Fungus arboreus maximus fuscus, subtus planus*, Doody Syn. 2. App. 335. Lateraliter Ulmo adherentem prope Epsom invenit D. Plukenet.

Agaricus varii coloris squameus, Inst. R. H. 562. *Fungus arborum & lignorum putrescentium, coloris varii*, Syn. 2. 18. 31. *Cerasorum imbricatum alter alteri imitatus variegatus*, C. B. Pin. 372. 8. *Fungi Cerasorum coloris varii perniciosi*, J. B. 3. 842. *Fungus semicircularis durus, multos durans per annos*, Merr. Pin. *Holofericeus iridiformis quasi, colorum alternatione variegatus*, Cat. Alt. *Inferne foraminulentus est, non lamellatus, colore albicante. Non Ceraso tantum, sed & aliis passim arboribus adnascitur.*

Agaricus villosus & porosus, substantia coriacea, C. Giff. 193. *Fungus arboreus variegato illi Cerasorum, &c. C. B. Similis, sed hirsutior, foraminulis etiam majoribus*, Doody Syn. 2. App. 336. *Arboribus junioribus plerumque adnascitur.*

Agaricus villosus, lamellis sinuosis & invicem implexis, C. Giff. 192. *Fungus arboreus villosus albus, foraminibus oblongis, semicircularis*, Doody Syn. 2. App. 336.

Agaricus quernus lamellatus, coriaceus albus, C. Giff. 191. *Fungus arboreus inferne foraminibus longis & rotundis insculptus*, Doody Syn. 2. 18. 33. Hic a D. Dale pariter observatus.

Agaricus quernus lamellatus coriaceus villosus, C. Giff. 191. *Fungus arboreus holofericeus, inferne lamellatus*, Syn. 2. 14. 26.

Agaricus parvus lamellatus, pectunculi forma elegans, C. Giff. 192. *Fungus parvus lamellatus, pectunculi forma Alno adnascens*, Syn. 2. 14. 27. Common in Woods in Ireland. Dr. Sberard. In the Woods near Dulwich, and many other Places. Mr. Doody.

Agaricus parvus lamellatus croceus, e Corylorum ramulis dependens. Undulatus est & figura sua lobum nucis juglandis non male refert. Croceo colore manus inficit. Corylorum ramis aridis & emortuis plerumque adnascitur.

Agaricus coriaceus longissimus, pectinatim inferne divisus. Raii Synopsis Methodica.

AGARICUS also is a Name for the *Marga Candida*, or white Stone Marl. See MARGA.

AGASYLLIS. Ἀγασύλλης. According to Dioscorides, the Shrub (θάμνος) that produces the Guma Ammoniacum, L. 3. C. 98. See AMMONIACUM.

AGATHARCIDES. An Author quoted by Plutarch, Symposiac. L. 8. Probl. 9. as giving an Account of the endemial Distempers, to which the Inhabitants of the Coasts of the Red Sea were subject. For this Reason Le Clerc ranks him amongst Physicians. But in Reality he was not of the Profession. He wrote amongst other historical Pieces an Account of the Red Sea, and in this gives a Description of the Dracunculi, a Sort of Worm of a considerable Length, that breeds in the muscular Parts of the Legs and Arms. See DRACUNCULI, and UENA MEDINENSIS.

Agatharcides, who is distinguished from other Authors of the same Name, by the Appellation of *Cnidius*, lived in the Time of Ptolemy Philometor, who reigned about 130 Years after Alexander the Great. He wrote many Treatises, as we learn from Photius, but nothing relating to Physic, except what the natural History of the Red Sea led him into.

His Works are lost.

AGATHINUS. A Physician quoted by Galen, Caelius Aurelianus, and Aetius. He wrote upon Hellebore, and the Pulse, and other Subjects. He was of the Pneumatic Sect, and consequently a Follower of Athenæus. Suidas informs us he was Master to Archigenes, who practised Physic at Rome, in the Time of Trajan. His Works are lost.

AGATHON. Ἀγάθων. The common Signification of this Word is good. But, according to Galen, Hippocrates uses it in a Sense somewhat different from other Writers, which is no uncommon Thing, both with Respect to this Word and many others. In this Author it sometimes signifies certain, firm, true, or perpetual.

AGATHONIS ANTIDOTUS HEPATICA. Agathon's Antidote for the Liver. This is a Medicine described by Myrepsus, S. I. C. 268. It is thus prepared:

Take of Gentian six Drams; of Elicampane, Wormwood, Spikenard, each one Dram. It is given to feverish Patients in Water, to others in Wine.

AGATY H. M. Galeæ affinis Malabaricæ arborescens, siliquis majoribus articulatis, D. Syen.

It is four or five Times the ordinary Height of a Man, and its Body as much as a Man can fathom. The Branches that grow out of the Middle and Top of the Tree, extend themselves in Height more than in Breadth. It grows in sandy Places. The Root is of a dark Colour, and spreads its hairy Fibres all around to a considerable Compass, and is of an astringent Taste. The Wood is of a soft Substance, and its inmost Pith, or Heart, softest of all. If an Incision be made in the Bark, there distils from it a thin and watery Liquor, which afterwards grows thick and gummy. The Leaves are pennated, almost a Span and a half long, two Lobes being connected to the main Rib, directly opposite to one another, the Pedicles very short, and bending forwards, the Lobes small, of an oblong Figure, and roundish

roundish at the Edges, about an Inch and half long, and a Finger's Breadth wide, almost of an equal Breadth from the Base to the Top, of a pretty close Contexture, and very soft, of an extraordinary Smoothness, of a lively Green on the upper Part, but fainter beneath, smelling like Beans, if they are rubbed. From the main Rib issue fine subtile Veins, which disperse themselves over the Leaf. The Leaves shut in the Night, with their opposite Lobes drawn close to one another. The Flowers which are of the papilionaceous Kind, and have no Smell, grow four, five, or more, on a little Twig, or Stalk, that comes out from the Axæ of the Leaves. The Flowers consist of four Leaves or Petals, which have this Peculiarity, that one of them, which raises itself above the rest, and two lateral ones bend in an Angle, are somewhat thick, whitish, and striated with Veins lengthwise; and the fourth, which is the broadest, is a round Oblong, striated with numerous subtile Veins, which proceed from the Base lengthwise, being first whitish, then yellowish, and a purplish Red. The Stamen forms an Angle, and is divided at the Summit into Filaments, or Threads, bearing oblong yellow Apices. The Calyx or Cup is deep, surrounding the Bases of the Petals with four short roundish Leaves, of a faint green Colour. The Flowers are succeeded by Pods, four Spans long, and a Finger's Breadth wide, somewhat round, strait, green, of a thick Rind, and containing Beans of an oblong Figure, each in its proper Cell, separated by carnosus Partitions, placed lengthwise in the Length of the Pod, somewhat protuberating, tasting like a Bean, and exactly resembling our Kidney-beans, only they are less, and turn whitish, or a greenish White; when they are ripe, they serve for Food.

It bears Flowers and Fruit, in rainy Seasons, two or three Times a Year, and sometimes, though but seldom, all the Year round. The Root mixed with the Urine of a Cow, and applied to the Place, discusses Tumors. The Juice of the Bark mixed with Honey, and used in Gargarisms, is good for the Quinsy, and Pustules in the Mouth. The Bark, boiled in Water and eaten, is beneficial in the Small Pox. The Juice of the Leaves, drawn up the Nostrils, relieves the Patient under inveterate Quartans, when the Day of the Fit comes. The Decoction of the Leaves purges pituitous and bilious Humours, and the Leaves themselves so eaten give Relief in the Vertigo and Cholera Morbus. The Flowers boiled are prescribed for a Catarrh, which Way they are also said to incite to Luxury. The Juice of the Flowers, dropped into the Eyes, takes away Films and restores the Sight. Ray, Lib. 31. Cap. 23.

AGELÆOS. Ἀγελᾶος. Gregarious, vulgar. It is sometimes joined with ἀγρός, and used to express the coarsest Sort of Bread. Athenæus.

AGEM. A Name of the *Syringa Persica*, or *Lilac Persicum*. Incisis Foliis. See SYRINGA.

AGER CHYMICUS. Dorneus in his *Genealogia Mineralium* says, Water is the Field (*Ager*) in which the Omnipotent has ordained that the Root of Minerals should be fixed, and from whence the Trunk and Branches shoot into the Earth.

The Uterus is also called the *Ager Naturæ*.

Ager, or *Agrorum Terra*, is also the common Earth or Soil. All fat Earths are good Applications for any Parts which want drying. The Egyptian clayey Soil was used by hydropical and splenetic Patients. Many also daubed with it their Legs, Thighs, Elbows, Arms, Sides, Backs, and Breasts, and found great Benefit by it. It cured old Inflammations and lax Tumors, and such as through an immoderate Evacuation by the hæmorrhoidal Veins, were over-run with hydropical and watery Humours, and it also intirely removed inveterate Pains fixed upon any Part. Aetius, *Tetrabib. l. Serm. 2. C. 3.* from Galen. See TERRA.

AGERASIA. Ἀγροσία. From a Negative, and ἥρως, Old Age. That State which maintains the Health and Vigour of Youth, in an advanced Age. What the Latins call *viridis Senectû*.

AGERATUM.

Maudlin thus distinguished: *Ageratum*, *Eupatorium Mefues*, Offic. *Ageratum foliis serratis*, C. B. 221. Boerh. Ind. A. 125. *Ageratum plerisque*, *Herba julia quibusdam*, J. B. 3. 142. *Ageratum*, *Herba julia*, Chab. 367. *Ageratum vulgare*, sive *Costus hortorum minor*, Park. 78. Raii Hist. 1. 364. *Achillea lutea*, *Agerati folio longiore*, A&R. Reg. Par. An. 1720. 322. *Balsamita fœmina*, Ger. 523. *Balsamita fœmina*, sive *Ageratum*, Ger. Emac. 648. *Parmica lutea suaveolens*, Elem. Bot. 398. Tourn. Inst. 497. MAUDLIN. Dale.

Ageratum is a spriggy Plant, producing from one Root many Stalks, no higher than a Span, not branched, but very like Origanum, bearing an Umbella, with yellow Flowers, like Gold Drops, less than the *Helichrysus*. It is called *Ageratum*, because the Flower preserves its Beauty for a long Time. Dioscorides, *L. 4. C. 59*. His Description is transcribed by Oribasius, *Collect. L. 11*.

This Plant from a woody branched Root, abiding long in the Ground, sends forth many round Stalks, little or nothing branched about a Foot high, on which grow a great

Number of small, long, narrow, round-pointed Leaves, deeply serrated about the Edges; on the Tops of the Branches stand Umbels of numerous small Gold yellow naked Flowers, in scaly Cups or Calyces, containing very small Seed. The whole Plant has a strong and not unpleasant Scent; it grows with us only in Gardens, it being a Native of Italy and the warmer Countries, and flowers in July and August. Miller, Bot. Off.

Its Decoction is good in Fomentations. The Vapour of the Herb burnt provokes Urine, and mollifies the Hardness of the Uterus. Dios. *L. 4. C. 59*.

It is a Digestive, and gently mitigates an Inflammation. Orib. Med. Coll. 1. *L. 15. C. 1*. Eginet. *L. 7. C. 3*. Aet. *Tetr. 1. Serm. 1*.

Maudlin is of a bitter Taste, warming and drying, and useful in Disorders of the Stomach and Liver. It is good in the Jaundice, and Obstructions of the Menes, provokes Urine, and kills Worms. Miller, Bot. Offic.

It contains the Virtues of Costmary and Tansey, and is an Ingredient in all capital Compositions. The Seed has been given, with Success, instead of Wormseed, to kill Worms. The distilled Water and Spirit yield a most fragrant Smell. This Plant is used in Syrup, Oil, Infusion, Decoction, Powder, and Pills. Mr. Boyle observes this Plant to be hurtful to the Eyes. Boerhaave.

Besides the common Maudlin taken Notice of by Dale, Miller enumerates the following Species:

Ageratum quæ ptarmica incana, pinnulis cristatis, F. Voy. The hoary Oriental Maudlin.

Ageratum Peruvianum, arboreum, folio lato, serrato, Boerh. The Peruvian Tree Maudlin, falsely called The Jesuit's Bark Tree, because at first supposed to be the Tree from whence the Jesuit's Bark was taken.

Ageratum serratum Alpinum glabrum, flore purpurascens, Tourn. Smooth Ageratum of the Alps, with a purplish Flower.

Ageratum Americanum erectum spicatum, flore purpureo, Houst. American Ageratum, with purple Flowers growing on a Spike.

Ageratum Americanum procumbens, gnaphalii facie, floribus ad foliorum nodos, Houst. Creeping American Ageratum, having the Face of Cudweed, and the Flowers coming out at the Setting on of the Foot-stalks.

Ageratum Americanum frutescens, Chamædryos folio, floribus ex foliorum alis, Houst. American Ageratum, with a Germander Leaf, and the Flowers growing from the Setting on of the Leaves.

AGERATUS LAPIS. A Stone, used by Coblers, to polish Womens Shoes. It is esteemed discutient, and astringent, and is useful in Inflammations of the Uvula. Galen, and from him him Paulus Aegineta, *Lib. 7. Cap. 3.* and Oribasius, *Lib. 14. Cap. 10*.

AGES. Ἀγῆς. The Palm, or Hollow of the Hand. Hesychius.

AGE VITA. The Name of an Antidote, described by Myrepsus. The Place is much corrupted, but the Commentator conjectures, that Myrepsus wrote ἰόςυς βίτα, *Jugis Vita*, long or continual Life, and that this Antidote took the Name from its great Virtues in procuring Longevity. This, Myrepsus informs us, is called *Meelchagee* by the Saracens. It is a medicated Wine, of which the Author gives the following Account:

Take six Measures of good Red Wine, and put into it, after they are well beaten, and passed through a fine Sieve, the following Ingredients: Of Galangals, two Ounces; of long and white Pepper, each an Ounce; of Sage an Ounce and a half; of Ginger and good common Cinnamon, an Ounce and a half; of Saffron, three Drains; of Cloves, a Dram and a half. Boil them well in the Wine, till of the six Measures there remains but one Measure and a half, and then pour it into your Vessel. The Dose is half an Ounce in the Morning fasting in a Glass of Wine.

It is beneficial in all cold Distempers, for paralytic, stomachic, shaking, cachectic, and hydropical Patients. It helps Crudities, Inflatons, and all Imbecillities and Coldness of the Stomach and Body. It cures Inflatons in the Uterus, the Tenesmus, the Maladies proceeding from Defluxions, as the Gout in the Feet and the Joints, and all nervous Distempers, arising from Crudity and Humidity. Nich. Myrepsus, *Seet. 1. Cap. 500*.

This seems to be a very good Stomach Medicine, and must be of considerable Efficacy in the Disorders for which the Author recommends it. On this Account it is called *νεύρον τῆς ζωῆς* the Nerve of Life.

AGEUSTIA. From a Negative, and ἡσυχία, to taste. It signifies a Fasting, or Fast.

AGGLUTINATIO. Agglutination. It signifies the Joining together, or Re-union of any separated Parts of the Body, or Healing. Hence Applications, that promote that End, are called Agglutinants.

Agglutination is also used in a different Sense by *Aetius*, as appears by the following Passage:

AGGLUTINATIO PILORUM. A Healing or Reducing the Hairs of the Eye-lids, that grow inwards, to their natural Order and Situation. This may be done by Mastich, applied with a Probe, which bends the Hairs back into their proper Order. Bitumen, the Slime of a Snail taken off with a Needle, the Juice of Hawk-weed, the Liquor of *Agglutinans*, or Ammoniac, work the same Effect. A compound Remedy may be thus prepared:

Take of dry Rosine, dry Pitch, Sulphur vivum, Bitumen Judaicum, each one Dram; Wax half a Dram. Melt them together, and reserve them for Use till Occasion offers, when touch the Mass with a heated Probe, and *agglutinate* the Hairs as before directed. *Aetius, Tetrabib. 2. Sermon. 3. C. 681.*

AGGREGATUM. An Aggregate. A Body resulting from the Union of a great many others, which are smaller, of which the whole Sum or Collection is the Aggregate.

AGIAHALID. An Egyptian Plant thus distinguished by Ray: *Lycio Affinis Egyptiaca*, C. B. *Agialalid Egyptiaca Lycio affinis*, Park. *Agialalid Egyptium folio Buxi, aut Lycium?* J. B.

It is a large Tree like the wild Pear, with but few Branches, and prickly, formed like the Lycium or Boxthorn. Its Leaves are like those of Box, but bigger and at a greater Distance one from the other. Its Flowers are but few, of a white Colour, resembling those of Hyacinth, but less. They are succeeded by little black Fruits, like those of dwarf Elder, of a styptic Taste, a little bitterish. This Tree grows in Æthiopia, and Egypt.

Its Leaves are sourish and astringent, and are esteemed good to kill Worms. *Lemery de Drogues.*

AGITATIO. Agitation, Shaking. In Medicine it is considered as an Exercise, and to this Dr. Sydenham attributes the great Benefit of Riding; and, no doubt, it is very efficacious in removing Obstructions of the Viscera, when assisted by the fresh Air. See AIR.

AGLIA. See AEGLIA and AEGIDES.

AGLITHES. *Ἀγλίθης*. The Divisions or Segments of a Head of Garlick, which we usually call Cloves. It is used by Hippocrates, in his Treatise *de Morbis Mulierum*, Lib. 2. See ALLIUM.

AGME. *Ἀγμέ*, or *Ἀγμέ*. From *ἀγν*, to break. A Fracture.

AGNACAT. *Scaligeri Pyri Specie.*

In a Country of America beyond the Terra de Labrador, towards the Isthmus of Darien, there grows a Tree of the Figure and Size of the Pear-tree, always covered with Leaves, and of an extraordinary Greenness and Lustre. It bears a Fruit also like a Pear, but green, even when it is ripe. The Pulp is of the same Colour, sweet, fat, and tastes like Butter. It is a powerful, and next to miraculous, Promoter of venereal Vigour. *Ray's Hist. of Plants.*

AGNANTHUS. A Genus of Plants mentioned by Vailant. It bears the Flower at the Extremity of the Stalk and Branches after the Manner of Grapes. Every Flower, which resembles much that of the Agnus Castus, is a small Pipe, the anterior Edge of which commonly expands and divides itself into six unequal Parts, three superior which are disposed like Trefoil, and three inferior, of which that in the Middle is the largest of the six, and the two lateral the smallest. There arises from the Bottom of the Cup or Calyx, which is indented, an Ovary. This Ovary is articulated to the Bottom of the Pipe or Channel of the Flower, and when the Flower falls off it becomes, according to Plumier, a Berry containing a single Seed.

Agnanthus comes from the Greek Word *ἀγνός*, chaste, and *ἄνθος*, a Flower, because the Flower of this Plant resembles that of *Agnus Castus*, or *Vitex*.

There is but one Plant of this Genus known which is the *Agnanthus Viburni folio*. *Cornutia flore pyramidato, caeruleo, foliis incanis*, Plum. Nov. Gen. 32. *Calychirichibou Caraibæarum*, Surian. Hort. Sicc. *Memoires de l'Academie Royale des Sciences, Année 1722.*

AGNATA. See ADNATA.

AGNINA MEMBRANA, or PELLICULA. *Aetius, Tetrabib. 4. Sermon. 4. C. 2.* calls one of the Membranes which involves the Fœtus by this Name, which he derives from its Tenderness. From him, probably, Bartholine and Drelincourt have borrowed the Expression. It is what Anatomists usually call the *Amnios*.

AGNINA LACTUCA, is *Lamb's Lettice*. See LACTUCA.

AGNOIA. *Ἀγνοία*. From a Negative, and *γινωσκω*, to know. When a Patient in a Fever, or any other Disorder, forgets, and does not know his familiar Acquaintance. This is called *Agnoia*, by Hippocrates, who pronounces it a very bad Symptom, especially when joined with a Rigor. *Prædict. L. 1. 64.* The Truth of this is evinced by every Day's Experience.

AGNUS. A Lamb. This Animal is too well known to want a Description. Many of its Parts are recommended for

particular medicinal Purposes. Thus Hippocrates in his Treatise, *de Superfœtatione*, advises us to apply the warm Skins of Lambs (*ἀγνιδας*) to the Bellies of Virgins who are disordered for Want of Menstruation at a proper Age, no doubt, with a View of relaxing the Uterine Vessels, and removing thereby that Part of the Difficulty, which depends upon their too great Tension. Dr. Friend, in his *Emmenologia*, recommends emollient Fomentations for the same Purposes; but the balsamic Warmth of a Lamb-skin, just taken from the Animal, seems more likely to relax, than any artificial Heat whatever.

The Lights are recommended in Disorders of the Lungs, and the Gall in Epilepsies, in the Quantity of two Drops to eight for a Dose. *Lemery.*

The Coagulum which is found at the Bottom of the Stomach is esteemed a good Antidote against Poisons. *Lemery.*

The Lungs, burnt and powdered, cure the Bruises from uneasy Shoes. *Aetius, Tetrabib. 1. Sermon. 2. C. 155.*

Lamb contains a great deal of volatile Salt and Oil.

The best and lightest Parts of a Lamb, according to Celsus, are the whole Head and Feet. *Celsus, L. 2. C. 18.*

It affords a glutinous Juice. *Oribas. Eup. L. 1. C. 21.*

It is of a moistening and loosening Nature, very nourishing, and lenifies sharp and pungent Humours.

It produces viscous, phlegmatic, and gross Humours, especially when it is too young.

It agrees in warm Weather, with young bilious People, but Persons of a hot and phlegmatic Constitution ought to refrain from it, or use it moderately. *Lemery on Foods.*

AGNUS SCYTHICUS. The Vegetable called the *Scythian Lamb*, in the Barbarian Language *Barametz, Borometz, or Boronetz*, is much noted among the Writers of Natural History.

The first who treated of it were Athanasius Kircher, in his *Ars Magnetica* (who cites Sigism. L. B. ab Herberstein, Hayton the Armenian, Surius, and Jul. Cæs. Scaliger) Lord Bacon, Fortunius Licetus, Andreas Libavius, Eusebius Nierenbergius, Adamus Olearius, and Olaus Wormius, to pass over the rest, among whom are many Botanists, who do little more than repeat what has been said before them.

This Plant is described by *Jul. Cæs. Scaliger*, under the Title of the *Scythian Lamb, Borometz*, as follows: "What has been related may pass for a Jest, if compared with the wonderful Tartarian Shrub. The chief Hord among the Tartars is the Zauolhan, distinguished as well for its Antiquity as Nobility. In that Country they plant a Seed very like that of a Melon, only less oblong; from this Seed springs a Plant, which they call *Borometz*, that is, a *Lamb*; for it grows in the Shape of a Lamb, almost three Feet high, resembling that Animal in Feet, Hoofs, Ears, and all the Head, except the Horns; instead of which, it has a Tuft of Hair that looks like a Horn. It is covered with a very thin Hide, which is stript off by the Inhabitants, to make a Covering for their Head. They say the inner Pulp resembles the Flesh of a Sea Crevise, and that Blood follows from a Wound made in it; that it is wonderfully sweet to the Taste; that the Root raises itself out of Ground as high as the Waist; a Circumstance that greatly heightens the Miracle. As long as it is surrounded by neighbouring Vegetables, it lives and enjoys itself like a Lamb, in a fat Pasture: When they die, or are extirpated, it pines away, and perishes. This Event does not happen only by Chance, or Length of Time, but has been brought to pass, by making the Experiment, and removing all Plants from its Neighbourhood. What increases the Wonder is, that it is greedily coveted by Wolves, and not by other carnivorous Beasts. But this last, I presume, is made only for the Sake of Allusion, to the Name *Lamb*, and to grace the Story: But I want to know, after what Manner four distinct Legs, with their Feet, are produced, and proceed from one Trunk."

What is here related, I have had by Information, partly from Persons of the highest Rank, and partly from the most curious Inquirers into the Secrets of Nature."

Other Authors give us the same Account, or rather transcribe Scaliger; however, some of them vary in certain Circumstances, and Kircher, in particular, to his Description, has added, or, to speak more properly, invented, a Figure: Nay, further, in some Museums of the Virtuosi, as those of Wormius and Swammerdam, the Skin, as it is pretended, of this remarkable Production of Nature, was formerly to be seen.

Antonius Deusingius, after nicely weighing the Matter in the Balance of Reason, suspected this Account of the *Lamb* as fabulous, and endeavours to persuade us, that Scaliger himself, who was one of the first that mentions it, treated it as a Fable; and it was called in Question by others, who were not willing to be imposed upon.

To speak the Truth, if we examine the whole Story of this *Lamb*, with a Mind void of Prejudice, we shall find that it favours strongly of the Romance; nay, in reality, is nothing else, and that Deusingius was in the right; which will appear from the following Reasons:

1. No Person of Credit ever saw this Vegetable *Lamb*. What Olaus Wormius had by Relation from Monf. Eovaldi de Kleifs, Ambassador of the Elector of Brandenburg (who told him, that while he lived on the Borders of Tartary, he was offered by a Tartar, in Exchange for some Leaves of Tobacco, a dried Plant, bearing on its Stem a Fruit, which plainly resembled a *Lamb*, a Foot in Dimension, and covered with a curled Fleece) is not convincing, for that noble Person might easily be imposed upon by some cunning Tartar.

2. The very learned and experienced Naturalist, Engelbert Kämpfer, M. D. took a great deal of Pains in searching for this *Lamb* in its own Country, but could find nothing like it. "They have no Notion, says he, nor Memory, in Tartary, neither among the vulgar Sort, nor the Skilful in Botany, of the Existence of a Zoophyte that feeds on Grass, tho' I have searched all over the Country for it, till I have been ashamed and laughed at for my Pains; nor is there any Thing called *Borometz* besides Sheep, and what belongs to that Kind. Therefore I am well assured, that whatever has been related of that Plant is meer Fiction". *Amoenit. Exotica*.

3. The whole Story of this *Lamb*, is so like a Fable, as one Egg is like another. What gave Rise to it, has been very well discovered by that most diligent Searcher after Nature, in those Eastern Countries, Kämpfer, before mentioned, in the Place cited, where, (having premised somewhat concerning the Etymology of the Word *Borometz*, which, he says, is corrupted from the Muscovite *Boranzet*, in Polish *Baranek*, which is a Diminutive of *Baran*, a Word of Slavonic Original, and used by the Russians and Poles, to signify a Sheep) he tells us that in some of the Countries about the Caspian Sea, there is a Species of Sheep very different from the common Sort, and highly valued for the Fineness of their Skins, which he describes, and the Manner how they are dressed, in order to serve as Ornaments, to set off the Garments worn by the Tartars and Persians: "Persons of Quality, says he, and the Rich, whose Pride and State require better Clothing than the common Sort of People, covet the Skins of Lambkins, which are much finer than when they are grown, and the younger they are, the more they are valued; for their Hairs may be twisted into finer and thicker Curls, which augments the Beauty and Price of the Skin. Hence a greedy Thirst after Gain has prevailed with some, in order to obtain Skins of the utmost Fineness, to exercise Cruelty, so far as to anticipate the Birth of the Lambkins, by ripping the Bellies of their Dams. A Skin, thus procured and skilfully dressed, is of so exquisite a Fineness, as to put it out of the Power of the Unacquainted to determine what it is, and when the Extremities are cut off retains scarce any Thing of the Figure of a *Lamb*, but just enough to deceive the Ignorant and Credulous with the Show of a woolly Membrane, in form of a Gourd." To this he subjoins, "The Price of a Skin, according to its Goodness, amounts to three Pieces of Gold, or more. It is used to line their Turbans, and often serves, by Way of Ornament, to border their Gowns and Cloaks". He concludes, at last, in these Words: "Whether this Fable owes its Rise to the Conjectures of some contemplative Philosopher, or the Ignorance of the first Relater, who, either through Carelessness, or Unskilfulness in the Language, might misunderstand a Thing he heard talked of by the by, or whether we refer it to some other Original, the Mistake being propagated to far distant Regions, and spreading every where, first occasioned this Pellicle the Loss of its true Name and History. Provision being thus made for its Reception, the Bauble itself was imported to us, under the specious Name of a *Miracle*, and lighting upon some illustrious Person of Curiosity, and an Admirer of this foreign downy Piece, it gained Credit and Admission, as all Prodigies are apt to do, by its Vegetable Face. This Error being illustrated by Authority, and soon after confirmed by Writing, took such firm Rooting in the Judgments of the Learned, as well as the Opinions of the Vulgar, that the Pellicle is shewn to this Day, among the rarest Curiosities in the Musæums, as a Species of Zoophyte, when, indeed, it is no other than a Fœtus of the Cæsarean Section".

From what has been quoted, it appears, that those Persian *Lamb-skins*, which our Skinners call *Persianische Baranken*, are of this Kind, that is, stript from Lambs that are cut out of the Bellies of their Dams, by the Cæsarean Section. But we have none of the choicest, the Price of which, as Kämpfer says, is three Pieces of Gold, or more, in their own Country, whereas we can buy the best that is imported, for one Piece, at most.

About three Years ago, a Russian, who was a Man of Learning and Curiosity, in his Travels, came to our City, and was pleased to desire a Sight of my Musæum, which, among other Natural Curiosities, was not unprovided with this Scythian *Lamb*, which passed for the true *Borometz*, the Wonder of Wonders. It was about six Inches in Length, and furnished with a Head and Ears, and four Legs of the Colour of Iron, and covered with a Sort of Down, like the knappy Silks called by us *Gammet*, except its Ears and Legs, which

were bare, and of a darker Colour. When it came to be examined, I found it was not of an Animal Nature, nor the Fruit of any Plant, but the Root of some Vegetable, thick, spreading, and hairy; or rather the Stem, or Stalk of some Plant, which, in its Climbing, had, by the Ministry of Art, acquired some Sort of Resemblance of a Quadruped; or the four Legs were the Reliques of so many Stems, or, if you will, Pedicles, which had born Leaves, and were lopped off, as were also the Ears, tho' they were like Horns. Besides this, the Fibres shooting out here and there, by which the thick Root, and through that the Plant, like all others, received Nourishment, left no Room for Doubt. Moreover, one of the fore Legs was not, like the rest, continuous to the Body, but inserted therein by Art; and the Head itself, with the Neck, was very artificially connected to the same, as I found upon making a more accurate Inspection. So that this *Lamb* was fabricated and put together, from this and that Root or Stump, by the same artificial Means, as your Homuncios or Pigmies are composed and pieced up of the Roots of Mandrake and Briony. But there still remained a Doubt with me, out of what Plant this Ludibrium of Art and Nature could be formed, tho' a Thought soon came into my Head, that it must be one of those commonly called the Capillary Kind, for which I had several Evidences, both from the Comparison of some Exotic Plants which I myself knew, and of others which are described and delineated by Hans Sloane, M. D. and the Rev. M. Plumier, in their costly and elaborate Works; for some of these Plants shoot up in several Stalks, which are covered with a ferruginous Down, or, as they call it, reddish Moss. But what Kind precisely to fix upon for this Piece of Handicraft, I could not determine, tho' I am apt to think, it is a Species peculiar to Tartary, and not yet described, till Time shall inform me better.

I am farther confirmed in this Opinion, by what I have since read in the English *Philosoph. Transf.* where Sir Hans Sloane, describes, and gives us the Figure of one of these pretended Scythian *Lambs*, which he procured from the East Indies; but it is far more unlike the Figure of a *Lamb*, than mine before mentioned.

I suppose, that such Sorts of Lambs are shaped out of certain Roots or Stumps in Russia and Tartary, so as to make this Story of the Scythian Vegetable *Lamb*, in some Measure, a Truth. But every one sees, that such a *Lamb* is a quite different Thing, from what is described by the forementioned Authors, and not to be so much wondered at; for it is no difficult Piece of Work, out of Roots and Stumps of Plants, to construct and frame several Sorts of Prodiges, which shall have some Resemblance of Natural Things, as was observed before of the Roots of the Mandrake; and the grotesque Figure of these Roots, may, with as good Reason, be called an *Hæmuncio*, or *Little Man*, as the other, which is constructed, and set together, from the Roots and Stems of another Kind or Kinds of Plants, be taken for a *Lamb*. *J. H. Breynius, M. D. Dantisc. Phil. Transf.*

The Description of Sir Hans Sloane, above referred to, is as follows:

It was above a Foot long, as big as one's Wrist, having several Protuberances, and towards the End some Foot-stalks, about three or four Inches long, exactly like the Foot-stalks of Ferns; both without and within. Most Part of the Outside was covered with a Down, of a dark, yellowish, Snuff Colour, shining like Silk, some of it a Quarter of an Inch long. This Down is what is commonly used for Spitting of Blood, about six Grains of it going to a Dose; and three Doses pretended to cure such an Hæmorrhage. In Jamaica are many scandent and Tree-ferns, which grow to the Bigness of Trees, and have such a Kind of Lanugo on them; and some of our Capillaries have something like it. It seemed to be shaped by Art; to imitate a *Lamb*, the Roots, or climbing Parts, being made to resemble the Body, and the extant Foot-stalks the Legs. This Down is taken Notice of by Dr. Merret, at the latter End of Dr. Grew's *Mus. Soc. Reg.* by the Name of *Poco Sempie*, a golden Moss, and is there said to be a Cordial. Dr. Brown, who has made very good Observations in the East Indies, says he has been told there, by those who have lived in China, that this Down, or Hair, is used by them for the Stopping of Blood in fresh Wounds, as Cobwebs are with us; and that they have it in so great Esteem, that few Houses are without it. I have known it, says the Doctor, much used for Spitting of Blood; but on Trials I have seen of it, though I may believe it innocent, I am sure it is not infallible. *Philosoph. Transf.*

AGNUS CASTUS. *Agnus Castus*, *Vitex*, Offic. *Agnus Castus*, Hort. Monsp. 7. Chab. 63. Herm. Hort. Lugd. Bat. 11. Mill. Cat. 124. *Agnus folio non serrato*, J. B. 1. 205. Raii Hist. 2. 1696. *Vitex*, *Agnus Castus*, Rand. Ind. 94. *Vitex*, Rivin. Rupp. Flor. Jen. 201. *Vitex sive Agnus Castus*, Ger. 1201. Emac. 1387. *Vitex folio angustifolius*, Park. Theat. 1437. *Vitex foliis angustioribus*, *Cannabis modo dispositis*, C. B. Pin. 475. Tourn. Inst. 603. Elem. Bot. 475. Boerh. Ind. A. 2. 222. THE CHASTE TREE. *Dale*.

The *Vitex*, or *Lygus*, is a willowy Shrub, almost deserving the Name of a Tree, which grows on the Banks of Rivers, and in marshy Fields, and in rough and rugged Places, and Channels worn by Torrents. It bears long flexible Rods, hard to break; and its Leaves resemble those of the Olive, but are longer, and more tender. One Kind of it bears a white purplish Flower, the other a Purple. The Seed is like Pepper.

It is of a warming and astringent Nature. The Fruit drank heals the Bites of venomous Beasts, and relieves such as labour under Disorders of the Spleen, and the Dropsy. The Quantity of a Dram, taken in Wine, breeds Milk in Abundance, and provokes the Menstrues; but it endangers a Miscarriage, and affects the Head, bringing on a Carus. A Decoction of the Herb and Seed makes a good Inseffion, for Women who are troubled with Inflammations, and other Disorders of the Uterus. The Seed drank with Penroyal, or in a Suffumigation, moves the Belly; a Cataplasm made therewith cures the Pain of the Head, and it is used with Oil and Vinegar in Embrocations for Lethargies and Phrenesies. A Fumigation, or bare Substration of the Leaves, chafes away venomous Animals, and applied in a Cataplasm heals such as are bitten by them. With Butter and Vine-Leaves, they mollify the Hardness of the Testes. A Plaister of the Seed, with Water, heals the Fissures about the Anus, and used with the Leaves cures Wounds and Luxations. A Rod, or Branch, of the Tree, carried in the Hand, is supposed to prevent Galling in Journeys.

This Shrub is called *ἀγνός*, [*castus, chaste*] because the Matrons, who lived chaste during the Thesmophoria [Feasts of Ceres] used to lie upon them at Nights: And it is called *λύγος*, [*Lygus*, as it were, *Offer*] for the Toughness, or Tenacity, of its Rods. *Dioscorides, Lib. 1. Cap. 135.*

Hippocrates (*de Morbis Mulierum, L. 1.*) recommends the Seed of the *Vitex*, for bringing away the Secundines; and those of the white Sort for expelling the Foetus.

This Tree arises not to any great Height or Thickness, having many ash-coloured Branches, flexible, tough, and not apt to break; on which grow many digitated Leaves, or such as are composed of five, and frequently seven, long, narrow, sharp-pointed Divisions, on one common Foot-stalk, pretty much resembling Hemp, but that they are not at all serrated about the Edges; they are of a deep Green above, and whitish underneath: On the Tops of the Branches grow Spikes of small whitish purple Flowers, consisting of a single Leaf, cut irregularly into five Parts, which makes them appear, as it were, galeated and labiated. They are set on Verticillatim, like the Flowers of Lavender, and are succeeded by small, round Seeds, like Pepper, but less, of a blackish, grey Colour, set in hoary Calyces, of a hot astringent Taste.

This Tree grows in the warmer Countries, as in Italy, in the Kingdom of Naples, and in Sicily, and flowers in August.

The Leaves, Flowers, and Seed of *Agnus Castus*, are accounted warming and drying, and useful against the Hardness of the Liver and Spleen, to expel Wind, and bring down the Catamenia. The Seed has been formerly mightily commended to allay venereal Heats, and Desires which arise from the Sharpness or Turgescence of the Seed, and by that Means preserve Chastity, but there is little Use made of it now, and the *Syrupus de agno casto* is left out of the new Dispensatory. *Mill. Bot. Off.*

The Leaves, Flowers, and Seed of this Shrub consist of very fine Parts. The Fruit is eaten, and sensibly heats the Body, and causes Head-ach. Fried in the Pan, it does not so much affect the Head, but heats and dries the Body, affording but little Nourishment, and that not in the least flatulent, whence it restrains the Inclination to Venus. It is supposed to promote Chastity not only when taken in Meat and Drink, but even if it be but laid under the Bed-cloths. The Seed of it is more effectual than Rue for Hardness of the Liver or Spleen. *Actius Tetr. 1. Serm. 1. Agnus.*

It contains a great deal of Salt and Oil and but little Phlegm.

AGOGÉ. *Ἀγωγή*. From *ἄγω*, to lead, or conduct. It signifies the intire Order or Tenour of a Thing, as the Manner of a Man's Life; the Procedure of a Distemper, or the State of the Air. *Castellus.*

Pliny, *L. 33. C. 4.* calls little Channels *Agogæ*, through which the Water runs from Gold-ore that has been washed with it, and in which the Gold is deposited.

AGOMPHIASIS, or GOMPHIASIS. *A Distemper of the Teeth.* It consists in their being loose in their Sockets. *Blancard.*

AGONE. The *Hyoscyamus*. *Henbane*. *Helychius*. See *HYOSCYAMUS*.

AGONIA. *Ἀγρία*. From a Negative, and *ῥέω*, an Offspring. Sterility.

AGONIA. *Ἀγρία*. From *ἄγω*, a Combat, or Struggle. Agony, when there is supposed to be a Sort of Struggle betwixt Life and Death.

AGONISTICON. *Ἀγωνιστικόν*. Paulus Aegineta (*L. 2. C. 30.*) makes Use of this Word as an Epithet to Water, which he explains by (*ὑπερβαίνειν*) *excessively cold*.

AGONOS. *Ἀγνος*. From a Negative, and *ῥέω*, an Offspring, or *ῥέω*. Barren.

Hippocrates, according to Coelius, calls those Women thus, who have never had Children, but are however in a Condition to breed. Or such to whose Fecundity there is at present some Impediment, which may be removed.

The Word is also applied to (*ἡμέραι*) *Days*, when it signifies equal Days, as the Fourth or Sixth, on which a Crisis is not to be expected; to distinguish them from (*ῥήματα ἡμέραι*) *unequal*, or genuine Days (as the third or seventh) on which a Crisis, especially if it is compleat, generally happens.

AGORÆUS. *Ἀγορεύς*. From *ἄγορά*, a Market. An Epithet for Bread that is very coarse.

AGOSTUS. *Ἀγρός*. From *ἄγω*, to bring, or lead. That Part of the Arm from the Elbow to the Fingers. Also the Palm, or Hollow of the Hand. *Castellus. Constantine.*

AGRESTA. *Verjuice*. The Juice of unripe Grapes. Or, the four Grape itself.

Lemery says, the *Agresta*, *Omphax*, or unripe Grape, contains a great deal of essential Salt and Phlegm, and a small Portion of Oil and Earth. He adds, that it is deterfive, astringent, and cooling; that it tempers the Acrimony of the Bile, and raises the Spirits.

AGRESTEN. *Acid Stone-tartar*. *Castellus.*

AGRESTIS. *Wild*. It is applied to Vegetables to distinguish those which grow spontaneously in the Fields, from such as are cultivated.

It is used also to express a malignant Disposition in some Distempers; and likewise a Brutality in the Manners and Dispositions of Men.

It is frequently used as an Epithet to Animals, to distinguish them from those which are domestic, and tame.

Wild Animals are more heating and drying, than those which are tame. *Actuarius de Spirit. Animal. C. 315.*

Wild Animals afford better Nourishment than tame ones. *Oribasius, Synopsis. L. 4. C. 1.*

Domestic or tame Animals are of a more humid Temperature than wild ones, whose Flesh is firmer, and has little or no Fat, and will therefore keep much longer without Putrefactions than that of domestic Animals, who are bred up and fattened in Idleness. Hence it appears that wild Animals afford an Aliment much less excrementitious than the others. *Orib. Med. Col. Lib. 2. Cap. 41.*

Wild Animals in general, by Reason of the strong Exercise they use, have their Salts and Oils more highly exalted than those which are tame, and hence proceeds their high Taste. For this Reason also they are usually more healthful, and vigorous, and consequently afford better Nourishment to Stomachs able to digest them, for their Flesh is more firm and hard, for the same Reason that their Salts and Oils are exalted.

AGRIA, in the Sense of the Botanists, signifies the same as *Agrifolium*, *Holly*, according to Blancard; but

AGRIA, is also a Sort of malignant Pustule, taken Notice of by Celsus, where he distinguishes two Kinds of Pustules, or Papulæ. The first, he says, is a very small Sort, which casts a Roughness and Redness over the Skin, but slightly corrodes it. It is somewhat smoother about its Center, and spreads but slowly. This Malady assumes a round Figure at its first Appearance, and preserves its Roundness as it proceeds. The other, here taken Notice of, is called by the Greeks *Ἀγρία*, which does not only cause an Exasperation like the other, but an Exulceration, with a vehement Corrosion and Redness of the Skin, sometimes making the Hairs fall off. The less this Sore approaches to a round Figure, the more difficult it is to cure; if it be not timely extirpated, it turns to the Leprosy. But the flightier Sort of Pustules, if they are every Morning wetted with fasting Spittle, are healed without much Trouble. For the greater Kind there is no better Remedy than the Herb Pellitory of the Wall, bruised and immediately applied. As for compound Medicines, the Remedy of Mycon, which follows, is effectual:

Take of red Nitre, Frankincense, each P. i. Cantharides cleansed P. ii. Of crude Sulphur a like Quantity. Of Refine of liquid Turpentine, P. xx. Meal of Darnel, three Pints. Of Fennel Flour, a Quarter of a Pint. Of crude Pitch, an Ounce. *Celsus, Lib. 5. Cap. 38.*

AGRIAMPELOS. From *ἄγρος*, *Wild*, and *ἄμπελος*, a Vine. The wild Vine. See *VITIS SYLVESTRIS*. Gerard says, it is the black Bryony.

AGRICULTURA. *Agriculture*. This is no other Way concerned in Medicine, than as an Exercise. The Exhalations from a light gravelly Earth just turned up, are reckoned extremely healthful. For this Reason People have frequently been

been directed to follow the Plough, in order to respire Air impregnated with these salutiferous Effluvia.

AGRIELÆA. From *Agros*, wild, and *Ælia*, an Olive. The wild Olive. See OLEASTER.

AGRIFOLIUM. *Agrifolium*, Offic. Ger. 1155. Emac. 1338. Raii Hist. 2. 1622. Synop. 3. 466. Merc. Bot. 1. 17. Phyt. Brit. 3. Mer. Pin. 3. *Agrifolium* sive *Aquifolium*, Park. Theat. 1486. *Aquifolium* sive *Agrifolium*, Chab. 605. *Aquifolium* sive *Agrifolium* vulgo, J. B. 1. 114. Tourn. Inst. 600. Elem. Bot. 473. *Aquifolium* *Tournefortii*, Rupp. Flor. Jen. 35. *Aquifolium* *baccis rubris*, Herm. Hort. Lugd. Bat. 56. Boerh. Ind. A. 2. 219. *Ilex aculeata baccifera folio sinuato*, C. B. Pin. 425. Johnst. Dendr. 206. The HOLLY TREE. Dale.

AGRIFOLIUM, seu AQUIFOLIUM [of *Agros*, a Prickle, and *Folium*, Lat. a Leaf, because the Leaves are armed with sharp Prickles]. The HOLLY-TREE. Miller's Dict.

This Derivation is very unnatural and far fetched. It seems more to the Purpose to derive it from *Agros*, rustick; rough, fierce, and *Ælia*, a Leaf.

The CHARACTERS are,

The Leaves are set about the Edges with long, sharp, stiff Prickles; the Berries are small, round, and for the most Part of a red Colour, containing four triangular striated Seeds in each. Miller.

This Plant is too well known to want a Description.

The Berries of Holly are hot and dry, of thin Parts; and expel Wind. They are good against the Colic; ten or twelve being inwardly taken bring away by Stool thick phlegmatic Humours.

The Birdlime, which is made of the Bark, is no less hurtful than that of Mistletoe, for it is marvellous clammy, it glueth up all the Entrails, it shutteth and draweth together the Guts and Passages of the Excrements, and by this Means it bringeth Destruction to Man, not by any Quality, but by its gluing Substance. Holly, beaten to Powder and drank, is an experimented Medicine against all the Fluxes of the Belly, as the Dyfentery, and the like. Gerard.

They make Birdlime after the following Manner:

In June or July they strip the Holly-trees, and boil the Bark in Spring-water, seven or eight Hours, till it becomes very tender. Then they take it out, and first letting the Water run off, till it is dry, they afterwards pile it up with Fern, intermixing for every Lay of Bark a Lay of Fern. There it is suffered to ferment and rot, for two or three Weeks, till it becomes a Mucilage. This they take and pound in a Mortar till it is capable of being moulded like a Lump of Dough, and afterwards work it well in their Hands in running Water, which in a short Time will cleanse it of all Sordes, and leave nothing but the pure and defecated Birdlime. Then put it in an earthen Pot, and let it stand three or four Days, till it has thoroughly purged and perfected itself by Despumation, and after that remove it into a fresh Vessel, and keep it for Use. Raii Hist.

N. B. Birdlime is not only made of the Bark of this Tree; but also of the Fruit, of Mistletoe, the Chestnut, and Sebesten.

The following Species of this Tree are enumerated by Miller:

1. *Aquifolium*; *Baccis rubris*, H. L. The common Holly with red Berries.
2. *Aquifolium*; *Baccis luteis*, H. L. Yellow-berried Holly.
3. *Aquifolium*; *Baccis albis*. White-berried Holly.
4. *Aquifolium*; *Foliis ex luteo variegatis*, H. R. Par. *Aquifolium aureum*, Munt. H. 163. Yellow-blotched Holly.
5. *Aquifolium*; *Foliis ex albo variegatis*, H. L. White-blotched Holly.
6. *Aquifolium*; *Echinata Foliis superficie*, Corn. 180. Hedge-hog Holly.
7. *Aquifolium*; *Echinata Foliis superficie Foliis ex luteo variegatis*. Yellow-blotched Hedge-hog Holly.
8. *Aquifolium*; *Echinata Foliis superficie Limbis aureis*. Gold-edged Hedge-hog Holly.
9. *Aquifolium*; *Echinata Foliis superficie Limbis argenteis*. Silver-edged Hedge-hog Holly.
10. *Aquifolium*; *Foliis longioribus, Limbis & Spinis ex unico tantum Latere per totum argenteo pictis*, Pluk. Alm. 38. BRODERICK'S Holly, vulgô.
11. *Aquifolium*; *Foliis subrotundis, Limbis & Spinis utrinque argenteis*. *Aquifolium elegans*, D. Doct. Eales. Pluk. Alm. 38. EALES'S Holly, vulgô.
12. *Aquifolium*; *Foliis oblongis lucidis, Spinis & Limbis argenteis*. Sir THOMAS FRANKLIN'S Holly, vulgô.
13. *Aquifolium*; *Foliis oblongis, Spinis & Limbis argenteis*. Hertfordshire White Holly.
14. *Aquifolium*; *Foliis subrotundis, Limbis argenteis, Spinulis & Marginalibus purpurascens*. BRIDGMAN'S Holly, vulgô.
15. *Aquifolium*; *Foliis oblongis, Spinis & Limbis flavescens*. LONGSTAFF'S best Holly, vulgô.
16. *Aquifolium*; *Foliis oblongis lucidis, Spinis & Limbis aureis*. BRADLEY'S best Holly, vulgô.
17. *Aquifolium*; *Foliis oblongis, Spinis & Limbis aureis*. WISE'S Holly, vulgô.

18. *Aquifolium*; *Foliis subrotundis, Spinis minoribus, Foliis ex luteo elegantissime variegatis*. The British Holly, vulgô.

19. *Aquifolium*; *Foliis oblongis atro-virentibus, Spinis & Limbis aureis*. BAGSHOT Holly, vulgô.

20. *Aquifolium*; *Foliis latissimis, Spinis & Limbis flavescens*. Glory of the East Holly, vulgô.

21. *Aquifolium*; *Foliis oblongis, Spinis majoribus, Foliis ex aureo variegatis*. Glory of the West Holly, vulgô.

22. *Aquifolium*; *Foliis subrotundis, Spinis & Limbis aureis*. ASLET'S Holly, vulgô.

23. *Aquifolium*; *Foliis longioribus, Spinis & Limbis argenteis*. The Union Holly, vulgô.

24. *Aquifolium*; *Foliis & Spinis majoribus, Limbis flavescens*. Fine PHYLLIS Holly, vulgô.

25. *Aquifolium*; *Foliis minoribus, Spinis & Limbis argenteis*. Painted Lady Holly, vulgô.

26. *Aquifolium*; *Foliis angustioribus, Spinis & Limbis flavescens*. FULLER'S Cream Holly, vulgô.

27. *Aquifolium*; *Foliis oblongis, ex luteo & aureo elegantissime variegato*. Milk-maid Holly, vulgô.

28. *Aquifolium*; *Foliis oblongis viridibus; maculis argenteis notatis*. CAPEL'S mottled Holly, vulgô.

29. *Aquifolium*; *Foliis oblongis, Spinis & Limbis luteis*. PARTRIDGE'S Holly, vulgô.

30. *Aquifolium*; *Foliis oblongis, Spinis & Limbis ocruleis*. MASON'S Copper-coloured Holly, vulgô.

31. *Aquifolium*; *Foliis parvis, interdum vix spinosis*. Box-leaved Holly, vulgô.

32. *Aquifolium*; *Foliis parvis, interdum vix spinosis, Limbis Foliis argenteis*. WHITMILL'S Holly, vulgô.

33. *Aquifolium*; *Carolinianum, angustifolium, Spinis raris brevissimis*. Carolina Holly with smooth Leaves, vulgô.

AGRIMONIA. *Agrimonia*.

Agrimonia is a Plant of the spriggy Kind [*Geranioides*] shooting forth one slender, woody, strait, black, hoary Stalk, a Cubit high, or more, with Leaves at Distances cut mostly into five Divisions, and sometimes more, best resembling the Leaves of Hemp or Cinquefoil, of a dark Colour, and serrated round the Edges. The Seed grows about the Middle of the Stalk, being somewhat rough, and bending down, so as, when dry, to stick on your Clothes.

The Leaves, bruised and applied with old Hogs-lard, heal Ulcers that are hard to cicatrize. The Plant, or its Seed, drank in Wine, cures such as are afflicted with the Dyfentery, a distempered Liver, or are bitten by Serpents. Some, by Mistake, have given this Plant the Name of Mugwort, which is quite another Thing. *Dioscorides*, Lib. 4. C. 41.

This Herb is called *Hociamsanum* by *Marcellus Empiricus*, Cap. 20.

Agrimonia is thus distinguished by the Moderns:

Agrimonia, *Eupatorium Græcorum*, Offic. *Agrimonia*, Ger. 575. Emac. 712. Raii Hist. 1. 400. Synop. 3. 202. *Agrimonia vulgaris*, Park. Theat. 594. *Agrimonia Officinarum*, Tourn. Inst. 301. Boerh. Ind. A. 79. *Agrimonia seu Eupatorium*, J. B. 2. 398. Chab. 172. *Eupatorium Veterum sive Agrimonia*, C. B. Pin. 321. *Eupatorium Veterum sive Agrimonia inodora, vel minus odora*, Hist. Oxon. 2. 614. AGRIMONY. Dale.

This is the *Eupatorium* of *Dioscorides*, *Galen*, and the ancient Greeks; it grows about two Feet high, or higher, having several winged hairy Leaves, of a pale green Colour, composed of unequal Numbers of Parts, sometimes five, oftener seven, whereof the three at the End are largest; they are serrated about the Edges, like the Leaves of Strawberries, having several smaller Leaves intermixed among them, and are set alternately on the Stalk, on the Tops of which grow the Flowers in long Spikes a little bending down, they are small and yellow, made of six small Leaves, with two green Appendices growing by them, and are succeeded by little rough Burs, which stick to any Thing that comes in their Way; each Bur containing two Seeds. The Root is long and slender, and creeps in the Ground, shooting out fresh Leaves and Branches every Year; it grows in Hedges and Borders of Fields, and flowers in June and July.

Some Authors will have this Plant called *Eupatorium quasi hepatorium*, from its Usefulness to the Liver; others will have its Name derived from *Mithridates Eupator*, who, as *Pliny* says, first found out its Virtue.

Lemery adds, that it is good for Loosenesses, and often put amongst astringent Clysters, as also in Gargarisms and Apozems. *Lemery de Drogues*.

Agrimonia is reckoned a Cleanser and Purifier of the Blood, a great Strengtheners of the Liver, and serviceable for all Diseases arising from the Weakness thereof, as the Dropsy, Jaundice, and the like; it is commended likewise for the Strangury, and making bloody Water, and *Riverius* extols the Powder of the dry Leaves, for Incontinence of Urine. It is also reckoned among the vulnerary Plants, and put in Wound-drinks, and outwardly used in Baths and Fomentations. *Miller, Bot. Off.*

It is a most noble Hepatic, Vulnerary, and Splenetic, as any we have, and therefore most frequently used in Distempers proceeding from a weak Liver, as the Dropsy, Cachexy, and Jaundice.

dice. It is prescribed also in Catarrhs, Coughs, and Retention of the Menfes; and very often used in Baths and Lotions. Dale.

It has a very fine fragrant Smell, and, infused in Wine till it has communicated its Fragrance, is accounted a sovereign Remedy against Sadness and Melancholy. It is a principal Vulnerary, and, though a Corroborative and Astringent, is good in Inflammations. It is of peculiar Service in Diseases caused by the Laxness of the Fibres, in Fluxes incident to Camps, and Obstructions of the Viscera from Weakness of the Fibres. It is of excellent Virtue against the Fluxus Hepaticus, the Diarrhoea, Dysentery, Scurvy, Rottenness of the Gums, Inflammation of the Jaws, Consumption, Spitting of Blood, Dropsy, and Languor consequent on a Fever. Externally, the Leaves boiled in refined Wine and Bran, and applied, are useful in Luxations and the Falling down of the Womb. Hence it appears to be a prime Medicine in Cases that require Strengthening or Exhilarating.

It may be used as Tea, in which, if it be thought too astringent, Honey may be put. This Herb is said to be appropriated to the Liver, because, if infused in Water or Whey, and drank, it opens and scours the Intestines, and strengthens them afterwards, which must be of singular Benefit to the Liver. It is of excellent Use in cold Countries. Boerhaave.

The Species of this Plant, according to Miller, are:

1. *Agrimonia officinalis*. Tourn. Common or medicinal Agrimony.
2. *Agrimonia odorata*, Cam. The Sweet-smelling Agrimony.
3. *Agrimonia minor, flore albo*, Hort. Cath. Lesser Agrimony with a white Flower.
4. *Agrimonia Orientalis humilis, radice crassissima repente, fructu in spicam brevem & densam congestis*, T. Cor. Dwarf Eastern Agrimony, with thick creeping Roots, and the Seeds growing in short thick Spikes.

The Leaves of *Agrimonia*, in the Quantity of five Pounds, being chymically treated, yield four Pounds of an acid and almost austere Liquor, two Ounces of an urinous alkaline Liquor, two Ounces of thick Oil, six Drams of fixed Salt, and an Ounce of insipid Earth. From this Analysis it appears, that this Plant contains very little Salt of the ammoniacal Kind, since no concrete urinous Salt is got from it, but the acid Salt, wherewith it abounds, joined with Earth, forms a Concrete resembling Tartar, or Salt of Coral, combined with a large Proportion of Sulphur. Moreover, *Agrimonia* has a saline Taste, a little astringent and acid, and its Juice turns the Tincture of Heliotropium to a faint Red; so that its astringent and aperitive Virtues seem both owing to the same austere Salt; for, though these Effects are contrary to one another, yet they often flow from one and the same Principle; the Strengthening of the weak and lax Fibres of the solid Parts. Experience shews, that *Agrimonia* has the Virtues which are supposed to arise from its Composition; for it is astringent, detergent, resolvent, vulnerary, and aperient. Geoffroy.

AGRIMONOIDES.

Agrimonia similis, C. B. *Agrimonoidea*, Park. Col. *Pimpinella folio Agrimoniae, nonnullis*.

It has a small, fibrous, woody, and reddish-coloured Root: The Leaves next the Ground are joined to hairy, reddish Pedicels, of nine Inches long, these are like Strawberry Leaves, but blacker, and more in Number, disposed after the Manner of Agrimony-leaves, with smaller ones interspersed (as is observed also in Agrimony) hairy, soft, serrated at the Edges with finer and more acute indentings than Agrimony; and the Leaves themselves are rounder. It produces several supine, hairy, red Stalks, that send forth three or four Branches, which are furnished with smaller, fewer, and rounder Leaves, that have Auricles about the Stalk, like others of the same Kind, and at their Top bearing three or four hairy Buds, like those of the Pomegranate, very much jagged at the Edges, and containing the small yellow Flower of the Agrimony, which sometimes hardly opens, though the Fruit is duly formed within. After the Flowers are fallen off comes the Seed, which is of a round oblong Figure, of the Size of a Grain of Wheat, and formed with two Protuberances. When ripe, it falls off spontaneously, leaving the Husk gaping. It is of an absterfive, drying, and bitter Taste; and in Smell is a Mean between the fragrant and common Agrimony.

It flowers in April, comes to Perfection in May, and grows among Bryers and Shrubs in some mountainous Parts of Italy. Raii Hist.

It agrees with Agrimony in Virtues. Boerh.

AGRIOCARDAMUM. From *Ἀγρίος*, wild, and *Καρδάμω*, Nasturtium. The same as *Iberis*, Scitica Cressies. See *IBERIS*.

AGRIOCASTANUM. The same as *Bulbocastanum*, Earth-Nut, or Pig-Nut, which see.

AGRIOCINARA. From *Ἀγρίος*, wild, and *Κινάρα*, Artichoke. The wild Artichoke. See *CINARA*.

AGRIOCOCCIMELEA. From *Ἀγρίος*, wild, *Κόκκος*, a Berry, and *Μέλεα*, an Apple-tree. The same as *Prunus Sylvestris*. Blancard.

AGRIOMELA. From *Ἀγρίος*, wild, *Μέλεα*, the Fruit of the Malus

Sylvestris. The *Malus Sylvestris*, or Crab-tree, is thus distinguished by Authors:

Malus Sylvestris, Offic. Ger. 1276. Emac. 1460. Jonf. Dendr. 1. Raii Synop. 3. 452. Park. Theat. 1502. *Malus Sylvestris fere agrestis*, J. B. 1. 26. Raii Hist. 2. 1448. *Mala Sylvestria, quæ & alba, & rubra, & majora, & minora*, C. B. Pin. 433. *Malus Sylvestris acido Fructu*, Tourn. Inst. 634. The CRAB-TREE, or WILDING. Dale, Pharmac.

It is commonly lower than the cultivated, more crooked, scraggy, branched, and is supposed to be of a harder and firmer Substance. The disorderly and entangled Multiplicity of its Branches and Twigs; and the Luxuriance and native Rigidity of the Shoots which it sends forth on all Sides, as well from the Stem as the Root, easily discover its wild and uncultivated Nature. The Leaves are generally lesser, and more shrivelled than those of the cultivated Tree; but their Flowers are alike, only the wild ones are, for the most Part, smaller, of a fragrant Smell, and sometimes inclining to a Red. But the principal Difference is in the Fruit, or Apples; for those of the Crab-tree are small, seldom as big as Walnuts, but near about the Size of Medlars, only rounder, and hanging by a somewhat long and slender Pedicle, with a green Rind, or Skin, which at last turns to Yellow, and in some to a beautiful Red. But they will bear no Comparison with the worst of those which grow on cultivated Trees, neither in Softness of Substance, nor Agreeableness of Taste, for they are endued with such a Sourness and Astringency, as renders them utterly unfit to be eaten.

There are as many Species of Wildings as of cultivated Apple-trees, and more than it is possible, or worth While to enumerate.

They are in Blossom at the same Time with those which are cultivated, or a little later, and their Fruit is also ripe after the others, that is, in October.

They are common in Woods and Hedges, not only in England but in foreign Countries.

The Fruit is vehemently austere, acid, and astringent, as well as the Juice expressed from it, which is very frequently used in England, France, and Germany, instead of Vinegar. Some call it *Agresta*. It will keep several Years. The French and Germans think it renders Fish, that are boiled in it, firmer, and more savoury; and this has been found true also amongst us, says Bauhine. The English call it *Verjuice*, that is, green Juice, borrowing the Name from the French. Raii Hist. Plant.

Wild Apples [such as grow on Crab-trees] are like your early ones, and have an astringent Quality. In Cases which require the Use of Astringents, you are to chuse those which are most unripe. Dioscorides, L. 1. C. 163.

Verjuice mixed with Yeast, and applied to the Place, is good for the Erysipelas, Itch, and all Sorts of Inflammations. Dropped into the Eyes, it is believed to cure their Redness, Inflammations, and Lippitude.

For the Scrophulæ [King's Evil] first wash and cleanse the Ulcers well with Verjuice, and afterwards apply thereto black Wool, moistened with Oil of Neat's-foot. Raii Hist. L. 2.

Its Fruit and Juice are the *Agresta* of the Shops, called *Verjuice*; it is vehemently austere, acid, and astringent. Dale Pharmac.

AGRION. Blancard says, this is a Name for *Peucedanum*; I do not know his Authority, having met with the Word in no other Author. See *PEUCEDANUM*.

AGRIOPHYLLON. This also, according to Blancard, is a Name for *Peucedanum*.

AGRIORIGANUM. From *Ἀγρίος*, wild, and *ὀρίγανος*, *Origanum*. Wild *Origanum*, or wild *Marjoram*. See *ORIGANUM*.

AGRIOSELINUM. The same as *Hippoeselinum*, which see. Dioscorides.

AGRIOSTARI. A Species of Wheat, called *Triticum Creticum*. See *TRITICUM*.

AGRIPALMA. A Name of *Cardiaca*, Motherwort. See *CARDIACA*.

AGRIPPÆ. Those Children are thus called, who are born with the Feet foremost, because Agrippa, the Roman, was said to be born in this Manner.

Of all Births, where the Child presents any Part but the Head; the least dangerous, and most easy, is that, when the Feet come foremost, and even often, by the Hands of a skilful Man-midwife, it is accomplished sooner and with less Pain, than a Birth where the Head presents.

Since the Head is to open the Passage, it has no Way to do it, but by pressing strongly against the internal Orifice, and redoubling its Efforts at each Pain, which are reiterated for that Purpose. But after the Waters are pierced, if the Feet present at the Passage, the Operator, by gently drawing them, causes the Orifice to dilate, in order to give a Passage to the Legs, and after them to the Thighs, and so on to the whole Body. Thus the Parts which come out first, being less in Bulk than those which follow them, they open the Way one after another; so that in this Situation, the Birth is often sooner brought about, and a great deal of Pain saved to the Mother.

There

There are Signs by which we know that the Child is not rightly turned, and that some other Part presents, and not the Head: For Example; if the Pains are remis, and at long Intervals; if they begin in the Region of the Reins, and do not press strongly downwards, there is Reason to believe the Head does not present. But the Operator is certain of it, when he touches the Woman, and perceives that nothing pushes against the internal Orifice; or if he does perceive something, it is not hard and round like a Head. In this Case, he feels the Waters prepared, but in pressing his Finger against the Membrane, he does not meet with the same Resistance, as he would from the Head of the Child.

In this Juncture, the Man-midwife is to wait till the Waters break of themselves, and, by their Evacuation, make Way for the Infant to descend, and for the Part which presents, to sink down. If the Feet, or a Foot, present, he is not to think of returning the Infant, or endeavour to give it another Posture; but he is to receive and bring it away by the Feet, conducting himself by the following Directions.

When, I say, that he is to wait till the Waters break of themselves, I do not pretend to make it a general Rule: I mean, when the Pains are remis, and the Delivery seems at a Distance; but when the Pains are frequent and intense, and the Waters are distended, so as to fill up the internal Orifice, the Operator ought to break them with his Nails, in order to make Way, by their Evacuation, for the Infant to descend, and present itself at the Passage. If it be rightly turned, its Head comes upon the internal Orifice, and hinders the rest of the Waters from running off, by this Means facilitating a Passage for the Body of the Infant, after the Head has made Way. But if any other Part, besides the Head, place itself at the Passage, all the Waters run off by little and little, there being nothing to stop them; so that, when the Child is coming away, there is none left, which makes the Birth the more difficult.

It would not be impossible, if the interior Orifice were enough dilated, to introduce the Hand, as soon as the Waters were pierced, and before the Infant was fixed in the Passage, to return it, when it presented the Feet, and to make it take its natural Posture, which is to come with the Head foremost; as it would neither be impossible, when it presented the Head, to return it, and make it come by the Feet: But we are not to aim at changing either of these two Postures, which are the most natural; and whether it present the Head or the Feet, we are to receive it after both Manners, and not expose the Mother to Pains that can be of no Service, nor the Infant to the Violences which must be offered it, in order to make it change its Situation.

As soon as the Waters are pierced, and the first Flow is over, the Man-midwife, who must have no Rings on his Fingers, nor his Nails too long, having anointed his Hand with Oil or Butter, must introduce it into the Vagina. If he finds the internal Orifice not enough dilated to pass his Hand up to the Infant, he must try gently with two or three Fingers, to dilate it. If the Feet present, he must grasp them, and, drawing them without Violence, oblige the rest of the Parts to follow: And so is the Woman happily delivered, and in a very little Time.

If one Foot only presents, we are to bring it down into the Vagina, and examine whether it be the right or the left Foot; in order to guide the Hand along the Inside of the Leg which is held; the more easily to find out the other; which is no difficult Matter to a skilful Practitioner, who, when he has got hold of one Foot, soon finds the other. Having got hold of both, he must join them together, and, wrapping them in a warm Cloth, draw them gently out, with the rest of the Body, which is obliged to follow them.

Mauriceau advises us to take Care, that the two Feet we hold, do not belong to two different Children; but as it is impossible for such a Case to happen, that Caution is unnecessary. When there are two Children, they are inclosed each in its particular Membrane, which never break together, but one after another, so that four Feet cannot present at one Time. Of the two Children, one is at the Passage, the other at the Bottom of the Uterus, which hinders them from coming out together. Besides, if one had a Mind to join the right Foot of one Infant, with the left Foot of another, he would find it impossible, for the Distance that there is between them. So that he might have spared his Pains in making an Observation, which can never exist but in Idea, and not in reality.

Deventer, and Heister, however, in this Point, are of a different Opinion, and agree with Mauriceau, that two Feet, belonging to different Children, may possibly present together.

They who have the Precaution to tie the first Foot of the Child which comes out with a Ribbon, which they fasten to the Mother's Thigh, for fear it should retire, while they are employed in finding the second, and so put them to the Trouble of searching for it a second Time, doubtless believe that it is in the Power of the Child to draw back its Foot: But they are mistaken; for the Mother who presses downwards, with-

out ceasing, rather constrains the Infant to advance in its Way out, than suffers it to replace itself within. So here is another needless Precaution, that can never be of any Service.

In drawing gently the Foot that is come out, the other often presents itself; but if it delays ever so little, it must be searched for, which is done by sliding the Hand along the Thigh of the Infant up to its Buttock, where you are sure to find it. The two Feet being brought out, and joined together, are to be wrapped in a dry linnen Cloth, to prevent the Moisture with which they are covered, from making them slip out of the Hands of the Operator, in the Time of the Operation.

The Child being thus extracted beyond the Hips, the Operator stops a while, in order to disengage the Arms, one after the other; and to lay them at Length by the Body. When this is done, he renews his Efforts, and pulls with more Force, because of the Shoulders, which, being the most bulky Part of the Body, are brought away with most Difficulty. When the Shoulders are passed, the Head follows easily, except it be of an extraordinary Bigness; and in order to prevent its being stopped, the Operator must call upon the Mother to redouble her Efforts, that while he is drawing on one Hand, and the Mother bearing down on the other, the Head may the more easily be extricated, and follow the rest of the Body.

Mauriceau would not have one Arm of the Child left for a Conductor and Stay to the Neck of the Infant; without bringing it down, though it is the Practice of many other Men-midwives, who say it succeeds very well. He says, that the Arm which is left, causing the Head to bend to one Side, hinders it from coming in a strait Line; and so may cause it to stick at the Os Pubis. But, in Answer to this, they say, there needs no more than to leave both Arms, for then the Head will be right, and its Bulk not the more augmented, because they are placed at the Sides of the Head, on the Temples, where it is flat. But whether the Arms are laid along by the Sides, or left in their Situation by the Sides of the Head, it makes no material Difference, and can do no Manner of Prejudice.

When the Feet of the Child come foremost, it is a Sign that it did not turn in the Beginning of the ninth Month, like all other Children, but that it presents in the same Posture it always kept in the Womb. If it lies on its Back, with its Face upwards, which is easily known by the Feet, which are brought out, the Operator must take a great deal of Care not to extract it in this Situation, because, the Face lying upwards, the Chin would be sure to catch upon the Os Pubis, which would extremely perplex the Operation. He must, therefore, in extracting the Child, gradually turn it, as it comes, on its Face, with its Back upwards, which is the most convenient Situation for the Birth, and where it runs least Hazard of being stopped by the Bones which surround the Passage.

The Child thus turned with its Face downwards, is brought away without much Difficulty, provided the Bulk of the Head be proportioned to that of the Body. But when the Head is of an extraordinary Size, it has the Misfortune to be stopped by the Bones of the Pelvis; which being incapable of giving Way, will not suffer it to pass. When this happens, you must not be too violent in pulling the Body of the Child, for fear of separating it from the Head, as it too often happens. In this Case the Operator is to give the Feet to be held by an Assistant; with a Charge not to draw before he orders it. Then, the Back of his left Hand being turned towards the Coccyx, he slips one or two Fingers into the Mouth of the Child, to press down its Chin; and with his right Hand grasping the Neck near the Occiput, he draws gently, with the Assistance of the Person who holds the Feet, and has Directions to draw in Conjunction with him. And thus the Child is born, without running the Risque of losing its Head.

If we ought to take Care of drawing the Child away with too much Violence, we are, at the same Time, to avoid leaving it too long in that Situation, because it would infallibly die if it remained there above half a Quarter of an Hour. It wants Respiration, in order to maintain the Circulation of the Blood, and Respiration cannot be performed, while the Head is thus encumbered. Nor can the Circulation between the Mother and Child be carried on, because the Cord, by Means of which it is preserved, is pressed between the Head of the Child, and the Bones that surround it. Since then, neither of these can be performed, it must unavoidably perish. Such a Misfortune happened in 1695, to a Male Infant of the Duke of Savoy; who had continued too long in that Situation, by the Fault of the Mid-wife. Upon this Account, two Years afterwards, when the Duchesse of Savoy, now Queen of Sicily, was with Child, the Duke, her Husband, now King, sent his chief Surgeon to Paris, to learn the Art of Midwifery, who afterwards returned to Turin, and delivered the Queen of all the Children she has had, who did very well. *Dionis des Accouch.*

Deventer, a very good Judge of these Affairs, agrees pretty much with Dionis as to the Manner of treating these Cases. He is very particular in directing, that one Foot should not be suffered to sink too far into the Passage, but that as soon as ever the Waters break, if one Foot presents it should be kept back;

mean Time the Operator must slide his Hand along the Inside of the Leg which presents, to which he is directed by the great Toe, and by this means he is infallibly directed to the other Leg, if he does not meet with it in the Way; this he is to join with the other, and bring both together out of the Passage.

But if it happens, that the Leg is already sunk too deep into the Passage, he advises to place the Woman with her Head considerably lower than her Hips, that the Uterus together with the Child may recede a little, and then to return the protruded Leg, or at least the Knee, that there may be more Room to search for the other Leg, and bring both away together in the Manner directed above.

This Author is utterly against bringing down either one or both Arms, but recommends it strongly to bring the Child away without that Trouble to the Mother, or Operator, and Danger to the Child, who must necessarily remain longer confined in the Passage. And gives repeated Assurances that leaving the Arms to come away lying on each Side the Head, can be of no ill Consequence.

At the Time the Head is extracting, all Authors agree with Deventer in advising the Mother to bear down forcibly, whether she has Pains, or not.

The grand Point wherein Authors upon this Subject disagree, is with Respect to bringing down the Arms, when the Child is advanced as far as the Shoulders. La Motte, Giffard, and Chapman advise it. Dionis, as we have seen, leaves the Thing indifferent, and Deventer is utterly against it. Hence we must conclude, that all these Authors have succeeded very well in their different Ways of delivering Women under these Circumstances. And if so, that Method which gives a Woman the least Pain, the Operator least Trouble, and the least endangers the Child, is to be preferred; and therefore Deventer's Method of leaving the Arms of the Child to come away with the Head, must be the best.

There is not much Difficulty in Births of this Sort, till the Child is extracted as far as the Head, but it is sometimes subject to stick a little there, some Management is therefore necessary to bring the Head away expeditiously, otherwise, as Dionis observes, the Circulation by the Intervention of the Umbilical Vessels being hindered, the Child must perish. The following Observations will set all Circumstances relating to Labours of this Sort, in an intelligible Light, and either confirm, or illustrate the Doctrine laid down by Dionis as above.

When the Head sticks, and does not come away readily, one, or two Fingers are to be introduced into the Child's Mouth, whilst with the other Hand the Operator lays hold of the back Part of the Neck, then by acting with each Hand alternately, and sometimes with both together, the Head is generally readily extricated. *La Motte.*

As soon as the Child is advanced as far as the Buttocks, if the Toes are turned towards the Mother's Belly, the Body as it is extracted must be turned by Degrees in such a Manner, that the Toes may be towards the Anus, and consequently the Heels towards the Belly of the Mother, otherwise the Chin will catch upon the Os Pubis, and endanger the Child and the Mother too. In this Case a greater Force is requisite to bring away the Child, and Pulling too hard may separate the Head from the Body, and cause a great deal of Trouble in bringing away the Head afterwards. *La Motte.*

When this Precaution has been neglected, and the Child is advanced as far as the Chin, where it sticks, being intercepted by the Os Pubis, the Method is to introduce the Fingers of one Hand betwixt the back Part of the Head, and Os Coccygis, and with these to thrust back a little the hinder Part of the Head, mean Time, one or two Fingers of the other Hand are to be introduced betwixt the Os Pubis and Chin, till they can be got into the Mouth of the Child; then turning the Head a little on one Side, and acting sometimes with one Hand and sometimes with the other, and sometimes with both together, as Occasion requires, the Head is to be freed from its Confinement, without endangering its Separation from the Body, which by pulling hard without these Cautions would probably be effected. *La Motte.*

The Reasonableness of this Method will appear very plain to whoever considers the Figure, and present Situation of the Head. When the Chin is thus fixed on the Os Pubis, the back Part of the Head is thrown towards the Os Sacrum, and this the more, the greater Force is used in drawing the Child in order to bring it away, inasmuch that it lies in some Measure across the Passage, with the Chin at the Os Pubis, and the Crown of the Head pointing towards the Os Sacrum; in this Situation then it is next to impossible for it to come away, unless the Passage is very large. But when the back Part of the Head is thrust from the Os Sacrum towards the Bottom of the Uterus, the Chin approaches nearer the Neck, and consequently is more likely to be brought off the Os Pubis, which obstructs it. On the contrary, when the Chin is made to approach the Neck, the Crown of the Head is made to recede from the Os Sacrum. So that each Hand in this Way of acting, recommended by La Motte, assists the other in the best Manner that can be conceived,

and gives them a Command of the Head to turn it a little on one Side, that the Child may be extricated from this dangerous Situation.

If both Feet cannot be found without Difficulty, the Child may be extracted by one; however, in this Case, Care must be taken, not to draw one Foot with the same Violence as both would bear, for Fear of stretching the Ligaments, and laming the Child for ever. *La Motte.*

La Motte observes in another Place, that before we attempt to bring away a Child by one Leg only, we should be very sure that the Child can come in that Posture, I suppose he means, that the Passage is large enough, in Proportion to the Size of the Child; for, he says, when the Child is engaged in the Passage to a certain Point, it is not in the Midwife's Power to bring it any other Way, that is, to get the other Foot.

The late Writers on the Subject of Midwifery of our own Country, I mean Chapman, and Giffard, are of Opinion that both Feet should be brought out, provided it can be done conveniently; but if they can get one Foot, they are in no farther Pain about the other than to assure themselves that it is bent forwards, towards the Belly; and then wrapping a soft warm Cloth about the Leg, they readily bring the Child away by that only; especially when the Passage is tolerably large, the Woman has had a Child before; and the Infant is of a moderate Size.

This Sort of Birth is of Importance enough to deserve a particular Attention, because all Births whatever, where the Child presents any Part but the Head, must be reduced to this, for the Method of turning a Child, which presents in a wrong Posture, in such a Manner as to bring the Head to the Orifice, as it ought to be naturally, is now exploded by the best Authors, and Practitioners, as more inconvenient and dangerous to the Mother and Child, as well as troublesome to the Operator. Deventer is even of Opinion, that in Cases where the Head presents, but the Birth is retarded by a bad Position of the Womb, it would be the best Way to bring the Child away directly by the Feet, without waiting to reduce the Womb to its natural Situation, which is not done without much Difficulty and Pain. Heister, in this Case, agrees with Deventer, provided the Womb, and with it the Head of the Child, cannot immediately be reduced to the natural Position. By a bad Position of the Womb, I mean, when it inclines too much, either forwards, or backwards, or to either Side, for then the Orifice, instead of answering directly to the Passage, is thrown either upon the Os Sacrum, Os Pubis, or the Bones which form the Sides of the Pelvis, which obstruct the Birth, and render the Pains, let them be never so strong, of no Effect.

I must not omit taking Notice, that Heister recommends another Method of extricating the Head, when the Face is turned towards the Os Sacrum. This Author is apprehensive, that the Tenderness of the lower Jaw would render it liable to be broke or dislocated, when the Fingers of the Operator are placed in the Mouth. He therefore advises to introduce the Hand far enough to place two Fingers one on each Side of the Child's Nose, and then with this Hand to press gently towards the Intestinum Rectum, in order to make more Room for the Egress of the Child.

He also advises, when the Face of the Child is turned towards the Mother's Belly, to place the Fingers on each Side of the Nose, instead of introducing them into the Mouth. Whilst the Operator is in this Manner endeavouring to bring the Head away, an Assistant should draw the Child gently, that by these united Efforts the Birth may be expedited.

When the Body of the Child is turned in such a Manner, during the Extraction, that the Toes point downwards, by which it should appear that the Face is turned towards the Os Sacrum of the Mother, it is possible, however, that the Neck may be twisted in such a Manner, that the Face may point towards the Mother's Belly, and then the Chin will catch on the Os Pubis. This Case is not to be discovered otherwise than by Feeling, and when the Operator is certain of it, he must conduct himself by the Directions given above.

It is a general Rule, that the Force with which a Child is drawn when it comes with the Feet foremost, should not be directed in a right Line from the Passage, but inclining somewhat downwards towards the Os Coccygis.

A few Cases will be sufficient to illustrate these Rules.

CASE I. from LA MOTTE.

In September, 1693, I was called to the Wife of a Carpenter. I found the Midwife pulling with all her Force the Child, who had presented the Feet, and was extracted as far as the Neck, but the Chin appeared to be fixed upon the Os Pubis. I immediately introduced one Hand betwixt the Os Pubis and Face of the Child, who had been dead a considerable Time, and got a Finger into the Mouth, and with the other Hand, which I introduced betwixt the Rectum and back Part of the Head, I pushed the Head a little backwards. By Means of my two Hands placed in this Manner, I had Command enough of the Head to turn it a little on one Side; and this gave me Room to introduce my Fingers somewhat farther,

ALARIS, or **ALIFORMIS**. *In the Shape or Form of a Wing.*

ALARTAR. *Æs Ustum. Burnt Brass. Rulandus.*

ALATAN. *Litharge of Lead. Rulandus.*

ALATERNUS. This is the *Alaternus*, Offic. Chab. 43. Park. Parad. 603. *Alaternus* 2. Clusio. J. B. 1. 542. *Alaternus major & minor*, Raii Hist. 2. 1608. Park. Theat. 1445. *Spina Burgi Monspelienfium*, ejusd. *Alaternus Plinii*, & *humilior*, Ger. 1212. Emac. 1398. *Alaternus*, sive *Philyca elatior & humilior*, C. Bauhini. Pluk. Almag. 12. *Alaternus* 1. Clusii & *minoris folio*, Tourn. Inst. 595. Boerh. Ind. A. 2. 213. *Alaternus prior & altera*, Clus. Hisp. 56. Elem. Bot. 468. *Philyca elatior & humilior*, C. B. Pin. 476. Jonsf. Dendr. 261. EVERGREEN PRIVET.

It is a small Shrub, about the Bigness of the Privet, covered with a black Bark, almost like that of the Cherry-tree. Its Wood is of a light Yellow, the Leaves oblong towards the Top, moderately large, firm, set all round with small Prickles, disorderly placed, resembling those of the Philyrea, but disposed in alternate Order on the Branches, whence it takes the Name *Alaternus*, whereas the Leaves of the Philyrea grow in Pairs, Side by Side. The Flowers are small, and stand many together. They are shaped like a Funnel, or Top of a Tent, and cut Star-like into five Points, or Rays, of a white Colour, odoriferous, succeeded by Berries, about the Bigness of Elder-berries, clustered like Grapes, soft, juicy, black when they are ripe, each inclosing three Seeds joined together, rounded on the Back, and flattened on the Sides where they touch. The Roots run a great Way in the Earth. It grows in the Hedges, and is cultivated in Gardens. It contains much Oil and Phlegm, and but little Salt. *Lemery des Drogues.*

The Plant is of a deterfivè, astringent, and cooling Nature, and is used in Gargarisms for Inflammations of the Mouth, and for the Quinsey. *Boerhaave. Lemery.*

The Fruit moderately binds the Belly. *Dale.*

Clusius confesses, that he knew no Use of either of the two Kinds of his *Alaternus*, but that he was assured by the Portuguese, that their Fishermen used to dye their Nets of a reddish Colour, with a Decoction of the Bark in Water; and that Dyers used the Decoction of the Chips of the Wood, which is of a pale Colour, to give a dark Blue. *Raii Hist. Plant.*

Another Species of the *Alaternus* is the

CELASTRUS, Offic. Jonsf. Dendr. 262. *Celastrus Theophrasti*, C. B. Pin. 477. Ger. Emac. 1600. Park. Theat. 1448. *Celastrus Theophrasti Clusio*, Parad. 603. *Alaternus latifolia*, *Celastrus dicta*, Herm. Cat. Hort. Lugd. Bat. 11. Raii Hist. 2. 1608. *Alaternus Hispanicus*, *Celastrus dicta*, Boerh. Ind. A. 2. 213. THE STAFF-TREE. *Dale.*

It grows to above a Man's Stature, with a firm and hard Body, which runs out into many Branches, that are covered with a green Bark while young, but blackish after a Year. The Leaves are numerous, always stand opposite, and are thick set, of a deep Green on the upper Face, but fainter on the lower, perennial, that is, never falling off, till displaced by new ones, which is the Case of most Evergreens. The Leaves are of a shining Smoothness, and no larger than those of the *Alaternus*, but most of them smaller, especially those of a Year old, which cover the lower Part of the Sprays, not jagged, especially the young ones, which, though they seem to have somewhat resembling Jaggs, cannot be called jagged; they are of a bitterish Taste. At the utmost Part of the young Sprays, among the Leaves, grow Pedicles, which bear five or six small Flowers, consisting generally of four or five small Leaves, of a greenish Yellow, and a sweet Smell, disposed in Clusters like the Flowers of the Mastick-tree, not expanded in the Form of an Umbrella, like those of the Wild Bay, or Elder. They open very late, and not before the latter End of Autumn, or Beginning of Winter, and sometimes not before the mild Air of the Spring breathes on it. So far Clusius; to which P. Paauwius adds, This Tree in the Leyden Garden, 1610, in the Month of June, began to shew the Rudiments of a Fruit, producing a short Pedicle, on which grew a Berry, about the Size of a Myrtle-berry. While growing it was green, but red at its full Growth, which turned by Degrees from a light Red to a coral Colour, extremely like the Berry of Sparrow-grass, I mean the lesser Sort. It kept up this lovely Colour to the Beginning of August, when its Skin, or Superficies, began to shrivel; and at the same Time to change Colour, and from a round to become of an oblong Figure, turning first of a dusky Colour, which grew at last to a Coal Black. After it fell off, we discovered in its Inside one single oblong, and in some Sort triangular, Seed, very like the Kernels of Grapes, and breaking the Shell, which was hard and somewhat stony, we found but one Kernel, covered with a thin Membrane, or Skin, of a Saffron Colour, under which lay the Pulp; hard, whitish, and like that of an Hasle-nut. *Raii Hist. Plant.*

A third Species of the *Alaternus* is the

Cassina Offic. C. B. Pin. 170. *Herba Cassiana famem stimule retardans*, J. B. 3. 631. Chab. 655. *Cassina vera Florida-narum*, *Arbuscula baccifera Alaterni ferme facie, foliis alternatim*

Jitis, tetrapyrene. Pluk. Mant. 40. Phytog. Tab. 376. f. 21. *Apalachine sive Cassine*, Ind. Med. 11. *Alaternoides Africana Lauri serrata folio*, Comm. Rar. Exot. 1. 61. *CASSINY. Dale.*

It grows in Carolina. The Leaves are about an Inch long and half as wide, shaped like the Leaves of Sena, blackish when dried, shining in the upper Part, but greener underneath, of no Smell, but a Taste somewhat aromatic.

It is accounted a very good Medicine in the Small-Pox, restraining the immoderate Fermentation of the Blood, without putting too great a Check upon the expulsive Faculty. It promotes Expectoration, preserves the Lungs, and keeps off the Small-Pox from the Head and Throat. *Dale Pharmac.*

The fourth Species of the *Alaternus* taken Notice of by Dale is the

Perygua, Offic. Marl. Obs. Mont. Exot. 8. *Cassine vera perquam similis Arbuscula Phyllireæ Foliis antagonistic ex Provincia Carolinensis*, Pluk. Mant. 40. Phytog. 381. f. 3. THE CASSIO-BERRY BUSH.

It is found in Carolina. The Fragments of the dried Leaves, and the Powder of the Stalks, are used.

Sometimes it purges, at other Times excites Vomiting, or promotes insensible Perspiration, still acting as Nature inclines. It is accounted an excellent Specific in the Diabetes, and several Histories of Cures done by it in that Distemper are related by Marloe. A Tea made of the Herb is good in the Nephritic Colic.

Of what Plant the *Perigua* are Fragments, is a Question not easy to be determined, nor can the Opinions of learned Botanists be well reconciled. Some take it for a Species of *Alaternus*, whose Authority I have followed in placing it here. Others put a Question, whether it be the *Peragua*. *Hort. Mal. Tom. 2.* To me it seems most likely to be the Plant of which Du Biscaï gives an Account, in his Voyage on the Rio de la Plata, by the Name of the Plant of Paraguay, which the Natives use as a Preservative against noxious and mineral Vapours, and also for a Vomit on Occasion. Query whether the Fragments of Plants of late imported, under the Name of PARAGUAY-TREE, be the same with the forementioned *Perygua* of Marloe. *Dale Pharmacologia.*

Miller enumerates six Species of *Alaternus*.

ALATERNOIDES [from *Alaternus* and *Eidos* Gr. Form or Shape] a Sort of *Alaternus*.

This differs from the *Alaternus* in having three Seeds joined together, in the manner of Tithymallus (or Spurge) whereas the *Alaternus* has three Seeds inclosed with one common Covering, and appears to be a single Berry till it is opened.

Miller enumerates three Species of *Alaternoides*.

ALATI. Those are called so whose Scapulæ, or Shoulder-blades are very prominent, and stand like Wings. Those who have such a Conformation are esteemed very subject to a Consumption.

ALATI PROCESSUS, or **ALARES**, are Processes of the Os *Sphenoides*. See SPHENOIDES.

ALAUDA, a Gallic Word for *Galerita*, a Lark. This Bird is a most effectual Remedy in all Pains of the Colon and other Intestines, both for Men and Cattle, whether it be roasted and eaten, or burnt to Ashes, and three Spoonfuls thereof carefully pulverized given in warm Water for three Days together.

It is called by the Greeks *Kopidantes*, and is to be burnt Feathers and all, in an earthen Pot plaistered over, and set in a Furnace, till it may be reduced to Powder. *Marcellus Empiricus. Cap. 29.*

The Lark eaten with the Broth made of it cures the Colic; but it ought to be frequently used. *Paulus Ægineta. Lib. 7. C. 3.*

The Lark is a little grey Bird very well known, celebrated for its agreeable Singing early in the Morning, when it is fine Weather; she lays her Eggs in May, July, and in August; her young ones are ready to fly in ten or twelve Days.

There are two Sorts of Larks, one that has a Crest, and another without one; the last fly in Flocks. The Lark is esteemed the Harbinger of the Spring; that with a Crest lives more on the Ground than the other; they both eat Wheat, Worms, and Pismires; they keep some in Cages; when young they are a delicious Meat; their Flesh is firm, brown, and of a good Juice easy to be digested; those are most eligible which are very tender; and well fed.

The Heart and the Blood of Larks are good for the windy Colic, and to extricate Gravel and Phlegm from the Kidnies and Bladder.

Schroder says the fresh Blood, taken in sharp Vinegar, or warm Wine, effectually relieves the Stone and Gravel.

They say that the Name *Alauda* is taken from the antient Gauls, and that Julius Cæsar having raised Soldiers in France they were called by the Name of Larks, because the Figure of their Head-piece resembled a Lark with a Crest. *Lemery de Drogues.*

When the Lark is old, her Flesh is hard, dry, and difficult of Digestion, and the Juice bad.

It contains much Oil and volatile S. It.

It agrees with any Age and Constitution, especially in Autumn when this Bird is fatter and more delicious, than at any other Time of the Year.

The Lark is a delicious Bird, and much esteemed for the Goodness of its Taste, and the happy Effects it produces. As it is much upon the Wing its Perspiration is abundant, and consequently it must contain but a few gross Humours, and many volatile and exalted Principles. *Lemery on Foods.*

As the Lark uses much Exercise, its volatile Salts must be much exalted, and its Juices alcalescent, especially as it feeds sometimes on Insects.

The crested Lark is thus distinguished, *Galerita*, Offic. Bellon. des Oyse. 268. *Alauda cristata*, Schrod. 5. 314. Aldrov. Ornith. 2. 841. Mer. Pin. 176. Jonf. de Avib. 70. *Alauda cristata, albicans*, Gen. de Avib. 72. *Alaudas cristata major*, Raii Synop. A. 69. *Alauda cristata, Galerita*, Ejusd. Ornith. 208. *Alauda cristata, Vienna Austria visa & descripta*, Will. Ornith. 151. *Alauda, Galerita cassina, cristata*, Charlt. Exer. 88.

The Sky Lark is thus named by Authors, *Alauda*, Offic. Mer. Pin. 176. *Alauda non cristata*, Schrod. 5. 314. Johnf. de Avib. 70. Aldrov. Ornith. 2. 844. Bellon. des Oyse, 269. *Alauda vulgaris*, Raii Ornith. 203. Ejusd. Synop. A. 69. Will. Ornith. 149. *Alauda altera*, Gefn. de Avibus.

ALAUROT. Nitre. *Rulandus.*

ALBA ANIMALIA. White Animals are almost universally weaker than black ones, which is evident from comparing their Flesh together, that of the latter being more savoury. *Act. Tetr. 1. Serm. 2. Cap. 88.*

In every Species of Seeds, Roots, or Juices, also some Indication of the Temperament may be taken from the Colour. For Instance, an Onion, a Squill, and Wine, the whiter they are, the less Heat they have in them; but the deep, or pale Yellow, carry the most Heat. The same is observable in Wheat, Kidney-Beans, and Chiches; as also in the Roots of Iris, Daffodil, and many others; and universally the pale or bright Yellow, and the Ruffet, are hotter than the White. *Act. Tetr. 1. Serm. 1.*

ALBA TERRA. David Lagneus, in the *Theatrum Chymicum*, Vol. 4. Page 721. tells us, that the Matter of the Philosophers Stone is Quicksilver and Sulphur, and that this Composition is called TERRA ALBA.

ALBA VITILIGO. See VITILIGO.

ALBADARA. It signifies in Arabic the Sefamoide Bone of the first Joint of the great Toe, which is about the Size of a small Pea. Its Use is to that Joint much the same as the Patella is to that of the Knee.

The Magicians are said to attribute extraordinary Virtues to this Bone. Some of the Jewish Rabbies relate strange Stories of a little Bone, which is called *Luz*, and which they say is found betwixt the last Vertebra of the Loins, and the Os Sacrum. As there is no such Bone to be found in that Place, perhaps they may mean this Sefamoide Bone, and may have borrowed some fabulous Accounts of it from the Magicians. They relate, that this Bone is not to be destroyed by either Fire or Water; and that God will make Use of this Bone at the last Day, to raise the Dead, making the Body to grow again from it, as a Plant does from the Seed.

But as there is something very remarkable in this Bone, with Respect to Physic, without recurring to Jewish Fables, and Magic Tales, I shall relate what I have heard and observed on this Subject.

About twenty Years ago, there was a Cure performed by a Physician, who then lived at Oxford, which was much talked of, and, I believe, most Gentlemen of the Profession who studied there, about that Time, may remember it. A young Lady had been subject to frequent Fits of an odd Kind, against which all Remedies which were tried had proved ineffectual. At last, a Physician was consulted, who was of Opinion, that these extraordinary Fits were caused by a Dislocation of the Bone, which is the Subject of this Article, and that an Amputation of the great Toe would cure them. The Lady pursued his Advice, the Toe was cut-off, and she recovered perfectly. I neither knew the Lady nor Physician; but the Fact was well known at that Time, and I never heard it disputed. The following Case in which I was concerned is a farther Evidence, that such Cases may, and actually do sometimes happen, though they have been generally overlooked by Medicinal Writers.

In the Summer of 1737, I was called to one Mr. Fitter, a substantial Farmer of Henwood-Hall, near Solihull in Warwickshire. I found him sitting on the Side of his Bed, where he told me he had been all that Day, and the preceding Night, without daring to move, because he was sure of having a Fit, the Moment he moved his Foot, the Apprehensions of which gave him great Terror. He said, that a few Days before, in crossing a Waggon Road in Haste, where the Ruts were deep, and the Sides of them very hard, he stumbled at a Clod, and hurt the great Toe of his left Foot very much; that in a few Minutes he fell into a Fit, and that whenever he moved that Toe, which he never did without a great deal of Pain, he was sure to fall into another of the same Sort. These Fits much re-

sembled those of the Epileptic Kind, except that no Froth was discharged at the Mouth, and that the injured Foot first began to be convulsed, then the Leg, and from thence a very uneasy Sensation ascended to his Head, and then the Convulsions began to be universal.

Upon Examination, I found he had never been subject to any Disorder like Convulsions before. He was at this Time upwards of fifty. Before this Accident, he was in all Appearance a very hearty Man, and had now no Complaints of any Kind, except the above-mentioned.

I do not recollect exactly what I directed for him; but I remember nothing did him the least Service, insomuch that in a Week, or thereabouts, he died, perhaps as much by the Neglect of those about him, as by his Distemper; for, as the Accident happened in the very busiest Time of Harvest, he had not the Attendance which a Case of this Importance merited.

I could never, with all my Intreaties, get Leave to examine the Toe, with the Attention and Exactness it deserved, for he was so excessively afraid of having it touched, or moved, that he was almost in Agonies, whenever I attempted to move my Hand towards it. I should have solicited for Liberty to dissect the Toe, if an Opportunity had presented, but he had been buried some Days, before I heard of his Death.

Hippocrates (*de Morbis Mulierum*, L. 2.) has a most exact Description of the Sort of Fits this Patient was affected with, which he attributes to Hysterics, or, in his Phrase, to the Uterus; this I shall transcribe from him, in order to give a better Idea of this Patient's Case: *Ἡ ἐστὶν τὰ σκίλα τῶ ἀπὸ τῆς μήτρας, γυναικὸς ὡδὶ. Ὅτι μεγάλοι δάκτυλοι τῶν ποδῶν σπένται ὑπὸ τῶν θυγῶν, καὶ ὅδῳ ἔχουσιν τὰ σκίλα καὶ τὸ μέν, καὶ ἔχουσιν καὶ σπένται τὰ ἀπὸ τὸ μηρὸν πύρα. Ἡ δὲ ἀναυδὸς γίνεταί ἐκ αὐτῆς, τὰ σκίλα ψυχρὰ εὐραὶ αὐτῆς, καὶ τὰ γυναικῶν καὶ τὰς χεῖρας, καὶ ἡ καρδία πάλιν καὶ βρύχει, καὶ ἰδρὸς πλουτὺς, καὶ τ' ἄλλα ὅσα ὑπὸ τῆς νύκτος ἐκδηλοῦνται ἀσάφως.*

ALBAGIAZI. The Arabic Name for the Os Sacrum. *Castellus from Fallopius.*

ALBANI. *Rulandus* explains this *Lapis Salis Laeti*, which is not very intelligible. *Johnson*, and *Castellus*, as is usual with them, in Case of Difficulty, take no Notice of it. There is a Kind of Salt to be procured from Milk, which crystallizes in the Form of a Cake, the Discovery of this is attributed to *Ludovicus Teffi*. It is possible that this Salt may be meant by *Albani*; and that *Ludovicus Teffi* might take the Manner of preparing it from some chymical Author that preceded him.

ALBANUM. Salt of Urine. *Rulandus.*

ALBARA. A Species of Leprosy. *Castellus*. See VITILIGO.

It signifies also the White Poplar. *Brunfelsius.*

ALBARAS. *Arsenic.* *Rulandus.*

Blancard explains *Albaras alba*, by *Leuce*, the white Leprosy; and *Albaras nigra*, by *Lepa Græcorum*.

ALBATIO, ALBIFICATIO, and DEALBATIO, are alchemical Terms, not easily understood. They seem to mean Reducing the baser Metals to a Whiteness, in order for their Transmutation into some of the more noble Sorts.

They also signify the Calcination of Metals, or Minerals, to a Whiteness, without any View to Alchemy.

ALBEDO. Is the Whiteness procured by Albification. Or Whiteness of any Kind.

In Proportion as the Flesh of Animals alters from its Whiteness, so much it loses of the Goodness of its Juices. *Aëtuarius de Spir. Anim. Cap. 7.*

Of Whiteness, with respect to Urine, there are four Kinds, viz. the Crystalline, the Snowy, that of Lime, and the Limpid, like that of fair Water. For Ice, Crystal, Snow, Lime, and Water, have a Whiteness, but not in the highest Degree. The Colour of Milk comes short of the highest Degree of Whiteness, but exceeds the aqueous and crystalline. Then the Whiteness of the glaucous Colour falls as much short of that of Milk, as it exceeds the *χαρδύς*, *Charopos*: For the Glaucous is perspicuous like a clear Horn, or the Cornea Tunica of the Eye; but the *Charopos* [Latin *Ravus*] is like the whitish Hairs of Camels; or the Colour of the Onyx Stone. *Theoph. de Urinis Cap. 5. Aëtuarius de Urinis Cap. 8.*

ALBERAS. The Arabic Name for the *Staphisagria*. *Schroder.*

ALBERICK. *Rulandus* explains this *Album Eris*. The German Word signifies *White Ore*.

ALBESTON. Quick-Lime. *Rulandus.*

ALBETAD. Galbanum. *Rulandus.*

ALBI. Both *Rulandus* and *Johnson* explain this by *Sublimari*.

ALBIFICATIO. See ALBATIO.

ALBINUM. A Name of the *Gnaphalium marinum*. SEA CUDWEED or COTTON-WEED. See GNAPHALIUM.

ALBIR. Pitch got from the Bark of the *Taxus*, Yew. *Johnson.*

ALBOR. Urine. *Rulandus.*

ALBORA. A compound Species of Itch, or rather Leprosy, of which *Paracelsus* gives the following Account:

I say that *Albora* is a Complication of three Things, the Morpew, the Serpigo, and the Leprosy.

When

When several Diseases of different Origins meet together in one Center, there is generated a new Disease under a new Name.

THE SIGNS.

When Cicatrices appear in the Face, like the Serpigo, and then turn to small Blisters of the Nature of Morpew, for which there is no Name, I say, the Patient has the *Albora*.

THE TERM.

It terminates, without any Ulceration, in extremely foetid Evacuations from the Mouth and Nostrils. The Distemper is known only by its outward Signs; it takes its Seat too in the Root of the Tongue.

A CAUTION.

Avoid all internal Medicines, and strong corrosive Waters.

THE CURE.

Take of Tin, Lead, Silver, each a Dram; distilled Water of the Whites of Eggs, half a Pint; mix them together. The boiled Whites of Eggs are to be distilled, and the Water put to the Filings of the said Metals, and the *Albora* is to be washed with the same. *Paracelsus de Apostematibus*, Cap. 42.

ALBORCA. *Mercury*. *Johnson*.

ALBOT. *A Crucible*. *Rulandus*. *Johnson*.

ALBOTAT. *Cerufs*. *Rulandus*. *Johnson* calls it ALBOTAR. It is also called ALFIDAS.

ALBOTIM. *Turpentine*. *Rulandus*. According to the same Author it is also called ALBOTAI.

ALBOTIS. The same as TERMINTHUS, which See.

ALBUCASIS. An Arabian Author, known also by the Names of *Albucasis*, *Albuchasius*, *Buchasis*, *Bulcasius Galaf*, *Alfaharavius*, and *Azaravius*, according to Fabricius, who places him in the eleventh Century. Hence it appears, that Dr. Friend is not the only Author, nor the first who acknowledged *Alfaharavius* for the same as *Albucasis*. He is esteemed an excellent Surgeon. *Wolf*. *Justus* places him about the Year 1085. Dr. Friend says a great deal about his Practice, which does not belong to this Article. What he says, however, concerning his Person, Character, and Writings, I shall insert.

Alfaharavius is an Author never mentioned by any other Arabian Physician, and scarce known in Europe, to any but *Matthæus de Gradibus* (who died in 1460.) till *P. Ricius's* Translation of him (a very bad one) appeared in 1519, and this itself never seen by *Gesner*. The Translator gives him a very great Encomium, and says, he is a very clear Writer, succinct, and at the same Time very comprehensive; and, in his Opinion, inferior to none, except *Hippocrates*, and his Interpreter, *Galen*. He compiled a Work, called *Al-Tasrif*, or a *Method of Practice*, divided into thirty-two Treatises, in which he is supposed by some to be excellent for the diagnostic Part, and describing the Symptoms of Diseases. The Book, indeed, is very methodically writ, and, without doubt, deserves a good Character: But then, I must observe, that the greatest Part of this Work is almost exactly the same with what we may read in *Rhazes*: For Instance, the 26th Tract, about the Distempers incident to Children; the 28th, concerning arthritic Disorders; the 30th, which treats of mortiferous Medicines, are all, in a Manner, transcribed from that Author. More particularly in his Account of the Small-Pox, in the 31st Treatise, he copies almost every Word of what *Rhazes* had written upon the Pestilence; and so little varies from him, that he retains the very same Divisions, and even Titles of the Chapters: Nay, he mentions the same extraordinary Virtue of a Medicine, which, though nine Pusules are come out, will prevent a tenth; though he describes the Medicine itself a little differently.

In perusing this Author, I observed, that he refers to a Book, which contained the Precepts and Practice of Surgery: This he does very often, particularly p. 80, 81, 88, 97, 99, 107, 117, 118, 129, 123, 124, 125, 127, &c. I compared these Passages with *Albucasis*, as he is commonly called the only Arabian, who has left us any separate Treatise of surgical Operations; and I had the Satisfaction to see, that every Case in Surgery, as mentioned by *Alfaharavius*, was treated of by him. I desired the Favour of Mr. Gagnier, who has very great Skill in the Oriental Languages, to enquire whether the Arabic Original of *Albucasis* could be found in the Bodleian Library. Upon searching, he met with one Manuscript, in Archbishop Marsh's Collection, No. 54. with this Title (translated into Latin thus) *Traſtatus x libri Zaharavi dictus operatio manſis (id est) Chirurgia & ars medica, circa cauterizationem, & disſectionem & commiſſionem fracturarum, in tres partes diſtributus*—but not finding the Name of *Abulcaſim* (which is the Name given him in a Latin Manuscript there, by *Gerardus Carmonensis*, who translated him) he went further, and found another Manuscript amongst Dr. Huntington's, No. 156, with this Title at large—*Pars xi libri Al-Tasrif, Authore Abul-caſem*

Chaiſ Ebn-Abbas Al-Zararavi—and, at the End of the Manuscript, were these Words translated out of Arabic thus, *Explicit hic Traſtatus de Chirurgia, eſque conſuſio totius libri Practices medicine cujus Author eſt Abul-caſem, &c. Die primo menſis Saſar, A. H. 807.* and, in the Latin Manuscript already mentioned of *Gerardus*, it is called *Particula 30 libri Albucasi*. The joint Authority of these two Manuscripts, concurring with what I have observed before, about the References to a Treatise of Surgery, puts it, I think, beyond all Dispute, that what we have now under the Name of *Alfaharavius*, and *Albucasis*, were writ by the same Person. Add to this, that *Albucasis* often refers to a Book, which he had writ concerning the Practice of Physic.

I do not find any Certainty of this Author's Age; but he is generally (though for what Reason I do not apprehend) supposed to have lived about the Year 1085: But there is some Ground to think he was not so antient. For, in treating of Wounds, he describes the Arrows of the Turks: A Nation which scarce made any Figure, till the Middle, at least, of the twelfth Century. And from what he says, that Surgery, in his Time, was in a Manner extinct, so that scarce any Footstep of the Art remained: One may, I think, infer, that he lived long after *Avicenna*; for, in that Physician's Time, we know, Surgery was in good Repute. *Albucasis* revived it; and thinks it is the highest Impudence to attempt any Thing in it, without being well versed in Anatomy, and in the Virtues of Medicines, especially the former, and adjures all of this Profession never to undertake, for the Sake of Gain, a Case which they do not understand. Though he takes a great deal from the Greeks, and especially from *Aetius* and *Paulus*, yet of the practical Writers he mentions only *Hippocrates* and *Galen*: And this, by the Way, may be another Reason to make us believe, that he is the same Person with *Alfaharavius*, who, in like Manner in his practical Work, does not quote above four or five Authors, viz. *Rhazes*, *Honain*, &c. besides these two. He throws by, he says, all that is superfluous in Surgery, and retains only what is useful, and necessary: And acquaints us, that he had joined long Reading and Experience together, and protests he will relate nothing but what he has seen. He is, to be commended particularly for this, that he is the only one among the Antients, who has described the Instruments in each Operation, and explained the Use of them; and the Figures of these Instruments are in both the Arabic Manuscripts which I have named, though not so finely and elegantly drawn, as in the Latin Copy. Another Thing very remarkable and indeed, peculiar to himself, is, that he gives his Reader Warning, wherever there is any Danger in the Operation: A Caution many Times as useful, as the long and minute Directions of others, how to perform it.

A Translation of *Albucasis*, intitled, *Methodus medendi certa, clara, & brevis, pleraque, quæ ad Medicinæ partes omnes, præcipue quæ ad Chirurgiam requiruntur, Lib. 3. exponens, cum Instrumentis ad omnes ferè Morbos utiliter & præcipue depictis*, was published, together with some other Authors, at Basil, 1541, in Folio.

Albucasis was also published in Latin at Venice, 1500, in Folio. And at Strasburgh, 1532, in Folio. *Vander Linden*.

ALBUGINEA TUNICA OCULORUM. The Coat of the Eye called *Adnata*, or *Conjunctiva*. See ADNATA.

A Coat of the Testicles is also called ALBUGINEA. It is so called from its Colour, which is white. It is a strong, thick Membrane, very smooth on the outward Surface; the inward, which adheres to the Substance of the Testicle, is rough and uneven. Into the upper Part of this Membrane are inserted the Blood-vessels, Nerves, and Lymphatics, which send from thence divers Branches into the Substance of the Testicle. *Drake*.

ALBUGINEUS HUMOR OCULI. The aqueous Humour of the Eye. See AQUEUS HUMOR.

ALBUGO OCULORUM. A Pearl or white Speck in the Eye.

Nitre finely powdered, and mixed with Oil, soon takes away Pearls from the Eye anointed with it. The Juice of *Anemone* has the same Effect, by its attenuating Virtue. *Oribasius de Loc. affect.* Lib. 4. Cap. 24.

The Collyrium of *Archigenes*, which at the first Anointing takes off most Part of the Pearl or Speck in the Eye, and is also an excellent Remedy for a bleared or blood-shot Eye, though long and dangerously affected.

Take of Snails calcined, three Drams; *Æs ustum*, four Drams; *Squama æris*, six Drams; *Squama ferri Stomomatis*, twelve Drams; *Ærugo*, six Drams; *Lapis Scissilis*, one Dram; *Aloes*, one Dram; *Omphacium* dried, two Drams; *Indian Thorn*, four Drams; *Chalcitis*, *Myrrh*, *Frankincense*, each three Drams; *Cortex thuris*, *Saffron*, *Crocomagma*, each two Drams; *Spikenard*, three Drams; the Flowers of *Pomegranate*, two Drams; *Gum Arabic*, eight Drams. Bruise them in Water, and make

make them into a Collyrium, which use with Water; or you may bruise the Collyrium, and use it dry. *Aetius, Tetrab. 2. Serm. 3. Cap. 39.*

All Cicatrices appear white in the Black of the Eye, for, the Cornea Tunica being thickened, the caerulean Colour cannot appear through it; the most eminent Parts of the said Tunica turn white, the even Parts are less white, and those which subside, are, in a manner, of the same Colour with the Black. Those Parts which have been treated with astringent Medicines, till the forming of a Cicatrix, are darker than the rest, because the Pellicles are much thickened by Adstriction. Now though old, callous, and thick Cicatrices, or Albugines, ought not to be meddled with, because, in such Cases, it is necessary to use Collyria that are of a very acrid Quality, which may endanger an Ulceration of other Parts of the Eye, we shall however describe some of those Medicines that have the Virtue of dying those Albugines, or white Cicatrices, of another Colour. For this End keep the Powder of Galls by you, and, upon Occasion, heat the blunt End of a Probe, and, taking up some of the Medicine upon it, apply it to the *Albugo*, and after that some Vitriol diluted in Water: Or apply the Powder of Malicorium, and then the Vitriol as before. Another Medicine from *Oribasius de Loc. Lib. 4. Cap. 24.* quoted by *Aetius*.

Take the Pulp of a sweet Pomegranate, and beat it well, adding now and then a little Water, and, after you have used this about the Eye for some Time, anoint the Place with the Juice of Henbane for fifteen Days together; this will take off the Colour of the Albugines, and with often using, in a Year's Time, leave no Sign of them. *Aetius, Tetrab. 2. Serm. 3. Cap. 37. & 40.*

Cicatrices in the Superficies of the Eye, are only so called by some, others call them *Nubeculae* [little Clouds,] and those that are deeper seated, *Albugines*. The Juice of Anemone, or the lesser Centaury, takes off the *Nubeculae*; the more inveterate, are attenuated and dissolved by Oil of Cedar, and Copper beaten in Water, and used as a Collyrium; and by all detergent Collyria. For *Albugines*, Nitre finely powdered, and mixed with old Oil, is a fine Detergent, and so is the calcined Shell of the Cuttle-Fish, beaten up with Honey. Among the Collyria, the following is a good mild Deterfive:

Take of Mamera (the Root of an Herb, supposed by the Commentator on *Myrepsus*, to be *Doronicum*) Gum Ammoniac, Myrrh, Crocodiles Dung, equal Quantities, and make them into a Collyrium: Or, take the Dung of the Land Crocodile, and beat it in Water for a Collyrium. *Aeginet. Lib. 3. Cap. 22. Actuarius, Lib. 2. Cap. 7.*

For the *Albugines*, Take Saffron and Pepper, of each equal Quantities, and, with a Cat's Gall, make them into a Collyrium. *Actuarius de Meth. Med. Lib. 6. Cap. 5.*

Take a Fox, and cut out his Tongue, and then let him go; dry the Tongue, and hang it by a scarlet Ribbon about the Neck of the Patient. *Marcel. Empir. Cap. 8.*

For the *Albugines* of Infants, caused by their Crying, anoint them with the Juice of the *Solanum Nigrum*, Black Nightshade. *Aetius Tetr. 1. Serm. 4. Cap. 11.*

ALBUHAR. *Cerufs. Rulandus.*

ALBULA. The same as ALBUGO.

ALBULA is also the Name of a Fish in the Lake of Zurich, mentioned by *Aldrovandus*; and said to be very good Food.

ALBULA. A little Pearl. *Rulandus.*

ALBULÆ AQUÆ, or ALBÆ, according to *Cælius Aurelianus*. These were much celebrated amongst the Antients for their medicinal Virtues.

The Waters called *Albæ*, or *Albulæ*, in Italy, were approved by the antient Physicians in Palsies and Fluxes, and other like Disorders affecting the natural Functions, because of their cooling Quality. *Cælius Aurelianus, Chron. Lib. 2. Cap. 1.*

Aluminous Waters, such as those they call *Albulæ* in Italy, are good for all Kinds of Ulcers, but especially such as are subject to a Flux of Humours, by speedily drying them up, and by that Means effecting a Cure. *Galen. de Simp. Med. Lib. 1. Cap. 7. 50.*

Galen, in his *Method. Med. Lib. 8. Cap. 2.* gives the History of a Cure he performed on a Man who contracted a Fever by bathing in the aluminous Waters called *Albulæ*; which stopping all the Pores occasioned that Disorder.

The *Albulæ Aquæ* are recommended by *Archigenes*, in *Aetius*, for Ulcers of the Bladder, to be drank after Walking in the Morning, three half Pints the first Day, and then to go on to five or six; for, besides their washing the Intestines, their fuliginous Vapour blunts the Sense of Pain in the Part, and, making a Separation of the Humours, renders the Blood more pure and florid; and they also cleanse the Ulcer effectually, and give an agreeable Sensation at their Entrance into the Bladder. So that, in short, nothing can more contribute to the Cure of the Patient. They are fittest to be drank after the Cool of the Morning. *Aetius, Tetr. 3. Serm. 3. Cap. 30.*

Aetius says, these Waters are sulphureous, aluminous, and warm as new Milk. *Ib.*

ALBUM GRÆCUM. The white Dung of Dogs gathered in March, called also *Spodium Græcorum*, *Nihil Album*, and *Album Canis*. It is esteemed drying, abstergent, discutient, and aperient. It is said to promote the Breaking of Abscesses, and to deterge Exulcerations; hence it becomes useful in Dysenteries, and Colical Pains. It is applied externally to the Throat in Quinsies, generally mixed with Honey, and to malignant Ulcers. It mollifies hard Tumors, draws away the Water in a Dropsy, and cures Warts. *Dale.*

ALBUM HISPANICUM. Spanish White, called also *Bianca Alexandrina*, seu *Album Hispania*. This is made from Tin in the same Manner that Cerufs is prepared from Lead. It is only used as a Paint, being thought to make the Skin look white. *Dale.*

ALBUM OLUS. A Name of the *Lactuca Agnina*, Lambs Lettuce, or Corn Sallet. *Dale.*

ALBUM NIGRUM. Mouse-dung. See *Mus*.

ALBUM OCULI. The White of the Eye.

Things preternatural, among which are oftentimes Hairs, growing in the White of the Eye, which cause no Pain, and differ not much in Colour from the natural, are cured by taking hold of, and raising them with the Hook, and then cutting them off with the Knife appointed for the Pterygia; after which a little fine Salt is applied, and a Lock of Wool bound on the Place; and the Management is the same as in the Cutting of the Pterygia. But Things that put on a reddish Aspect, and appear humid, and with turgid Veins, that are painful, and affect the Temple by Consent of Parts, are better let alone by the Surgeon, as being of a malignant Nature, full of Hazard, and endangering the Loss of the Eye itself. *Aet. Tetr. 2. Serm. 3. Cap. 57.*

ALBUM IUS. White Broth, good for sick People, is thus prepared: Boil Whiting, Haddock, Cod, or any such white-grained Fish, in Plenty of Water, with a sufficient Quantity of Oil, and add some Anis, and Leeks; when they are parboiled, put in a little Salt, just enough to give a Taste. *Oribasius, Med. Col. Lib. 2. Cap. 51.*

ALBUM is also a Name of many compound Medicines, as, ALBUM SEVERI COLLYRIUM. The White Collyrium of *Severus*, much recommended by *Aetius*, is prepared of the Juice of Fenugreek, Cadmia, Cerufs, and Gum Tragacanth. *Aetius, Tetr. 2. Serm. 3. Cap. 102.*

ALBUM UNGUENTUM. This is commonly called *Unguentum Album Rhafis*, and is thus ordered in the College Dispensatory:

Take of Oil of Roses nine Ounces; of Cerufs carefully washed in Rose-water, and powdered, three Ounces; of white Wax two Ounces. After the Wax is melted in the Oil, sift in the Cerufs after it hath been well dried from its Washing, first in common, and then in Rose-water, so that, together, they may be made into an Ointment, S. A. To which add two Drams of Camphire, rubbed with a few Drops of Oil of Almonds, and then it is called the *Camphorated white Ointment*.

There is a very different Ointment in the *Pharmacopœia Regia*, under the same Title, and which too is ordered at Pleasure to be camphorated: But that hath not been thought worth any one's Prescription, since *Avicenna* likewise directs one under the same Name, which the Augustane Dispensatory hath got, wherein Litharge is made an Ingredient, and the White of Eggs beat into it; but that also now is quite laid aside. That which is here retained is attributed to *Rhases*, whose Compositions are generally more uniform, and simple, than any of the Arabians. But our wholesale Dealers in Medicine, have learned grievously to corrupt it, by using Hog's Lard, for the Oil of Roses, and Wax, which greatly frustrates the Intention of the Medicine as a Cooler; inasmuch, that it may not be unworthy the particular Care of a Prescriber, to enquire into this Matter, when any Stress is laid upon this Medicine, which is the most commonly used of any of this Intention. *Quincy's Notes.*

The *Unguentum Album*, of the *Edinburgh Dispensatory*, is something different from the preceding.

Take of unripe Oil Olive three Pints; of Cerufs, a Pound; of white Wax, nine Ounces; and mix them together according to Art, so as to make an Unguent.

ALBUMOR is also sometimes used to signify the same as ALBUMEN, The White of an Egg.

ALBUMEN. The White of an Egg.

As the White of the Egg supplies the Fœtus of Birds with its first Nourishment, and bears a great Analogy to the Serum of the Blood, it becomes a Matter of some Importance to be well acquainted with its Nature.

The *Albumen*, says *Fabricius*, called the *Ovi Albus Liquor* by *Pliny*; *Ovi Candidum*, by *Celsus*; *Ovi Albor*, by *Palladius*; *Ovi Album*, and *Albamentum*, by *Apicius*; by *Aristotle*, *ἀλβύνη*; by *Anaxagoras*, *ἐπίθεον γάλα*, the Milk of Birds. It is a cold,

a cold, viscous, white Liquor of the Egg, differing in Consistence, for towards the acute and obtuse Parts of the Egg, it is more liquid, in other Parts of a more dense Consistence, and likewise in Distribution, being more copious towards the obtuse, than towards the acute Part of the Egg, and more copious in this last, than in the other Parts of the Egg, surrounding and covering the Vitellus, or Yolk, on all Sides.

I have not only observed this Difference in the *Albumen* of an Egg, but also that there are two *Albumens* different from each other, and involved in their proper Membranes: Of these, one is very thin and liquid, the other more dense and viscous, and of a somewhat whiter Colour; but in old and stale Eggs, after some Days Incubation, inclining to a Yellow. As this second *Albumen* covers the Vitellus or Yolk on all Sides, so it is itself surrounded by the other external Liquid. That these two *Albumina* are distinct, will thus appear: If you take off the Shell, and penetrate both the adjacent Membranes, you will see the Liquid and exterior *Albumen* immediately all run out; but though these Membranes are opened, and reclined on each Side upon the Dish, yet the interior and denser *Albumen* will keep its Place and globous Figure, as being circumscribed within its proper Membrane, which is so fine, as not to be discerned by the naked Eye. If you cut this Membrane, the second *Albumen* will instantly fly out on all Sides, and lose its round Figure, just as when you cut a Bladder the contained Liquor bursts out on a sudden; and when you break the Membrane that holds the Vitellus, the yellow Liquor runs out, and its former Globosity subsides. *Harvæus de Generat. Animal. Exercit. 11.*

As the Eggs of Hens consist of two Liquors, each of a different Colour, separated from one another by Membranes, and distinguished by two Branches of umbilical Veins, one of which goes to the Vitellus, and the other to the *Albumen*, so it is very probable they are of different Natures, and consequently, appointed for different Purposes: "The Vitellus of the Egg," says Aristotle, differs from the *Albumen*, not only in Colour, but in other Properties. The Vitellus is condensed by Cold, the *Albumen* is rather liquefied. On the contrary, the *Albumen* is condensed by Fire, the Vitellus retains its Softness, if it be not burnt; and concretes, and dries, more in boiling, than in roasting." When the Vitellus grows warm with Incubation, it becomes more humid, and like melting Wax, or Fat, whence it takes up more Space; for, as the Fœtus increases, the *Albumen* insensibly wastes away, and condenses; the Vitellus, on the contrary, seems to have lost little or nothing of its Bulk, when the Fœtus is perfected, and only appears more liquid and humid, when the Abdomen of the Fœtus begins to be formed.

The Chick in the Egg is first nourished by the *Albumen*, and, when this is consumed, by the Vitellus, as with Milk. Therefore the umbilical Process of Veins that goes to the *Albumen*, when that is spent, withers, and breaks off before the Birth, leaving no Sign behind it, but vanishing even before the lower Belly comes to be bounded with an Abdomen.

Both the *Albumina*, are designed for Nutrition, and the outer one is first consumed, as being the first that receives the umbilical Branch of Veins, that visit the *Albumina* before they enter the Vitellus, which is the last Nourishment of the Chick. *Harvæus de Generat. Animal. Exercit. 59.*

The *Albumen* is contained in concentric Membranes, but is not all of the same Consistence; for the exterior Part of it is thin, and diffuses itself almost like Water, when the Membranes are broke, whereas its interior Part is more viscous.

It can make its Way through the Shell, as it appears from its Wasting by keeping, especially if it is exposed to a gentle Heat.

It is specifically lighter than the Vitellus.

By Incubation, the *Albumen* becomes thinner, and more turbid, especially on its upper Part, near the obtuse End, where it is also first consumed; and it is afterwards diminished towards the sharp End of the Egg, till at last nothing of it is left, except a white cretaceous Substance at the lower Part of the Shell.

The *Albumen* of a fecundated Egg is as sweet and free from Corruption, during all the Time of Incubation, as it is in a new-laid Egg. *Edinburgh Medical Essays.*

Boerhaave has given some Experiments on the White of an Egg, and immediately afterwards, nearly the same Experiments on the Serum of Blood, with a View of shewing the Similitude there is betwixt the two Substances just mentioned. These I shall insert in this Place, as they will contribute much to our Information, with respect to many Things relative, not only to the Whites of Eggs, but also to the Effects of Heat upon nutritious Juices.

EXPERIMENTS upon the WHITES of EGGS, in order to prove them neither ALKALINE, ACID, nor in any Degree ACRIMONIOUS.

Put some Whites of new-laid Eggs, well cleared from their Shells, Membranes, and Yolks, into clean glass Vessels. Into each of these pour different Acids, then shake and mix them

well together, and there will not in any of them appear the least Sign of an Effervescence. Put into another Glass, wherein is a Portion of the same Whites of Eggs, a fixed, and into another a volatile Alkali, and you will find them continue perfectly at Rest, without discovering the least Tendency to Ebullition.

If the fresh Whites of Eggs are put into a Cucurbit, and distilled with a Heat of a hundred Degrees, an insipid Water comes over, which contains nothing in the least spirituous. If these Whites of Eggs are applied to the Eye, or the bare Nerves; they do not excite the least Degree of Pain; they scarcely affect the Organs of Smell; applied to the Tongue, they taste perfectly insipid, and inert, and to the Touch they feel viscid, and mucous; without the least Indication of Activity.

REMARKS.

Hence it is evident, that in the fresh White of an Egg, neither an Alkali, nor an Acid exists, nor any Thing formed by a Combination of these two together. But it is a thick, viscid Liquid, utterly inert, and perfectly insipid. It appears, however, that by this truly animal Fluid, within the Space of twenty-one Days, and in a Heat of ninety-three Degrees, a Chicken is formed by Incubation under the Hen, which weighs more than an Ounce, and this from a Body so small, that it scarcely weighs the hundredth Part of a Grain. Here then we find a Fluid different from all others, out of which, by the Application of requisite Causes, Fibres, Membranes, Vessels, Viscera, Muscles, Bones, Cartilages, all the Parts both tendinous, and ligamentous, the Beak, Claws, and Feathers, and all the Humours contained in all these are produced. And yet in this Liquid we find a Softness and Inactivity, without the least Appearance of any Thing either acid, alkaline, or spirituous, or any Disposition to an Effervescence. And indeed, if there should happen any Effervescence, the Egg must unavoidably burst. The whole Substance therefore consists of such a Matter as has been described; and demonstrates to us from how tenacious and inactive a Mass all the Parts of the Chicken, both solid and fluid, may be formed. And yet this very Substance, by a somewhat greater Degree of Heat, is rendered absolutely unfit for the Production of a Chicken; it scarcely bearing a hundred Degrees to any good Purpose, whilst a little less proves equally prejudicial; fewer than eighty Degrees not being sufficient.

The ingenious Malpighi has demonstrated, that this White of the Egg is not a Liquid every where equally fluid, like the Serum of the Blood, which circulates through the Vessels of the Body, but that it is a Substance composed of many membranous Bags which are distinct, and filled with their proper Fluids almost in the same Manner as we observe the vitreous Humour of the Eye to be formed. And hence those Waves, as it were, concentric to the Sacculus Colliquamenti, by which the nutritive Juice being gradually attenuated, is at last strained into the Ainnios of the Chicken.

EXPERIMENT tending to shew the ANALOGY betwixt the SERUM of the BLOOD, and the WHITE of an EGG.

If Blood, drawn with a free Stream from a young Person in Health, whilst fasting, is immediately set to rest in a clean Vessel, it soon spontaneously separates into two Parts, a concreted solid Cake, and a fluid, yellowish, thin Serum, which perpetually increases for a considerable Time, whilst the Mass remains without Motion. Let this Serum be separated from the red concreted Part as accurately as is possible, and divide it into separate clean Vessels. Into one Portion of it pour some of the strongest Vinegar; into another Spirit of Salt; into a third Spirit of Nitre; and into a fourth Oil of Vitriol; and you will observe that neither of the Mixtures discover the least Effervescence.

To a Portion of Serum in another Vessel add a fixed Alkali, and to another a volatile Alkali; and the Consequence will be, that in both Cases they will remain perfectly at Rest, without the least Conflict, or Appearance of Ebullition.

This Serum has a Taste, which is mild, and but very little inclinable to Saltiness. It diffuses a Smell which is disagreeable, but by no Means acrid or very active. If a Drop of it is instilled warm into the Eye, it excites no painful Sensation, but is one of the most speedy Lenients in Inflammations and Wounds of that Part. And if it is applied to the Nerves laid bare in Ulcers, or Wounds, it is scarcely perceived.

REMARKS.

This plastic Serum is soft and inert, perfectly like the White of an Egg; and as out of that are formed all the Parts of a Chicken, so this furnishes all the Parts of the human Body with Nutriment.

EXPERIMENTS on the WHITES of EGGS with HOT WATER.

If an Egg is exposed to a continual Heat of eighty Degrees, the White soon loses its Tenacity and Thickness, and becomes so subtle as to perspire through the great End, where the Membranes being separated from the Shell, are depressed towards the

Yolk, and form a large Cavity. The other Part of the White at the same Time will be dissolved, grow thin, and ichorous, nor will it afterwards harden with the Heat of boiling Water, but becomes foetid, putrid, and very acrid, and destroys the vital Stamina of the Chicken.

The fresh White of an Egg thrown into Water heated to a hundred and sixty Degrees, loses its Pellucidity, grows white and opaque, and becomes concreted into one thick, scissile Mass. Or if into Water boiling in a glass Urinal you drop a little White, it will be coagulated surprisingly, even during the Motion of the boiling Fluid, though it is agitated about by it to every Side. Or, lastly, if you put a whole Egg into Water as hot, it will be hardened in the same Manner. Hence therefore it appears, that this Coagulation does not arise from any Loss of the Liquid of the White, dissipated by this Heat, but from the true Action of the Fire applied in such a Degree; for it happens in the Middle of the Water. And if you put the White into a large Quantity of cold Water, it will harden and separate itself from the Water as soon as it begins to be near boiling.

If an Egg is boiled till it is very hard, and you then accurately separate the White from the Membranes, Tread, Yolk, and Sacculus Colliquamenti, and lay it in a glazed Bason, it begins gradually to sweat, as it were, and to be resolved into a subtile Liquid, which appears of a watery Nature, but is a most penetrating Solvent, insinuating itself into the Body of Myrrh and other Substances, that are otherwise dissolved with Difficulty.

REMARKS.

By this Experiment then we learn, how that Matter is disposed with Regard to Heat, out of which all the animal Parts without Exception may be formed in a short Space of Time. We see here that a certain Degree of Heat dissolves it, that a greater coagulates it, and that a less again resolves it, when it is coagulated. All these Things therefore are owing to determined Degrees of Heat, without a proper Regard to which nothing can be asserted that will always here hold true. And it will appear still farther, that a Heat exceeding two hundred twenty-four Degrees will attenuate and dissolve this Coagulation brought about by a less Heat. Hence, therefore, let us be warned to conclude more cautiously concerning the dissolving or coagulating Power of Fire with Regard to plastic, nutritious Humours, or the Degrees of Heat necessary to attenuate, putrefy, inspissate, or again resolve them.

EXPERIMENTS ON the SERUM of the BLOOD with HOT WATER.

Pour Serum of the Blood into clean Water, boiling on the Fire, it immediately grows white, and a Kind of Coagulation is formed in the Middle of the Water. In this Property, therefore, Serum agrees with the White of an Egg, though it must be observed, that the White of an Egg forms a more solid Coagulation than the Serum of the Blood.

REMARKS:

Hence then the Effects of Heat upon Serum of the Blood are manifest; hence also we may learn how boiling Water acts upon the Humours when it is applied to, and consequently burns the Parts of a living Body. It is plain, that by that Means neither the saline Parts, nor the Oils of the Blood are rendered volatile.

EXAMINATION of the SERUM of the BLOOD with a DRY HEAT.

Take some Serum of Blood, put it into a clean Vessel, and gradually expose it to the Fire, and when it begins to smoke, that Part which is in Contact with the Vessel, will grow opaque and white, and coagulate; and thus proceeding successively, the whole Serum will at last be hardened into a white, tenacious, opaque, scissile Mass, lying in Waves, as it were, in the Middle of the Surface, perfectly solid, of a mild Taste, like that of the White of a boiled Egg, and almost without Smell. If this Mass is kept in the open Air, a thin watery Liquid gradually exsudes, perfectly in the same Manner again, as it happens in the boiled White of an Egg. And here, if the Coagulation is made with a proper Degree of Fire, that is, with such a one as will just effect it, and no more, it will then harden without any Empyreuma, without expelling any Salt, and without the least Appearance of an Alkali. When it is once consolidated in this Manner, it can scarcely be by any other Means resolved.

REMARKS.

Hence it appears, that in a certain Degree of Heat, not much exceeding a hundred, all our Humours will be reduced into Masses, that will not be able to pass through their Vessels. A Heat, therefore, of a little above a hundred Degrees, arising either from an internal or external Cause, cannot be supported in the human Body, because it would utterly stop the Circulation of the Humours, and consequently cause immediate Death. And

the Effects of such a Heat would be first sensible in the Head and Lungs, because their proper Actions would be first disturbed.

EXAMINATION of the WHITE of an EGG with ALCOHOL.

Put the White of an Egg into a transparent Vessel, upon which pour some of the purest Alcohol of Wine, in such a Manner that it runs very gently down the Sides upon the White; and this do very carefully, that you may evidently perceive that every Part of the Surface becomes coagulated, as the Alcohol touches it, whilst the lower Part still continues liquid and pellucid. Then shake them gently together, the Coagulation still spreads with the Alcohol; and by shaking them thoroughly, and mixing them well together, the White is intirely coagulated. If the Alcohol is heated before the Experiment is made, the Coagulation is effected in a greater Degree, and the same Effect is produced, by shaking the *Albumen*, and Alcohol together with Rapidity, the Heat and Motion here promoting the Coagulation.

REMARKS.

Hence it appears, that the purest vegetable Spirits coagulate that plastic Matter which is the Basis of Nutrition; and certainly in that Instant of Time it becomes absolutely unfit to perform its Office. This Admixture, however, of Alcohol preserves the White from Putrefaction. How much then does the plastic Matter of Animals tend towards Coagulation? What unexpected Powers does the too great Depuration of some Bodies produce in them? Wine will suffer itself to be mixed with this White; the Alcohol produced from it becomes coagulated with the coagulated White; and yet Alcohol diluted with a pretty deal of Water will not coagulate it.

EXAMINATION of the SERUM of the BLOOD with ALCOHOL.

To Serum, contained in a transparent Glass, pour some very pure cold Alcohol, and immediately, in those Parts which it touches, the Serum begins to grow turbid, white, and opaque. Shake them together, the same Thing happens throughout, and the Whole becomes coagulated, though not so strongly as the White of an Egg, but in Pieces, cohering less firmly together. If Alcohol is mixed with it very hot, the Coagulation becomes much more solid. When the Serum is coagulated in this Manner by Alcohol, it will never grow putrid, but may be kept for Years without Alteration.

REMARKS:

Here then we observe a farther Analogy betwixt the Serum of our Blood, and the White of an Egg; that is, in their Coagulation by Alcohol. That the Serum is not consolidated by the Alcohol into so dense a Mass as the White of an Egg, seems to be owing to the original greater Solidity of the White. For the White which contains all the Matter of Nourishment which is conveyed to the Chicken, so long as it continues inclosed in the Shell, has nothing putrid in it, nor is it much diluted; whereas the Serum of the Blood contains both urinous Particles, and a large Portion of Water; but Alcohol, diluted with Water, will not condense the Serum in such a Manner, nor even the White of an Egg. Hence we may learn the Efficacy of pure Alcohol upon our Blood, for it condenses it like Fire, and preserves it from a spontaneous Corruption, on both which Accounts it is the most ready Styptic we are acquainted with, at the same Time that it prevents Putrefaction, producing a very thin, indeed, but solid Eschar. For if a Tent dipped in the purest Alcohol made scalding hot, is applied to a bleeding Wound, pressed on pretty strongly, covered with a Piece of Hogs-Bladder softened with Oil, and then secured with a proper Bandage, the Hæmorrhage will be immediately stopped, and the whole Dressing may be kept on for the Space of three Days, in which Time the Vessels generally coalesce, being very much contracted and consolidated by the Alcohol. Thus then does Alcohol coagulate all our thicker Fluids, contract the fibrous Parts into a hard dry Coalition, and defend both of them from the Putrefaction they are naturally disposed to. A famous Instance of this is communicated by that excellent Physician, Samuel Cabelliau, in a Leg that was perfectly sphacelated, which by the Help of Spirit of Turpentine, and alcoholifated Spirits of Juniper, was preserved from Extirpation for the Space of six Months, without any farther Putrefaction. *Eph. Germ. Dec. 3. An. 5 and 6. p. 495.* But those Parts of the Body that are composed of exceeding fine Vessels, soon grow hard in Alcohol, together with their contained Humours. No Wonder therefore, that those poor Wretches who use this Alcohol, though somewhat diluted, too freely, should be obnoxious to such terrible Disorders of the Nerves, and Polypuses in the Blood.

The fresh WHITES of EGGS resolved by DISTILLATION.

Boil some new-laid Eggs in clean Water, till they are hard, and then accurately separate the Whites, and chop them to Pieces. Put these into a clean glass Cucurbit, and fitting on an Alembic

Alembic apply a Receiver. Place the whole Cucurbit in a Bath of Water, and urge it by successive Degrees, till the Water in the Bath keeps constantly boiling. By this Means there do not appear any Streaks like those of Spirits, but there comes off a simple Water discovering itself in dewy Drops, and that in such an incredible Quantity, as to rise to nine Tenths of the whole Weight of the original Mass. Continue patiently this Distillation with the Heat of boiling Water, till not a Drop more of this Liquor will rise. This Water then, upon Examination, discovers no Sign of any Oil, Salt, or Spirits in it. It is very pellucid and insipid, except that towards the latter End it tastes a little bitterish, and is almost inodorous, except that at last it smells a little empyreumatical. Nor does there appear the least Sign of any Alkali, though examined by proper Experiments; nor by any Trial does it discover an Acid. A very small Quantity, in Proportion to what was put in, remains at the Bottom of the Cucurbit, each Fragment being contracted into a small Bulk from their former Magnitude; and they are of a golden Colour, especially in those Parts which were in Contact with the Glass, but yet they are transparent, like stained Glass. When taken out of the Cucurbit, they appear to be light, hard, and perfectly brittle, so that they break with a Noise like Glass, and have a slight empyreumatical Smell, and a bitterish Taste, occasioned by the Fire, but are by no Means either alkaline or acid.

Fill a glass Retort one Third full with the Fragments above-mentioned, apply a large Receiver, place the Retort in a Sand-heat, carefully lute the Joint, and then distil with successive Degrees of Fire to the very greatest, called a suppressing Heat. By this Means a pinguious, oily Spirit arises, which runs down in Streaks, and at the same Time a volatile Salt fixes itself to the Sides of the Receiver, considerable in Quantity, with Regard to the dried Fragments, but little in Comparison of the whole Whites before the Water was drawn off. Last of all, besides a light gold-coloured Oil, mixed with the former Parts, there comes over a black, thick, pitchy Oil; and when this last Oil is forced out by the extreme Torture of the Fire, then the Earth at the Bottom of the Retort, still intimately united with its ultimate, exceeding tenacious Oil, rarefies, puffs up, and rises to the Neck of the Retort, and, if it happens to be filled too full, enters into the Neck, and chokes it up, and hence has sometimes caused the Vessels to burst, not without Danger to the Operator. Continue the Operation till nothing more comes over. The first oily, pinguious Spirit appears strongly alkaline, by every Mark; thus, upon being mixed with an Acid, it causes a very violent Effervescence. By Rectification it is resolved into a volatile alkaline Salt, an Oil, and an inert foetid Water. The Salt that adheres to the Sides, is perfectly alkaline, very acrid, fiery, oily, and volatile, and the last Oil is acrid, caustic, and remarkably foetid. The Earth that remains at the Bottom of the Retort, is exceeding black, shining, light, rare, and brittle, and has a foetid Smell from the empyreumatical Oil that is united with it, and a bitter Taste from the same. If this is burnt in an open Fire, it leaves a little fixed, white, insipid, inodorous Earth, from which no Salt can be procured, exhibiting only an exceeding subtle Powder.

REMARKS.

Hence it is evident, that the White of an Egg contains a very large Proportion of Water, but that it has in it not the least Portion of an Alkali, which will rise even with a Heat of two hundred and twelve Degrees. That Matter therefore, which by a greater Degree of Heat is converted into a volatile Alkali, is not by one of two hundred and twelve Degrees, though very considerable; disposed either to be alkaline or volatile. Hence therefore it may be inferred, that there is no volatile Salt naturally contained in it; for, in Chymistry, that is called a volatile Salt which is more so than Water, and rises with a much less Degree of Fire. Nor do we discover any Spirit, that rises with the Heat of boiling Water; nor any Oil that suffers itself to be separated by the same; nor indeed is the Residuum, after the watery Part is drawn off, so altered by this Action of the Fire, as to give the least Indication of its containing any Salt; but, the more liquid Parts being expelled, it spontaneously acquires the Appearance of a brittle Glass. By this Experiment therefore, we learn, that a volatile Salt may be produced from the White of an Egg, but does not naturally exist there in that Form; for when this Salt is, by a proper Degree of Fire, separated from the rest of the Mass, and become volatile, it will then rise with a Heat of sixty Degrees, though it was not to be raised before by one of three hundred. That Volatility therefore is not natural to the Salt of the *Albumen*, but is communicated to it by Fire; and this is true also with Respect to its alkaline Quality. And hence we discover, the tenacious Adhesion of the Oil to the more fixed Parts of the White, whilst the Water is separated from them very easily; and we also see, that an animal Coal will never part with all its Oil in a close Vessel, but that it adheres so obstinately to the terrestrial Elements, that no Fire, except in the open Air, can destroy the Union. From what has been said then, we may be en-

abled to form just Notions concerning this Matter of the White of an Egg, from which all the Parts of the Animal are afterwards produced.

PUTREFACTION of the WHITES of EGGS.

Sound Eggs, or their Whites, when kept in a Heat of seventy Degrees, or upwards, begin in a few Days to be attenuated, grow foetid, dissolve, and putrefy, and at the same Time, if the Eggs are whole, they begin to grow empty about the large End, and, if they are then boiled, will not harden, but retain their Fluidity. And this Change happens much sooner in those Eggs which are impregnated, than in those which are not; for in these the greatest Part of the putrid Moisture exhales, so that at last the whole Shell almost is filled only with Wind or Air. If you continue to keep the Eggs or Whites in the same Degree of Heat, at last all the Parts grow surprisingly putrid, and alkaline, cause an Effervescence with Acids, and, in Distillation the first Part that rises from them is an alkaline Spirit, and an alkaline Salt, exactly in the same Manner as in putrefied Urine. If the White is suffered to putrefy in the open Air, it becomes almost totally volatile, exhaling in Proportion as the Putrefaction advances, and at last leaving nothing behind but a few Skins, all the rest being dissipated into the Air. In all these Experiments there is never generated the least Portion of Acid.

REMARKS.

If a little Quantity of Egg, putrefied to such a Degree as to become of an alkaline Nature, is taken into the human Body, it produces there very extraordinary Effects, exciting a Nausea, Horror, Vomiting, great Uneasiness, a Diarrhoea, and Gripings; inflaming the Bile, and exciting Heat, Thirst, and a Fever, and by its putrid Exhalation only it induces a Horror, Nausea, and Vertigo, and wonderfully dissolves the Humours of the Body like a pestilential Poison. This, therefore, we know to be the Nature of that Matter, which is nearly in a State fit to being changed into all the Parts of an animal Body. Rest only, and such a Degree of Heat as has been specified, produce all these Qualities in that Substance. Hence therefore we learn its spontaneous Alteration and Corruption. But it is farther very surprising, that if an impregnated Egg is digested in a proper Stove, with a Heat of ninety-two Degrees, the Parts that are attenuated and altered by this Heat, are spent for the Space of twenty-one Days in nourishing, increasing, and perfecting a Chicken, in which there does not appear any Thing alkaline, foetid, or putrid. Here then the Physician may observe some very wonderful Phenomena; for by Rest, and a certain Degree of Heat, a Substance from thick becomes thin; from tenacious, liquid; from inodorous, foetid; from insipid, of a fracid, very acrid, abominable Taste; from exceedingly mild, caustic; from non-alkaline, extremely alkaline; whilst the latent Oil which was sweet, grows extremely putrid. These Experiments are made in particular upon the Whites of Eggs, the other Parts, where it could be done, being accurately separated from them, because the White alone is that Matter which supplies the Embryo with Nourishment, all the other Parts assisting only to the Alteration of the White, that, when it is changed in a proper Manner, it may be applied to the Carina of the Chicken that is to be brought to Perfection by it.

PUTREFACTION of the SERUM of BLOOD.

Serum put into a tall open Glass, and exposed to a Heat of seventy Degrees, will grow every Hour more and more thin, so as in the Space of three or four Days to be quite resolved and sanious. At the same Time also, from being almost inodorous, it becomes foetid, and exhales a cadaverous Stench; from being insipid, it acquires a fracid, rancid, acrid, abominable Taste; and, if it is kept in this Degree of Heat a few Days, it grows alkaline, putrid, and intolerable to our Senses, evidently discovering its alkaline Nature, by raising an Effervescence with Acids. If it is committed under these Circumstances to Distillation, it yields the first Time a volatile alkaline Salt, exactly like the White of Eggs, treated in the same Manner.

REMARKS.

Hence then we observe, that Serum, when exposed to the Observation of our Senses, by Rest, and the Degrees of Heat mentioned, becomes spontaneously thinner. When it stagnates therefore in the obstructed Vessels of a sick Person, by a gentle Heat, and Time, it dissolves of itself, and often opens the Vessels it had obstructed. Hence in acute inflammatory Disorders, when the Body is reduced to a moderate Heat, in a certain Number of Days, the obstructing Matter becomes capable of circulating in its Vessels, as in Practice is every Day observed. During the Alterations the Serum undergoes in this Experiment, it never becomes acid; whatever the greatest Artists write to the contrary, but always grows putrid. Nor do we ever observe the least Sign of Fermentation, what-

ever Arts are made Use of in order to raise one, but a determined Putrefaction only. It must indeed be confessed, that by thus putrefying it rarefies and produces an elastic Air that flies off from it, but not one that is fermentative, and spirituous. Nor are there any fermented inflammable Spirits generated by this Putrefaction, but putrid Spirits, of another Kind, which are, however, volatile, and capable of taking Fire. For Excrements, close stopped up in a Jakes, and compressed together, have sometimes conceived a strong intestine Motion, and at the same Time have exhaled an extremely foetid Vapour, which, upon the Application of a Candle, has burst out into a violent Flame. From the same Cause sometimes a Heat and Rarefaction have been excited in a dead human Body, about the Abdomen only, and that not very considerable. From what has been said then, the Physician may learn the spontaneous Degeneration of the Humours, when they stagnate, either in their Vessels, or in the Cavities of the Body when extravasated. By acid, compound, saline, and spirituous Bodies, however, this Putrefaction may be prevented.

By the foregoing Experiments, which seem made with great Judgment and Accuracy, we are taught that a great Similitude exists betwixt the *Albumen* of an Egg, and the Serum of the Blood. Now, as the White of an Egg has all the Requisites to the Formation of an animal Body, that is, to Nutrition, when properly applied by the vital Actions to the Parts which require it, and this without any previous Digestion by the Stomach, it must necessarily be one of the most proper Aliments in the World, in morbid Cases, where the digestive Organs are relaxed and weak, where the Fibres of the whole Body want a due Tension, and Elasticity, and where consequently Restoratives are indicated. But in order to answer any good Purpose in this View, it must be given fresh, raw, and without the Application of the least Heat, for Heat, as appears by the foregoing Experiments, renders it unfit for Nutrition; the genial and plastic Warmth of the Body being all that is required to apply it to the Parts which require Nourishment.

It is to be given in a little Milk and Water, or Broth, or may be taken alone, well separated from the Yolk.

It is recommended for many medicinal Purposes, as will appear by the following Quotations.

The raw *Albumen*, or White of an Egg, refrigerates, stops up the Pores; instilled into the Eyes, mitigates an Inflammation there; prevents Pustules from rising after Scalds or Burns, if the Place be immediately anointed with it. It keeps the Face from Sun-burning; applied with Frankincense, as an Anacollema, to the Forehead, it restrains Defluxions; mixed with Wine, Honey, and Oil of Roses, and applied in Wool, it mitigates an Inflammation of the Eyes. Supped raw, it is good against the Bite of the Serpent *Hæmorrhoids*. Used with the least Degree of Warmth, it is effectual in Corrosions of the Bladder, Ulcerations of the Kidnies, Roughness of the *Aspera Arteria*, Vomiting of Blood, and Distillations, or Defluxions, on the Breast. *Dioscorides, L. 2. C. 155.*

The White of an Egg has a refrigerating, astringent, and agglutinating Quality.

It is frequently used for Redness of the Eyes, to conglutinate Wounds, mixed with common Bole, and in Fractures. It is of Service also in Anacollemas. See ANACOLLEMA.

Hippocrates prescribes three or four Whites of Eggs in Fevers for Refrigeration, and the Expulsion of the morbid Matter.

The Yolk of an Egg is endued with an anodyne, maturing digesting, and relaxing Virtue. Hence it is very often an Ingredient in Clysters, and, mixed with a little Salt, is commonly applied, in a Walnut-shell, to the Navels of Infants in order to loosen the Belly.

They make a Drink of it, which the German Women commonly use in Child-bed; they call it *Seiff*. It is thus prepared:

Take two or four Yolks of Eggs, and one Measure of Water, with half a Measure of Wine (more or less); boil them very well together, in order for drinking. *Schroder. Pharmacop. Med. Chy.*

Sydenham advises the Whites of Eggs as a good Gargarism in a Quinsey, in the following Manner:

Take of distilled Waters of Plantain, red Roses, and Frog-spawn, of each three Ounces; the Whites of three Eggs, beat to a Liquor; white Sugar, three Drams; mix them together for a Gargarism.

ALBURNUM. The white, soft Part of Wood next the Bark. Artificers call it the Sap, to distinguish it from the Heart, which is harder, and of a deeper Colour.

ALBURNUS AUSONII, is a little River Fish which resembles an Anchovy; with a little Head, its Eyes in Proportion large and red, its Back somewhat green, and its Belly white, with two Lines on the Sides.

It is esteem'd aperitive. *Lemery de Drogues.*

It is esteem'd a very ordinary Fish. The Flesh is flabby. It is taken Notice of by Aldrovandus.

ALBUS. A Sort of very ordinary Fish taken Notice of by Aldrovandus, and Gesner. The Flesh is hard, and difficult to digest. Gesner calls it *Capito Lacustris*.

ALBUS FLUOR, or **FLUXUS**. See **FLUOR ALBUS**.

ALCADD. *White Ink.* *Rulandus.* Johnson calls it **ALCADDY**.

ALCAFIEL. *Antimony.* *Rulandus.*

ALCAHEST. This is an arbitrary Word derived from no Language, and coined by Paracelsus, to express an universal Menstruum, or Solvent, as Helmont explains it. As the Discovery of such a Menstruum would be of infinite Importance to Medicine, the Sentiments of the principal Authors who have wrote about it, seem to deserve Consideration. But I am sorry to say, that we are left at last much in the dark, with Respect to this grand Arcanum.

After the elder Van Helmont had published his Writings, the Chymists began to be acquainted with the History of a secret, universal Menstruum, which Paracelsus was said to have possessed, and which he, according to his extravagant Way, called the *Alcahest*. If any such Thing was ever known to Man, as Helmont solemnly avers it was, it certainly ought to be esteemed the most excellent Gift, that the Divine Being ever bestowed on Mankind, either with respect to Chymistry, or any other Art; for without Dispute it would be infinitely a greater Treasure than the Philosophers Stone, and much more desirable, as, by the Help of it, might easily be obtained, the most certain Instruments, both of Health and Riches. This, with a great deal of Reason, was the Opinion of Mr. Boyle, who, after infinite Diligence, and much Skill thereby acquired, could scarcely believe the Existence of such a Menstruum, so far was he from arriving at a Knowledge of it. The greatest Chymists, however, have so far depended upon the Authority of Helmont, that they speak of it as a Thing he was certainly acquainted with. And here Impostors have taken the Opportunity of cheating People curious of such Kind of Arcana: Prudent Men have always remained in Suspence, not daring absolutely to pronounce any Thing either one Way or other, concerning it. For these Reasons, I shall give an historical Account of this Affair, just as it is, that is, as it may be collected from the Writings of those Authors, who alone have wrote of this Menstruum; that at least we may know the Opinions of those, who tell us, they have possessed, and made Use of this Arcanum. Every Thing, however, that Authors have said on this Subject, has been borrowed from Helmont alone; for, from what Paracelsus himself wrote of the *Alcahest*, no Mortal would ever have thought of any such Thing, had not Helmont given the Hint, that such great Mysteries were couched under this uncommon Word. As I am not Master of this Chymical Secret, all, therefore, that I can do, is, by carefully examining, and faithfully comparing one Passage with another, to lay before you what is to be found in these Authors upon the Subject of the *Alcahest*. And if these were really acquainted with it, and design that one who studied their Writings attentively, should find it out, I know no better Way of searching for it, than that which I have proposed. By this Means, at least, any one who is inclined to set about this grand Work, may know what Matter he must make Use of, by what Instruments he must operate, and in what Method he must proceed, that he may not lose both his Labour and his Money. And it will have this farther Advantage, that it will secure us from being cheated by the Artifices of itinerant Impostors, whose confident Boasts of Things they are not in the least acquainted with, render this Caution to the unwary and credulous, in some Degree necessary; for these Pretenders may be easily detected by any one who is acquainted with the Doctrine of Paracelsus, and Van Helmont.

First, let us consider the Name **ALCAHEST**. This Word, before Paracelsus, no Body ever made Use of, not even among the Chymists. And even he himself, as far as I have been able to discover, never used it, but in one Passage, and that in his Treatise, *De Viribus Membrorum, Lib. 2. Cap. 6.* where there are these Words: 'The Liquor *Alcahest* is of wonderful Efficacy in comforting, strengthening, and preserving the Liver, and consequently preserves against Dropsies, and all Sorts of Distempers, which arise from Disorders of the Liver. The Process for its Preparation is by Resolution after Coagulation, and by coagulating again into a transmuted Form; as the Process of coagulating, and resolving, teaches. And if it separates its like, it becomes a Medicine for the Liver, superior to all Medicines; so that, if the Liver itself were to burst and dissolve, this Medicine would supply its Place, as well as if it had never been burst or dissolved. Whoever therefore apply themselves to Physic, ought to use their utmost Endeavours to be Masters of the Preparation of the *Alcahest*, that they may be able to avert many Diseases that arise from the Liver.' So that Paracelsus never made Use of this Word but twice, and that only in this Place; nor is there the least Mention of any such Thing, either before or after, that I could find, by a careful Examination of all his Works. No Mortal, therefore, from what he said upon this Head, would ever have thought of this grand Arcanum, had not Helmont afterwards added his Interpretation.

The Derivation, therefore, of this new Word, thus coined by Paracellus, was examined into. And upon considering, that it was usual with him to conceal common Words by the Transposition of their Letters, it was imagined that was the Case here; though sometimes he formed strange Words, by joining the Beginnings of different Words together. Thus, when he would have you make Use of (Tartarus) Tartar, to resolve the Saburra in the Spleen, he says, *take Sutratar, L. 11. De Vir. Memb. C. 7.* And again, when for Diseases peculiar to the Kidnies, he prescribes Saffron, which, from its golden Colour, the Chymists called *Aroma Philosophorum*, he says, *these Distempers are cured by Aroph. Lib. 11. de Vir. Memb. Cap. 10.* Hence, therefore, some have thought, that *Alcahest*, signified *Alkali est. Rolfinc. Eph. Germ. D. 12. Ann. 6, 7.* Rulandus in his Lexicon, Glauber; and hence supposed, that it has always an Alkali for its Basis, which is then saturated with a proper Acid. Others have been of Opinion, that it was called *Alcahest*, that is, *Staltzgeist*, because if the *Alcahest* is the same with the *Circulatum*, they imagined it was made from Sea Salt, coagulated, resolved, and coagulated into a transmuted Form. But again, others suspected, that it was called *Alcahest*, quasi *Algeist*, or a perfectly pure simple Spirit: This they thought its Process of Coagulation, Resolution, and Coagulating, seemed to teach us. And lastly, there is Faber's Opinion, who says, it is a pure, mercurial, metalline Spirit, which is so united with its own proper Body, that hence two become one Body, that is inseparable, and indestructible. *Eph. Germ. D. 11. Ann. 8. App. 3.* This, then, being all we can learn from the Etymology, let us pass on to the Terms, and see, if by comparing them together, we can get any farther Light into it. Paracellus himself has left us no synonymous Name, but Helmont has a great many; and therefore these we will now examine. And in short, we have no other Assistance, besides the Authority of Van Helmont alone, who declares, 'that the very same Bottle was delivered to him.'

That I may explain Helmont's Doctrine of the *Alcahest*, so far as it is possible to render it intelligible, I will give the principal Passages in this Author, where it is mentioned, or any Thing said relating to it, and then shall give the Sentiments of Boerhaave, by way of Commentary.

'I know a Water, which I do not care to discover, by Means of which, all Vegetables are changed into a distillable Liquor, without the least Fæces at the Bottom of the Glafs; which Liquor being distilled, with the Addition of Alkalies, is reduced into insipid elementary Water. *Helmont. Complexionum atque Mistionum elementalium Figmentum, Sect. 27.*

'I put of oaken Coals, and a certain Water, an equal Quantity, in a Glafs hermetically stopped. In three Days, all the Coals were turned, by the Heat of a Bath, into two diaphanous Liquors, differing in Gravity and Colour, which being distilled by Sand, with two Degrees of Heat, the Bottom of the Glafs appeared as clean, as when it came new from the Glafs-house; and soon after, the two Liquors ascended in a Bath-heat both together, equiponderating the Mass of Coals; but the dissolving Liquor remained at the Bottom, keeping its own Weight and Virtues. Moreover, the two Liquors, mixed with a very small Quantity of Chalk, by a third Distillation, ascended almost with their first Weight, and with all the Qualities of Rain-water. Therefore the Gas of the Coals, which does not exhale, except the Vessel be open, and vehemently heated; together with its Ashes, are no other, materially, than meer Water. For the seminal Property of the Concrete which remains in the Gas, by Length of Time, and the Cold, perishes, and the Gas returns to its original Water. *Helmont. ib. Sect. 29.*

'I thought on a Method how to transfer all my Tribulations on the Heads of Nero and Tiberius; and being greatly fatigued, I was on a sudden wonderfully refreshed and comforted, and falling into a Kind of Slumber, I found myself in a Palace superior to human Architecture, where was an exalted Throne, environed with an inaccessible Light of Spirits. He that sat on the Throne was called *Eft*, and his Footstool *Nature*. The Keeper of the Gate was named *Understanding*, who, without speaking a Word, reached me out a Book, *Election from Darknes*, the Title of which was, *The Bud of the Rose not yet opened*. And though the Door-keeper spoke not a Word, I knew I must eat it; I held forth my Hand therefore, took it, and eat it, and it was of an austere and earthy Savour, so as almost to stop my Larynx, and it was with much Time and Difficulty that I got it down. When I had so done, I fancied my Head to be diaphanous; after which came another Spirit of a higher Order, and gave me a Cup, in which was comprehended in a Word, *Ignis Aqua*, a Name purely simple, singular, indeclinable, inseparable, immutable, and immortal. *Potestas Medicaminum. Sect. 3.*

'It is the *Arbor Vitæ*, the Tree of Life alone, that can restore lost Strength, and make Life flow on for a certain Space of Time. But the Difficulty of preparing lies in this, that the Wood [the Cetim] must be resolved, without a Resolution of its Virtues, by such a Warmth as that of Sol Martius, as far as its *Ens Primum*. For it is on account of

these Qualities that it is endued with a fermentative Faculty of preserving and seasoning, with free Ingress into our first constituent Principles; and insinuating itself, through the Organs, into the Familiarity of our natural Spirits. Now the Liquor obtained by such a Resolution has all the Virtues of the Vital Cedar, together with its seminal Property, and that which is formative of long Life. For the whole Mass of Wood is resolved into a Liquor, which Mass, if it were otherwise distilled, would undergo Transmutation, and become a new Creature; which is sufficiently proved by distilling *Aqua Vitæ* from Grains of Corn or Lees of Beer; and also by Oil distilled from Wood, and even from the Oil of Olives itself. The Manner of Preparation is as follows:

'Resolve Fragments of the Wood Cetim with an equal Weight of the Liquor *Alcahest*, in a sealed Glafs, over a gentle Heat; and within a Week you will see all the Wood dissolved into a milky Liquor. About the fifteenth Day there will swim at the Top distinctly two Sorts of Oil, which will increase in Quantity for a Month; and their Separation appear more obvious. Then separate the Oil from the Water by manual Operation, and distil the Water in a Bath, and the Liquor *Alcahest* shall remain, with its first Weight at the Bottom. But digest the Water and Oil for three Months in a gentle Heat, and all the Oil shall take the Nature of Salt, and mix itself with the Water. This is the *Ens primum Cedri: Helmont. Arbor Vitæ.*

'The highest and most dignified of all Salts, is what has attained the utmost Degree of Purity, and Subtlety, which pervades all Things, is the only Thing that whilst it acts, remains itself immutable, and which resolves all at Pleasure by a ready Obedience, triumphing over rebellious Matter, with as much Ease, as warm Water melts and volatilises Snow. *Helmont. Potestas Medicaminum. Sect. 24.*

'I am taught by spagyric Theorems that a small Liquor may be prepared, which shall keep the Constitutions of Simples uncorrupted without any other Seasoning. *Helmont. Pharmacopolium. Sect. 34.*

'*Alcahest* reduces all the tangible Bodies of the Universe to their first Life, without any Change in itself, or Diminution of its Virtues, and can be changed or subjugated by none but its Equal. *Helmont. Ignita Actio Regininis. Sect. 11.*

'None ever cured the Leprosy, who had not first obtained the Liquor *Alcahest*, which being so tedious in Preparation, no Man, though he understands the Art, will ever arrive at the Possession of it, except whom the Most High, by special Grace, shall conduct thither: For he must be elected by a peculiar Privilege, and be otherwise qualified, in order to obtain so extraordinary a Medium, by which all sensitive and insensitive sublunary Things are equally penetrated, even to the seminal and intrinsic Root of the *Primum Ens*; whence it puts all Things under Subjection to it, and changes them without Reaction of the Patient, or Depauperation of the Agent, and is therefore the same in Number, Weight, and Activity after the thousandth Action, as after the first. *Helmont de Lihiasi. Sect. 27. de Febribus. 11.*

'Take of the Ludus or Cevilla Paracelsi, and the Liquor *Alcahest*, each one Pint. Distil off the *Alcahest*, and the first Time all the Ludus will be changed into a Salt which will run down in a glafs Plate set in a moist Place, without any earthy Residuum, and the defluent Liquor will be of a yellow Colour, and, being hermetically stopped, will rise in small Bubbles, like Froth, and swim at the Top in the Form of green melted Fat. And this is the *Altholizoin* correctum of Paracellus, and the Gall of the Earth. But the Man who thinks he can attain it by an Addition of Salt-petre, or the like, must know that such Salts, how often, or how carefully soever they are mixed with the Ludus, the Salts will only all run down, and leave the Earth in Dregs, in the Plate. But the Ludus ought to be all transmuted into the tinctured Sal Volatile, reserving nothing of its Adjunct, the *Alcahest*, which, as well as the Ludus, preserves its former Weight, and the Ludus keeps its mineral Virtues, which were bestowed on it by the great Creator. This is an extremely difficult Operation, not as to the Preparation of the Ludus but of the *Alcahest*. *Helmont. de Lihiasi. Sect. 23.*

'The Liquor *Alcahest*, *Ens primum Salium*, Lili, the first Metal, the Mercurius Diaphoreticus, or the Aurum Horizontale, one of these, which so ever it be (for they all conspire as Unions in Consanguinity of one Dissolvent) is sufficient to cure all Diseases. *Helmont. Respondet Author. Sect. 1.*

'The Arcana of Paracellus are,
1. 'The Tincture Lili, reduced from an immature Electrum to a Vinum Vitæ, one Part of which is the first Metal, the other the Essence of the Members.
2. 'The Mercury of Life, the intire Offspring of Stibium, which absolutely cures all nervous Distempers.
3. 'The Tincture Lili, an Antimonial Preparation, of the same Virtues with the preceding, but weaker.
4. 'The Mercurius Diaphoreticus, which is sweeter than Honey, and fixed by the Fire, has all the Properties of the horizontal Sun. It will perform all that the Physician, or Surge-

Surgeon can with, as to the healing Part; but is not so powerful in Renovation, as the preceding Preparations.

5. 'His *Alcabeft* is more eminent, than immortal Liquor, that immutable resolving Water.

6. 'His *Sal circulatus*, which reduces all tangible Bodies to the Liquor of their Concretes.

7. 'Then follow the Element of Fire out of Copper, the Element, or Milk of Pearls; but the Essences of Gems, and Herbs, are far inferior to the foregoing.

8. 'Lastly volatile Salts carry in them the precise Particularity of Herbs and Stones, but attain not to the Efficacy of Universals. But the Salt of Coral, which is the only Cathartic among them, cures Ulcers of the Lungs, Bladder, Larynx and Reins by Purging; and even extirpates the Gout.

'It is common Mercury from which the Liquor *Alcabeft* is once distilled, and resides at the Bottom coagulated and pulverisable, neither increased or diminished in Weight. The Water of the Whites of Eggs is to be cohobated with this Powder, till it has acquired the Warmth of Coral.' *Helmont.*

Arcana Paracelsi.

In the first Place Van Helmont calls it simply, *Water*; telling us that he 'Knew a *Water* which he must not discover, by the Mediation of which all Vegetables might be transmuted into a distillable Liquor, without the least Fæces remaining at the Bottom of the Vessel.' And he farther tells us, that 'He mixed together a certain *Water* and Coals made from Oak, in an equal Quantity, and digested them with a Bath-heat, in a Glass hermetically closed.' He calls the same a *thick Water*, for he says, 'that in the second Book of the Maccabees,' Chapter the First, there is Mention made of a 'Thick Water, which was a perpetual Fire, and perhaps not unlike his Water.' And he in another Place calls it a *solvent Water*, when he says, 'The Liquor *Alcabeft* is an immutable, solvent Water.' But he came still nearer the Thing, when, in one Word, he called it (*Ignis Aqua*) Fire Water; for whilst he is giving an allegorical Account how he came by his Knowledge, he pretends 'He received a Bottle in which there was *Ignis Aqua*, of one Word only, a Name perfectly simple, singular, indeclinable, inseparable, and immortal.' And again he calls it, 'A *Latex* reduced to its least Atoms possible in Nature.' But he very frequently calls it a *Liquor*. 'By the Addition of the Liquor *Alcabeft* of Paracelsus, may be known how much any Vegetable contains of either Luminary.' And he calls it also the *solvent Liquor*. All these Things, therefore, seem to intimate, that this ARCANUM was of a moist, liquid Form, like a Sort of Water. In another Place, as a Synonymon, he makes use of the *Fire of Hell*; for he says expressly, by the 'Fire of Hell, which is the Liquor *Alcabeft* of Paracelsus. Original Sand resists both Art and Nature, nor can by any Means be made to recede from its Constancy, except by an artificial infernal Fire, in which artificial Fire, Sand becomes Salt.' If Helmont, therefore, in this Appellation has followed Paracelsus, by this we may know what the *Alcabeft* was, because Paracelsus himself has wrote of this infernal Fire.

Afterwards, Helmont says, 'This is a most excellent and happy Salt, which has arrived to the utmost Degree of Purity and Subtlety that Nature will admit of.' And, for this Reason, he seems to call it, the '*Ens primum Salium*, the '*Sal Circulatus*,' and the '*Sal Circulatus Paracelsi*;' of which he made Mention in his Book, *de Renovatione & Restauratione*. If, therefore, Van Helmont has acted candidly and honestly in this Affair, we may from these synonymous Terms, and the Writings of Paracelsus, make an Attempt towards a Discovery of this wonderful Menstruum. But before we proceed to this, we must consider its Origin. First, then, 'It is never found spontaneously in Nature, for here Nature is deficient;' in the same Place he asserts, 'That a Part of Earth may be homogeneously reduced into Water by Art;' but strenuously denies at the same Time, that 'This can ever be effected by Nature alone, because by Nature alone no Agent is produced, by which true Earth may be reduced into Salt and Water. Nor is this Agent produced without the Assistance of Chymistry, which alone discovers a Liquor that cannot be altered, being reduced to the smallest Atoms that are possible in Nature. Not that this is to be effected by vulgar Chymistry, but by the Labour of Wisdom.' And this Agent, as he expressly asserts, 'Is the ultimate, and most perfect Production of this sublime Chymistry.' And lastly, he says, 'Chymistry, as its most excellent Effect, prepares an universal Solvent. Moreover, in the whole Art there is not any Operation more difficult than the Preparation of the *Alcabeft*; nor is there in the whole Art any Thing more laborious. Nor can the Knowledge of this Operation be acquired either by Reading, or Speculation, but by a Fulness of Science, and that too doubly confirmed; and hence very few are qualified to arrive at a Knowledge of it. Hence this Liquor, whose Preparation is so excessively tedious, and difficult, cannot be obtained by human Understanding; for though a Person should have so much Skill in the Art, as to be properly qualified to come to the Knowledge of it; yet

'unless the Most High, by a special Favour, conducts him to it, he will never arrive at it; for whoever enjoys it, must be chosen by a particular Privilege: For God alone is the Dispenser of it, for Reasons that are known to the Adepts.'

From this Origin of the *Alcabeft*, thus delivered by Helmont, we may see how much they are mistaken, who idly imagine, they shall be able to prepare it with very little Trouble. These vain Boasters certainly thus discover both their Ignorance and their Dishonesty. Nor let them impose upon you, by pretending to more Things of the same Nature; for Helmont absolutely refutes every Thing of this Kind, by plainly asserting, that 'As in the whole Compass of Nature there is but one Fire (*Vulcanus Ardens*) a burning Fire, so there can be but one Liquor, which will dissolve all Bodies into their first Matter, without any Alteration in itself, or Diminution of its Strength; as the Adepts know and testify.' Being secured, therefore, by this Doctrine, I have been able to silence many ignorant People, rich in Promises and Expectation, and sometimes exceedingly artful, for upon asking them a few Questions, by their Answers their profound Ignorance, with Respect to the Knowledge they boasted of, soon appeared.

Let us now proceed to examine into the stupendous Virtues, which are ascribed to this wonderful and almost tremendous Arcanum. This Menstruum then can efficaciously exert its dissolving Power upon all sensible Bodies whatever, whether Simple or Compound, Volatile or Fixed, Solid or Liquid, Animal, Vegetable, or Fossil; even upon Gold and Mercury themselves, upon which nothing else can act, so as to affect their intimate Parts.' Thus in his own Way of Speaking, 'Our Mechanics have discovered to me, that all Bodies, whether rocky, stony Substances, or Gems, Flints, Sand, Marcasites, Clay, Earth, Bricks, Lime, Sulphur, &c. may be transmuted into an actual Salt, equiponderant to the Body from whence it is produced: And Vegetables, Flesh, Bones, Fish, and every Thing like them, I have known to be reduced by it into their three mere Principles: Metals, however, on Account of an Atactic Commixture of their Seed and Sand, are reduced to a Salt with Difficulty. For Sand, or original Earth, resists both Art and Nature, nor will by any Help of Art or Nature be made to recede from its primitive Constancy: But under the Power of the artificial infernal Fire alone, Sand becomes Salt; and at last Water. Again, the *Alcabeft* of Paracelsus, by subtilising them, transmutes all natural Bodies.' And in another Place, 'All Bodies are easily reduced to Water by the Application of the Liquor *Alcabeft* of Paracelsus; even those that otherwise refuse to be resolved into their three Elements. By the Help of this likewise all Vegetables are commutable into a Liquor, which may be distilled without any Fæces remaining at the Bottom of the Glass, even coken Coal itself. For one and the same Liquor, *Alcabeft*, perfectly reduces all tangible Bodies in the Universe to their first Life, even all Poisons themselves, and dissolves every Thing besides itself, as warm Water dissolves Snow. Oil itself, and Spirit of Wine, Cedar-wood; all Kinds of Elixirs Proprietary; the *Ludus* also of Paracelsus, Mercury, Gold itself, which cannot by any other Solvent whatever be radically destroyed as far as its constituent Principles, as it is much easier to make Gold out of what was not Gold before, than to produce any Thing from Gold which shall not be Gold.' And indeed in this the whole Fraternity of Adepts unanimously agree.

Now let us consider the Manner in which the *Alcabeft* exerts its Power upon these its Objects, and here we find its Efficacy is always excited by Fire, and this applied only in a gentle Degree, whether it acts in Digestion, Distillation, or Cohobation. For he mixed the *Alcabeft* with 'Coal, made from Oak, in equal Parts, and digested them for three Days in a Bath-heat, in a Glass hermetically closed, and the Solution was then completed.' The '*Sal Circulatus*, by Digestion only, reduces every Sort of Oil, and Spirit of Wine, into a prodigious different Form, from what they were in before.' If the '*Alcabeft*' is mixed with an equal Weight of Cedar, reduced to small Pieces, and is exposed to a kindly Warmth in a sealed Glass, the whole Wood will, in a Week's Time, be reduced to a milky Liquor. Sometimes too, the Work is done by one simple Distillation: 'For if the Liquor *Alcabeft* is distilled once only from common Mercury, it leaves it at the Bottom coagulated, and pulverizable, and neither increased nor diminished in its Weight, which is effected in a Quarter of an Hour.' But sometimes a Cohobation is necessary, in order to accomplish your Design; 'for frequently, when Bodies are converted into a Salt of the same Weight they were of before, they must be cohobated some Number of Times with the *Sal Circulatus* of Paracelsus, before they will intirely lose their Fixity, which happens principally in Metals, Gold in particular, on Account of the perfectly equable Commixture of its Seed. On the other Hand, if by one Distillation only it is drawn off from the *Ludus*, or *Cevilla* of Paracelsus, this Distillation in so small a Space of Time as that of two Hours, it converts the whole Stone into a Salt of the same Weight. As for any other Manner of applying this universal Solvent, I can discover none, nor does it appear by any

any Argument, that a greater Degree of Fire is necessary for the Operation. By a gentle Agitation of its Parts therefore, excited by the Fire, it is capable of dissolving all Bodies. For the *Alcabeft* itself rises in Distillation with the second Degree of a Sand-heat. But it does not ascend with a Bath-heat.

But farther, there was Nothing ever observed in all Nature, or even related, that is more surprising than the physical Effects which these Authors ascribe to the Action of this Menstruum: For it intirely converts the whole Body of its Solvend, into a Matter which has neither gained nor lost the least Weight during the Operation, and this transmuted Matter seems always to be liquid or saline. In this, however, there is some Diversity; for, Mercury, by the Action of the *Alcabeft*, is reduced to a fixed Powder, which is pulverizable, resists a Wind-fire, and remains fixed if mixed with Lead. Almost all other Bodies are converted into a Salt æquiponderant to their former Mass. An oaken Coal is soon changed into two diaphanous Liquors, which differ in Situation and Colour. Cedar-wood is converted into a milky Liquor of equal Weight with it, and then farther into a two-fold Oil, which afterwards, by simple Digestion, are changed into a pure Salt, so that it may be mixed with Water. But the Ludus, or Cevilla of Paracelsus, which is a Stone found at the Bottom of the Schelde, near Antwerp, is within the Space of two Hours only, converted by a gentle Distillation into a Salt equiponderant to the Concrete, which being exposed to the Air, dissolves, and runs into a Liquid without leaving any Fæces at all. From this whole Account then, it is evident, that this Solution at the Beginning is performed after different Manners, but that at last, however, it reduces all Bodies into a Kind of Salt that may be dissolved in Water, Mercury alone excepted, which on Account of its perfect Simplicity, which renders it more pure than Gold, and exceedingly like pure Water, refuses to be converted into a Salt; and hence it radically resists all Division possible to be effected, either by Art or Nature, and for this Reason is perfectly indestructible. These Bodies, however, after they are by the Help of the *Alcabeft* reduced to an æquiponderating Salt, still retain their proper Virtues, which depend upon the seminal Property of them, and which therefore are peculiar to them, and not common to others. This very remarkable Circumstance is described, when he says: 'The *Alcabeft* of Paracelsus, by subtilising them, transmutes all Bodies in Nature; for Bodies, when they are reduced to their utmost possible Subtility, at last pass into another Substance, with a Retention of their seminal Properties. By the universal Solvend, all Things return back to their *Ens primum*, and exhibit their native Qualities, whence they have an Opportunity of acquiring great and unlimited Powers.' But more plainly still, while he asserts, 'that this Liquor alone dissolves all Solids into their first Matter, without any Diminution, or Alteration of itself.' And therefore, he cries out, 'Get but acquainted with this homogeneous, immutable Solvent, which resolves all its Objects into their first liquid Matter, and then you will be able to look into the intimate Essences of Things, and examine their Qualities. By this Means, therefore, all these Bodies are converted into a saline volatile Matter, which still retains their particular spirituous Rector. Hence it may be intimately mixed with any Humour of the human Body, and with it circulate through all its Vessels, and in its whole Passage, every where, exert those Powers which are proper to it, with Regard to our Bodies. These, therefore, they called Potables.' Hence, then, we learn, what the Adepts meant by potable Gold, and how vain and deceitful the Boast of those is, who pretend to be Masters of it. Gold, when it is corroded by Acids, will still give you again its actual Particles of Gold, though they then lie concealed in the Acid: But the philosophical potable Gold is a saline Liquor, æquiponderant to the Gold, without any Menstruum whatever united with it, being only the pure, simple, first Matter of the Gold, or its *Ens primum*. Here therefore, above all, it is particularly remarkable, that the *Alcabeft*, whilst it thus dissolves, never mixes itself at all with its Solvend, but remains perfectly separate from it. Hence therefore, it neither increases nor diminishes the Substance of the Body dissolved, but leaves it exactly the same as it found it. This evidently appears, when he says, 'that the two Liquors of the dissolved oaken Coal, which were different in Situation and Colour, rose with the Warmth of the Bath, whilst the solvent Liquor remained at the Bottom, of the same Weight as before. For it finds no Body with which it can be joined, itself being too pure and subtle, and reduced to its least Atoms, and hence disdaining all Ferments, and always remaining single. Hence it acts only by an external Action, not concurring with its transmuted Object, as the purest Fire uses to act upon its Object, as warm Water melts Snow. For this Liquor leaves nothing of itself mixed with its Solvend.' Hence, therefore, besides others, this Menstruum seems to have two great Advantages above all others: In the first Place, that it does not act by Attraction, or Repulsion,

but only by a mechanical dissolving Power, contrary to all others that we are acquainted with, Fire, perhaps, alone excepted. And then, Secondly, that it always preserves intire the native Powers of its Solvends, and yet, whilst it resolves Poisons, it deprives them of their violent and deadly Quality, and gives them the most excellent medicinal Virtues, by reducing them to their *Ens primum*, which, however, it must be allowed, is very difficult to comprehend. When Bodies, now, are by the Help of the *Alcabeft* reduced into their saline volatile *Ens primum*, retaining at the same Time all their seminal Qualities, if they are then urged any farther by the Action of this Solvend, they are perfectly deprived of their proper seminal Virtue, and from every one, how different soever, there is produced the same unactive, inodorous, insipid, simple, elementary Water, so that by too great an Application of the very same Menstruum, whatever Excellence was produced before, is now destroyed. It appears, therefore, that the ultimate Matter of all tangible Substances is Water, upon which the *Alcabeft* itself can act no farther, but which being again impregnated with the seminal Fecundity of any Seed, may be converted again into any new Bodies whatever. Hear what he says himself: 'Every Body is transmuted into an actual Salt equiponderant to the Body from whence it is made; and this Salt being cohobated some Number of Times, with the Salt Circulatum of Paracelsus, loses intirely all its Fixity, and is transmuted into a Liquor which itself likewise at last becomes an insipid Water, of the same Weight with the Salt from which it proceeded. Original Sand, by the artificial infernal Fire alone, is changed into a Salt, and then a Water.' And, 'I know a Water, by the Mediation of which, all Vegetables are converted into a distillable Juice, which rises without leaving any Fæces at the Bottom of the Glass, and which Juice being distilled with Alcalis, is totally reduced into an insipid elementary Water. An oaken Coal, turned into two Liquors by the *Alcabeft*, and then mixed with a little Chalk and distilled, rises with almost its former Weight, and has all the Qualities of Rain-water. And then they all become so volatile, that they rise with a Bath-heat, and fly off from the *Alcabeft*, which remains at the Bottom.'

But what is much more surprising than all the rest, is, that this Menstruum, whilst it operates so surprisingly upon all other Bodies, is not in the least lessened, altered, or weakened in its Efficacy by any of them: So that in this Respect again it resembles Fire, and is with a great deal of Reason compared to it. By a very expressive Phrase, therefore, it is said 'To act by its Power of acting upon all sublunary Bodies, without Reaction. And after it had dissolved the oaken Coal in so extraordinary a Manner, the solvent Liquor remained at the Bottom of its former Weight and Strength. For its Transmutation is despaired of, as it cannot find any Body worthy to be wedded to, and is single with Regard to every commiscible Ferment, to which it might be in Subjection, and hence it cannot die. In its most perfect Action, therefore, it reduces every tangible Substance to its middle Life, without any Change in itself, or Diminution of its Strength. It is immutable therefore, and immortal. This alone, by operating, is not altered: It acts, therefore, without any Reaction of the Patient, or Depauperation of the Agent; for this Dissolvent is homogeneous and immutable, and being the same, both in Number, Weight, and Activity, it is as efficacious, the thousandth Operation, as it was at first.'

But among other Things remarkable in this Menstruum, is, its Degree of Fixity or Volatility in the Fire; and this again is exceedingly surprising. For after it has rendered all Bodies, the most fixed not excepted, so volatile, that they will rise with the gentle Heat of a Bath, yet itself remains fixed at the Bottom, nor ascends with them. In the mean Time, however, the *Alcabeft* itself is so volatile, that it rises in Distillation, together with the Bodies it has dissolved in the second Degree of a Sand-heat. And hence it may, by Distillation be drawn off from common Mercury, which it fixes and coagulates. Hence, therefore, the small Compass of Heat is exactly determined within which the whole Power of this *Alcabeft* exerts itself upon all Bodies in Nature.

Lastly, before we quit this Subject, we must observe, that this Solvend, which thus remains intire in all its Operations, nor is ever overcome, or fatigued by the Resistance it meets with from any Thing, does yet acknowledge one Body in Nature with which it may be so united, as to be brought into Wedlock with it. This appears evident, by considering the Text of the Author, 'Chymistry was solicitous about finding out a Body, which should have so great a Sympathy of Purity that it should not be dissipated by any Corruptent. And at last, Religion was astonished to see a Liquor discovered, which being reduced to the least possible Atoms in Nature, remained single, and disdained to be wedded to any Ferment. Its Transmutation therefore was despaired of, as it could not find any worthier Body with which it might be united. But the Labour of Wisdom found out an anomalous Body in Nature; which rose without any commisc-

cible Ferment different from itself. This Serpent bit itself, revived from its Poison, and afterwards knew no Death.' So that we see here the Conjunction of two Things which were in some Measure different. But he intimates this still more plainly and distinctly. He says, 'That one and the same Liquor, *Alcabeft*, reduces all the tangible Bodies in the Universe to their first Life, without any Alteration in itself, or Diminution of its Strength, but is brought under the Yoke, and altered by its equal alone.' But he comes still nearer the Affair when he tells us, 'That when Mercury is perfectly freed from the original Sulphur, which intimately adheres to it, it is not afterwards mutable by any Fire, but immediately destroys all other Seeds, except its Equal.'

This is the Sum of what Helmont has said on the Subject of the *Alcabeft*, and the Whole must rest upon his Authority, because no other Author, I have met with, speaks of it in such Terms. The antient Philosophers and Chymists seem to have been utterly unacquainted with it, at least they nowhere mention it, though, of all the Desiderata in Physic, this is of the greatest Importance.

What has been said on this Subject, will undoubtedly raise a Curiosity of knowing, in what Kind of Matter the *Alcabeft* ought to be looked for. It is for this Reason I will expatiate a little upon this Subject, having made an incredible Variety of Experiments, many of which I have had Reason to regret, and heartily repent of.

Paracelsus had a Liquor, which he prepared, by an infinitely tedious Circulation, from Sea Salt, in which Nature has placed the greatest Degree of Perfection. This, by an indefatigable Industry, he reduced to a perpetual Oil, and then he called it the *Ens primum Salium*, *Oleum Salis*, *Liquor Salis*, *Aqua Salis*, *Circulatus Sal minor*, *Circulatum minus*. And the troublesome Preparation of this *Sal Circulatus* is described without any Thing obscure in it, unless that he does not explain what the Spirit of Wine is, which is required to separate the impure from the pure. This agrees exactly with the Opinion of Van Helmont; for he says, that 'The Salt of Bodies, being some Number of Times cohobated with the *Sal Circulatus* of Paracelsus, is converted into Water.' And hence he ascribes the Virtues of the *Alcabeft* to the *Ens primum Salium*; and says, that 'By the *Sal Circulatus* all Poisons die. Hence he calls it 'The most supreme and happy Salt, which is reduced to the ultimate Degree both of Purity and Subtlety, and hence pervades every Thing, that alone remaining immutable during its Operation, whilst it readily dissolves every Thing else. This *Sal Circulatus* acts wonderfully upon Oil and Spirit of Wine. This *Sal Circulatus* reduces Bodies into the Liquor of their Concrete; and with that may be prepared the *Ludus*.'

But Paracelsus had another SOLVENT much more powerful than the former *Circulatum minus*, and much more difficult to arrive at the Knowledge of, which therefore he called his *Circulatum majus*, *Archidox*. 10. C. 4. And hence, in the same Place, he calls it *Materies Mercurii Salis*; and afterwards, *Living Fire*, *Archid.* 10. C. 4. In common Mercury he acknowledges a most perfect Fire, and a latent, celestial Life, and that the Quintessence of Mercury is celestial Fire, if it is dissolved with its Mother, viz. an *Arcanum* of Salt, *Archidox*. 10. C. 6. When these two, therefore, are intimately united by a true Union, and together rendered pure, subtle, and volatile, then seems to arise that wonderful mercurial Water, which he describes in the Chapter *de Corrodente specifico*, where he says, 'That Gold so dies there, that it continues to be Gold no longer; whereas, in all other Corrosions of Gold, the Gold is only divided into very small Particles, but still remains the same true Gold, and, by an artificial Reduction, may be always recovered again. By this Art, therefore, there is a perfect Marriage of Water with Water: For Water is twofold, viz. a common Water, which resides in Salt; and a metallic Water, which is found in Mercury, both which however have the same Root.' All this seems to have been understood by Van Helmont exactly in the same Manner, and therefore I shall just add what he has said upon it, as follows: 'The internal Mercury of Metals, perfectly freed from every Taint of a metallic Sulphur, coheres together with an indissoluble Union, so that it radically resists all possible Division, either by Nature or Art. Nor could I learn the Nature of Water, except under the Rod prepared from Mercury's Wand. And I found the Nature of Mercury adequate to Water; for it does not contain the least Earth in it, but is always the Son of Water alone.' And he says, with all the antient Alchemists, 'If I had not seen, that Mercury eludes all the Labour of the Artists so, that it either flies all off from the Fire still intire, or else all remains in it, and in both Cases retains its immutable and primitive Identity, and the anatic Homogeneity of its Identity, I should say that that Art was not true, which is true without any Falsity, and by far the most true of all others. So that what is above is like that which is beneath, and the contrary. And hence it is absolutely impossible either for Art or Nature to find any different Parts in the Homogeneity of Mercury, not even by the *Alcabeft* itself, as Mercury is more simple than even Gold, and formed with a greater anatic Identity: and

hence therefore Mercury is as indestructible as the Elements themselves. Hence all sublunary Things are too weak to subdue pure Mercury, or to penetrate, alter, or defile it. It remains secure in Air, Fire, and the acrid Liquor. It is not affected by any Solvent, much less penetrated by Air; and therefore there is nothing in Nature like this pure Mercury, no not at a Distance. It resembles the *Ens primum* of Metals, and comes very near it, and at last, existing actually simple, is not as a constitutive Part of Things. From these Principles we know that it is brought under the Yoke, and changed by its Equal alone: For this anomalous Body in Nature rose without any commiscible Ferment different from itself; but it bit itself, revived from the Poison, and afterwards knows no Death.'

Thus we have the History of the *Alcabeft* of Paracelsus, and Van Helmont, extracted from their own Writings with the utmost Accuracy. Hence it evidently appears that it is in vain to seek for this universal Menstruum in human Urine, or any of its Productions. Nor can it ever be found in Tartar, or any of its Preparations, though this may be substituted as *Vice-Roy to the Prince*. Nor can Phosphorus ever be reduced to it; because its Properties that have been specified, will not allow of it. Hence also it appears that Glauber is mistaken, when he searches for it in the fixed Alkali of Nitre; as is Zwelfer in expecting to find it in the extremely acid Spirit of Vinegar, distilled from Verdigrease. Nor does the celebrated Guernerus Rolincius seem to have had a better Idea of it, when he supposed it to be procurable from a fixed Alkali as its Basis, and a mineral, vegetable, or animal Acid; for from Salt of Tartar, and Vinegar of Antimony, a meer vitriolated Tartar is produced; from Salt of Tartar, and Vinegar, a Tartarus Tartarificatus; and from Salt of Tartar saturated with acid Whey, only a more precious Tartarus Tartarificatus. Nor does the Addition of Sal Ammoniac much alter the Case. See *Eph. Germ. D. 1. Az. 6, 7. p. 193--196. App.* And indeed, Nobody in the Description of the *Alcabeft* has come nearer to the Sentiments of Paracelsus and Van Helmont, than Petrus Johannes Taber, in his Manuscript upon the Subject of Alchemy, wrote to the most serene Duke of Holstein, which is printed in *Eph. Germ. D. 2. An. 8. App. p. 111. 117.* in which are these remarkable Words, which confirm my Opinion. 'The Liquor *Alcabeft* is a mercurial, pure, metallic Spirit, so united to its own proper natural Body, that these two become one inseparable indestructible Being, destroying every Thing else, and converting them into their first Matter. It is the true *Mercurius Philosophorum*, prepared from the mineral Kingdom, joined to its own Body, inseparable from it, being a milky, buttery Liquor, penetrating, and dissolving every Thing. This is of two Sorts, simple and compound. The Simple is made from a pure metallic Acid, and a pure metallic Salt, rendered volatile with its Spirit; and the Preparation of this is extremely difficult. But that of the Compound, is still far more so; for this is prepared from a mineral Acid, and a pure animal and vegetable Salt. The Liquor *Alcabeft*, or the perfect pure *Mercurius Philosophorum*, is like Fire, of an incorruptible, unalterable Nature, reducing every Thing to its first Matter.' And the ingenious Joachim Becherus, in his *Physica Subterranea*, is almost of the same Opinion; for he asserts, that he has discovered in Sea-salt, a certain arsenical and mercurificating Power, which was it but separated, and pure, would be the *Alcabeft* itself, which nevertheless would be very different from the *Mercurius Philosophorum*. Hence Mercury itself, he looks upon as a sulphureo-metalline Substance, which of itself would be solid, and which receives all its Fluidity from an arsenical Sulphur of common Salt. This very subtle Conjecture, I wish he had more clearly demonstrated. The Sum of his Argument amounts to this: 'The purest Silver, corroded by Spirit of Nitre, and precipitated by Spirit of Sea-salt, becomes volatile, and then easily disposed to part with its Mercury; and therefore Sea-salt can change the purest Metals from their fixed Nature, into true Mercury.' If I should be asked, if I believe that any of the Chymists were ever possessed of this grand Arcanum? I should answer thus: Van Helmont complains, that the Bottle was once given him, but that it was taken away again, and therefore he could not make many Experiments with that Liquor: And Paracelsus does not say so many and so great Things of his Solvent, and therefore it is difficult to determine any Thing about it with any Degree of Certainty. This, however, I will venture to assert, that if you examine Sea-salt and Mercury, by every chymical Method possible, you will never repent of your Trouble. *Boerhaave's Chymistry.*

Boerhaave has said so much on the Subject of the *Alcabeft*, that I have only to add, that Van Helmont's *Circulatum Minus* is said to be prepared by a Circulation of nine Weeks, from equal Parts of Spirit of Urine rectified three Times, Alcohol, or highly rectified Spirit of Wine, and Vinegar twice rectified.

Those who are acquainted with the great Effects which may be produced by these separately, will readily believe that these by an intimate Union may be converted into a Menstruum capable of doing surprising Things; especially as we know, that

that neutral Menstrua, as this must be, will act upon some very hard Bodies, which are not otherwise dissoluble by acid, alkaline, watery, or spirituous Menstrua.

This I insert on the Authority of a Gentleman who had it from a Son of Helmont's, who lived for some Years at the Court of Hanover, under the Favour and Protection of the Princess Sophia, Grandmother to the present King of Great Britain.

ALCALI, or ALKALI, a Word much used by the Chymists to express a Body which is esteemed the Reverse of an Acid. Many whimsical Theories have been spun out by Chymists of warm Imaginations, upon a Supposition of a certain Enmity subsisting betwixt these two. This is therefore an Article of Importance enough to deserve a strict Examination, which I shall therefore bestow upon it, in Hopes of giving a just Idea of some Things not commonly known, unless to Chymists of a philosophical Turn, and those perhaps of the first Rank.

KALI, a Word well known upon the Eastern Coasts, and in Egypt, signifies a certain Herb, replete with Salt, which grows about the Sea-shore, and the Banks of the Nile, and also those of the celebrated River Belus in Syria; as Pliny assures us from the Testimony of antient Authors. This Plant, if burnt, when it arrives to its full Growth, produces Ashes remarkable for their salt, acrid Taste, an Evidence of its abounding with Salt. When these Ashes are boiled in Water, they yield a strong, acrid, salt Lixivium, or Lye, consisting of the Salt communicated by them to the Water, which being properly separated, there remains a greyish Part, which will neither dissolve in Water, nor burn in the Fire, but is perfectly insipid, and of the Nature of Earth. If this Lixivium, or Lye, is evaporated to a Dryness in an iron Vessel, a white solid Mass, of a most acrid caustic Taste, and perfectly soluble in Water, is left behind. Since, therefore, *Lix* in the Latin Tongue signifies *Ashes*, and *Lixa*, a *Maker of Ashes*, hence Pliny very properly says, *Cinerum Lixivium*. L. 39. C. 99. and *Lixivium Cinis*, L. 14. C. 2. 25. L. 15. C. 18. And Columella calls Water when it is impregnated with this Salt, and filtered, *Lixivium*, L. 12. C. 41. All these Salts, therefore, are properly enough called *Lixivious Salts*. By Terms, however, already received, they are called *Alcalies*, or *Alcaline Salts*. They are also called by some *Rochetta*, *Soda*, or *Zeda*. From this Salt, and the Calx of all Stones that strike Fire with Steel, may be prepared *Frit* for the making of Glass. These also quickened with Lime, and mixed with any oily Substances whatever, are convertible into Soap. The best of this Sort of Salt is brought from Alexandria in Egypt and Tripoli.

As all our physical Knowledge of Things depends upon the Discoveries which our Senses make in natural Bodies; hence all their Characteristics must be taken only from such sensible Signs thus discovered. Nor are we able to distinguish Bodies in any other Manner. The following Characters therefore of an *Alkali*, may be laid down as genuine, and sufficient for the Purposes both of the Chymist, the Philosopher, and Physician.

1. A fixed *Alcaline Salt* is produced from a vegetable Substance.

2. It is only prepared from a Vegetable by the Action of Fire, which converts it into Ashes.

3. When it is thus prepared, it will remain a considerable Time in the Fire, thus demonstrating its Fixity.

4. In a moist Air, it perfectly dissolves and deposits some Faeces, being impatient of a continued Dryness, if any Part of the Air has Access to it.

5. It impresses an acrimonious Taste upon the Tongue, somewhat caustic, and it excites a Taste of Urine, on which Account these Salts have, though not very properly, been called *Urinous Salts*. For the Taste of this Salt does not resemble that of Urine, at the first Application. But when this has been in the Mouth some Time, and by its Stimulation caused a Discharge of the Saliva, then the neutral animal Salts which are in the Saliva, deposit all their Acid on the fixed *Alkali*, and thus become volatile and *alkaline*, and then impress upon the Tongue a disagreeable urinous Taste, of which this is the true Origin.

6. This Salt, when it is perfectly pure and without Mixture, has not the least Smell, being extremely fixed, even in the Fire. But as it attracts every Acid, if it meets with any Body, which contains a volatile *alkaline Salt*, fixed by an Acid, and therefore without any Smell, it then immediately absorbs the Acid, and the *Alkali* being by this Means disengaged, and rendered volatile, affects the Organs with an *alkaline* Smell, which is falsely ascribed to the fixed Salt. This appears evidently upon mixing a fixed *alkaline Salt* with warm fresh Urine, upon which the Liquor that was inodorous before, instantly emits a disagreeable *alkaline* Smell.

7. Another Property of this Salt is, that when mixed with any Acid whatever, it immediately produces an Ebullition and Effervescence; and afterwards is so intimately united with it into one Mass, that if the Saturation is compleat, the Compound discovers no Sign, either of an *Alkali* or an Acid, but there

is always by this Means produced a Salt of another Nature, which is usually called *Neutral*.

8. If a pure fixed *Alkali* is mixed with the Juice of the Turnsole, Roses, or Violets, it presently changes their natural Colour, which is a Kind of Purple, into a Green.

9. When this *Alcaline Salt* is applied for some Time to a human Body that is warm, and consequently exhales some Moisture, it excites an acute Inflammation, attended with all its Symptoms, which soon becomes a grey, hard, dead, and often black Escar, it is therefore capable of producing a true Sphacelus, or Mortification.

10. All these Salts have the Faculty of deterging, and cleansing, which is not the Case with Respect to those called *Neutral*. These then are the Marks by which fixed *Alcaline Salts* may be known and distinguished from all others; and by these we shall be enabled to avoid Confusion.

Such *alkaline* fixed Salts may be also procured from any crude, fresh Vegetable, burnt to Ashes, and treated in the Manner above mentioned. But some Plants, by this Management, yield a very small Quantity. Such are those, which, when crude, have a pungent Smell, which strikes the Nose, and makes the Eyes water; for almost all the Salt of the Plants is volatile, and is dissipated by the Heat of the Fire. Garlic, the bulbous vomiting Roots, Onions, Scurvygrasses, Ladies-smock, Rockets, Hedge-mustard, Cresses, Radishes, Rapes, Squills, Leeks, Mustard, and the like, are of this Class, in which Nature has so far perfected their *Alcaline Salts*, as to render them volatile, as in Animals.

These lixivious acrid Salts, have been known to the Antients, in almost all Ages of which we have any Account. Aristotle tells us, that the Ashes of burnt Reeds and Bulrushes, boiled in Water, yield a plentiful Salt. And Varro, *de Re Rustica*, informs us, that some People about the Rhine, having neither Fossil, nor Sea-salt, instead of those, made Use of a salt Coal, which they prepared from some Sorts of Wood, burnt: From which it is plain; that they knew a Method of preparing these Salts, not unlike that of Trachenius, so as to make them less acrid, and to come nearer to the Nature of the native neutral Salts. Hence Pliny asserts, that Ashes have the Quality of Salt, but are milder. And that the burnt Faeces of Wine have the Virtues of Nitre (the antient Nitre). And in another Place he speaks of the Nitre produced from burnt Oak, which, he says, yields but a small Quantity, L. 31. C. 10. We farther learn from Pliny, that Ashes were in his Time used medicinally, and the Lixivium made of them drank as a Remedy. All these Authorities, to which more might be added, sufficiently evince, that the Discovery of *Alcalies* is not so modern as some imagine.

No Native Salts have yet been discovered, with which the preceding Characteristics agree; *Alcaline Salts* being procured from vegetable Substances only, by the Action of Fire. But since the first Calcination of Vegetables that ever happened in the World; these Salts have been produced. Hence therefore, in all Ages and Places where this has happened, there must have been a prodigious Quantity of this Salt generated, which always is at last together with the Ashes returned to the Earth. In the Revolution, therefore, of such a Number of Years, the whole Earth must have been converted into this Salt, provided it was immutable. But this is not the Case, for these Salts, when committed to the Earth, render it indeed fruitful, but then they lose their *alkaline* Nature, and, imbibing the Acid of the Air, become neutral Salts, and act as such.

It is farther remarkable, that no Plant which ever grows upon the Surface of the Earth, if it was suffered to grow dry, carious, and rotten, would ever yield a single Grain of a fixed *Alkali*; but on the Contrary, they are always either dissipated into such minute volatile Particles, as escape the Notice of our Senses, or leave behind them a Substance, which upon Examination appears to be simple Earth. This Experiment, therefore, confirmed universally in all Ages, evidently demonstrates, that Nature never produces a fixed *Alcaline Salt*, either in the Solids or Fluids of Vegetables.

Hence it is certain, that fixed *Alcaline Salts* have their specific Nature imparted to them by Fire, and not by any natural vegetable Operation. But this is still farther evinced by the following Experiment, which never fails to succeed in the same Manner: Take any Vegetables, which, if burnt, would yield a large Quantity of a fixed *Alcaline Salt*, let them be reduced to Putrefaction by Art, so that their whole Substance shall be perfectly putrefied, they will then be rendered exceedingly foetid, and a great Part of them volatile, and, if they are burnt in an open Fire, will not yield the least Portion of a fixed Salt, but what remains will be a perfectly insipid Earth. If therefore we view this Experiment in a just Light, we must be of Opinion, that fixed *Alcaline Salts* are as much the Creature of Fire as Glass, which Nobody ever suspected to be a vegetable Production, though vegetable *Alcaline Salts* enter its Composition, and are necessary to its Existence.

It must also be remembered, that these *Alcaline Salts* are capable of being resolved into a considerable Part that is saline, H h h hard,

hard, bitter, and almost vitrescent; into a simple Earth; and into an *Alcaline Salt*, that is stronger and more pure: And thus we may observe that these *Alcaline Salts* are no simple Bodies; but that they are compounded of different Parts united together, and that the Conjunction of their Principles into one Mass, which has the Appearance of being homogeneous is effected by the Strength of the Fire. Hence it will follow, that Nature never acts by fixed *Alcaline Salts*, as by her proper Instruments, unless when they are received first prepared by the Fire. And that even then, when she makes Use of them; thus prepared, in bringing about her Purposes, she only operates by them, as they are compounded of the three above-mentioned Principles; to which, however, as a fourth Part, there still seems to remain a Portion of Oil, as many Arguments evince.

Hence it appears, that as these fixed *Alcaline Salts* are rendered more and more simple by a Separation of their constituent Parts, the Salt that thus arises will be continually different; for that which remains after a Separation of some of its Principles, will always be of another, and more simple Nature, and consequently will have a different Power of acting. Thus, in Pot-ash, which yields the best *Alkali*, a considerable Part of it is a bitter, hard, pellucid Salt, which does not very readily dissolve in Water. If this is carefully separated from the rest, a purer *Alkali* is obtained, fitter than the former, before this Separation, for many Operations that are performed by *Alkalies*.

It is farther to be observed, that these *Alcaline Salts* may be greatly altered by the casual Admixture of some other Body, whilst the Vegetables are burning, which being also of a fixed Nature, may be united with them, and remain in the Ashes. Suppose, for Instance, that Nitre should happen to come among them; then this being fixed with the other vegetable Salt, would produce an *Alkali*, to which, if Oil of Vitriol was added, it would emit a fetid Fume, that would in Smell resemble Spirit of Nitre, which never is the Case, if the *Alkali* is pure. The same is true with Respect to Sea-salt, and many others. And lastly, we must take Notice, that the very Burning of Vegetables, as it is performed in a different Manner, will produce different Salts; for it is a known Truth, that if the same Vegetable is burnt suddenly in a brisk strong Fire, it will yield a Salt different from what is produced by burning it in a slow smothering Fire.

Amongst *Alcaline Salts*, the most common is that which is usually called *Pot-ash*. This is imported in great Quantities from Courland, Russia, Poland, and other Parts of the North, where it is prepared from the Wood of green Firs, Pines, Oaks, and others of a like Nature, of which they make large Piles in proper Trenches, and burn them till they are reduced to Ashes. These are immediately sifted, and were by the Antients called *Lix*, by the Moderns *Cineres Clavellati*, a Name taken from the *Clavae*, or *Clavi*, Billets, into which the Wood is cleft, to make it burn more readily. These Ashes are then dissolved in boiling Water, and when the Liquor, which contains the Salt, is depurated by Subsiding, it is poured off clear, and makes a Lixivium. This is immediately put into large Copper Vessels, and is there boiled for the Space of three Days and Nights, till at last a Salt is left, which takes the Name of *Pot-ash*, from the Pots the Lixivium is boiled in. This Salt, whilst it is hot and dry, must be put up in Casks, made of dry Wood, and which is not impregnated with Oil of any Kind, and by this Means it may be preserved dry; otherwise, if it is exposed to the Air, especially one that is moist, it will run into a pinguous *alcaline Fluid*, exactly like Oil of Tartar *per Deliquium*.

By the Manner in which these fixed *alcaline Salts* are produced, one would not suspect them to contain any considerable Quantity of Earth, and yet upon Examination, we find they yield a great deal, even after they have been rendered as pure as it is possible to make them. The Truth of this will be evinced by the following Process:

Take a strong Lixivium of vegetable Ashes, and by suffering it to stand quiet for a long Time, let all the terrestrial Fæces subside to the Bottom; and by this Means, it will be so depurated, as to become as limpid as Water: Let it then be depurated by repeated Filtrations till it become as clear as Crystal. This Liquor then, if examined with a Microscope ever so nicely, will not discover the least Sign of any terrestrial Substance. Then take this pure Lixivium, and put it into a clean Vessel, and in a quiet Place, as free as possible from Dust, reduce it to the Consistence of a thick Oil; and then in a clean iron Pot evaporate this thick Liquor to a Dryness, keeping it continually stirring with an iron Spatula; and by this Means, you will procure an exceeding *Alcaline Salt*. When this is done, put this Salt into a clean Crucible, and with a Tile cover it over as close as possible, and in this Condition commit it to a very strong Fire till it is melted: Then pour it out into a warm brass Mortar, and with a hot Pestil rub it immediately into a Powder. Let this Powder then be put into a large glass Basin, and be thus exposed to the Air in a Place free from Dust, and the Salt in a very short Time will be intirely dissolved into a Liquor perfectly fluid, whilst to the Bottom there will fall a

white terreftrial Powder, which being thoroughly washed from the Salt that adheres to it, will appear to be nothing but mere Earth, such exactly as that, which remained, of the vegetable Ashes after the Salt was all extracted. If you take this Oil of Tartar *per Deliquium* and dry it, calcine it, and expose it to the Air as before, it will dissolve again, and you will have a new Oil *per Deliquium*, and always some Earth remaining; and if this Operation is repeated a sufficient Number of Times, at last the greatest Part of the fixed *Alcaline Salt* will be reduced to a mere simple Earth, which in burning was united with that other Principle, both which, joined together, formed the *Alcaline Salt*; which saline Principle being now by many Calcinations and Solutions separated from its Earth, and set at Liberty, flies off, and is dissipated into the Air, and leaves the Earth alone. If all this, Earth, however, is collected together, and weighed, it will be found a good deal lighter than the Salt at first made Use of; this Decrease in its Weight evidently evincing, that a great Part of the Salt was rendered volatile, and thus carried away. As this Experiment, therefore, constantly succeeds in this Manner, we cannot but conclude, that this Earth, thus discovered, did really exist before in the fixed *Alcaline Salt*, from which it is by this Means procured, and that in so latent a Form, that it suffered itself, during that Time, to be perfectly dissolved in Water, which otherwise is so repugnant to the Nature of Earth. And hence, therefore, it farther appears, that the purest Earth, when it is united with some other Principle, is totally dissoluble in Water, though it is in no Degree soluble in Water when alone.

But it often happens during the Repetition of this Operation, that the *Alkali* changes its first Nature, and is converted into a neutral Salt, which easily melts in the Fire like Wax: And hence some Chymists have vainly thought, that they were Masters of that great Secret, *an incrated, fixed, Alcaline Salt*, which the antient Chymists so highly extolled. But this only happens from the volatile Acid in the Air, applying itself to this Salt, and being united with it, by which Means a new Kind of Salt is produced, compounded of the *Alkali*, and this Acid, and hence easily melting in the Fire, but deprived of all its *Alcaline Virtue*.

A fixed *Alkali*, procured in the Manner above described, has, above all others, every Mark of an *Alkali*. This Salt, therefore, we may fix as a Standard for all of this Kind, by the Character of which we may examine any Salts that we are in Doubt about, whether they belong to this Class, or not. And thus we learn, that *Alcaline Salts*, procured by burning, are by no Means homogeneous, but composed of different Principles. Amongst these, the true saline Part is greatly less, than might be imagined, and when it is alone it is volatile, and escapes the Notice of our Senses, inasmuch that as yet we are not come to a Knowledge of its proper Nature.

The Juice pressed from ripe Grapes, spontaneously ferments; and during this Operation, it is called Must. After this Fermentation is over, and the thicker Fæces subside, and it has stood a sufficient Time quiet in the Cask, it becomes limpid, fine, and, in Appearance, homogeneous. This is called new Wine, after having deposited these Fæces, which are named the *Lees*, or *Mother*, of Wine, and which were first dispersed in the Must, then elevated into Flowers, or Yeast, and afterwards subsiding, are collected at the Bottom of the Vessel. The Wine, when it is thus become fine, if it is drawn off from the Lees into a clean Vessel, leaves all these thick Fæces behind it; from which, by pressing them strongly through thick Canvas Bags, a turbid Wine is procured, which is used for making the strongest Vinegar. If the dry Fæces that still remain in the Bags, and are formed into Cakes, are burnt to Ashes, these, if they are sifted, dissolved in Water, and depurated from the subsiding Earth, yield a clear Lixivium. And this, by Evaporation, in large Vessels produces a Salt, very like the former, but more pure, and more acrid. This, then, is a second Species of fixed *Alcaline Salts*, which by the preceding Fermentation seem to be rendered more subtle than the former.

If Wine, thus fermented, defecated, and rendered fine, is drawn off into a clean Cask, and stands for some Time, there will then begin to appear small shining Bodies in it, like Particles of Glass, which gradually uniting together, form larger Globules, which fix upon every Part of the Vessel that the Wine reaches, and thus, by Degrees, incrustate over its whole Surface with a Kind of stony Matter, called, for this Reason, very properly, by the Germans, *Wine-Stone*; by the Chymists, *Tartar*. This is always of an acid Taste, and produced from Wine only which has been fermented, and depurated in the Manner above-mentioned.

When Tartar is distilled, a very black Mass remains at the Bottom of the Retort, which is perfectly *Alcaline*, and exceedingly acrid; and this is the only Method known of producing a fixed, alkaline, acrid, vegetable *Alkali* in a close Vessel; for all other vegetable Substances whatever, when exposed to the strongest Fire in a Retort, produce a black Coal, but never afford any *Alcaline Salt*, till this Coal is afterwards burnt in an open Fire. But if this black *Alcaline Coal* of Tartar is taken out

out of the Retort, and burnt in an open Fire, it yields a white *Alcaline Salt*, of all fixed *Alcalies*, the most acrid and pure. By this surprising Experiment, we learn, how much Fermentation promotes the Production of an *Alkali*, though at the same Time it always heightens, and even generates an Acid. Both *Alcalies* and Acids, therefore, are more readily produced, by the Assistance of Fermentation, than without it; which Observation, certainly, is of great Importance, though very little taken Notice of.

But all *Alcalies*, from whatever Vegetable produced, when by the strongest Fire they are at last brought to their greatest *alkaline* Perfection, become so perfectly alike, that they can scarcely be distinguished from each other. There is, however, one trifling Circumstance, wherein they differ, which is, that Glass made with the very same Flints, but different fixed Salts, will differ a little with Respect to Colour, so that what is prepared with the *Alcaline Salt* of Fern, shall be different from that made with any other Salt. But Chymists are very sensible, that a very small Matter will make a considerable Alteration in the Colour of Glass; thus, Pounding the Salt in a metal or marble Mortar, will produce a Difference. Hence it seems possible, that something metalline may insinuate itself into Vegetables, which being naturally fixed in the Fire, may impart Properties to the Salts which escape the Notice of our Senses, till they discover themselves in the Colour of the Glass produced from them. It is certain, that Particles of Iron lie concealed in many Bodies; and perhaps Copper may do the same.

Another Sort of fixed *Alcaline Salt*, which has been discovered by the Chymists, and accurately described by Glauber, is prepared in the following Manner:

Put some pure Nitre in a clean Vessel, let it melt over the Fire, and it will then scarcely have any visible Motion. Whilst it is in this State, throw a Piece of burning Coal into it, and in an Instant it will produce a great Noise, the Coal will be agitated upon the Surface of the Nitre, till it is consumed, and then the Nitre will flow quietly again, as before; then throw in another Piece of Coal as before, and the same Appearances will be renewed. Repeat this till the Nitre is no longer moved by the Application of the Coal, and then what remains, will in every Respect answer the Character of an *Alcaline* fixed Salt: Thus, for Example, it betrays a caustic Acrimony, and an urinous Taste in the Mouth; it raises an Ebullition with all known Acids; if saturated with an Acid, it is converted into a compound Salt, whose Nature is determined by that of the Acid; and it has the very same Effect as the *Alcaline Salt* described above, with Respect to the Production of Colours, Precipitations, and Solutions of Bodies. This Salt, however, differs in some Respects from the former, as it always retains something of Nitre, which is not utterly destroyed by the Process. This does not discover itself, till some of the best Oil of Vitriol is poured upon it; but then a Vapour instantly arises, which by its Smell, like that of Spirit of Nitre, or Aqua Fortis, discovers its nitrous Nature. In this Experiment, the Oil of Vitriol generally grows black, when it is mixed with the *Alkali*, whence it appears, that something of the Charcoal is united with the *Alcaline Salt*. Glauber, therefore, was certainly in the right, in believing this *Alkali* of Nitre, to be in some Measure different from vegetable *Alcalies*; but when he extols its Virtues above all others, it is possible his own Discovery might betray him into a little Exaggeration. For he boasts of the Oil *per Deliquium* of this fixed *Alcaline Salt*, as if it was the *Alcahest*, or universal Solvent.

But a third, and the most expeditious Way of producing a fixed *Alcaline Salt*, and that in great Quantity, is as follows: Take of the best and driest Tartar, and Nitre reduced to a fine Powder, an equal Quantity; mix them together, and throw them by a little at a Time, into a clean iron Vessel, made almost red hot, and an instantaneous Deflagration will ensue, and a white, *alkaline*, fixed Salt will be produced. This, too, is like a vegetable *Alkali* in every Characteristic, except that upon being mixed with Oil of Vitriol, it betrays by the Smell its original Nitre.

There is another singular Method of preparing a fixed, fiery, *Alcaline Salt* from Nitre, and that in a very little Time, as follows: After Antimony is as much as is possible deprived of its Sulphur, the pure metalline Part, which remains, is called its *Regulus*. Take this *Regulus*, put it into a clean Crucible, melt it in the Fire, and when it is in Fusion, add an eighth Part of the purest, and driest Nitre. It is something surprising to find that this Nitre, which generally flows easily in a strong Fire, cannot now be melted, without the Application of a Heat, intense enough to fuse Copper. And when it is urged with a Degree of Fire sufficient to melt it, it immediately acquires a golden Colour; and when the Whole is poured out into a Cone, the Nitre rises to the Top, in the Form of a golden Cake. This, when separated by striking the Cone, is impatient of Dryness, and is of so acrid, *alkaline* a Nature, that it is perfectly fiery in almost all its Effects: Nor have the greatest Masters in Chymistry ever found any Method of communicating to Salt an equal Degree of Acrimony. And here it is observable that Nitre, which is the coldest of all Salts, and has not the least Mark

of any *Alkali* in it, when it is thus fused with the metalline Part of Antimony, acquires this Acrimony, as it were, by Contact. It is probable, in this Case, that the Sulphur of Antimony is very intimately united with the Nitre; for the Salt thus produced, whilst it is exceeding dry, and hot, makes a red Tincture with pure Spirit of Wine, and that immediately, of an exceeding caustic Nature. This Experiment succeeds, whether the *Regulus* is made with Iron, according to Suchten's Method, or with Tartar and Nitre, in the common Way. But this Effect will not be produced, so long as the external Sulphur adheres to the Antimony, the Experiment then only answering, when this Part being separated, the remaining reguline Part is fused with the Nitre. The sudden Change that is in this Case effected, is so much the more surprising, as Nitre with Sulphur never becomes *alkaline*, but is converted into a bitterish Sal Polychreston. And what still makes it more extraordinary is, that Nitre, if it is kept for a considerable Time in Fusion by itself, will undergo no Alteration, but remain the same. Hence, then, we learn, what sudden and unsuspected Effects are produced by the Combination of Bodies, which it was not possible to foresee; and that general Conclusions in Physics, are liable to a great deal of Error. From this Experiment, also, we may observe, how easily the whole Substance of Nitre grows *alkaline*, as it were, by mere Contact; for in this Instance, it is not mixed with the melted Antimony, but only flows at the Top of it.

The Properties of fixed *Alcaline Salts* are as follows:

They attract Water very powerfully and at a great Distance, and from every known Body in which it resides. This is plain to the Eye, for when such an *Alkali* is taken out of a strong Fire, if it is suffered to remain in a very hot Air, close by the Fire, where Water can by no other Art be discovered, it will even there grow moist, and dissolve: And if it is then put into a clean, dry, glass Vessel, and dried over the Fire, and the Vapour that exhales, is received, and condensed in an Alembic, it will yield again the pure Water which the *Alkali* had attracted. Other Salts, if moist before, would have been deprived of their Water in the very same Degree of Heat, and the same Place where the dry *Alkali* attracted Moisture. These *Alcaline Salts* therefore, are true Magnets to Water; by this they are dissolved, and are strongly united with it; and hence, when they are once dissolved in Water, a Heat equal to that of boiling Water will not perfectly dry them again.

Thus, for Instance, Oil of Tartar *per Deliquium*, will not be dried in a Heat of two hundred and fourteen Degrees of the common mercurial Thermometer, which is sufficient to make Water boil; but it must be put into a metal Vessel, and kept continually stirring in a Heat of more than six hundred Degrees, in order to separate all the Water from it: Hence, we scarcely know any Body that parts with its Water with more Difficulty.

The following Experiments were made with a View of discovering the Force with which fixed *Alcaline Salts* attract Water, the Quantity they imbibe, and the Spaces through which their attractive Virtue is diffused.

An Ounce of a fixed *Alcaline Salt*, exceedingly pure and dry, was put into a clean glass Basin, and exposed to a dry Air, in a subterraneous Place, that was every way inclosed, and not in the least disturbed by any Wind; and in a little Time, the Water was attracted out of this still Air to the Surface of the Salt, and the Water was thus attracted by the Salt, till the Salt was impregnated with near three Ounces of Water, but being then thoroughly saturated, it did not imbibe any more. Hence it appears, that six cubic Feet of Air at least, was required to supply this Salt with such a Quantity of Water: For if we suppose the Weight of Air to that of Water, as one to a thousand, and a cubic Foot of Water to weigh sixty-four Pounds, then all the heavy Bodies in a cubic Foot of Air, will weigh $\frac{1}{16}$ of a Pound. Let us imagine only half of these heavy Corpuscles to be pure Water, the other half, all the rest of the ponderous Bodies contained in the Air, and then it appears that in a cubic Foot of Air, there will be about half an Ounce of Water: As this Salt, therefore, is capable of attracting Water out of so large a Space, we hence discover a very surprising Power in Nature. Sendivogius, therefore, well observed, that the more *Alcalies* are burnt, the more Water these calcined Bodies attract out of the Air. It is possible, however, that the Water in the Air, at a Distance from that which surrounds the *Alcaline Salt*, may be drawn into this Air, and supply the Place of that Water which is attracted by the Salt.

But to come at a more accurate Knowledge of this Attraction of Water by *Alcaline Salts*, Boerhaave took a large glass Bottle, very clean, and dry, and hot, as if it had just been taken out of the Glass-House Oven. Into this he put some pure Salt of Tartar, very hot and dry also, and reduced to Powder, in the Manner above described. He then immediately stopped the Mouth of the Bottle with a dry Cork, and tied over it a Hog's Bladder softened with Oil, and made very supple: The Effect of this Experiment was, that the Salt which adhered to the Side of the Glass, was grown moist with the Water contained in that small Quantity of Air included in the glass Bottle, though the Air was extremely hot and dry, at the Time that the Bottle was closed.

2. It has not yet been determined with any Degree of Certainty, whether fixed *Alcaline Salts* repel Air, or attract it so strongly, as not to part with it again readily. Experiments that have been made with this View leave the Thing dubious. It is very certain that Oil of *Alcaline Salts per Deliquium*, examined by the Air-Pump, gives not the least Indications of containing Air, since none is to be separated from it, when the Pressure of the Atmosphere is taken away, even though the Oil is made very hot in order to expel the Air. On the contrary it is equally certain, that when *Alcaline Oils per Deliquium* are mixed with Oil of Vitriol, from which the Air has been extracted by the Air-Pump, a surprising Quantity of elastic Air is produced, or, as it is called, generated. Upon considering these Circumstances, it appears most probable that fixed *Alcaline Salts* actually attract Air, and unite it with themselves so strongly, that it is not to be dislodged, till the Texture of the Salt is destroyed by the Effervescence upon mixing it with an Acid.

These pure, acrid, fixed, *Alcaline Salts*, if they are mixed with the purest Alcohol, when they come very hot out of the Fire, attract it, and unite with it; but if there is the least Mixture of Water, either in the Salts or the Alcohol, then the Salts repel the Alcohol, nor can they be united by any Art whatever. In this Manner, therefore, pure, fixed *Alcaline Salts* divide strong Spirit of Wine into two Parts, that are not afterwards miscible with each other, that is, into a Water saturated with the *Alcaline Salt*, and into a pure Alcohol, which swims at the Top. And thus, again, plainly appears the reciprocal Attraction between Water and fixed *Alcaline Salts*: Take a Pint of the purest Alcohol, mix with it a small Quantity of Water, and then add a dry *Alcaline Salt*, and the *Alkali* will in an Instant draw into it that little Portion of Water, and will appear in the Form of a thick Oil about the Sides of the Glass; and, at the same Time, the Combination of the Alcohol and Water will be utterly prevented.

These *Alcaline Salts* act also upon vinous Spirits in another Manner: For, as every Spirit drawn by Fire, from Wine of any Sort, has always a volatile Acid intermixed with it, the Acid being greedily attracted by the *Alcaline Salt*, the Spirit by this Means becomes much more pure, when freed from the Acid which adhered to it, and consequently will be very different, both in its Nature and Virtues, from what it was before this Operation. And the *Alkali* itself will also, at the same Time, be intirely altered, and become a Salt compounded of an Acid and *Alkali*, inasmuch that, if it is perfectly saturated in this Manner, a Salt perfectly neutral will be produced.

These Observations direct us to a Method of preparing a pure Alcohol, without Distillation, or any Assistance from Fire; for add a sufficient Quantity of Pot-ash to common Spirit of Wine, and stir them about till they are thoroughly mixed together, the Water will be attracted by the *Alcaline Salt*, and the Alcohol will swim at the Top, which, by a gentle Decantation, will come off good the first Time. If any Doubt remains, whether it is quite pure, or not, put some more Pot-ash into the Alcohol thus prepared, and by stirring them about, and then pouring the Liquor off, as before, it may be rendered so. In this Operation, however, the Spirit of Wine always discovers an Oil, which before appeared neither in the Spirit of Wine, nor the *Alcaline Salt*, but is generated when they are thus mixed together.

Another Property of *Alcaline Salts* is to unite intimately with distilled vegetable Oils: For if the most acrid, pure, dry *Alcaline Salt* is thrown very hot into a distilled Oil, it attracts the Oil greedily, with a considerable hissing Noise, and unites it so with its own Substance, that there is immediately formed a Kind of Soap, and the Oil is more firmly united to the *Alcaline Salt*, and the Soap is rendered more perfect, if the Mixture is set in a subterraneous Place; for by this Means both of them become semi-volatile, and form a Mass dissolvable in Water, which is endued with excellent medicinal Virtues. This is the *Ens parvum Sapientum*, the *Sapo Helmontianus*, the *Salt-Volatile Tartari* of Starkey, and the *Corrector* of Matthews. It was formerly in great Reputation, first in England, and afterwards all over Europe; for it powerfully resolves almost every Kind of viscid Concretion that is generated from the Humours of the human Body: Hence it incises and attenuates the tenacious Concretions that obstruct the Vessels, and at the same Time it gently stimulates the Vessels themselves; and thus, by acting both upon the Solids and Fluids, it promotes the Secretions by Sweat and Urine, and by these Evacuations carries off the Cause of many chronical Distempers. This Soap also intirely alters the Nature of many Simples, when digested with them, and hence, depriving some of their Virulence, imparts to them Virtues very different from what they naturally possessed. The Chymists, however, as is usual with them, have been too lavish in the Praise of this Medicine, which they have extolled as an universal Remedy. But it must be observed, that this Combination of a fixed *Alcaline Salt* and distilled Oil can never be brought about, if the least Portion of Water adheres either to the Salt or Oil; and for this Reason it is necessary the Salts should be hot when mixed with the Oil. It will even hinder

the Success of the Operation, if a small Portion of the *Alcaline Salt* stands above the Oil in the Vessel, and thus, by being exposed to the Air, grows ever so little moist.

Fixed *Alcaline Salts* are easily united also with the expressed Oils of Vegetables, or Animals, as is daily seen in their Combination into artificial Soap by the Assistance of quick Lime, Water and Fire.

But *Alcaline Salts* remarkably attract all Kind of Acids whatever, whether animal, vegetable, or mineral, and that whether dry or moist, pure or diluted. And this Force, with which *Alcalies* thus attract Acids, is incomparably greater than that with which they attract Water: For in this Action, by which they unite these Acids with themselves, they violently expel the Air that resides both in the Salt and Acid, whence arise such Numbers of Air-bubbles, which suddenly appear, and burst. This Union also makes them repel even Water, and when they are thus saturated, they will easily suffer themselves to be dried, or deprived of their Water, which before, when they were separated, they retained most tenaciously. Pure Oil of Vitriol, for Instance, when it is alone, can scarcely by any Art be utterly deprived of its Water; Oil of Tartar not without a great deal of Difficulty: And yet, when you mix them together, the Water is expelled in such a Manner, that a Salt almost dry appears in the Vessel under it, as is evident in the Preparation of Tartarus Vitriolatus. The same is true also of other Acids, when they are combined with an *Alkali*. This Power however, by which *Alcalies* attract Acids, is limited to certain Bounds; hence there appears a great Diversity among them, though this, indeed, seems more owing to a Difference in the Acids, than in the *Alcalies*. Upon this Subject the illustrious Homberg has communicated to the World many useful Observations, some of which are of Importance enough to deserve inserting:

One Ounce of Salt of Tartar absorbed all the Acid from fourteen Ounces of the best distilled Vinegar; and hence, after it was dried, it was increased in Weight three Drams thirty-six Grains; the remaining Part of the Vinegar was mere insipid Water. By this Means, then, we discover the Proportion there is between the Acid, and the Water of the Vinegar.

The same Quantity of Salt of Tartar absorbed all the Acid from two Ounces five Drams of Spirit of Salt; the Increase of Weight, when dried, was three Drams fourteen Grains.

An Ounce of Salt of Tartar absorbed all the Acid from one Ounce, two Drams, thirty-six Grains of Spirit of Nitre; the Increase of Weight was three Drams ten Grains.

The same Quantity of Salt absorbed all the Acid from one Ounce, two Drams, thirty Grains of Aqua Fortis; the increased Weight was three Drams six Grains.

From five Drams of Oil of Vitriol an Ounce of Salt of Tartar absorbed all the Acid; the Increase of Weight in the dried Salt was three Drams five Grains.

As these are the principal Acids, we may infer, First, that in acid Liquors, though various with Respect to their Bulk, whilst united with their Water, yet the acid Principle has nearly the same Weight in all. Thus Vinegar, which is the lightest of all these Acids, increased the Weight of the same Salt of Tartar, as much as the Oil of Vitriol, which is the heaviest and strongest. The same too is true with Respect to the other Acids, the Difference between the greatest and least Increase of Weight being no more than thirty-one Grains, and that only in the Vinegar, and this because the Tartarus Regeneratus, that is, the compound Salt formed by the Union of the Salt of Tartar and Acid of the Vinegar, is not dried without a vast deal of Difficulty.

Secondly, Acids seem to differ principally as to the Quantity of Water they are diluted with, since the pure Acid, when it is extracted, discovers always the same Weight. If fourteen Ounces, therefore, of the strongest Vinegar could by any Contrivance be reduced to five Drams, by separating the Water from it only, and collecting the Acid into a smaller Compass without altering it, it is possible that the Vinegar thus reduced in Bulk would be as strong as Oil of Vitriol. It is however certain, that it would be then capable of saturating the same Quantity of *Alcaline Salt*.

Thirdly, We hence perceive, how great a Part of these acid Liquors is Water.

Fourthly, It is probable, that if these acid Salts could be obtained pure without any Water at all, they would then appear in a solid Form. This, however, has never yet been accomplished: Very intense Cold has come nearest it of any Thing, but not quite compleated it. Hence also we may conceive what surprising Effects *Alcaline Menstruums* may produce, when they act upon Substances that have any latent Acid in them, or upon those that are actually consolidated, and held together by an Acid; and hence, when this Acid is absorbed, they fall again into their constituent Elements.

When this Affusion of an Acid to an *Alkali* is performed gradually and cautiously in warm Liquors, and in a large Vessel, if at the same Time the Vessel is shaken after every Instillation of the Acid, the Mixture at last arrives to such a Temperament, that there will be no farther Ebullition: And this is called the *Point of Saturation*. If Acids are after this added, no more Agitation

tation will be excited, than there is upon mixing Water with Water: And then the Compound thus produced is neither *Alcaline* nor *Acid*, but *neutral*, formed by the Union of both. Hence *Acids* have been called Males, and *Alcalies* Females, and the Compound of them both Hermaphrodites: The *Alkali*, the Vacuum; the *Acid*, the Implet: The *Alkali*, the Chaos, and the *Acid* the impregnating Spirit.

The violent Ebullition and Effervescence, that appear upon the Mixture of an *Alkali* and an *Acid*, whilst the Air and Water are forcibly expelled, may possibly arise, because these Bodies impetuously drive out whatever lies betwixt them, when they rush strongly into mutual Contact: And if so, this Ebullition and Effervescence do not arise from any Disagreement, but from an Association of Principles. Hence the following Queries will naturally arise: 1. Whether *Acids* abound plentifully with Air, whilst *Alcalies* contain none at all? So far is certain, that the strongest *Alkali*, taken very hot out of the Fire, and so probably deprived of all its Air, will, if it is thrown into an acid Liquor, produce a prodigious Effervescence, and a great Quantity of Air will be generated. Hence may we not arrive at the true Reason, why *Acids*, when they are predominant in animal Bodies, are productive of so much Flatulency? Do not neutral Salts, produced from a Combination of *Alcalies* and *Acids*, lose the greatest Part of their Air; and are they not for this Reason found to be very little flatulent in the human Body? Are not acid, or at least ascendent Bodies, the only Substances which are disposed to ferment, because of the latent Air they contain? And is not this latent Air the Source of that prodigious Quantity of Air, which is generated by Fermentation? Does Fermentation therefore naturally tend to the Generation of *Acids*, whilst an intense Fire produces *Alcalies*?

From what has been said it appears, that amongst natural Causes, by which Motion is excited in the Universe, we must reckon *Alcalies* and *Acids*, at the Time when these are mixed together, which Motion ceases, as soon as ever this Combination is compleated.

The Motion thus excited seems of considerable Importance in Vegetation, or rather in preparing the Earth for it. People concerned in Husbandry are sensible, that frequent Ploughing or Digging the Earth mellow it, as they call it, and renders it fertile; or, to speak more philosophically, disunites the Parts of the Earth, which otherwise cohere together, and form large Glebes, and reduces them into small Particles, better suited to the subsequent Solution they are to undergo, in order to the Production of a Plant. Now when the Earth is once furnished with an Alkaline Salt, and that is intimately united with the earthy Particles, which soon happens, because these Salts, attracting the Water floating in the Air, run into an Oil per Deliquium, and sink into the Ground; the same Salts attract also the Acid of the Air, till they are saturated, and both together rendered neutral. Whilst therefore this Neutralization is effecting, an Effervescence is made leisurely and by Degrees, as the Alkaline Salt imbibes the Acid. Hence Motion is excited in the Parts of the Soil which were impregnated with the Alkali, and by this Motion the Particles of the Earth are separated from each other, more effectually than either by Ploughing or Digging. This Separation is an excellent Preparative for a future Solution, and indeed is one Step towards it, since the Solution of a Body is only the Reducing it into Particles fine enough to float in the Menstruum that dissolves it, and small enough to be transparent, and consequently not visible.

There can be no Doubt, but that in the Action of these Alkaline Menstrua upon *Acids*, the Water is expelled out of them, as well as the Air, when they thus unite together; for though they are perfectly fluid, when they are mixed, yet they harden in the very Act of Combination, into little saline Glebules, and appear in the Water in the Form of pellucid Crystals, the watery Liquid being driven out, and swimming at the Top. And when the Saturation is compleat, the Water may be separated pure, and without any saline Taste, and then the Remainder is easily dried into the Form of a white, farinaceous, opaque Powder, and that too by a gentle Heat, whereas the Parent *Alkali* and *Acid*, by whose Combination they are produced, either cannot be dried at all, or not without the greatest Difficulty.

It is farther remarkable, with respect to these compound Salts thus prepared, that it is extremely difficult to separate again the *Alkali* from the *Acid*, so as to procure either of them pure, by the Assistance of Fire only. Sal Ammoniac, for instance, made by a Combination of Alkaline Spirit of Sal Ammoniac, and Spirit of Sea-Salt, may be sublimed, by exposing it to a sufficient Degree of Fire; but it will not be thus possible to separate it into the saline Principles of which it was compounded. The same is true with Regard to Tartarus Vitriolatus, Sal Marinus Regeneratus, Nitrum Resuscitatum, Tartarus Regeneratus, and others. There are, however, some Methods discovered, by which this Resolution of compound Salts, into their constituent Alkaline, and Acid saline Principles, may be accomplished, and the Knowledge of these will make us acquainted with some of the most secret Mysteries of Chymistry. In order, therefore, to arrive at the Knowledge of these, it is necessary to examine some farther Properties of *Alcalies*.

Alcalies, therefore, though they attract all known *Acids*, at the same Time it is remarkable, that they attract some, much more powerfully than others. This Assertion is abundantly confirmed by Experiments. Thus, if upon an *Alkali* perfectly saturated with Vinegar, or upon Tartarus Regeneratus, Spirit of Salt, or Nitre, or Sulphur, or Vitriol is poured, then the latent *Alkali* will attract into it that Acid, and repel from it the Acid of the Vinegar with which it was before saturated; and hence a Liquor, nearly of the Nature of Spirit of Vinegar, may be afterwards drawn from this Compound with a moderate Heat, there remaining a considerably fixed, regenerated, nitrous Salt at the Bottom of the Vessel: Again, if Spirit of Nitre is poured upon an *Alkali*, saturated with Spirit of Salt, an Aqua Regia will arise in Distillation; and a nitrous Salt will be left at the Bottom; but much changed from its former Nature. On the contrary, if Spirit of Salt is poured upon an *Alkali*, saturated with Spirit of Nitre, the Mixture will in Distillation also yield an Aqua Regia; and the Salt that remains will be of a nitrous Nature, and somewhat inflammable; however of a Nature very different, both from Sea-Salt, and Nitre. In both these Cases, as there is no considerable Difference betwixt the Acid of Nitre, and that of the Salt, with respect to their Strength, each of these *Acids*, in some Degree, dislodges, and expels the other, by which means they rise mixed together, and both of them also remain united with the *Alkali* in the Residuum.

Pour Oil of Vitriol upon an *Alkali*, saturated with Spirit of Nitre; a pure Spirit of Nitre is immediately expelled, and the Acid of the Vitriol unites with the Alkaline Part of the Nitre, and forms a Salt at the Bottom, somewhat of the Nature of Tartarus Vitriolatus, though different from it in some of its Properties; it has, however, scarcely any Thing in common with Nitre. And, lastly, if Oil of Vitriol is poured upon facitious, or natural Sea-Salt, a very volatile Acid, fuming Spirit of Sea-Salt, will instantly arise, endowed with almost all the known Virtues of Spirit of Salt, except that it fumes more, is more volatile, and its Vapour is noxious and suffocating, till it is corrected by repeated Depurations. All these Experiments, therefore, certainly prove that those *Acids*, which are naturally diluted with a less Quantity of Water, have a greater Power of uniting themselves with *Alcalies*, than those, which are naturally diluted with a greater. And this Rule, so far as has yet appeared by Experiment, may be laid down as general, that the stronger *Acid* always expels from the *Alkali* that which is weaker and which is the least powerfully attracted by the *Alkali*. And then the stronger *Acid* always unites with that *Alkali* from which the weaker was expelled, and takes Possession of the Place in which that resided.

Again, the Salt thus generated, losing the Disposition it had acquired from the first and weaker Acid, which is now removed, puts on very nearly the Nature of that Salt, from which the last and stronger Acid, which is now united with the Alkaline Part, was drawn. It must, however, be confessed, that there is always some remarkable Difference betwixt the Salts thus produced, and the native Salts from which those stronger *Acids* were procured. Thus, for Instance, the Sal Mirabilis Glauberi, which is prepared by a Distillation of Sea Salt, with the best Oil of Vitriol, is of a very different Nature from that Tartarus Vitriolatus, which is obtained by a Saturation of Oil of Tartar with Oil of Vitriol: This is also true, with respect to other compound Salts. Thus the Salt which is procured by distilling Glauber's Spirit of Nitre, is intirely different from the Sal Mirabilis of the same Author, though both these are supposed to be produced from the same *Acid*, and the same *Alkali*. This Rule therefore, which has been laid down by the most eminent Chymists, That *Acids* always convert *Alcalies* into their Nature in such a Manner, that from these Compounds, may be constantly regenerated those Salts, which before yielded those *Acids*, is too general, and must be understood with some Restriction.

It is farther remarkable, that when these stronger *Acids* thus poured upon compound Salts, expel thence the weaker *Acids* which were united with them before, and join with the remaining *Alcalies*, this new Combination is effected without any considerable Effervescence or Conflict: For the first and weaker *Acid* quits the *Alkali*, and the last and stronger takes its Place, without any great Ebullition, notwithstanding there arises such a prodigious Emotion, when a pure *Alkali* is mixed with a pure *Acid*. Nor does it appear, that any Air is generated by this Union, though in the other Case it was expelled in so large a Quantity. It is probable, therefore, that the Effervescence which was excited in the first Saturation of the *Alkali*, had expelled all the Air, so that now the new *Acid* does nothing more than enter into the saturated *Alkali* thus deprived of its Air, and remains there, without either expelling or attracting any Air; and it seems a farther Confirmation of this, that if the *Acid* which is expelled by a stronger *Acid*, is mixed with another *Alkali*, it will with that raise a violent Effervescence, so that a great Heat, Noise, and Generation of Air will be produced, whilst in the compound Salt, there was very little of any such Appearances.

What has been said above, with respect to fixed *Alcaline Salts*, will be sufficient to give a general Idea of their Nature and Properties. It remains, that I give the different Methods of preparing fixed *Alcaline Salts* for medicinal Uses, and specify the Virtues they are supposed to exert in and upon the human Body. This I shall do principally from Boerhaave, because he has given the particular Processes with more Exactness, and been more just in his Reflections upon them, than any preceding Writer upon these Subjects.

I must, however, take Notice of two Mistakes which the above-mentioned Author seems to have made, in regard to the Theory of these Salts, and which he is so solicitous of propagating, that he takes all Opportunities of repeating them.

The first is, when he tells us, that fixed *Alcaline Salts* are never produced naturally, but are only generated by Fire from Vegetables. This is evidently an Error, because, according to the best Accounts we have of the Egyptian Natron, it agrees with fixed *Alcaline Salts* in most, or perhaps all its Properties. Now this is a native Salt, procured either from the Earth by boiling it in Water, or else by evaporating the Water of certain Ponds, or Lakes, to Dryness. And we have an Account of an Earth which is got near Smyrna, which, by boiling in Water, and a subsequent Evaporation, yields a Salt very little, if at all, different from Pot-Ash, and which may for all Purposes be used in its Stead. And the Heat of boiling Water is in no Instance sufficient to generate an *Alcaline Salt*.

The second Mistake is, when he inculcates, that the fixed *Alcaline Salts* of Vegetables of all Kinds are exactly alike, and nothing different, either in their physical Properties, or medicinal Virtues; though he confesses, that the Salts of different Plants, impart a different Colour to the Glass which is made from them, which proves, at least, some Variety. He farther says, that a Portion of the vegetable Oil always adheres to the Salt, notwithstanding the excessive Fire they have endured; as therefore the Oil of every Vegetable differs from that of every other Vegetable, this Circumstance must make some Difference in the fixed Salt. And in this I have the illustrious Hoffman's Opinion in my Favour.

If this Controversy is brought to the Test of Experience, I am certain it will be determined against the above-mentioned illustrious Boerhaave. For the Salts procured from some Plants will, even when mixed with an Acid, and saturated, cause a great Heat and Sensation of Burning at the Stomach, whilst Salt of Wormwood saturated with the same Acid, and given a few Hours after, will cause no such Uneasiness, but have a much better medicinal Effect. And this is so remarkable, that I have frequently discovered by the Effect, that other Salts have been substituted in the Room of Salt of Wormwood. And from the various Effects I have seen produced from the fixed Salts of different Plants, I am convinced that it is as much impossible to procure a Salt endued with exactly the same Virtues as Salt of Wormwood from any other Plant, as it is to produce a Plant of Wormwood from the Seed of any other Vegetable. And I believe the same may be said with respect to the fixed Salts of Broom, Bean-stalks, Mint, Fern, and most other Plants. Though at the same Time it must be confessed, that the fixed *Alcaline Salts* of all Vegetables agree very much in all their sensible Qualities; but as Nature has Ways of acting, to which we are Strangers, and draws mechanical Properties from Sources to us unknown, it is dangerous, as well as imprudent, to determine any Thing from Theory, before it is confirmed by a Multitude of Experiments.

As *Alcaline Salts* made after the Manner of Tachenius should, by the Character Boerhaave gives of them, be of great Importance in Physic, I shall begin with those.

THE METHOD of preparing a fixed ALKALINE SALT from BURN'T VEGETABLES, after the MANNER of TACHENIUS.

1. Put into a large and deep iron Frying-pan, a Quantity of the Leaves and Stalks of clean, dry, fresh, green Rosemary; upon this lay an iron Plate, in such a Manner, that it may compress the Rosemary, and perfectly cover it all over. Then place the Pan upon a gentle Fire, which increase gradually, till the Vessel grows red hot. The Plant will then smoke, diffuse a Smell, and be converted into a Coal. Then add more fresh Rosemary, cover it, compress it down, and proceed as before, till this is also turned into a Coal. Repeat this till a Quantity is procured, sufficient for the Purpose intended. During this Operation, take all possible Care that the Herb does not flame, which is best prevented, by covering it in such a Manner, that it has no Communication with the Air, for if that comes to it, it bursts out into a Flame, which in this Case does Harm. This is called the Ustulation of a Plant, and the flower and more gradually it is performed, the Operation will be proportionably more perfect. The burnt Herb will be very black, brittle, and bitter; and boiled in Water, the Decoction scarcely discovers any Salt in it, but tastes burnt and bitter, and is sudorific; so that in the Ustulation of a Plant into a black

Coal, scarcely any Salt is discoverable, either by the Lixivium made from it, or by the Taste of the Coal.

2. When this first Part of the Process is rightly performed, take away the iron Plate which covered the Rosemary, and let the Frying-pan, with the ustulated Herb, remain on the same Fire; upon which, as soon as ever the Air comes to it, the Herb, which is now become black, will take Fire, and would very easily rise into a Flame; but this must here be carefully prevented, and the Ignition must be sustained by a Fire accommodated to the Purpose. When the upper Part, which is contiguous to the Air, has for some Time sparkled, its Fire goes out, and then it immediately grows white. But the Parts of the ustulated Vegetable which are covered with these white Ashes, will still remain black, and on Fire, and therefore all the Herb must be gently stirred about with an iron Rod, till the whole Mass has in every Part been successively on Fire, and, by this continual Agitation, been for a sufficient Time exposed both to the Air and Fire together, so as to be converted into one homogeneous white Mass, which is then but in small Quantity, ponderous, and equally white. And when this is done, it is impossible to raise a single Spark in the Mass by the strongest Fire: Though if there is but one black Leaf in it, that, as soon as ever it comes into Contact with the Air, will take Fire in the same Manner as the rest did. When the whole Herb is thus reduced to a Whiteness, it has then an acrid, and somewhat urinous, saline Taste, which never appears in the Herb, as long as that black Part, which is a pure inflammable Oil, continues to adhere to it; but as soon as ever this is intirely consumed by the Fire, then the Salt, which is not wasted by the Fire, begins to discover itself. Hence it appears, that the Consumption of the Oil is necessary, before the Salt can be procured.

3. Let the Ashes thus prepared, be left an Hour or two upon the Fire, so as to be kept constantly red hot, and let them be continually stirred with an iron Rod; and this completes the Calcination of Herbs for Tachenius's Salt. In the first Part of this Operation, the suffocated Action of the Fire, after it has expelled the Water, intimately unites the saline and oily Principles, into a sulphureous saline Concrete, to speak in the Language of the Chymists, which is in some Measure of a saponaceous Nature; but which, at the same Time, has a large Admixture of a very subtle Earth.

4. Put the Ashes thus procured into a clean iron Vessel, with six Times their Weight of pure Rain-water, and boil them, stirring them often with an iron Ladle, then the Liquor that swims at the Top will be acrid, lixivious, and saline, and will have drawn a great Part of the Salt out of the Ashes, leaving the Earth at the Bottom. Let this be poured off, and filtered boiling hot, till it becomes perfectly limpid, and then let it be set by, under the Title of a *Lixivium* for Tachenius's Salt. If the Earth that remains at the Bottom of the Vessel, or in the Filter, is boiled again, with fresh Water, it will still yield a farther *Lixivium*; but the Taste of this will more resemble the Acrimony of Lime, and will contain less Salt: This may be filtered too, and mixed with the former. Let the Earth that is left behind be boiled with more Water, and the Liquor poured off as before, and this be repeated, till the last Water comes off as insipid as it was put on. These last *Lixiviums* may be thrown away as of little Use. Let the Earth that remains be shook about with Rain-water, let this, when it is become turbid, be poured off, and proceed in this Manner, till the Sand, which alone will sink to the Bottom, is perfectly separated from the true Ashes, which last will be mixed with the Water. Let these turbid Waters be mixed together, and suffered to settle, and there will fall an Earth to the Bottom, which being dried, is a pure vegetable, elementary, almost virgin Earth, very proper for making Cupels.

5. Let the pure *Lixivium*, above-mentioned, be evaporated in a clean iron Vessel, till it is become quite dry, keeping it continually stirring towards the End of the Process to prevent the Salt from adhering too much to the Vessel, and by these Means, is procured a brownish Salt, that will be acrid, and somewhat *Alcaline*, and which will gradually dissolve in the Air; but yet not so readily, as a perfect *Alkali*: The browner this Salt is, the more rightly will it be prepared; for it will have so much the more of the Oil in it.

6. If this Salt is put into a clean Crucible, and set in a Fire every Way surrounding it, till the Crucible is red hot, it will easily flow like Water, much sooner than a true fixed *Alcaline Salt*; and then it must be poured out upon a clean brass Plate in Form of little Cakes. And thus you have the pure fixed vegetable Salt of Tachenius; which may be rendered still purer, by exposing it to the Moisture of the Air, or dissolving it in Rain-water, and then filtering the Liquor, and letting it stand quiet, for a sufficient Time, let it be inspissated till a Pellicle appears on the Surface; and then, by setting it by in a still Place, it will shoot into saline Globules, which are Crystals, of all others, the most pure. In these there is not contained an acrid *Alkali*, but the Oil of the Plant, being united with the *Alcaline Salt*, renders it more mild. It is observable, that the Colour

four of this Salt will be very easily altered, if a Coal happens to fall into it whilst it is melting, for then it immediately acquires a leaden Colour, which will vary, according to the Quantity of the Coal that gets amongst it.

OBSERVATIONS on the preceding PROCESS.

1. These Salts are neither acrid, nor igneous, but are a saline Compound of an Oil closely united by the Fire with an acrid *Alkali*; and they differ from an acrid, *alkaline*, caustic Salt, in Proportion, as the Herb undergoes a longer Ustulation, and as the Air is kept from them during the Operation. And by these Means their medicinal Virtues too, are increased in Proportion.

2. They are not, therefore, in their Nature so contrary to an Acid, as to destroy so great a Quantity of it, as pure *Alkalies*. If they are properly prepared, they may in some Measure supply the Want of sea and fossile Salt for the common Uses of Life, as has been observed before from Varro.

3. If these Salts are put into open Vessels, and are exposed to the external Air for a considerable Time, they will attract the Water from the Air and liquefy; but slower, and with more Difficulty, than a pure *Alkali*; but in Water they dissolve immediately.

4. They will readily mix with all the Humours of the human Body, even with the oily Parts and the inspissated Bile by the Assistance of the vital Heat, and the Action of the circulating Fluids.

5. Hence they are capable of penetrating into the sanguiferous, serous, lactiferous, lymphatic, urinary, sudoriferous, and bilious Vessels; but they cannot penetrate into the Nerves.

6. When they are mixed, and diluted with the animal Fluids, they are able, by the Concurrence of the natural Heat, and vital Actions, to resolve the principal Concretions that are formed in our Humours; especially, if they are assisted by Friction, Riding, or other suitable Exercise. They will not however dissolve Stones in the Body, as a Menstruum, but will wear them away, by the mechanical Motion, and Attrition, which they increase in the Body, and determine particularly to the urinary Passages. Disorders in the Juices of the Nerves, however, they cannot reach, and therefore are not capable of curing a genuine Gout; otherwise, when they are diluted with warm Water, and assisted with Motion, they become considerably penetrating, even into the most intimate Parts of the Body.

7. When these Salts are received amongst, and mixed with our Humours, they there act with an Acrimony which is not destructive, but which however renders the Juices more stimulating than they are in their natural soft and mild State, and hence they irritate the sensible Parts of the Nerves, and stimulate them to the Performance of their Vibrations with a greater Force than usual; and on this Account, they are of great Importance where a Stimulus is wanting in a languid Habit of Body, in slow, hypochondriacal, and hysterical Disorders, and others that arise merely from Inactivity.

8. They therefore produce very considerable Effects, by opening the obstructed Vessels of the Body, both as they agitate the whole nervous System, and, at the same Time, dissolve the concremented Fluids, and by their Weight also, which is greater than that of our native Salts, urge all the animal Functions with a Force greater than that which is usual, without their Assistance.

9. They act therefore by promoting all the Secretions, and Excretions, for at the same Time that they render the Humours sufficiently fluid, and free the Vessels from Obstructions, they exercise a Stimulus both upon the Humours and Vessels at the same Time; and thus they equally excite the true Causes of the Motion of our Fluids through their Vessels, on which depend all the Secretions and Excretions in every particular Part of the Body.

10. Hence it appears, why these Salts are a Sudorific; for since it is certain, that the Sweat naturally contains in it the native Salts of the Body, and deposits them on the external Surface of the Skin, by Means of small Arteries which open there, these Salts, when mixed with the circulating Juices, will readily find a Way to the same excretory Arteries, and bring with them their Power of increasing the Secretions; and this is confirmed by Experiment. These Salts in a particular Manner augment the Discharge of Urine; for the Author of Nature has formed the Kidnies principally to carry off the Salts abounding in the Humours, that it may be evacuated out of the Body, to which otherwise it would prove pernicious. This the Urine, of all our Humours much the saltiest, sufficiently evinces. And hence the Efficacy of these Salts is never more manifest than in their Operation by Urine, and at the same Time purging the Humours from any noxious Impurities with which they are loaded. They help also to forward the Discharge of the harder Excrements by Stool, whilst they resolve them, open the Passages, and stimulate the too tardy Intestines to a quicker Performance of their Offices. In melancholic Cases, attended with considerable Costiveness, we find no Medicines more effectual than these Salts, if directed in a proper Manner, and Quantity, and continued for a sufficient Time. And in this Case, they have this particular Excellence, that when they

are left off, the Intestines continue regularly to discharge their Contents without any remaining Costiveness, which is not the Case with Respect to any other Cathartic whatever. The Liver, Spleen, Gall-bladder, biliary Ducts, and Vena Porta, which together constitute the Laboratory of the bilious System, cannot be more effectually purged and freed from Obstructions, or noxious Humours, than by these Salts. And by this lixivious Soap, the viscid and tenacious Obstructions in the Primæ Viæ, that is, in the Stomach and Intestines, are dissolved, and properly prepared for Excretion, without Danger or Violence; so that upon the Whole by this Means we arrive at that Coction or Preparation of the Humours, recommended by Hippocrates, as necessary to their successful Evacuation.

11. From what has been said upon the Subject of these Salts, it appears, that they are excellent in all chronical Distempers, where there is a mere Torpor, or Inactivity of the Spirits, too great Laxity of the Fibres, and a sluggish Viscidity of the Juices without any Tendency to a putrid Acrimony, an Acidity from a Weakness of the vital Powers, or a Coagulation from a prevailing austere or acid Acrimony. If, therefore, we consider, what a great Number of Diseases depend upon these Causes, we shall be convinced, that many chronical Distempers may be cured by Salts prepared in this Manner, which destroy Acids, and convert them into neutral Salts, which last stimulate the Solids, and dissolve Concretions in the Fluids, by new Properties they acquire the Moment they are rendered neutral. We must not, however, conclude from hence, that these Salts are always salutary, and never noxious; for in Cases where the Humours are putrid, bilious, alcalescent, or are moved with too great Velocity, and hence acquire too much Heat, these Salts only add Oil to the Fire; Nor are they less hurtful to Persons whose Constitutions are so tender, that they are not able to bear the Effect of them; for then the Motion they excite proves destructive. They are also noxious where Salts already abound too much in the Body.

THE METHOD of using these SALTS in MEDICINE.

1. They ought to be exhibited when the Stomach is empty, and has completed the Digestion of the Aliment last taken, and consequently about ten Hours from the last Meal. The Dose ought to be varied, according as the Circumstances of the Patient determine it; but in general they may be taken from four Grains to two Drams, or more, which must be left to the Judgment of the Physician.

2. They should be diluted with a large Quantity of Water, lest, if they should be taken too naked, they should injure the Fauces, Oesophagus, and Stomach. Let a Dram therefore of this Salt be dissolved in nine Ounces of common Water, and then it will in some Measure operate like mineral Waters, which act by a small Quantity of fossile Salt dissolved in a great Deal of pure Water.

3. If the Physician's Intention is to purge, let the Patient take, going to Bed, nine Grains of purified succotrine Aloes made into three Pills; or half a Dram of Pil. Ruf. and the next Morning let him rise early, and walk a little in a coolish Air; taking particular Care not to raise a Sweat, and whilst he is walking, let him take a proper Quantity of these Salts, divided into five or six Doses. The Effect of this will be excellent; for it will purge and take away all Heaviness, without any Diminution of Strength; thus becoming an exceeding proper Remedy for the Costiveness of sedentary learned Men, and extirpating Disorders so deeply rooted, that no other Purges whatever will have any Effect upon them.

4. But if the Intention is to purge the urinary Passages, and sanguiferous Vessels, proceed as is above directed, but omit the Aloes in the Evening; mean Time let the Region of the Loins, and Hypogastrium be kept warmer than the other Parts of the Body, and let the Patient now and then drink a Draught of warm Tea or Coffee.

5. If the Design is to raise a Sweat, let the Patient take these Salts in Bed in a Morning, in the same Manner as before directed, and, after each Dose, let him drink some mild Sudorific, as a Decoction of Burdock-Roots, of the five opening Roots, of Sanders, or Sassafras-wood, Tea, or Coffee; and, being covered with a sufficient Quantity of Clothes, let him promote Sweat according to the Nature of his Distemper.

6. For the Cure of Autumnal Tertians, or Quartans, purge two or three Days successively, according to the Rules laid down above. Then about four Hours before the Fit is expected, let a gentle Sweat be raised in the Manner just now directed, taking Care that the Sweat may be the greatest about the Time of the Access of the Fit. In this Manner very obstinate Intermittents are happily cured. And, in this Respect, a Lixivium of these Salts excels even the Acidulæ, and Spaw Waters.

These Salts may as easily be procured from a dry Vegetable, and indeed, with something less Trouble; if, however, the Plant is so old and dry, as to be carious, it will yield little or no Salt.

Boerhaave is of Opinion, as I observed before, that it is of no Importance from what Plant this Salt is prepared, because, according to his Sentiments, Plants thus treated lose their proper Nature, and do not in the least preserve their specific Properties. But as so large a Portion of the vegetable Oil adheres to Salts prepared in this Manner, these above all the *alkaline* Tribe should seem to be in some Degree impregnated with the Virtues of the Parent-Plant. I will not however be positive, that they actually do retain the medicinal Qualities of the Vegetable they are prepared from; but I will venture to affirm that the fixed *Alkaline Salts* of different Plants vary both in Respect to their Effects as Remedies, and their Action upon other Bodies in chymical Operations, that require great Accuracy.

Rosemary is in the preceding Process given for an Example, but a Salt may by the same Management be procured from most Vegetables. There are, however, some preferable to others. Those which I should make Choice of, for medicinal Purposes, are Wormwood, Broom, Bean stalks, Mint, Carduus Benedictus, and all of the Thistle Kind.

The above-described Method of making fixed Salts from Vegetables with a View to Medicine, is much preferable to that commonly pursued, on many Accounts, for as the Oil is preserved in some Measure, they must necessarily be more saponaceous, and consequently more resolvent; they are also less acrid.

The common Way of making fixed Salts is by burning the Vegetable freed from the Dirt that adheres to it, in an open Fire, to white Ashes; these are then boiled in Water, till all their Salts are dissolved; this Water is filtered, and after that evaporated to Dryness, taking Care, especially at the latter Part of the Process, to keep the Lixivium continually stirring; what remains in the Vessel after Evaporation, is the fixed *Alkaline Salt* of the Plant, which may be again dissolved, filtered, and then evaporated to Dryness; and by this Means the Salt may be rendered more white and beautiful, but at the same Time much worse for medicinal Uses, because by every Solution, and Filtration, it loses some of its adhering Oil, which gives it a brown Colour. Those therefore who boast of the Whiteness and Beauty of these Salts, either intend a Fraud, or are ignorant of their real Virtues.

The SEPARATION of a BITTER, CRYSTALLINE, HARD, FIXED SALT; that is SUBVITRESCENT, and not ALKALINE, from a FIXED ALKALINE SALT.

Take six Pounds of the best Pot-ash, and dissolve it in twenty Pints of cold Rain-water in a glass Vessel, stir them well with a Stick, and then let them stand quiet. When the Parts not dissoluble have sufficiently subsided, pour off gently the clear Lixivium, and there will be found at the Bottom with the Fæces a great Number of very small Grains, of an Ash-colour, and bitter Taste, which have almost the Hardness and Brittleness of Glass, and in which nothing of an *Alkali* can be discovered. There is another Method of separating these crystalline Globules, as follows: Take six Pounds of the best Pot-ash, and dissolve them in a brass Kettle, by boiling them with four Times their Weight of Water. Strain this Lixivium, whilst boiling hot, through a linnen Bag, that it may be perfectly pure whilst it continues very hot. Put it then into a hot, moist, clean, glass Vessel, and so leave it. Immediately a Crust somewhat opaque, of a brownish-ash Colour, begins to fix to the Bottom and Sides of the Vessel, which increases, and grows thicker continually. When the Lixivium has stood thus for some Time, and ceases to deposit any more of this Salt, pour off accurately all the pure Lixivium, and at the Bottom there remains a Salt, like that procured by the former Method, but purer, and in a larger Quantity. Take the Lixivium thus freed from this Salt, and inspissate a little; and set it by, it will then yield perhaps a small Quantity of the same Kind of Salt, but it will afterwards produce no more, so that the *Alkaline Salt* contains but a certain limited Quantity of this Salt.

If the Salt separated in this Manner, is agitated with cold Rain-water, it will not be dissolved by it, but the *Alkali* that adheres to it, will be thoroughly washed away, so that by this Means it will become perfectly pure; and if then gently dried, it will be simple, and may be preserved so.

REMARKS.

1. Many skilful Chymists have formerly asserted, that true fixed *Alkaline Salts*, can scarcely be reduced to crystalline Globes; and this is in a great Measure true. When the more modern Chymists, therefore, have produced the Salt thus separated from an *Alkali*, as an *Alkaline Salt* crystallized, they have not distinguished so accurately as they should have done; and in Fact when an *Alkali* is well freed from this Salt, it is not easy to reduce it into Crystals, though even that is possible.

THE NATURE and QUALITIES of this SALT.

This Salt never spontaneously liquefies in the Air. In cold Water it does not dissolve readily. But in a large Quantity of boiling Water it will at last be dissolved; but as soon as ever the

Water grows cold, it concretes again into Globules. It is hard, and brittle, and may be reduced to a fine Kind of mealy Powder, which will remain dry, and will not in the least attract the Moisture of the Air. It has an exceeding bitter Taste, which continues long in the Mouth. In the Fire it crackles, and flies about with some Violence. It is neither Acid, nor *Alkaline*, neither is it like any other Salt that we are hitherto acquainted with, but a perfect new Kind of Salt. It seems, however, to approach nearest the Nature of that Salt which is thrown up in making of Glass; and, being collected at the Top, goes by the Name of the *Gall of Glass*. It is possible that the Fire, whilst it produces the *Alkali* from Vegetables, generates this Salt at the same Time; and that the Fire, when it combines the *Alkali* with the Calx of Flints, for the Production of Glass, separates again this Salt, and casts it on the Surface of the Metal. It is very probable, that this may be the Case. And hence we may in some Measure understand why no such Salts can be procured from the *Alkaline Salt* of Tartar; for Tartar is generated in exceeding fine Particles from a subtilly fermented Liquor.

3. A fixed *Alkaline Salt*, when it is perfectly freed from this brittle, bitter Salt, differs entirely from the same when united with it. Whenever, therefore, any Experiment is to be made with a pure *Alkaline Salt*, Care must be taken always first to separate this from it; otherwise it often impairs, or interferes, with the true *Alkaline* Virtue of Salt. *Boerhaave's Chymistry*.

SOME OBSERVATIONS ON fixed ALKALINE SALTS.

1. Fixed vegetable Salts are procured only by Fire, from Vegetables that are naturally fitted for their Production. Some Plants, when they are burnt, scarcely yield any of this Salt: And even those that are naturally disposed to do it, if they are exposed for a considerable Time to the Air, and undergo alternately repeated Vicissitudes of Moistness, and Dryness, lose at last all that Matter, which, by burning, would have produced an *Alkaline Salt*, and therefore, if they are then burnt, they yield none at all: For the Air perpetually changing, with respect to Moisture and Heat, acts upon Vegetables, and deprives them of that Matter which they otherwise yield by Decoction and Infusion, and disperses it in the Atmosphere, and by this teaches us, that the Part, which the Fire fixes into an *Alkaline Salt*, was spontaneously volatile in its own Nature.

2. Again, fixed, *alkaline*, vegetable Salts, are generated only by Fire, whilst it actually consumes Plants that are disposed for this Operation: For in the Matter which Vegetables yield by Infusion, and Decoction, and native vegetable Salts, no such Thing appears: But they are only generated by a burning Fire. And here also it is observable, that according to the different Degrees of Fire, and Duration of its Action, the Salt is rendered proportionably more or less strong, fixed, and *Alkaline*. It must, however, be confessed, that in Mustard-Seed, there naturally exists somewhat *alkaline*, as appears by its Effervescence with Acids; but this is volatile, and disappears when the Mustard-Seed comes to be burnt.

3. A fixed *Alkaline Salt*, therefore, is not a native, vegetable Salt, that is, a Salt-generated by the specific Nature of a Vegetable, from the common nutritious Juices it receives from the Earth, and which of consequence will always remain in it, so long as it is left to itself, and suffers no Violence sufficient to alter its natural Disposition. But this is destroyed by the Fire, and is converted into something of a quite different Nature. The larger Garden-sorrel abounds with a native, acid Salt; and yet, if this is burnt in an open Fire, it yields a fixed *Alkaline Salt*, though before it evidently contained an Acid. This *Alkali*, therefore, is not native to Plants, but is changed by the Fire, from one that was not an *Alkali*, to an *Alkali*.

4. From what has been said, the Nature of an *alkalescent* Vegetable may be understood: For by this Name are meant, first, such as abound with an acrid, and almost *Alkaline* Juice, affording a volatile, odorous Exhalation, for which Garlic, Onions, and others of the like Kind, are remarkable. Secondly, those that, by their acrimonious Stimulus, increase the Velocity of our Humours, as they circulate through the Vessels, and by this Means cause our native Salts to verge towards an *Alkaline* Putrefaction. Hence the most acrid Aromatics, though not in themselves really *alkaline*, dispose, however, our native Salts to an *Alkaline* Putrefaction. And, thirdly, those which by Fire yield a large Quantity of a fixed, *Alkaline Salt*.

5. Betwixt a native, vegetable Salt, therefore, and the most acrid, *alkaline*, fixed Salt, there are a great many Degrees of fixed Salts, all which differ in their physical Actions, and consequently in their Natures, these ought then to be carefully distinguished from each other. An Example will make the Meaning of this more obvious. Take the best Rhenish Tartar: This is the native Salt of the Wine, perfectly acid, and in some Measure sharp, and hence of infinite Use in *alkalescent*, bilious, putrid Distempers; if this is distilled in a glass Retort, with a gentle Fire, it yields a small Quantity of an aqueous, acidish, light Liquor, which allays Thirst. When this is drawn off, the Substance that remains in the Retort begins to be *alkaline*, and will make a Man hot and thirsty. Urge the Remainder

with

with a Fire somewhat stronger, there will then arise a fragrant, penetrating, bitter, heating Oil, of a golden Colour. This being separated, the remaining Mass will appear black, will be more *Alcaline*, will heat the Body more, create a greater Thirst, and, being boiled with Spirit of Wine, will yield a noble, aperient, detergent, diuretic, anti-hydriopical Medicine. If the Fire is farther increased, a thicker, tenacious, foetid, bitter Oil comes over, and at the Bottom of the Retort, there will be left a very black Coal, which will be much more *Alcaline* than the former. If this is then taken out of the Retort, put into a Crucible, and exposed to an intense naked Fire, a fixed *Alcaline Salt* will at last be produced, which, according to the Strength and Duration of the applied Heat, will be continually changed in all its Properties, becoming constantly more and more acrid, as the Action of the Fire upon it is more intense, and longer continued. In this Case we see a native, acid Salt, rendered at last extremely *Alcaline*, by the Action of Fire only.

6. Three Causes are observed to impart these Differences to *Alcaline Salts*. First, the Proportion of combustible Oil that adheres to the saline Matter; for the greater this is, the less acrid will the *Alkali* be; and if the Quantity of this Oil is less, the Salt will be more acrid. Secondly, the artificial Combination of this Oil with the *Alkali* makes a Difference; for if the Plant is ustulated with such a slow suffocated Fire, as is used in the Preparation of Tachenius's Salt, it will yield a greater Quantity of Salt, but less acrid, and *alcaline*; but if it is burnt hastily in a strong, open Fire, it will produce less Salt, but of a more acrimonious Nature. Thirdly, the proper Action of the Fire itself, seems to add something igneous to the *Alcaline Salt*, whether this arises from the Fixation and Accretion of the very Substance of the Fire to the Salt, or only from a Power which it is endued with of altering the Salt in this Manner. This is beyond Dispute, that the longer Lime is burnt, and the intenser the Fire is that is made use of in the Operation, the more Heat, or the more true Fire it will excite in cold Water. And fixed *Alcaline Salts* also, will generate more Heat in cold Water, as they have been exposed to a greater Torture of Fire during their Preparation. To these Causes, perhaps, a fourth may properly be added, and that is, the original seminal Property of Plants, which is not easily destroyed. One Plant shall yield a great deal of fixed Salt; another, none at all; not that this last naturally contained less Salt than the former, but because it was of such a Nature, that it would not suffer the Matter which constitutes the *Alkali* to be fixed, by the Salt, or the Oil, or Earth, or all together.

7. From what has been said above, we arrive at the Knowledge of the Origin of *Alcaline Salts* in Animals, so far as they regard the Matter of their Food, Drink, and the Air they respire. For Animals that live solely upon pure Water, and Vegetables, take into their Bodies the very Matter, from which *Alcaline Salts* are generated. No-body could naturally suspect, that such an insipid Body, as soft, moist Grass, should, by being burnt, yield an acrid, igneous *Alcaline Salt*. Or who can possibly discover any Thing of this Kind in Ale or Wine? and yet Experience proves that an *Alkali* may be produced from all these. But the Action of the Animal Body brings this latent Matter to Light, and manifests it. A Child that is fed with nothing but sweet, mild, fresh Milk, which does not discover the least Degree of Saltiness, makes constantly a salt, acrid Water, not by actually generating any Salt, but by setting that at Liberty, which before lay concealed. The Urine also of a Bullock, which lives on Vegetables only, is found to be exceeding salt, for the very same Reason. But in Animal Bodies, this Salt is rendered volatile, because it is freed from its fixing Earth, by the Digestion it undergoes in the Stomach, which resembles a sudden Putrefaction. And Putrefaction is known to render the Salts of Plants volatile.

A compendious VIEW of the EFFECTS of fixed ALKALINE SALTS upon the BODY.

1. They soon destroy all the Acid in the Body; for there it meets with but a small Quantity, and that too, a mild, vegetable Acid, only residing in the *Primæ Viæ*, that is, in the Stomach and Intestines.

2. If they meet with an Acid there, they cause an Effervescence, generate Wind, and cause Eructations, stimulate by their Activity, and are converted together with the Acid into a neutral Salt, which then becomes harmless, penetrating, aperient, diaphoretic, diuretic, and antiseptic, and productive of new Effects by Virtue of their Neutralization, which are sometimes attributed improperly to the *Alcaline Salts*, because subsequent to their Exhibition.

3. By Means of this Effervescence they stimulate the Nerves, move the Spirits, and incline both to Motions, different from what they had before. Hence, they often cure the Spasms of hypochondriacal Men, and hysterical Women, and the Distempers depending on them; an Instance of which we see in the celebrated Anti-emetic of Riverius, consisting of an *Alcaline*

Salt mixed with Juice of Lemons, which, if drank in the Act of Effervescence, cures the Cholera Morbus, and stops obstinate Vomiting, which resist all other Methods.

4. They attenuate and resolve whatever is coagulated by an Acid; and hence, when Milk is curdled in the Stomach, they have very good Effects, if prudently administered. They are also capable of resolving other tenacious Concretions.

5. They attenuate glutinous, oily, and fat Concretions, and render them more easily miscible with Water, and hence become Detergents. Fullers, Laundresses, and Dyers, are sensible of this Property in a Lye of these Salts, and therefore they use them to remove viscid, greasy Concretions from Cloths. If moderately used, therefore, they free the chylo-poietic Organs from all glutinous Impurities.

6. They resolve Coagulations of the Bile, Lymph, Blood, and Serum, when admitted into the internal Parts of the Body, and there agitated by the vital Powers.

7. By their acrid Stimulus, they put in Motion Bodies that were before unactive, and hence they provoke Urine, Sweat, and Perspiration, and for this Reason are numbered amongst Diuretics, Diaphoretics, and Sudorifics: The Intestines also they stimulate to a Discharge of their Contents.

8. In Diseases, therefore, attended with unactive, mucous Viscidities; where an Acidity prevails in the Stomach and Intestines from acceft Aliment; where there is a Load of acceft, austere Crudities, manifest by the Coagulations it produces; where a watery Serum, or fat, tenacious Concretions abound; or where Distempers have been generated by these Causes, as the Dropsy, Jaundice, Leucophlegmatia, Gout, Rheumatism, and Scurvy: In these Cases, this Salt is of great Use, if prudently given, that is, well diluted, in small Doses, and those administered at a proper Time, and properly repeated. That Species of Gout which is caused by an abundant Acid, scarcely admits of a more successful Method of Cure, than that which may be performed by a continued Use of these Salts, taken in small Doses. But it does not follow from their Effects in this Case, that they are to be extolled as universal Remedies for the Gout; for they will do a great deal of Prejudice to gouty Patients, whose Bile is exalted into an acrid *Alcalescence*, and whose Humours tend spontaneously to an *Alcaline* Putrefaction.

9. These Salts also are of considerable Use to the Surgeons; for as Caustics they are employed to raise Escars, in order to make Issues; by a temperate Lixivium of these, fordid, putrid Ulcers are successfully mundified; Parts that are corrupted by a Gangrene, if scarified almost to the Quick, and then fomented with a Lixivium of these Salts, contract into a Crust, and then admit of a Separation from the living Part, and by these Means the Mortification is prevented from spreading farther, and a Cure is happily effected; they extirpate Warts also, and eat away small Cancers with Safety; and if sufficiently diluted, they will effectually take away Discolorations or Spots of the Skin.

10. It is however necessary to remark, that the Use of these Salts is highly pernicious in every Disease, where the native animal Salts begin to degenerate into an acrid, *alcalescent*, putrid, volatile Nature; or where the natural Oils of our Bodies are disposed to turn acrid, foetid, putrid, rancid, and volatile, which is manifested by a disagreeable Smell, peculiar to this Kind of Putrefaction, and a Redness of the Urine. But these Salts are particularly destructive, when the Bile is thus degenerated into an acrid *alcaline* Nature, and when the Humours of the Patient are too much dissolved, fluid, and putrid; hence in the Plague they are almost an immediate Poison, and this pernicious Quality is even communicated to the Soap, in which they are an Ingredient. Hence, therefore, in Inflammations, Suppurations, Gangrenes, a Sphacelus, continued putrid Fevers, and Diseases arising from too great a Velocity of the Blood, the internal Use of these Salts must be absolutely forbid.

11. And, indeed, in all Cases they should be used with Caution. Let a Dram of them be dissolved in twenty Times its Weight of Water, and this is the largest Dose that ought ever to be given. Let them be repeated with Circumspection, and let it be carefully observed when the Necessity for their Exhibition ceases. And with these Cautions they may be used successfully, and without Danger. Lastly, let the Effects be determined to particular Parts of the Body, in the Manner specified in the Remarks upon Tachenius's Salt.

Besides the *Alcaline Salts* already taken Notice of, there are others which are volatile, that is, which are capable of being forced by a considerable Heat from the Body which contains them, and which afterwards rise with a very small Degree of Heat. The most remarkable amongst these are animal Salts, which may be procured by Distillation from every animal Substance we are acquainted with. Thus Hartshorn, Bones, Blood, Silk, and Cobwebs yield it in great Plenty. The Analysis of Blood given below under the present Article, may serve for an Example of the Method by which they are separated from the respective Bodies wherein they reside; and the Process with the whole Apparatus is specified under the Article CORNU

CERVI, together with their medicinal Virtues, with Respect to which, let it suffice to say in this Place, that they agree pretty much with fixed *Alcaline Salts*, with a Reserve to the Difference which depends on their Volatility.

But there are besides these two Substances which yield a volatile *Alcaline Salt*, very like those which are prepared from animal Bodies. These are almost all those warm pungent Plants, which, if bruised, send forth a Vapour so acrid, that it makes the Eyes water, and will cause Sneezing, if it gets into the Nose. Many of the bulbous Roots possess this Acrimony in a great Degree; as Onions, Garlick, Leeks, Squills, Hyacinths, and the Narcissus; and the Seeds of a great many of the *alcalescent* Plants, a Catalogue of which will be given in this Article, abound with it.

The other Body which yields a volatile *alcaline Salt*, is almost any soft, juicy, vegetable Substance, which has undergone Putrefaction.

The following Process may serve for an Example of the Method by which volatile *Alcaline Salts* are procured from acrid Vegetables:

Fill a glass Retort almost to the Neck with ripe Mustard-seed, lute on a large clean glass Receiver, and distil gradually with a Sand-heat. The first Fluid that comes over, is oily, and yellowish, and, when collected by itself, is limpid and acrid. Increase the Fire, and there arises another Spirit like the former, but more yellow, and with a light and a very pinguious Oil. These also, if saved by themselves, are very acrid. Lute on the Receiver again, after it has been cleared of the last-mentioned Liquor, increase the Fire underneath, and at the same Time lay live Coals upon the Sand above, and by this Degree of Heat there will ascend from the remaining Mass a light black Oil in a large Quantity, and, at the same Time, an oily, *alcaline*, volatile Salt will stick upon the Sides of the Receiver, collected into little Spots, as it happens in the Distillation of Hartshorn. If this Degree of Heat is sustained for a considerable Time, white Fumes will continue to come over perpetually. A very black Mass will remain at the Bottom of the Retort, which is light and bitter, but not in the least salt.

Distil again in a clean Vessel, by a gentle Heat, the first and second Spirit which came over, and you will have in the Receiver a limpid acrid Liquor, not unlike Spirit of Hartshorn, and of much the same Virtues. A foetid oily Water will remain in the Retort.

Separate the Oil from the Liquor which ascended last, and from the Salt, and wash off the Salt which adhered to the Sides of the Glass with the last-mentioned rectified Spirit, and a Liquor will be obtained abounding with a volatile *Alcaline Salt*, which makes a considerable Effervescence with *Acids*, and which by Distillation with a gentle Heat, out of a tall Vessel, yields a pure volatile Salt, little different from Salt of Hartshorn, after Rectification.

Dr. Daniel Cox gives the following Account of the volatile *Alcaline Salts*, procured from putrefied Vegetables:

Take in warm Weather a considerable Quantity of the Leaves of any Vegetable, stripped or pulled from the greater Stalks, lay it on a Heap pressing it pretty close together; they will soon become very hot, especially in the Middle, and in a few Days resolve into a pappy Substance (excepting the outward Leaves) which being made into Pellets, and put into a glass Retort, and distilled, will yield, besides a great Quantity of Liquor, much thick black Oil, of a balsamic Consistence. The Liquor being separated from the Oil, and distilled in a tall glass Body, a volatile Spirit sublimes, which, after one, two, or three Rectifications, becomes perfectly urinous, not to be distinguished by Smell, or Taste, from well-rectified Spirit of Hartshorn, Blood, Urine, or Sal Ammoniac.

I never made Trial of any Herb, which, thus ordered, did not yield the mentioned Substances; although I have examined many, by this Method of Procedure, which seemed very different from each other, as well in sensible Qualities, as those vulgarly called *Occult*; such as Rue, Sage, both Celandines, Carduus Benedictus, Tobacco, stinking Orach, Garden Scurvy-grass, the lesser Spurge, Baum, Mint, Tanfy, Camomil, Monk's Rhubarb, several Docks and even common Grass, with many others, which it were altogether unnecessary to enumerate; besides Flowers of Elder, Pæony, Cowslips, Clove Gilliflowers, &c. with several Sorts of Mosses, and Rudiments of Vegetation; which last is a green Substance on the Surface of the Earth, in Rivers, Cisterns where Rain often falls, and on Ships between Wind and Water, very apt to run into Moss and Fibres.

1. The Vessels wherein these Distillations were performed, though exceedingly well washed with Water, scoured with common Salt, Sand, Ashes, Soap, fixed Salt, &c. and afterwards exposed many Years to the Air, Wind, Rain, Dews, and Frosts, yet nevertheless retained a very strong Smell, not much unlike that of Musk.

2. The Water left at the Bottom of the Glass, after the first

Rectification, was somewhat acetous; especially when the Herbs were not sufficiently putrefied.

3. If the Herbs are duly putrefied, they leave little Caput Mortuum, sometimes not a twentieth, and never, by my Trials, above a tenth Part; whereas distilled before Putrefaction, they leave much more; and this remaining Coal, burnt to Ashes, yields scarce any *Alkali* or fixed Salt.

4. The volatile Salt is much more than the fixed Salt would have been, afforded by the Herb incinerated the ordinary Way.

5. All those Herbs which yield Store of fixed Salt, such as Wormwood, Carduus, Mugwort, Sage, &c. do likewise, being thus managed, afford plentifully a volatile Salt.

6. These volatile Salts being highly rectified, did not, that I could perceive, differ from each other; as neither do vinous Spirits of putrefied Vegetables, or their fixed Salts highly purified and rectified.

7. During the Putrefaction, the Room would be strongly perfumed, at the Beginning, with the natural Scent of the Herb, if it had any eminently peculiar Smell, in the Middle of the Putrefaction with the Scent of a Mixt between that and the urinous; but, being well putrefied, became sensibly urinous.

8. The distilled Liquor of some Herbs, at the first Rectification, yielded a Spirit very hot; but the last inclined rather to that of pungent vinous Spirit of Scurvy-grass, Horfe-radish, &c. being, if I may so speak, Piperaceous, and biting, rather than like volatile Salts; but, after repeated Rectifications, one, two, or more, according to the Nature of the Plant, or Time it had putrefied, became perfectly urinous. This was usually when the Herbs had not duly putrefied, which proceeded, in my Apprehension, from some Commixture of essential Oil, which, by reiterated Rectifications, is either separated or transmuted. The same happens in the vinous Spirits of putrefied Vegetables, and in their fixed Salts.

9. In the Distillation of the putrefied Herbs, the urinous Spirits and Salts came chiefly at the latter End with the Oil, in the Form of a thick white Cloud, or Fumes, and, condensing in the Recipient, formed an innumerable Company of very irregular crooked Rivulets, exactly after the Manner of Hartshorn, Blood, &c. and at the Beginning came the Phlegm, with most of the Acetum, in great Drops with little Fume, and the Rivulets strait, and without Striae and Wanderings.

10. Some Herbs, as Winter-favory, Sage, &c. in the first Distillation, yielded copiously a volatile Salt in a dry Form, which coated the Receiver, and sublimed into the Neck of the Retort; so doth Tobacco, and once Saffron did so, in Digestion with Spirit of Wine.

11. All Plants, thus putrefied, yielded plentifully (especially towards the latter End of the Distillation) a foetid gross Oil, which, if the Herb was well putrefied, did not in the least resemble the Plant which produced it. I could hardly perceive that they differed from each other in either Taste or Smell, only, if the Plant was not thoroughly putrefied, an Oil would come over at the Beginning of the Distillation, which, as also the Water, would retain exactly the Taste and Smell of the Vegetable which afforded it, and it would be fluid and transparent like other essential Oils. The Oil of Herbs very well putrefied came over chiefly at last, and did require a very strong Fire to extricate it out of the Herb; was mostly (especially that which comes last of all) of the Colour and Consistence of Tar, very tenacious, and did far and wide emit a very odd, faint, foetid, offensive Odour. If any Thing became infected by this Oil, it was not to be freed from it in a long Time.

12. Herbs, which are distilled in an Alembic with Water, yield little essential Oil, as Baum, Mint, Camomil, &c. afford much of it thus putrefied; and those that give much essential Oil, as Wormwood, with many others, being putrefied, yield abundantly more.

13. During Putrefaction, the Herbs became exceedingly hot, especially those that were closely compressed, and had Store of Moisture in them; so that I could as well detain my Hand in the Flame of an ordinary Fire, as in the Midst of them.

14. Fatty, moist, and insipid Herbs putrefy much sooner, and with greater Heat, as Grass, Docks, Garden Scurvy-grass, Celandine, &c. Drier, and much more sapid Plants, more leisurely, and with less Heat, as Winter-favory, Rosemary, Sage, Rue, Mint. The Stalks of no Herb putrefy so soon as the Leaves freed from them. This is most evident in Docks, whose tender Parts are pappy and mucilaginous, when the Stalks are intire.

15. Herbs seem by this Putrefaction to be deprived of all their specifical or peculiar Properties. Celandine loses its tingeing Quality; Spurge, its Milk, vesicating and poisonous Nature, &c.

16. Herbs, which before Putrefaction were extremely foetid, as Atriplex Olida, &c. become afterwards either inodorous, or not ill-scented. And, on the Contrary, Monk's Rhubarb, Garden Scurvy-grass, with many other inodorous Vegetables, during

ing Putrefaction, become abominably, and almost insupportably foetid, like the worst of Excrements, all which yet they lost immediately upon Distillation.

17. None of those Flowers, I have hitherto used, do stink in Putrefaction.

18. Many of the Herbs, thus putrefied, swarm with Maggots (an Argument of the close and stedfast Contexture of the seminal Principles in Insects) especially at the Bottom, and in the Middle, whither Flies and other Insects can have no Access, to deposite their Eggs, and where the Heat is so violent, that they could not possibly subsist.

19. Yet the volatile Spirit and Salt is not afforded by these Insects; for, having distilled separately a great Quantity of them, they yielded no volatile Salt or Spirit, but a Liquor of a very different Nature.

20. Herbs, putrefied in a great Glass with a narrow Neck, the Mouth left open; in a few Weeks became, for the greater Part, a Mucilage; and, distilled a Year after they had stood so open, yielded a little urinous Spirit, but not a Drop of Oil.

21. Vegetables, if the external Air be excluded from them, will not putrefy or ferment.

22. Some Herbs, Mosses, and Rudiments of Vegetation, yield a volatile Salt, distilled without previous Putrefaction; as do also many Seeds, and several of them sufficiently insipid.

23. These volatile Spirits and Salts have not only the same sensible Properties, but also agree in all known Effects, and Operations, with common urinous Spirits, and Salts; as, in the changing Syrup of Violets, and many other vegetable Tinctures, green, in being diaphoretic, diuretic, and deobstruent, contrary to Acids, which they do mortify, precipitate all Metals and Minerals dissolved in acid Menstruums; being highly rectified, and mixed with perfectly dephlegmated Spirit of Wine, strike the *Offa alba*, as Chymists speak. They unite with Acids, and thereby become Ammoniac or neutral Salts; and, indeed, perform whatsoever can be expected, or desired, from the common urinous Spirits of Salts: *Phil. Trans. Abr. Vol. 3.*

DISEASES generated by an ALCALI abounding in the HUMOURS.

What has been specified above with Respect to *Alcalies*, will lead us to a Knowledge of the Nature of *alcalescent* Aliments, and their Effects upon the Body in altering the Juices so as to be productive of Distempers. A Knowledge of infinite Importance to every Body concerned in the Practice of any Branch of Physic, because every Fever, or febrile Disease, is either caused by, or accompanied with a Tendency to an *alcaline* Putrefaction. And many chronical Disorders, which depend upon the Vitiations of particular Parts, owe many of their Symptoms to this *Alcalescence*.

Aliments are taken either from the animal or vegetable Kingdom. Of vegetable Aliments, the Juices of some, if exposed for a Time to a Heat sufficient, will turn sour, and these have been called *acescent Vegetables*.

But there is a considerable Class of Plants, which do not become acid by Putrefaction, but are resolved into a foetid oily *Alcali*. And from these, it is remarkable, that no vinous Spirit can be produced by Fermentation; for Fermentation is only an Effort to render vegetable Juices acid, or rather to disentangle the latent Acid, and separate it from the Oil and Earth, that confine and disguise it.

To this Class belong almost all the very acrid Aromatics, which by the Pungency of their Taste betray their Family. These are seldom taken in Quantities sufficient to produce a Disease by their own Power, but are however capable of promoting any preceding Tendency in the Juices to an *Alcalescence*, and heightening it into a Distemper. Physicians should therefore be careful how they prescribe the warm Antiscorbutics, because when any Degree of the above-mentioned *Alcalescence* prevails in the Juices, these will not fail to increase it by their Use, and if long continued, the Patient will run a great Hazard of incurring a Putrefaction of the Lungs, Liver, or some of the principal Viscera, which according to the Part thus affected will be attended with a foetid Breath, Spitting of Blood, a putrid Diarrhoea, Dropsy, or hepatic Flux.

Amongst *alcalescent* Vegetables, Boerhaave enumerates the following:

<i>Abstinium</i>	Wormwood
<i>Alliaria</i>	Sawce all alone, or Jack by the Hedge.
<i>Allium</i>	Garlick.
<i>Alyssum</i>	Mad-Wort.
<i>Armoracia</i>	Wild Radish.
<i>Arum</i>	Cuckow-Pint.
<i>Atriplex Olida</i>	Sinking Orache.
<i>Asparagus</i>	Sparrow Grass.

Many of these are not proper for Aliment, as abounding so much with an *alcalescent* Acrimony, that it renders them poisonous. Besides the Vegetables above-mentioned, there are many others which properly belong to this Class.

All animal Foods have a spontaneous Tendency to an *alcaline* Putrefaction; the Milk of some Animals only excepted. This is obvious to every one who has observed Flesh, when exposed to a certain Degree of Heat, to putrefy and become foetid. But animal Foods differ very much:

- First, With Respect to the Parts of the same Animal.
- Secondly, With Respect to the Food of the Animal.
- Thirdly, With Respect to the habitual Exercise of the Animal.
- Fourthly, With Respect to the Manner of its being killed.
- Fifthly, With Respect to the Season of the Year, or Climate in which it is eaten.

I. With Respect to the different Parts of the same Animal, Milk differs very much from all the other Parts, especially that of such Animals as live on Vegetables only, and Water; thus the Milk of the Ass, Goat, Cow, Mare, and Sheep, are *acescent*, that is, turn sour upon Putrefaction, like *acescent* vegetable Juices, from whence it is prepared, and not yet perfectly converted into an animal Substance, by the Powers of Digestion. And this Milk will acquire a Difference from the Sort of Vegetable, which the Animal that affords it principally feeds on.

The Entrails of Animals also differ from the muscular Parts, and have a greater Tendency to Putrefaction, as being more full of Juices, and of these Juices some incline more to Putrefaction than others. Thus we find, when an Animal dies, the Abdomen and its Contents putrefy first.

The Blood also is more subject to Putrefaction than the solid Parts, and promotes Putrefaction in the Solids where it abounds. Hence, the more animal Aliment is cleared of Blood, the lesser subject will it be to produce an *Alcaline Acrimony* in the Stomach and Intestines, and an *Alcalescence* in the Juices of another Animal that eats it.

II. With Respect to the Food of Animals, those which live on Grass, or other *acescent* Vegetables, on ripe Fruits, or Corn, are furnished with Juices less inclinable to Putrefaction than other Animals, abound less with volatile *Alcaline Salts*, and these Salts are less volatilised, and exalted. Hence upon Putrefaction they are less foetid, and offensive. Of this Sort are the following Animals:

The Lamb, and Sheep,
 The Calf, Cow, and Ox.

The Kid, and Goat, especially when young.

The Rabbit.

Swine, provided they are fed with Vegetables only. See the Article PORCUS.

The tame Duck, if fed with Corn only.

The tame Goose, if fed with the same.

Hens of all Sorts.

Turkeys.

Tame Partridges.

Tame Pheasants.

The Quail.

But all Animals which feed principally on other Animals, or Insects, have Juices which abound with a highly exalted volatile *Alkali*, having undergone a Sort of double, and sometimes triple Sublimation, or Rectification, first in the Organs of the Animal which serves for Food, and secondly in those of the Animal which feeds on it.

III. Animal Foods differ with Respect to their habitual Exercise, for strong Exercise, long continued, exalts the volatile Salts of Animals, and makes them approach to a State of Putrefaction.

The following Animals, used commonly for Food, abound with a volatile Salt, exalted either by their Food, Exercise, or both.

Deer, both red and fallow, by Reason of their habitual Exercise, though they feed on Vegetables.

The Hare, for the same Reason.

The wild Boar, for the same Reason.

Pigeons in some Degree, because of their habitual Exercise.

The Lark, both because of its Exercise, and Food, which is principally of Insects.

The wild Duck, both because of its Exercise, and Food, which consists much of small Fish, Frogs, and aquatic Insects. This is also true of all the Duck Species.

The wild Goose, Solan Goose, and all of the Goose Species, for the same Reason.

The wild Swan, or Elk, for the same Reason.

The Bittern, because of its Food, consisting principally of Fish, and Frogs.

The Woodcock, because of the great Exercise it is used to.

The Snipe, for the same Reason; and in general all Birds of Passage, very few excepted.

The Plover, and Lapwing, both because of their Food, which is principally of Insects, and their Exercise.

The wild Pheasant, because of its Food, which consists principally of Ants.

The Sparrow, and all small Birds which feed partly on Insects, partly on Vegetables, and use much Exercise, have Juices proportionably *alkalescent*.

IV. Animal Food is more or less *alkalescent*, with Respect to the Manner in which it is killed. Thus if an Animal is killed whilst very hot with strong Exercise, or soon after, the Tendency to Putrefaction in the Juices will be very much increased; inasmuch that an Ox, or Sheep, killed in such a Manner, will be as subject to Putrefaction as an Animal whose Juices are naturally more *alkalescent*, but killed whilst perfectly cool. Hence Deer, and Hares that are hunted, and Birds killed by hawking after a long Flight, contract an immediate Tenderness, which is the first Stage of Putrefaction.

Animals also which are shot, strangled, or killed in any Manner which prevents their Bleeding, are more subject to an *alkaline* Putrefaction, than those which are suffered to bleed freely. Of this the nice Judges of culinary Arts are so sensible, that they frequently kill Fowl by strangling them, in order to exalt their Taste, or, which is the same Thing, increase their Tendency to Putrefaction.

V. The Climate, or Season, makes a Difference in animal Food, because Putrefaction is always in Proportion to Heat, and consequently the Juices of the same Animal will be more disposed to an *alkaline* Putrefaction in warm Climates and Seasons, than in those which are cold.

Hence the Inhabitants of very hot Climates are obliged to use animal Food sparingly; and through a Neglect of this Consideration it is, perhaps, that many of the Northern Europeans, who travel far to the South, contract Calentures, and putrid Fevers. I am also persuaded, that the indiscriminate Use of animal Food in the hottest Summers, and coldest Winters, is productive of many acute Distempers and Deaths in England.

Most Sorts of Insects are highly *alkalescent*.

Fish of all Kinds are *alkalescent*, and that in a very high Degree. Those of fresh Lakes and Rivers, however, are less so, than Sea Fish; and again, the softer Sort of Fish without Scales are observed to incline sooner, and more, than those furnished with Scales, to an *alkaline* Putrefaction; and Shell-Fish most of all.

And it may be laid down as a certain Rule, that of all Sorts of Animals, whether terrestrial, or aquatic, those which putrefy soonest, and become most offensive when putrid, incline

the Juices of our Bodies most to an *alkaline* Putrefaction, when used as Food. And indeed some of them are not to be eaten safely for this Reason, without Vinegar, Salt, or *acescent* vegetable Liquors.

From what has been said under the preceding Articles in Relation to the *Alcalescence* of animal Aliments, and what is specified under the Article PORCUS, one Reason at least will appear, why it pleased the Supreme Being to forbid the Jews, a People that inhabited a very warm Climate, the Use of many Sorts of Animals as Food; and why they were enjoined to take away a great deal of Blood from those they were allowed to eat.

It would be prudent if we, though Inhabitants of a colder Climate, would however believe, that he who cannot err has consulted our temporal Welfare in every positive Injunction he has laid upon us, though the Reasons for it may not always be very obvious; for this would surely incline us by Acts of implicit Obedience to secure to ourselves Happiness and Health.

But that I may set the Advantages, accruing to the Children of Israel from these Prohibitions, in a stronger Light, I shall make the following Observations on the Foods they were forbid to use, with this further Remark, that if we, even in our cold Climate, would conform to the Rules laid down by the wise Legislator of the Jews, Longevity would be more frequent amongst us, as we should be much less subject to be affected by epidemical Distempers, and acute Diseases of all Sorts, which carry off at least two Thirds of Mankind. Nor would chronic Affections perhaps be so terrible, and difficult to conquer, as they are found to be at present.

It must be remembered, that the Climate, in which the Children of Israel lived, was very hot; and that therefore every Species of Aliment which is improper to be eaten in our Climate, on Account of its Tendency to an *Alkaline* Putrefaction, was much more pernicious in the warm Country inhabited by the Jews.

The Aliments forbidden the Jews were:

Blood. This is extremely subject to an *alkaline* Putrefaction, and the Juices formed from it are highly *alkalescent*, and subject to putrefy. For the same Reason all Animals whatever killed, without being suffered to bleed sufficiently, are improper Food. It is well known to common Observers, that the more succulent, and juicy the Flesh of Animals is, the more subject it is to Putrefaction.

If an Animal has been heated by Hunting, there seems a farther Reason to let it bleed, in order to lessen the Tendency to Putrefaction it acquires by Exercise, and Heat. And thus we find it directed, *Leviticus, Chap. xvii. V. 13.*

And whatsoever Man there be of the Children of Israel, or of the Strangers that sojourn among you, which hunteth or catcheth any Beast, or Fowl which may be eaten; he shall even pour out the Blood thereof, and cover it with Dust.

Animals which die of themselves are unwholesome, both as they do not bleed, and as their Juices are generally in an actual State of Putrefaction, or near it, before they die. And we find the Flesh of such Animals forbid in the above quoted Chapter, Verse the 15th.

גמל Gamal. — The Camel. Though the Food of this Animal is only Vegetables, and Water, yet the Fibres are hardened, and rendered in a great Measure indigestible, and the Salts are highly exalted by its habitual Exercise.

שפן Shaphan. — The Coney, as we translate it, but Bochart in his *Hierozoicon* says, it is a large Species of Rat, and others call it a Mountain Rat. Thus, *Proverbs, C. xxx. V. 26.* *שפנים* are said to make their Houses in the Rocks.

As the general Food of all Creatures of the Rat Species is Animal, their Juices must be consequently much inclined to an *alkaline* Putrefaction, and therefore their Flesh must be unwholesome.

ארנבת Arnebeth. — The Hare. The Animal we call thus is certainly meant in this Place; the Septuagint translates it by *daurates*, and with this the Syriac and Arabic Versions agree; and thus the Jews understood it, who abstained from eating it, as we learn from Plutarch, *Symposiac. 4. Quest. 5.* and Clemens Alexandrinus, *Pedag. 2. 10.*

The Hare is remarkable for being extremely timorous, and this makes it use a great deal of Exercise by way of Precaution, when he goes to seek his Food, and at the Approach of any Danger, either real, or imaginary; this habitual Exercise probably contributes to the Exaltation of the Salts. We find in Effect that the Hare has a very high Taste, even in our cold Climate; and this high Taste universally is an Evidence, that the animal Flesh which gives it is strongly inclined to an *alkaline* Putrefaction. It is remarkable that the old Britons abstained religiously from eating Hare, as we learn from Cæsar, *de Bello Gallico, L. 5.*

חזיר Haxir. — The Swine. This Animal is remarkable for Filthiness, and feeding on all Manner of Ordure, even Carrion if it falls in his Way. It is the only Animal in the Brute-
Creation

Creation subject to the Leprosy; and also something very like what we call the King's-Evil, called in Latin *Scrofula*, from *Scrofa*, a Sow; as this Disease is in Greek called *Σκροfula*, from *Σκροfula*, a Swine. The Measles is another filthy and contagious Disease which this Brute is frequently infected with, inasmuch that it has passed into a Proverb, as we learn from Juvenal, who calls it *Porrigio*. In this Distemper, all the fleshy Parts are full of innumerable small, round, white, and hard Substances somewhat like Hail Stones.

Hence it must appear to every reasonable Observer, that the Flesh of this Beast, as an Aliment, must be highly improper for a People so subject to Leprosies, as the Jews appear to have been, and who were Inhabitants of a warm Climate, which renders every Thing more inclinable to Putrefaction.

All BEASTS which do not both divide the Hoof, and chew the Cud.

Under this Prohibition are included all Beasts of Prey, and those which eat Flesh, whose Juices are highly *alcalescent* for Reasons before given. All Animals of the Horse, and Ass Kind, are likewise here prohibited. And we find that the Flesh of all these is difficult to be digested, and assimilated by the vital Powers, and that the Juices are rank and *alcalescent*; perhaps because they are frequently heated by the habitual Exercise they are obliged to use for the Service of Man.

I cannot explain scientifically all the Effects which Chewing the Cud may have upon the Flesh and Juices of the Animal that does it. But it is worthy of Observation, that all Creatures which chew the Cud live on Vegetables and Water only; have a very slow Digestion, spend a great Part of their Time in getting their Food, and the rest either in chewing the Cud, or sleeping; so that it is accidental if they ever use Exercise sufficient to heat themselves, harden their Flesh, and exalt their Salts to any considerable Degree of *Alcalescence*. Of this the Cow, and Sheep are obvious Examples. Deer both chew the Cud, and divide the Hoof; and their Juices are notwithstanding somewhat *alcalescent*, as they are usually killed amongst us. The Flesh is however tender, and easy of Digestion; and if they are killed according to the Directions of the Levitical Law, that is, if they are suffered to bleed plentifully, this Tendency to an *alkaline* Putrefaction is in a great Measure removed.

All FISH which have not FINS and SCALES.

These are what medicinal Writers call *Pisces molles*. It has been observed above, that all Sorts of Fish are very subject to Putrefaction; but those without Scales more than others, and Shell-fish most of all.

נשר *Nesher* — The Eagle.

פרס *Peres* — The Osprey.

עיונה *Iznijah* — The Osprey, so called from חיונה with a *;* *Epenthetic*. It is an Eagle, so called from his Strength, which we may imagine to be the little Black Eagle, which is therefore called *Valeria*. The Syriac renders it a Crow.

דאה *Daah* — The Kite, so called from his Flight, which is very strong, especially when he hangs in the Air, without moving his Wings.

איה *Ajjah* — The Merlin, a Kind of small Hawk.

ערב *Oreb* — The Raven, or perhaps the *Nycticorax*.

בת העונה *Bath Hajjaanah* — The common Owl.

תחמס *Tahmas* — The Noctua, a Species of Owl.

שחפ *Shabbaph* — The Cuckoo.

נץ *Natz* — A Hawk. It is explained a Bird with which other Birds are taken, and which Fowlers carry on their Fists.

קוס *Cos* — The Goshawk. Some translate it an Owl; others *Onocrotatos*, a Bird which makes a Noise like an Ass.

שלך *Shalach* — The Cormorant.

ישופ *Yanbuph* — The great Owl.

The Juices of all these are highly *Alcalescent*, both as they are Birds of Prey, and as their habitual Exercise is great.

תושמת *Tinshemeth* — The Swan, or Chough Daw. It is of no great Importance which is here meant, for the Juices of both are much *Alcalescent*, and their Flesh rank, and scarcely digestible.

קאה *Kaah* — The Bittern. This Fowl feeds on Fish; the Flesh is very rank, and subject to Putrefaction.

רחם *Rahham* — The Gier Eagle. It feeds on Flesh.

חסידה *Hafsidah* — The Stork, so called from חסיד, because its Piety to its Parents is said to be remarkable. Hence Petronius calls it *Pietatis Cultrix*. The Stork feeds on Frogs, Serpents, and other Reptiles, which are in general extremely *Alcalescent*, and therefore it must afford Juices in a State very near to Putrefaction.

אנפה *Anaphah* — The Heron. It feeds on Fish, and uses a great deal of Exercise, and for both these Reasons has Juices highly *Alcalescent*.

דוכיפת *Duchiphath* — The Lapwing, a Bird almost perpetually on the Wing, and which feeds on Insects. The Flesh is of a very high Taste, and near to a State of Putrefaction.

עטלפ *Atallaph* — The Bat. It feeds on Insects.

חלד *Chloed* — The Weasel, a Beast of Prey.

עכבר *Achbar* — The Mouse. It feeds on Flesh.

צב *Tzab* — Properly the Toad from its Swelling, derived from צבה, *intumuit*.

אנקה *Anakah* — This is sometimes translated the Ferret, and by some it is called a Species of Locust. But, as in the Prohibition it immediately follows after the Toad, and is derived from אנק, which signifies *clamavit*; there is great Reason to believe it should be understood the Frog, literally the Cryer, or, the Beast that cries, alluding to the Croaking of this Reptile.

כוז *Coabb* — The Lizard.

לשאה *Letaah* — Bochart calls it the Salamander, a Sort of Lizard.

חמט *Homet* — The Snail.

תושמת *Tinshemeth* — Bochart calls it here the Ghamaelion; in another Place quoted above, the same Word signifies a Swan, or Jack-Daw.

All these Reptiles are extremely subject to Putrefaction, as are Reptiles of almost every Kind; the Smell of these, when putrefied, is extremely offensive; and hence we must conclude their Salts to be highly exalted, and their Juices *Alcalescent* to a great Degree.

Before I proceed farther in the Account of an *Alkaline* Putrefaction in the Juices, and its Consequences, it is necessary, that I specify the Parts into which the Blood is separable by Chymical Analysis.

First then, if the Blood of a Person in Health, fresh taken away, is put into a Retort, with a Receiver accurately luted to it, and is then committed to a Heat much less than is sufficient to make Water boil, a Vapour comes over, which condenses into a Liquor very little, if at all, different from Water, and which does not appear to be either *alkaline* or acid, saline, pinguious, or in any Degree acrimonious. And if the Fire is increased to the Degree of boiling Water, the same Vapour still continues to come over, forming exactly the same Kind of Water, till the Blood put into the Retort loses much about seven Eighths of the original Weight.

If the remaining dry Mass is taken out of the Retort and examined, it affords no Signs of containing any Thing the least *alkaline*, acid, or acrid; but is utterly insipid, except that it tastes and smells of Burning, and that not much. This inclosed in a wooden Box, will keep for Ages without Putrefaction. But by a Sand-heat, gradually increased, it yields, first a fattish, oily, bitter Liquor, somewhat inclining to be *Alkaline*; then a white volatile Salt; and, as the Fire increases, a yellow Oil, and with it the same Kind of Salt. Take the Receiver away that contains what is come over, and lute on another; urge the Remainder with the most extreme Degree of Fire that the Glass will bear without melting, and white Fumes will arise without ceasing, if the Operation be continued ever so long, and with these a black, thick Oil.

The Mass remaining in the Retort is very black, and shining, brittle; extremely light and spongy, of a disagreeable Smell, empyreumatic, bitter, and scarcely at all salt; this, when urged with a Heat almost sufficient to melt the Retort, continues perpetually to emit Fumes, and preserves its black Colour so long as it remains in a closed Vessel; but when exposed to a naked Fire, it flames, and, losing this Blackness, becomes white, and is then found to be an insipid Earth, containing not the least Portion of an *Alkaline Salt*; but a small Quantity of an Acid may be got from it by an extreme Degree of Fire, which Boerhaave imagines to be the Offspring of the Sea-Salt which had been used in Food, and remains in the Blood unaltered; but in his Observations on this Process, he tells us, that he had observed the same Appearances in the Distillation of the Blood of many Brutes, and therefore this Acid cannot be owing to Sea-Salt, because no Animal, that I know of, eats Salt, except Man and Pigeons, unless domestic ones, as Dogs, and Cats, sometimes by Accident, not by Choice. I am sensible it may be answered, that there is Salt, more or less, in all Water that Animals drink; and I know a Salt may be procured from the Urine of Animals, much resembling Sea-Salt in the Figure of the Crystals, and some other Properties. But if the Source of this Salt was the Sea-Salt taken into the Stomach with the Aliment, human Urine would probably yield more of this Salt, than that of gaminivorous Animals, because the Salt taken in the Water of these Animals, bears no Proportion to that which is eaten by a Man; however it appears, that the Urine of a Cow, or a Horse, yields a much larger Proportion of this Salt than that of a Man.

Here then we find in the Blood a Water, an Oil, a volatile *Alkaline Salt*, a fixed Earth, and a Portion of Acid. And now, if we consider attentively the Progress of animal Putrefaction, we shall find it has exactly the same Effects, as the Distillation described above, and that it only differs from it in taking up a somewhat longer Time. For first the watery Particles exhale; next the saline Part is attenuated, and disengaged from the Earth and Acid, and thus being rendered acrid, *alkaline*, and volatile, rises together with a Part of the Oil also attenuated, and separated from the Earth, and affects the Organs of Smell

with a Nidor, or Stink peculiar to animal Substances in a State of Putrefaction.

The rest of the oily Particles unite with the Earth thus deprived of the finer Part of the Oil, Water, and Salt, and both together form a black, tenacious, viscid Substance, which, however, at last is resolved, and leaves nothing behind but a pure virgin Earth, the Acid also exhaling. Thus the animal Juices, by Putrefaction, undergo a thorough Alteration, and Separation, after which it is impossible to unite the separated Particles again, so as to make an uniform homogeneous Fluid, like what it was before.

It is impossible this Putrefaction should prevail universally in the Juices whilst the Animal is alive, for Reasons which will be given hereafter; but particular Parts of the Body may putrefy, without causing immediate Death. — *Alcalescent* Food also may putrefy in the Stomach and Intestines, and cause great Disorders in the animal OEconomy, when taken in Quantities disproportioned to the Powers of Digestion. And the Juices in general may have a strong Tendency to Putrefaction, and of this several Birds that feed on Carrion are sensible, much sooner than Mankind, for as soon as the volatile Salts, and rancid Oils, begin to exhale, the Organs of Smell, in these Birds, are sooner affected than ours, inasmuch that they are frequently allured from considerable Distances, to the Neighbourhood of Houses inhabited by People in Fevers.

The antecedent Causes therefore of an *Alcalescence* in the Body, and the Diseases depending thereon, may be reduced to the following:

1. *Alcalescent* Aliment, that is, Aliment of *alcalescent* Vegetables, or of Animals, the Milk of graminivorous Animals only excepted. And amongst these Fish, particularly their Livers, and Skins: Fowls that live on Fish; all Birds which prey on other Animals, or Insects, or which are used to a great deal of habitual Exercise; also Animals killed whilst heated with strong Exercise, incline more to an *Alcaline* Putrefaction than others.

2. A Weakness of the Organs of Digestion.

When this is the Case, the Aliment, following its natural Tendency, putrefies in the Stomach, and causes what is usually called a Surfeit. And the Chyle enters into the Blood in a State near to Putrefaction, or in Part putrefied.

3. A great Strength of the digestive and assimilating Organs, for this produces

4. A great Quantity of Blood highly exalted, and in a State very near to Putrefaction, and a Bile in a State near to Putrefaction.

It must be remembered, that *Acescent* Aliments are by the Actions of the above-mentioned Organs converted into *Alcalescent* Juices. When therefore these Organs act strongly on Food already *alcalescent*, it must be rendered more so, and brought nearer to a State of Putrefaction.

It is upon this Account that Plethoric People are more subject to epidemical Disorders than others; that People in a full State of Health, are more in danger of falling into Fevers, and those of a bad Kind, than others whose general State of Health is not so good; and that such who have very strong Constitutions, are more liable to pestilential Disorders, and putrid Fevers, than Valetudinarians.

Hence Hippocrates, *L. 1. Aphorism. 3.*, advises to beware of an Excess of Health, for the same Strength of Constitution which was sufficient to bring the Blood and Juices to such a Degree of Perfection, will at last exalt them into a Disease. And Celsus tells us, that a full State of Health is to be suspected: *Ergo si plenior aliquis, & speciosior, & coloratior factus est, suspecta habere sua bona debet. Quæ quia neque in eodem habitu subsistere, neque ultra progredi possunt, fere retro, quasi Ruina quadam, revolvuntur.*

Hippocrates thinks it prudent to subtract something from a State of Health arrived at the utmost Perfection, because, as it is not possible it should remain long without Alteration, and cannot mend, it must necessarily grow worse. But with all Deference to so great an Authority, I must remark, that Nature has Resources of more Importance for the Preservation of Life, and Health, than any Assurances which Art can afford her, and from which she draws Help upon these Occasions. Thus in Case of too much Fulness of Blood, an *Hæmorrhage* lowers the Habit to such a State, as Hippocrates advises us to reduce it to by Art. If the Juices are so much exalted, as to tend too much to an *Alcalescence*, the Acrimony attending this State, before it becomes sensible by any ill Consequences frequently stimulates the Glands of the Skin, and thus causes its own Evacuation by an increased Perspiration; or else, if it happens to affect the Glands of the Kidnies, it is carried off by Urine; but if it falls upon the Liver, the most likely Part to receive it first, or the Pancreas, or the Glands of the Stomach, and Intestines, the Danger is prevented by Vomiting, or a *Diarrhoea*, or both, sufficient for the salutary Purposes above-mentioned; and hence the popular Opinion, founded on the Experience of all Ages, that a Looseness in the Spring and Summer is salutary. Thus we see this Acrimony so much to be dreaded, is frequently under the Conduct of a well regulated animal OEconomy, its own

Antidote, and the Means of preserving, instead of interrupting Health. But here we must suppose no Excesses are committed, and regular Exercise is used.

5. Long Fasting. For, if the Blood is not perpetually diluted with fresh Chyle, it will contract an *Alcaline* Acrimony, and the Breath will become foetid, till in the end a Fever and Death ensue from this Putrefaction.

6. A Stagnation of any Part of the Blood or Juices.

Because all Animal Juices, which stagnate, follow their natural Tendency, and putrefy.

7. Great Heat, whether of the Season, or Climate; external, or internal; natural, or artificial.

8. Violent Agitation of the Blood. Because it produces Heat.

9. Excessive Exercise, especially if long continued.

When any of these Causes, or many of them conjointly, have produced an *Alcaline* Putrefaction, it is manifested by the following Signs, in the *Primæ Viæ*.

1. Thirst.

It is observable that Nature, or rather the Author of Nature, has given to all Animals a certain Sagacity, to enable them to distinguish Aliments which would be noxious to them, from those which are salutary; and to direct them to the Means of curing the Disorders they labour under. This, in Brutes, is called *Instinct*; and as we find the same Propensions calculated for the same good Purposes in Mankind, I think we may properly enough call them by the same Name.

In the present Instance, Thirst is raised, that is an Inclination to drink large Quantities of small diluting Liquors. Now these Liquors dilute the *alcaline*, putrid, acrimonious Salts, relieve the present uneasy Sensation, and dispose the putrefying of putrefied Matter to be discharged out of the Stomach and Intestines, either by Vomit, or Stool. But if the Propensity is to acid Liquors, which is generally the Case, these Acids, when mixed with the putrid Salts, destroy them, and are both together converted into a neutral Salt.

It is remarkable, that taking internally volatile, *alcaline*, animal Salts, as Salt or Spirit of Hartshorn, raises a Thirst, in the same Manner, and for the same Reasons.

2. An utter Loss of Appetite, and an Aversion for *Alcalescent* Aliment, particularly of that Sort of Aliment, which originally caused the Disorder.

This is another Instance of the Instinct above-mentioned; or rather, of the Protection of Providence, which watches over us in Sickness as well as Health. An Appetite would be prejudicial, when the Stomach is in such a Condition, as not to be able to digest the Aliment taken into it; and *Alcalescent* Aliment would increase the Disorder.

3. Nidorous Eructations, or Belches which affect the Mouth with the Taste of putrefied Eggs.

Because a Portion of the putrid Salts, and rancid Oil, is excluded together with the rarefied Air.

4. Putrid Sordes upon the Lips, Teeth, Tongue, Palate, and Fauces, which affect the Organs of Taste with a Sensation of Bitterness, because animal Oils, when they grow rancid, become bitter; or perhaps this Taste may be caused by the Bile too much exalted, and tending to Putrefaction.

5. A Sickness at the Stomach, from the Stimulation of the acrimonious Salts, especially at the Sight, or even Idea of *Alcalescent* Aliment near to a State of Putrefaction. This Stimulation increased, causes a Discharge of the putrefied Matter by Vomit, which is salutary, when the Disorder proceeds only from a Putrefaction of the Aliment in the first Passages; but if from a Putrefaction of the Liver, Pancreas, or any other of the Contents of the Abdomen, it is sometimes a very bad Symptom. When this *Alcaline* Acrimony affects the Intestines, it stimulates them to a Discharge of their Contents by a *Diarrhoea*, which is also the Means of Cure, when the Putrefaction is confined to the Aliment contained in the Stomach and Intestines; but is often fatal, when caused by large Putrefactions in any of the Viscera.

Fish that has been kept too long before it is eaten will cause a plentiful *Diarrhoea*; and a very small Quantity of putrefied Egg will have the same Effect, by stimulating the Intestines.

6. This *Alcaline* Acrimony produces a spontaneous Lassitude, and universal Uneasiness; a troublesome Sense of Heat, and inflammatory Iliac Pains.

The Effect of an *Alcaline* Putrefaction in the Blood is its Dissolution into an *Alcaline* acrimonious Fluid; the watery Particles separate from the other Principles and exhale; the finest Part of the Oil grows rancid; the rest of the Oil joining with the Earth, they form together tenacious Obstructions in the Vessels to which they adhere; and the Salts no longer uniformly mixed with the diluting Water, softening Oil, and neutral Earth, become acrid and corrosive. Hence the Fluid circulating in the Vessels, which in order to be fit for Nutrition, and the Exigencies of the animal OEconomy, must be mild, and destitute of all Acrimony, is, in the present State, very far from being accommodated to these salutary Purposes; but, instead of that, stimulates, abrades, and carries away a Part of the Solids; and corrodes and destroys the extremely minute Vessels,

Vessels, to which those of the Brain are above all others subject, whence a Train of Symptoms which are usually called nervous, as Deliriousness, Convulsions, Comas, or Want of Sleep.

This Corrosion and Destruction of the internal Parts is nothing more than what may at any Time be produced on the external Skin, by confining a small Quantity of animal, *Alcaline Salts*, for a short Time, to any Part of it, for it will then act as a Caustic, and raise an Eschar. This may serve as a seasonable Caution to those who wantonly accustom themselves to smell to volatile Salts, especially those which have their caustic Acrimony exalted by Lime in their Distillation; for when a Part of these is drawn into the Lungs, it may, and without Dispute has, very bad Effects on the tender Membrane which lines the Lungs.

In the State of the Blood mentioned above, the Liquors secreted from it are fetid; and the Urine is high coloured, approaching to Redness, in Proportion to the Degree of Putrefaction prevailing, and the Patient necessarily labours under a continual burning Fever.

From this Account of an *Alcaline* Putrefaction in the Blood, it is easy to perceive, that the Consequences must be a Disturbance, Depravation, or utter Destruction of all the Actions, whether natural, animal, or rational; an intire Alteration in the Circulation, and consequently in the Secretions, and Excretions which depend thereon, with general, or local Inflammations, which, if the Putrefaction is considerable, must terminate in Suppurations, or Gangrenes, Sphacelations, and Death.

The different Parts of the Body which are affected by this *alcaline* Putrefaction, make some Difference in the Cure. Thus, if the *Alcaline* Aliments, taken in Quantities too large for the digestive Powers, putrefy in the Stomach and Intestines, and produce the Effects mentioned above, the most rational Method of Cure is to procure their Discharge, either by a Vomit or Purge, or both; and in this the principal Symptoms must be our Guide; for if from these we learn the Stomach is affected, a Vomit is to be given; but if the putrefied, or putrefying Aliment, is protruded into the Intestines, a Purge will sometimes be sufficient to promote their Exclusion. Proper Vomits, in this Case, are warm Water, green Tea, Infusions of Carduus, or Ipecacuanha, in the Quantity of half a Dram; and Purges of the saline Kind seem best adapted for this Purpose; because as they increase the natural Tendency to a Diarrhoea, and thereby carry off the offending Matter, they at the same Time relieve the Symptoms, by destroying a Part of the Acrimony. Both Vomits and Purges must be repeated, according as the Continuance of the Disorder shall make them appear necessary. In general one Vomit, but repeated Purges are required.

I have met with a popular Remedy for an Over-charge of the Stomach by *alcalescent* Aliment, of too much Efficacy to be omitted; it is the Runnet with which Milk is curdled, in order to make Cheese. Runnet is thus made; the first Stomach of a Calf is salted and dried, or else preserved in Brine; this Brine, or an Infusion of the dried Stomach in cold Water, is the Runnet. One or two Spoonfuls of this Brine in half a Pint of cold Water, or an Infusion of a Piece of the dried Stomach about two Inches square for a few Hours in the same Quantity of Water, if drank, is said to take away all the uneasy Sensation caused by the stimulating Acrimony, and to promote the Expulsion of the offending Matter, either by Vomit, or Stool. It would perhaps be somewhat difficult to demonstrate the specific Action of the Juices in the Stomach of a Calf, by which Milk is curdled; but we find in Fact, that this Effect is produced; both in the Stomach of a Calf whilst it is alive, where all the the Milk it takes is found curdled, and in Milk wherewith the Infusion of the same Stomach is mixed, even after the Death of the Calf. I am equally at a Loss to account for the salutary Effect of Runnet, considered as such, upon a human Stomach under the ill Impressions of *alcalescent* Aliments putrefying therein. But I am sensible that the Salt, which preserves the Calf's Stomach from Putrefaction, will also have a very good Effect upon the Aliment putrefying in the Stomach, destroy totally or in Part the *alcaline Acrimony*, and consequently relieve the Symptoms caused thereby; but whether all the good Effects of Runnet as a Medicine depend on the Salt, I will not take upon me to determine; I am, however, certain upon my own Knowledge, that it is an excellent Medicine in the Case above-mentioned.

When a Tendency to this Putrefaction is got into the whole Habit, and prevails in the Blood and Juices, the Cure is much more difficult and tedious, and the Disorder is attended with a much greater Degree of Danger. And as almost all acute Distempers whatever are either raised originally by, or else accompanied with a greater or less Tendency to an *alcaline* Putrefaction, the Regimen and Medicines proper to destroy or curb this *Alcalescence*, are of the utmost Importance to the Art of Healing. The Regimen, however, is most to be regarded, for upon this the Cure principally depends.

With Respect then to the Cure, Bleeding seems proper, as it relaxes and diminishes the Action of the Solids upon the remaining Mass of Fluids, which lessens the Attrition betwixt the

Solids and Fluids, and betwixt the Particles of the Fluids with each other; now, as Attrition is one great Cause of Heat, and Heat a great Promoter of Putrefaction, Bleeding promises fair to remove at least one principal Cause thereof.

In such Cases also Rest must be strictly enjoined, and an Abstinence from all Sorts of Motion rigorously persisted in. Because every Degree of Motion proportionally hardens the Fibres, and accelerates the Circulation of the Blood; this increases the Attrition betwixt the Solids and Fluids, and betwixt the Particles of the Fluids with each other, and consequently promotes Heat, the Parent of an *alcaline* Putrefaction, and all its Consequences.

Warm emollient Baths, Fomentations, and Clysters, are also of Service, as they relax the Fibres, and thereby help to remove one considerable Cause of Heat; and as the absorbent Vessels take up a Portion of them, they become farther serviceable by diluting the Blood.

With Respect to the Air which the Patient respires, it should be temperate and refreshing; if too hot, it increases the Tendency to Putrefaction; if too cold, by contracting the animal Fibres, it is consequentially productive of internal Heat.

Hence the Reasons are very plain, why all Heat beyond Temperateness, whether natural, and produced by the Climate, or Season; or artificial, and generated either by Fires, too many Bed-cloaths, or hot Medicines, must necessarily be pernicious in all Distempers, where there is a Tendency to an *alcaline* Putrefaction.

Our next Care must be to saturate the Blood and Juices with Aliments which are acescent; which have a strong Tendency to become acid when taken into the Stomach, or which are actually acid. Such are Milk either alone, or diluted with Water; Whey, and Buttermilk.

Bread, which has been fermented, is another Aliment of the acescent Kind, but if it has been much fermented, it is actually acid. Of this great Varieties of Foods may be prepared, by boiling it with Water, till it is of such a Consistence, as answers the End proposed, and afterwards adding to it other acescent Ingredients, as Wine, or the crude, or prepared Juices of Fruits. The most common of these is called *Panada*.

Many Sorts of Aliments, exceedingly proper when there is an *Alcalescence* of the Juices, are also prepared from farinaceous Vegetables, particularly Barley and Oats. The Pisman of the Antients, so famous in all Ages, was made of Barley husked, and boiled in Water, and seems to have been a Kind of Gruel, which obtained different Names, according to some Circumstances to be taken Notice of hereafter. The Word is derived from *πρίσσω*, which signifies to peel, or take off the Husks, this being the first Part of the Process for its Preparation, but the French have, through an unpardonable Error, applied the Name of *Pisman* to any Sort of medicinal Decoction.

Amongst farinaceous Vegetables Boerhaave enumerates the following:

Wheat.
Barley.
Oats.
Rye.
Rice.
Buck Wheat, or *Frumentum Saracenicum*.
Millet.
Mays, or Indian Wheat.
Panick.
Spelt Wheat.
Pistachio Nuts.

Of these boiled in Water, and digested for a considerable Time, till they acquire a Tendency to Acidity, many Sorts of Food may be contrived, very proper in an *alcaline* State of the Juices. Decoctions and Emulsions of these, drank in large Quantities, are of considerable Service; first, as they are in some Degree saponaceous, and dissolve Obstructions in the Vessels, which Water alone cannot act upon. Secondly, as they dilute the Juices inclinable to an *Alcalescence* with an acescent Fluid. Thirdly, as they relax the Solids. And, Fourthly, as by their oily Softness they envelope, and obtund the *alcaline* Acrimony, and, thereby rendering it mild, prevent its Effects in the Body.

I must not omit observing, that acescent Aliments in general seem more healthful than those which are *alcalescent*, and are less subject to form Obstructions, provided they are taken in Quantities proportioned to the Strength of the digesting and assimilating Organs, and by People inured to habitual Labour and Exercise.

Thus Homer celebrates the Hippimolgi, a Northern Nation, whose usual Food was Milk, for Longevity. And the Mountaineers of Great Britain, who generally live on Milk, and Cakes made of Oatmeal, fermented till they grow quite sour, are remarkable for Health, Strength, Activity, and living to a very great Age, and are seldom or never visited by epidemical Distempers, in any considerable Degree. And what Virgil says of a Northern Nation is something to our present Purpose:

Pocula lati
Fermento atque Acidis imitantur Vitea sorbis.
Talis Hyperboreo septem subjecta Trioni
Gens Effrena Virum Rhiphae tunditur Euro.

There is another Class of Vegetables of excellent Service, when the Juices tend to an *alkaline* Putrefaction. I mean the Summer or Autumnal Fruits, when perfectly ripe.

Boerhaave mentions the following:

Oranges.
 Lemons.
 Elder-Berries.
 Cherries of all Sorts.
 Citrons.
 Garden Cucumbers.
 Garden Gourds.
 Figs.
 Strawberries.
 Pomegranates.
 Jujubs.
 Apricocks.
 Peaches.
 Melons.
 Mulberries.
 Apples.
 Sweet Plums of all Sorts.
 Currants of all Sorts.
 Raspberries.

I do not know why the illustrious Author has omitted Grapes, Tamarinds, and some others of the like Kind.

Of these considerable Uses may be made. For they may be boiled, or roasted, and eaten occasionally; or their Pulp, or crude Juices, may be mixed with Panadas, Gruels, or other acefcent Aliments. Or else the Juices, expressed after baking, or boiling them with a very small Quantity of Water, may be mixed with Food, or given as a Medicine, first adding to them the Quantity of Sugar which shall be judged sufficient. And it must be observed, that boiling, or baking Fruits, destroys a great Quantity of the elastic Air which they contain when crude, makes them fit more easy upon the Stomach, and thereby renders them more fit for medicinal Purposes.

With Respect to Fruits, it is a very great Error to condemn them in general as unwholesome; for, on the contrary, when thoroughly ripe, they are the most admirable Remedies that perhaps Nature has furnished us with, and never pernicious unless taken in Quantities too excessive, and disproportioned to the Powers of Digestion. Nothing can be better adapted to check that Tendency to an *alkaline* Putrefaction, which the Juices are subject to contract during the Summer's Heat. We scarcely meet with a more powerful Remover of Obstructions, than the Juices of ripe Fruits, if taken in Quantities sufficient, frequently repeated, and these continued for a considerable Time. For the Juices of Fruits, when neutralised by the Heat of the Sun, that is, when perfectly ripe, are saponaceous, and capable of dissolving Obstructions in the Vessels which no other known Fluid is able to act upon effectually. Every common Observer can judge, that Eruptions on the Surface of the Body are salutary, and promise a future State of Health. The Reason of this is, that when the obstructing Matter, which forms Concretions in the small Vessels, is dissolved, and reduced to Particles small enough to circulate with the Blood, the vital Powers find Means of discharging them by the intestinal, or urinary Glands, or else dispose of them by the Pores of the Skin; now when it happens that the Particles of Matter to be discharged are somewhat too large to perspire, they stick in the perspiratory Vessels of the Skin, and there suppurate, for Suppuration is one Way which Nature takes to disburthen herself of what is useless or offensive. Hence those salutary Eruptions, which frequently appear on the Skin in various Parts of the Body, after a plentiful Use of Summer-fruits, have been erroneously deemed, by many, the pernicious Effects of those Fruits, which in Reality acted the Part of a Medicine, and removed Obstructions, which otherwise might have produced a Disease. It is farther to be remarked, that a Diarrhoea, or Looseness, after the Use of the above-mentioned Fruits, is so far from being dreadful, provided it keeps within due Bounds, that it does good Service to the animal Economy, by carrying away the Matter of Obstructions previously dissolved by the saponaceous Juices of the said Fruits. But it is prudent to bake, or boil these Fruits, both for the Reasons given before, as also, because the Fire destroys the Eggs of Insects, which are sometimes deposited in them, and because it brings them to a more exact Neutrality, the Sun being scarcely sufficient in our Climate to render them perfectly ripe.

In an *Alcalescence* of the Juices, watery Liquids, drank warm especially, are also of Service, though endued with no saponaceous Quality, as they relax the Solids, dissolve the Salts, and carry them out of the Body, and contribute to preserve the Blood in a State of Fluidity.

As to Medicines, they may be contrived in various Forms, either from native vegetable Acids, as the Juices of Oranges,

Lemons, Crabs, and many other acid Fruits, or the Essential Salts of acid Plants, as of the Sorrels.

Fermentation also furnishes us with many valuable Medicines in this Intention. Thus Moselle, or Rhenish Wines, which incline to Acidity, are admirable, when diluted with a sufficient Quantity of any saponaceous Fluid. Thus also Vinegars of all Kinds, are of considerable Use, properly diluted; and of these Medicines may be made extremely resolvent, and absterfiv, by mixing them with Water, or Honey, or both, or infusing in them Vegetables suited to answer particular Intentions, as Squills, in making Oxy-mel of Squills.

Many Medicines also of excellent Virtues are, and more might be, prepared by inspissating the Juices of Fruits perfectly ripe to a Jelly or Rob, and amongst these none excels Rob of Elder, a Medicine which deserves the highest Encomiums.

By Distillation we procure another Class of Medicines which powerfully destroy a Tendency in the Juices to an *alkaline* Putrefaction. These are the acid Spirits of Sal Gemmae, Sea-salt, Nitre, Vitriol, and Sulphur, commonly called *Oil of Sulphur by the Bell*. But these must be taken diluted in a great Quantity of Fluid, and they are never proper, unless in Cases where a great Tendency to Putrefaction renders the milder vegetable Acids ineffectual, as in the Plague, and some very bad Kinds of the Small-pox.

There is another Class of Medicines of very great Importance in the Case before us; I mean, the natural; or artificial neutral Salts. The natural neutral Salts are Nitre, Sea-salt, and Sal Gemmae. The two last are seldom used, except in Clysters; but Nitre is, or at least ought to be, an Ingredient in almost every Medicine, given with a View of checking the Progress of an *alkaline* Putrefaction. It is well known, that these Salts preserve all animal Substances from Putrefaction; and Nitre has a remarkable Property of preserving the Fluidity of the Blood, either in, or out of the Blood-vessels. Nitre has also a Power of resolving Concretions already formed, and of expelling the obstructing Matter thus resolved by the proper Emunctories, as by the Glands of the Intestines, Kidnies, or Skin; it is also extremely penetrating, and thus it appears possessed of every good Property, that can render it an eligible Remedy in all Disorders where Danger is to be apprehended from an *alkaline* Putrefaction, that is, in most acute Distempers. It is usually given in a Powder or Bolus, or dissolved in some proper Fluid.

Artificial neutral Salts may be made from almost every different Sort of Acid, impregnated or saturated with any Sort of *Alkali*, either fixed, or volatile. The *Acid* and the *Alkali* must be joined in such a Manner that neither may prevail over the other. Whilst they are mixing together, a considerable Effervescence arises, and the Acid is destroyed by, and destroys the *Alkali*, and then both, thus united, form a Body very different in every Property, Characteristic, and medicinal Effect from the Parent Salts.

Neutral Salts the most generally used in Practice, are the *Tartarus Vitriolatus*, made as directed by Boerhaave (See *TARTARUS VITRIOLATUS*) a Medicine very different from that directed under the same Name in our Dispensatory, though made of the very same Ingredients. The *Tartarus Regeneratus*, and *Tartarus Tartarizatus* of the same Author.

Many extemporaneous Prescriptions of a neutral Fluid may easily be contrived to very good Purposes. Thus, a Scruple of Salt of Wormwood will saturate about half an Ounce of Juice of Lemons; or about ten or twelve Grains of volatile Sal Ammoniac will saturate half an Ounce of distilled Vinegar; either of these mixed with an Ounce of some simple Water, and rendered agreeable by a few Drams of a proper Syrup, and the same Quantity of some compound Water, makes a very pretty Draught of considerable Efficacy, which may be repeated as Occasion requires, for Example every four Hours.

These neutral Medicines deserve the same Encomiums which I have given above to Nitre, and for the same Reasons.

From what has been said above with Respect to the Causes, and Cure of Diseases from a Tendency in the Juices, or any of them, to an *alkaline* Putrefaction, it appears, that in all Diseases where Danger is to be apprehended from the aforesaid Putrefaction, any acid Excretions are to be esteemed good Symptoms, as they are certain Evidences that the *alkaline* Acrimony is destroyed. Thus in Disorders of the Stomach from such a Cause, acid Eructations of Wind witness, that the Cause of the Distemper is almost, if not intirely removed. And thus in acute Distempers, Sweats which have an acid Smell, have been remarked to be of good Presage.

It has been observed, that many who have recovered of the Plague, and pestilential Fevers, have been affected as their Health returned, with a saltish Taste in their Mouths, somewhat like that of Sal Ammoniac; the Reason of this appears to be thus: It is well known in Chymistry, that a putrid *alkaline* Salt, when united with an *Acid*, forms a neutral Salt somewhat resembling Sal Ammoniac. Now when the Juices have been loaded with such a putrid Salt, as it happens in the Plague and pestilential Fevers, when this Salt is saturated with

an Acid, the *alkaline* Acrimony is destroyed, and the Patient by Degrees recovers; and then all the Excretions are infected with the muriatic Salt above-mentioned, like Sal Ammoniac, and amongst the rest the Saliva; hence a perpetual Taste, like that of Sal Ammoniac, in the Patient's Mouth; and hence he fancies all Sorts of Aliments salted.

The Forms of Medicines calculated to destroy an *alkaline* Acrimony are infinite. I shall therefore only give a few by Way of Example:

Take of Oats, bruised with the Husks, two Ounces,

Boil these in three Pints of Water to two, and add to it when strained,

Of fresh Citron, or Lemon Juice, an Ounce.

Of Cinnamon-water, two Drams.

Of Syrup of Mulberries, an Ounce.

Let the Patient use this for his constant Aliment. *Boerhaav. Mat. Med.*

Take of Oats peeled, two Ounces.

Boil them in three Pints of Water to two, strain it, and let the Liquor stand in a gentle Heat for twelve Hours, or till it grows somewhat acid; then add,

Of Syrup of Violets, an Ounce and half.

Rhenish Wine, half a Pint.

Simple distilled Water of Citron-peel, an Ounce and half.

To be used like the preceding Decoction. *Boerhaav. Mat. Med.*

Take of peeled Oats, three Ounces.

With a sufficient Quantity of Water make an Emulsion; to a Pint and half of which add,

Of purified Nitre, half a Dram.

Syrup of Violets, an Ounce.

Vinegar of Squills, two Drams.

An Ounce or two of this may be taken frequently. *Boerhaav. Mat. Med.*

Take of Oxymel of Squills, three Ounces.

Vinegar of Squills, two Drams.

Tincture of Myrrh extracted with Vinegar, a Dram.

Simple Succory-water, six Ounces.

Half an Ounce of this may be taken every Hour. *Boerhaav. Mat. Med.*

Take of Vinegar boiled to the Consistence of Honey, half an Ounce.

Fine Honey, an Ounce.

Syrup of Succory, an Ounce and half.

Simple Fumitory-water, six Ounces.

To be used as the preceding. *Boerhaav. Mat. Med.*

Take of Rob of Currants and Elder, each two Ounces.

Simple Oxymel, an Ounce.

Spirit of Salt, twenty Drops.

Barley-water, two Quarts.

Let the Patient use this at Pleasure for his constant Drink: *Boerhaav. Mat. Med.*

Take of clear Barley-water, twenty-six Ounces.

Rhenish Wine three Ounces.

Syrup of the five opening Roots, two Ounces.

Rob of Elder, six Drams. Make a Decoction.

Let the Patient take three or four Quinces of this every three or four Hours.

Take of Crystals of Tartar,

Pure Nitre,

Vitriolated Tartar perfectly neutralised, according to Boerhaave's Method, of each ten Grains mix into a Powder.

Let one of these be taken every four, or six, or eight Hours, with a Dose of the preceding Decoction, or some other acrescent Liquor.

As what has been said in the preceding Pages will explain; and abundantly confirm many important Points of Doctrine relative to the Cure of acute Diseases, which are delivered by Hippocrates, in his Treatise *Περὶ διαφόρων ὁρίων*, I shall finish this Article with that incomparable Piece, which Dr. Friend, a very good Judge of these Subjects, calls *One of the most valuable Remains of Antiquity*. And indeed, he might have given it much greater Encomiums.

I believe it impossible to do the excellent Author of this Piece Justice in our Language, or any other, at least I am willing to think so, because I am sensible of the Defects of

my own Translation. If, however, I have rendered this most valuable Piece intelligible to those who cannot understand it in the Original, I am certain it will be of no inconsiderable Benefit to Mankind.

I must remark, that the latter End of this Treatise does not seem to have arrived to us as Hippocrates left it; for it is probably either mutilated, or has had something added to it by an Interpolator, much less judicious than the Author of the rest, at least it wants the finishing Stroke of that masterly Hand which completed the other Parts of this incomparable Piece.

Hippocrates begins this important Treatise with blaming the Method of the Physicians of the Cnidian School, who seem to have been the Rivals of those of Cos. This Introduction is somewhat obscure, and the more so, because we have not the Cnidian Sentences, which he finds Fault with.

It should seem that the Cnicians had described Distempers very accurately, but omitted taking proper Notice of many Circumstances which occur in every Disease, which are worthy of Remark, because they inform the Judgment of the Physician, and point out the Indications, or the Method to be pursued in order to cure the Disease. Amongst these are the Age, Strength, and Constitution of the Patient; his Manner of living; the natural Evacuations which promote, or retard the Cure; the Concoction of the morbid Matter; and, in short, every other Circumstance, which can assist us in foreseeing the Event of a Disease, and directing a proper Regimen.

HIPPOCRATES ON REGIMEN IN ACUTE DISTEMPERS.

The Authors of the *Cnidian Sentences*, as they call their Work, have indeed given us an accurate Account of what Patients suffer in every Disease, and of the Events of some Distempers. And so far any Man, however ignorant of the Art of Medicine, might write, and not be mistaken, provided he perfectly understood each Patient's Representation of his own Case. But as to the Prognostics which cannot be learned from the Sick, though it is the Business, and Accomplishment of a Physician to be well versed in them, they are in a great Measure neglected; as are also many Circumstances highly necessary in order to enable us to form a right Judgment of any Case before us.

Now since the Management of each Patient is to be regulated by a perfect Knowledge of every Circumstance relative to every particular Case, I am of a quite different Opinion, in this Respect, from what they have declared themselves to be. And I am not only dissatisfied with them on this Account, but also because they made Use of but few Remedies. They have indeed offered us Plenty of Medicines (except in acute Diseases) that purge downwards, and talked of the seasonable Use of Whey and Milk. If these Remedies were good, and proper for the Distempers in which they prescribe them, the fewer they were in Number, if sufficient for the Purpose, the higher would be their Value. But the Case is otherwise.

But in what they published afterwards, the Character of Physicians was better supported, with Respect to what ought to be exhibited in each Case. But indeed the Antients never left any Thing worth Notice in Writing concerning a Method of Diet, but were wholly silent as to that important Point. Some of them, it is true, were not ignorant of the various Forms and Divisions of Distempers, but, while they endeavour to give us the Names of Distempers, they shew themselves mistaken. For it will be no easy Matter to number them, if we reckon, on one Hand, every Disease a Person labours under a distinct Species from another, because it differs from it in some Respect; or, on the other Hand, suppose it cannot be the same Disease, unless it passes under the same Denomination.

My Opinion is, that, in all Respects, we ought to have a strict Regard to the Rules of Art. For, if we desire that any Work should prosper and be promoted, we must proceed in every Thing relating to it with Exactness. In Things that require Dispatch, and where Delays are dangerous, our Assistance ought to be speedy in Proportion. Where Things ought to be performed after a neat and decent Manner, we are to observe Neatness and Decency. If a Case admits of an easy and gentle Treatment; we are by all Means to avoid putting the Patient to any unnecessary Pain or Torment. In short, we ought to endeavour at Improvements in every Branch of Medicine, without confining ourselves to the vulgar Modes of Practice.

I praise that Physician most, who knows how to distinguish himself, above others of his Profession, by his Skill in improving the ordinary Methods of Practice in acute Diseases, which make the greatest Havock amongst Mankind: Such are those to which our Ancestors gave the Names of Pleurisy, Peripneumony, Lethargy, Burning Fever, and other Disorders which have an Affinity with them, for these destroy the Patient, by a Fever altogether continual, which accompanies them.

M m m

For,

^a I have given *ἑκαστὴν ὁρίων* a Turn somewhat different from the Latin Translations, for Reasons which the learned Reader will easily apprehend. But, as my present Business is rather to explain Things than Words, I shall attach myself very little to Criticisms of this Sort.

^b For, when there is no pestilential Distemper that rages epidemically, but only sporadical Fevers of various Kinds, more die of these Fevers than all other Diseases. The Generality, indeed, are not capable of distinguishing such as excel their Neighbours in medicinal Knowledge, and therefore they only praise, or condemn, capriciously the Cures which they see performed. And it is strongly to be presumed, that common Observers cannot understand these Fevers, because their Nature is not to be comprehended without Study. But even those who are no Physicians may easily appear to be such, particularly in the Distempers above-mentioned. For it is not difficult to learn the Names of Things usually employed about the Sick: Suppose, for Instance, any one should name the Cremor [*χρως*] of Ptisan, or this or that Sort of Wine, or Hydromel, the Sounds are the same to vulgar Apprehensions, whether they proceed from a better or a worse Physician. But these Things are to be considered in a very different Light, and a Man of Skill is more especially distinguished in such Cases.

Now it is my Opinion, that such Things as are advantageous to be known, and yet have escaped the Notice of Physicians, or which are the Occasion of much Good, or Hurt, to the Persons concerned, highly deserve to be communicated to the Public. The Things unknown are as follow:

What should determine some Physicians, in acute Distempers, to persevere for ever in giving their Patients Ptisan not strained, and yet think their Method right.

Some dispute, with all the Reason they are Masters of, against allowing the Patient boiled Barley, because they apprehend it to be of very pernicious Consequence, but however strain it through a linnen Cloth, and exhibit its Juice [*χυρος*].

Others, again, will neither suffer the thick Ptisan, nor its Juice, to be given, some of these extending the Prohibition to the seventh Day of the Patient's Illness, others of them to the full Determination of the Crisis.

Our Physicians are not very fond of proposing such Questions as these, or if they were so ingenuous as to propose their Doubts, the Answers, perhaps, are not at Hand.

Mean while, the Art itself falls under Reproach and Disregard, among the Vulgar, always too subject to conclude from Difficulties, and contrary Practices, that there is no such Thing as *real Medicine*. For in acute Distempers, for Example, our Artists differ among themselves to such a Degree, that those very Remedies which one of them shall prescribe as the best, another shall think improper to be used. It is upon this Account, that the Art of Medicine, seems very like Divination. For Augurs [*μάντις*] look upon the same Bird which appearing on the right Hand, they embrace as a good Omen, to be a bad one, if it appears on their left; not to mention many other Singularities belonging to the Art of Augury; mean Time there are others of the same Profession, who interpret the very same Omens in a Manner directly contrary to the former.

I however affirm, that the Regimen, in acute Diseases, is a Speculation extremely noble and excellent, [*πράξις*] and that it bears a near Relation to many of the most important Points in the Art of Medicine. For Regimen is capable of doing great Things for those that are sick; of preserving Health to those, who already enjoy it; of procuring a good Habit to those who exercise themselves; and of contributing, much to the Attainment of that desirable State, to which the Wishes of every wise Man tend.

Ptisan seems to me; preferable to all Aliment of the frumentaceous Kind, in these acute Distempers, and I commend their Judgment who have given it this Preference. For it has a Kind of Viscosity, which is smooth and equal, soft, and slippery, moistening, causing no Thirst, but conveniently washing whatever wants Elution. It is no Astringent, raises no Disturbance in the Stomach during Digestion, nor Inflation in the Belly, having lost that Property in the Boiling, where it swelled as much as its Nature would permit.

^b This Passage Sydenham seems to have had in View, when he says nearly the same Thing.

^c Aretæus speaking of a Pleurisy, says, Ptisan is to be preferred before all Foods. The best Way, in the Beginning of the Disorder, is to use the Cremor of it, strained from the solid Part, and seasoned only with Honey, without those Drugs which are commonly used to give Relish and Variety to the Ptisan, for at this Time the Cremor alone is sufficient. It serves for the Purposes of moistening and warming, and is effectual in dissolving and detaching Phlegm, and expels upwards, by Spitting, what ought to be expelled that Way, at the same Time gently loosening the Belly. Its Smoothness is both grateful to the Palate, and makes it easily swallowed; and its Viscidity allays Heat, purges the Membranes, digests Coughs, and mollifies all the Parts. Such are the Virtues of Barley. *Aretæus empir. Syden. c. 2. lib. 1. Cap. 10.*

It appears that Hippocrates was convinced by Experience, that the Ptisan was an admirable Aliment in acute Diseases; but he does not seem to have been acquainted with all the Reasons why it was so. As it relaxes, it removes one great Cause of Heat, the grand Promoter of an *Alcaline* Putrefaction. During the Time it boils, and digests, it acquires a Tendency to Acidity, and is, on this Account, a proper Aliment in acute Diseases, where the Juices tend to an *Alcaline* Putrefaction. And again, as it is in some Degree saponaceous, it will dissolve Obstructions, which Water alone will not act upon.

^d The Inanition here hinted at, is that which is brought about by long Abstinence from all Sorts of Aliment; a Practice which some of the Antients gave into, however contrary to Reason, and unsuccessful in Practice.

^e In the Course of this Treatise, Hippocrates explains himself more at large, with respect to Honey, and Wine, which are both Astringent. Mean Time it must not be imagined, that he advises Wine unmixed, for the Antients seldom drank it without fix, or at least four Times as much Water, even in Health. This will be explained more amply in the Sequel.

^f The Sense of the Author is, that if the Tongue and Mouth appear moist, and the Patient begins to expectorate laudably very soon in the Disease, the Crisis will be speedy in Proportion: But on the contrary, if these Evidences of Humectation appear late, the Crisis will be slow.

^g The whole Ptisan seems to be the Ptisan not strained.

^h The great Advantages of Relaxation in inflammatory Disorders, are specified under the Article INFLAMMATIO, which see.

Death.

A Physician, then, who allows his Patients the Use of Ptisan in these Distempers, need not enjoin Inanition, or Emptying of the Vessels, as it is called, though but for one Day, unless he finds himself obliged to intermit it for the sake of a Purge or a Clyster.

Those who are accustomed to two Meals in a Day, may have their Ptisan twice in like Manner; but such as usually make but one Meal, are to eat their Ptisan once the first Day, but may, in Time, be brought by Degrees, to take it twice a Day, if it shall be thought convenient. But here you are to observe, that it is not to be given the Patient at first, in too great Quantities, nor too thick, but only enough to comply with Custom, which requires that something should be taken, and to prevent the too great Inanition of the Vessels. As to the Increase of the Ptisan, with respect to Quantity, in the Progress of the Disease, if it is attended with any uncommon Degree of Dryness, too much must not be given; but Honey and Water, or Wine, or any Thing else that shall be judged proper, must be drank, before the Ptisan is exhibited. What is most proper in each particular Case, I shall specify hereafter.

If the Mouth be moist, and what is discharged from the Lungs laudable, and without any bad Quality, the Quantity of forcible Food (Ptisan) to be allowed the Patient is, in one Word, to be increased considerably. For a quick and plentiful Humectation indicates a speedy Crisis, but that which is slow, and sparing, the contrary.

And this is so far the true State of the Case. But we shall pass over many Things that may happen very seasonably to furnish us with Prognostics, and resume the Consideration of them hereafter. The more plentiful the Purgation, (of the Lungs) the more freely may the Patient take his Ptisan till the Crisis, and it will be proper to continue it for two Days after the Crisis, for Fear of Relapses in those Cases, particularly where there is an Appearance of a Crisis on the fifth, seventh or ninth Day; always having Regard to the equal or unequal Number of Days. After this (two Days from the Crisis) it will be prudent to give the Patient Ptisan in the Morning, and in the Evening to proceed to more solid Food.

The Advantages which the Patient reaps by the immediate Use of the whole Ptisan are principally these: The pleuritic Pains immediately cease spontaneously, so soon as the Patient begins to spit any Thing considerable, and to expectorate [*ἐκπύσσει*]. Besides, the Purgations (of the Lungs) are far more perfect, and the Patients escape with less Putrefaction (of the Lungs) than if they had made Use of any other Regimen. The Crises are also more genuine, are performed with less Difficulty, and are less subject to Relapses.

Ptisan ought to be made of the finest Barley, and to be very well boiled especially if any Thing, unless the strained Juice, is to be used. Besides the other Virtues of Ptisan, the Lubricity which this Manner of preparing it gives the Barley, renders it innocent, when eaten. For Ptisan never causes Obstructions, nor oppresses the Thorax; it is very lubricous, excites no Thirst, is very easy of Digestion, and is extremely relaxing, provided it be well boiled; all which Properties render it beneficial in acute Diseases; inasmuch that a Patient will frequently be injured by too scanty an Allowance of this forcible Aliment.

But in Case the Patient is costive, and takes Ptisan without previous Evacuation of the Excrement, if he was before in Pain, it will be increased; if easy, a Pain will immediately succeed, with a Shortness of Breath, which must have bad Effects, as it dries the Lungs, and creates a deal of Fatigue and Uneasiness in the Hypochondria, lower Belly, and Diaphragm. Moreover, in a continual Pain of the Side, that will not yield to hot Fomentations, and where nothing is expectorated but a viscous uncooked Matter, if, instead of attempting to remove the Pain, either by Bleeding or Purging, as shall seem most convenient, we should give them Ptisan, we by this Conduct hasten

Death. For these, and such like Reasons, those who make Use of the whole Ptisan, die on the seventh Day, or perhaps sooner, some delirious, and some suffocated with an Orthopnoea, and Stertor (*Rattling in the Throat*).

The Antients believed such Patients blasted [*ῥαγισ*] on Account of these Symptoms, and were confirmed in their Opinion by observing the Sides of the deceased to be livid, as they would have been from a Blow received. But the true Cause of this Lividness was, the Patient's dying before the Inflammation of the Pleura and Lungs was resolved¹. These immediately become asthmatic [*ἄσθμα*]; for by much and frequent Respiration, the Matter to be discharged from the Lungs being rendered highly viscous without Concoction, as was observed before, prevents Expectoration, and, sticking to the Aspera Arteria, causes a Stertor; and when the Distemper arrives at this State, it is generally fatal². For the viscid Matter obstructs the Passage of the Air into the Lungs, and makes immediate Expiration necessary. And thus both conspire to hasten the Fate of the Patient; for the viscid Matter, by Adhesion, causes a short Respiration, and this Shortness of Respiration renders the viscid Matter (*ῥαγισ*) more and more glutinous, and prevents it from growing slippery, and moveable.

Nor is the unseasonable Use of Ptisan alone, thus pernicious; but the Eating or Drinking of any Thing that is less proper than Ptisan, is attended with still greater Inconveniencies. Whether a Person be injured by the Use of the whole Ptisan, or its strained Juice (*χυρῶς*), the Remedies are much the same, as also if the Injury is received from neither of these, but from an improper Use of Liquids; some Circumstances may however occur, which may induce a Necessity of varying the Means of Relief. The Methods to be pursued are as follow:

If a Man finds himself seized with a Fever soon after a Meal, and before he has had a Stool, whether his Indisposition be attended with Pain, or not, let him abstain from Ptisan, till he has Reason to think that there is a due Seceffion made of the Aliment into the lower Intestines. If he has any Pain, let his Drink be Oxymel, warm if it be Winter, but cold in the Summer; or if his Thirst be considerable, Hydromel (*ὑδρομέλι*) much diluted with Water. After this, if the Pain continues, and there is any Appearance of Danger, let him not proceed to the Use of Ptisan, till after the seventh or ninth Day, provided his Constitution be strong; and even then, let him not take it too thick, or in too large Quantities. If the Food of his former Meal does not secede, to make Room for what he has just now eaten; if he be robust, and in the Vigour of his Age, give a Clyster; but if his Constitution be weak, a Suppository is preferable, unless he has Stools spontaneously. As to the proper Times for giving the Ptisan, this Maxim ought to be observed, both in the Beginning, and throughout the whole Progress of the Disease; that whenever the Feet are cold, we abstain from giving any Ptisan, but especially from the Use of Liquids; but when the Heat descends to the Feet, then is the Time for the Patient to take them. And it will always be prudent to consider the Observation of this Point of Time, as a Thing of the greatest Importance, in all Diseases, but principally in those which are acute; and more especially in such as are attended with a high Fever, and great Danger of Life.

To proceed, the strained Juice of the Ptisan (*χυρῶς*) is generally to be made Use of first, and after that the Ptisan itself, always having a strict Regard to the Rules laid down above. And it will not be amiss to attempt the Resolution of the Pain in the Side, whether it happen in the Beginning, or in the Progress of the Disease, by hot Fomentations³: The best of this Kind, is warm Water in a leather Vessel (*ἀνθή*)⁴, or in a Bladder, or in a copper or earthen Vessel, first applying something soft to the Side, in order to protect the Part which is in Pain from being hurt. The Application also of a large, soft

Sponge, squeezed out of warm Water, is of good Service; but whatever is made Use of as a Fomentation, must be covered with a Cloth, both to preserve its Efficacy the longer, and to keep the Vapour from being drawn into the Lungs, unless, as it may sometimes happen, we have some End to answer by doing the contrary. It will be useful also to apply Barley and bitter Vetches [*ῥαγισ*] macerated in Vinegar, which is so tempered, as to be a little too sour for Drinking, sewed up in Bags; or Bran may be used after the same Manner. For a dry Fomentation, Salt, and torrifed Millet in woollen Bags, are very proper; for Millet is lenient and relaxing; and such emollient Fomentations as these resolve, and relieve Pains that reach even to the Clavicle⁵. If the Pain is not eased by hot Fomentations, they are not to be long continued, for that dries the Lungs, and promotes Suppuration. But if the Pain at the Clavicle gives a sufficient Indication, or if there is a Sense of Weight at the Arm, about the Breasts, or above the Region of the Midriff, we are, without Delay, to open a Vein on the Inside of the Bending of the Elbow, and, as expeditiously as may be, to bleed without sparing, till the Blood runs of a much redder Colour, or, instead of pure and red, runs livid; for either of these Alterations is usual⁶. But if the Pain is situated below the Midriff, and there be no Indication at the Clavicle, the Belly must be loosened with Black Hellebore [*ῥαγισ* *ἡνδρόβω*] or purple Sea Spurge [*πυρρῶς*] mixing with the Hellebore wild Carrot [*δαυρῶς*] or Hartwort [*σισυρῶς*] or Cummin, or Anise, or some other of the fragrant Herbs; but with the Spurge the Juice of Silphium [*σισυρῶς*] for though here be a Mixture of Simples, they are of a like Quality, and produce one uniform Effect. But black Hellebore works better than Spurge, and is more effectual in promoting a Crisis, but Spurge more powerfully dispels Wind; both are Anodynes, and so are many other Cathartics, but these are the best that I am acquainted with: But whereas we find those Purges which are not nauseous on Account of their Bitterness, or any other disagreeable Taste, the Quantity necessary for a Dose, the Colour, or some particular Aversion of the Patient, are with good Success given in Ptisan, it will be proper to give the Patient Ptisan, and that not in a much less Quantity than usual immediately after taking a Dose of the Cathartics above-mentioned, but it is inconsistent with Reason to give forbile Aliment, during the Operation of the Purge; when that ceases, it may be taken in a less Quantity than usual, which afterwards may be increased by Degrees, if the Pain be removed, and no other Circumstance forbids it.

The same Rules will hold good with respect to the Cremor of Ptisan [*χυρῶς*]. For I assert, that it is much better to begin with it at first, than, after Inanition of the Vessels by Fasting; on the third, fourth, fifth, sixth, or seventh Days, except the Disease come to a Crisis within that Time; and the necessary Preparations previous to its Use, are nearly the same as those already mentioned. And these are my Sentiments, in regard to the Exhibition of Ptisan. And with respect to the Drinking any of those Liquids to be mentioned, this is my Opinion. But I know some Physicians, who act quite contrary; to what they ought, in this Affair. For their Method is, after they have first exhausted their Patient, in the Beginning of the Disease, by an Abstinence of two, three, or even more Days, then to allow them forbile Aliment, and Liquors upon this Principle, perhaps, that it seems reasonable to compensate for one great Change in the Body, by introducing another as great, and contrary. A Change, indeed, would be very advantageous, could it be brought about in a regular Manner, or the Transition made by just, and easy Stops. But as this Change consists principally in the Allowance of Food, if this be not regulated, the Sick will be greatly injured, and those, most of all, who are indulged the Use of the whole Ptisan. Those also who

¹ A Mortification is the true Cause of this Lividness, and this frequently happens, when the Inflammation is not resolved early enough to prevent it.

² This Passage, and the Prognostic upon it, is extremely just, though the Way of accounting for the Danger of such Cases is none of the best. I have more than once known Prognostics made in inflammatory Cases of the Breast, where the Event has not much promoted the Reputation of the Prognosticator. Thus a Patient has had a violent Pain arising from an Inflammation of the Pleura, and has, on a sudden, become entirely easy, and upon this the Person who had the Conduct of the Case, has rashly given Assurances, that the Case was no longer dangerous, which the Event has in a very few Hours contradicted; the Patient being seized with a Shortness of Breath, which Hippocrates expresses by *ἄσθμα*, and this has, to the Confusion of the unwary Practitioner, terminated in Death. In such Cases, when the Mortification is once begun, the Patient is no longer in Pain, as it frequently happens in external Inflammations. Hence we may learn to beware of sudden Changes in acute Cases, particularly Inflammations.

³ I believe every Physician is sensible of the great Importance of Fomentations applied to the Part in Pain, in all inflammatory Diseases, and perhaps nothing has been invented, since the Time of Hippocrates, equally capable of assisting Evacuations, and internal Remedies, in the Resolution of the Inflammation.

⁴ The *ἀνθή* here mentioned, was the Hide of some Beast, sewed up in a Manner to make it hold Water, or any other Liquor.

⁵ *V. Cal. Aurel. Acut. L. 2. C. 19.*

⁶ Whatever has been said by Sydenham, Hoffman, and almost every other modern Author, has been founded upon what Hippocrates says on this Subject.

Sydenham lays the whole Stress upon Bleeding, and an acescent Diet, much the same as Hippocrates recommends.

As to Diet, I forbid all Flesh-meats, and the smallest Flesh-broths, and advise the Patient to sup Barley-broth, Water-gruel, and Panada; and to drink a Ptisan, made of Pearl-barley, Sorrel, and Liquorice Roots, &c. boiled in Water, and sometimes small Beer. Sydenham de Pleuritide.

⁷ Hippocrates was not acquainted with some lenient and gentle Cathartics, which we now make Use of with great Success in acute Cases. He therefore recommends giving the brisk and stimulating Purges which he knew, in such a Manner, as to take off a Part of their Stimulation, which should seem to be in some Degree effected, by the soft and lubricous Particles of the Ptisan, given immediately after a Dose.

take the Cremor will be injured, as will those who drink only Fluids; these last, however, will be the least Sufferers. We may furnish ourselves with Reasons, in this Case, from the Consideration of the Diet of Persons in Health. For if there appear great Differences in Foods, as in other Things, particularly in their Changes, with respect to Persons in a State of Health, may we not very well suppose them to differ not a little, in regard to the diseased, and especially such as labour under acute Distempers? Now it is obvious to be understood, that a bad, but constant and uniform Course of Diet, both with respect to Meat and Drink is, upon all Accounts, a safer Way to preserve Health, than a great and sudden Change, from a bad to a more wholesome Regimen. So they who are used to eat twice, or but once, in a Day, find themselves injured, and disordered, by altering their old Custom. Let one who is not used to dine make a Dinner, he immediately finds himself not well, and feels a Heaviness over all his Body, with a Weakness, and Inactivity; and if he takes besides his usual Supper, he is molested with sour Eructations, and sometimes loose Stools, when the Stomach is burdened beyond its usual Custom, having been usually suffered to dry, and clear itself, and not obliged to the Fatigue of two Intumescences, and two Concoctions. In this Case therefore the Change is to be compensated by another, that is, by Sleep after Dinner, as in the Night after Supper, taking Care to avoid the Inconveniencies of Cold in the Winter, and Heat in the Summer. If a Person cannot sleep, let him walk about gently for a considerable Time without standing still; and let him make little or no Supper, drinking sparingly, and nothing aqueous. The same Person would be more affected, if he was to make three Meals in a Day to Satiety, and the oftener he eat, the more Inconvenience would he find from it. And yet there are some who eat plentifully three Times a Day, and bear it very well, because they are accustomed to it. And others who eat but twice, if they should miss their Dinner, find themselves weak and feeble, and too much dispirited for any Business, and are besides affected with a Pain at the left Orifice of their Stomach [*καρδιαγῆς*] their Viscera seem in a Manner suspended, they make hot Urine of a pale Colour, and their Excrements are baked within. Some taste a Bitterness in their Mouth, their Eyes grow hollow, and they feel a Pulsation at their Temples, and a Coldness in their Extremities. Again, there are many, who, unless they have had a Dinner, dare not venture on a Supper, because a Supper would oppress their Stomach, and create a greater Degree of Restlessness, during the succeeding Night, than if they had also made a Dinner. Since, therefore, a Change in Diet from the usual Custom, though but for half a Day, produces such Effects in healthy Persons, it seems the safest Way, neither to add to, nor retrench from, our usual Fare. If any one therefore, contrary to his usual Way of Life, eats but once a Day, and, after causing an Inanition of the Vessels by fasting all Day, takes his usual Quantity of Food for Supper, he will probably find himself ill, and disordered, on Account of missing his Dinner; and after Supper he will feel a Heaviness, which, however, will be much greater, if he eats more than his usual Quantity for Supper. But if after Inanition of the Vessels, by a longer Fast, he should then suddenly make a hearty Supper, he will find himself yet much more oppressed by it. Whoever, therefore, has exhausted himself by Fasting, cannot take a better Method to compensate for his Day's Abstinence, and recruit his Strength, than in the first Place to guard against Cold or Heat, and not fatigue himself with Labour, because he is in no Condition to bear any of them. Then at Supper, let him eat much less than usual, and no dry Food, but Aliment of the more moist Kinds. Again, let his Drink be by no Means aqueous, nor less in Proportion to his Food. The next Day let him make a slender Dinner, and so, by gentle Degrees, return to his customary Way of Living. Some are, more than others, affected by these Irregularities, particularly those who abound with Bile in their superior Parts; for those who are phlegmatic are, on all Accounts, better qualified to sustain unusual Abstinence; and for this Reason, if they make but one Meal a Day, they are better able to bear it.

We have said enough to prove that great and extraordinary Changes in Things which relate to Nature, and Habits, are the principal Springs of Diseases. It is utterly unsafe, therefore, to attempt unseasonable and extravagant Inanition of the Vessels, or to offer Food in the Height of a Disease, attended with Inflammation, or, in short, to make any sudden Alteration, in any Respect, during the whole Course of the Distemper.

Relative to what has been explained, much might here be said in regard to the Stomach, and Things of the like Kind. As that we bear with Ease what we are accustomed to, whether Meats or Drinks, though bad in their own Nature; and, on the contrary, are incommode with the best of Foods to which we have never been used. The Effects also of eating much Flesh, contrary to Custom, or of Garlick, or Silphium, or its Juice, or Cabbage, or any others of that Kind, which are endued with some remarkable Virtue, might be taken Notice of; but it is no Wonder, that these should, more

than other Things, disturb, and incommode, the Stomach; especially if we have observed, what Disturbances, Intumescences, Inflation, and Gripings, are excited only by Maza, in a Stomach never used to it; what a Thirst, and sudden Repletion, are caused by hot Bread, by Reason of its drying Quality, and slow Digestion; also what various Effects are produced by the finest Bread; as well as the coarser Sort [*ἐσπίμυρον*], when eaten contrary to Custom; and by Maza; when dryer, moister, or more viscous than ordinary; what are the Effects of new Polenta [*ἀλφίτα*] on those who are unused to it; and how it operates, when stale, with such as are accustomed to eat new; what are the Consequences of Wine and Water, being contrary to Custom, on a sudden, exchanged one for another; or of the sudden abandoning a Custom of drinking our Wine pure, or diluted, with Water, for the contrary; for one will be sure to produce a Redundance of Humidities in the Stomach; and Flatulencies in the lower Intestines; and the other a Palpitation of the Heart, Heaviness of the Head, and Thirst. White and black Wines, exchanged one for another, in Violation of Custom, will cause many Alterations in the Body, though both are equally spirituous; so that we have little Reason to wonder, that sweet, and generous Wines [*γλυκὺς καὶ ἐννύδιος ἄριστος*] when exchanged on a sudden, are not capable of producing the same uniform Effects.

On the contrary it must be confessed, that in acute Diseases some Instances occur, where a Change with Respect to Diet may be induced, without any Alteration in the Body as to Strength or Weakness, considerable enough to render an Addition to, or Subtraction from the Aliment necessary. In these Cases, however, Regard must be had to the Strength of the Patient, the Nature of the Disease, the particular Constitution, Way of living, and usual Diet of the Sick, both as to Meat and Drink. The Addition of Food is much less to be regarded, but an intire Subtraction of it is frequently of Use, provided the Patient has Strength sufficient to support him under such an Abstinence, till the Distemper arrives at its utmost Height, and is ripe for a Crisis: And in what Cases this is to be put in Practice I shall specify hereafter. Much might be added, relative to what has been already said, in Confirmation of these Sentiments; but, as no Illustration is of equal Force with the Thing itself, I have been endeavouring to set in a just Light by similar Instances, I shall proceed to the direct Doctrine, I would inculcate, as of more Importance with Respect to Instruction.

In the very Beginning of acute Diseases, some have been indulged in eating the first Day of the Distemper, others the second Day; some have taken any forbile Aliment, Cyceon not excepted [*κυκεων*]. Now this Method of Diet was far from being the best that might have been contrived. Errors, however, of this Kind are less pernicious, than if, after two or three Days Abstinence enjoined, and a consequent Inanition of the Vessels, the Patient had entered on such a Regimen the fourth or fifth Day: Much more unsafe is it, after all these Days Abstinence, and Inanition, to allow such a Regimen on the succeeding Days, before the Disease is prepared for a Crisis. Such a Method would manifestly prove fatal to most, unless the Distemper were very favourable. But Errors in the Beginning are not so destructive, but more easy to be retrieved than those which are committed in the farther Progress of the Distemper. This, therefore, seems to me a very good Argument why we should not, during the first Days, injoin an Abstinence from this or that Sort of forbile Aliment to those who will be under a Necessity of taking some Sort or other on the succeeding Days. Wretchedly ignorant, and ill-advised, then are those Patients, who enter upon the Use of Barley-Ptisan after two, three, or more Days Abstinence, because it is in such Case prejudicial to them. Nor do they who use only the Cremor [*κρεμώ*] understand that it does them a Mischief, when they begin to make Use of it at an improper Time. However, they are wise enough to know that the Use of Barley-Ptisan, before the Disease is prepared for a Crisis, is very hurtful to those who were accustomed only to the Cremor; and they have Caution enough to avoid it. All these Things are strong Evidences that Physicians use a preposterous Method with their Patients, with Regard to their Aliment, and injoin Abstinence, and consequently Inanition, where there ought to be none; and from these make a Transition to forbile Liquors, by equally wrong Steps, and, for the most Part, exactly counter to the Method required: Sometimes they pass from Inanition of the Vessels to Sorbition, when on the contrary they ought to have proceeded from Sorbition to Inanition, if the Exacerbation of the Disease required such an Alteration. On Account of such Errors it sometimes happens that bilious Crudities are drawn from the Head, and Region of the Thorax; these are succeeded by Want of Sleep, which prevents the Concoction of the morbid Matter; the Patients grow dejected, morose, and delirious; their Eyes sparkle, and look wild; their Ears ring; their Extremities become cold; their Urine is unconcocted; what they spit grows thin, salt, and sincere (*ἀκρίτου*) as to Colour, and little in Quantity; Sweats break out about the Neck, accompanied with Anxieties, and Restlessness; their Inspiration is, as it were, interrupted, quick, and

and very large. Their Eye-brows are in some Measure enlarged, they fall into troublesome, fainting Fits, toss off the Bed-Cloaths from their Breasts, and are seized with Tremors of the Hands, and sometimes of the under Hip; and, if these Symptoms appear early, they portend a high Delirium, and generally Death. They, who escape, come off with an Abscess, an Hæmorrhage at the Nose, or a Discharge of thick Pus by Expectoration, and no other Way.

And indeed I do not find Physicians so sagacious, as to distinguish in Diseases betwixt a Weakness caused by an Inanition of the Vessels, or some other Incentive, and one that is owing to the Pain, and Violence of the Distemper; nor do they discern the various Impressions and Affections of every Kind, which have their Spring in the Nature, and Habit of Individuals, though on the Knowledge or Ignorance of these Things Health or Death depend. Now that Physician does the greatest Mischief, who, mistaking his Patient to be weakened with Inanition, orders him Drink, or increases his Allowance of forbile Aliment, or other Food, when the unhappy Person is exhausted, and debilitated by the Anguish, and Fury, of the Disease. It is an unpardonable Error not to distinguish when a Disorder proceeds from Inanition, and, in Consequence of that Ignorance, to restrain the Patient from Food. Such a Blunder indeed carries Danger with it, but much less than that before-mentioned, but is however much more ridiculous: For, if another Physician, or one utterly ignorant of Medicine, should come, and be informed of what had happened, and should administer Meat and Drink, which the other had forbid, he would, no Doubt, be thought to have relieved the Patient. Such Events bring public Disgrace upon an Artist, in the Opinion of Men; for, in this Case, the before-mentioned Physicians, or the illiterate Person, seem in a Manner to have raised a dead Person to Life.

For these Reasons we shall describe the proper Signs of these Affections by which they may be distinguished; and indeed they have some Affinity with what happens in regard to the Stomach. If the whole Body has rested a long Time, contrary to Custom, it will not immediately increase in Strength; and if it be suddenly put to Labour, after a long Course of Inactivity, it is plain, that this sudden Change must be attended with some Inconvenience. The same Opinion are we to form of each Part of the Body. For the Feet will be in like Manner affected, and likewise the other Limbs, if they should suddenly be put upon strong Exercise, after a long Series of Rest. After the same Manner will the Teeth, the Eyes, or any other Part of the Body, suffer in the like Case; and even a soft Bed, as well as one that is hard, will give Uneasinesses to those who are not used to them; and a Bed, contrary to Custom, made in the open Air, hardens the Body. But it may be useful to illustrate this Doctrine by Instances: Suppose then a Man contracts an Ulcer in his Leg, not bad enough to give him much Concern, yet too considerable to be slighted; and that his Flesh is not very difficult, nor yet remarkably easy to heal. Suppose also, that he is immediately laid up for it the first Day, and never moves his Leg, he will by this Method, indeed, avoid an Inflammation, and it will be much sooner healed, than if he gently walked about during the Cure. But if he has a Mind to rise, and try to walk on the fifth, sixth, or any farther Day, he will find himself worse afflicted, than if he had kept himself upon his Legs, and walked gently about from the Beginning. And if he should on a sudden put himself upon hard Labour he will suffer vastly more, than if he had laboured in that Manner all those Days, while he was under Cure. So that all these Things, taken one with another, will still concur to prove abundantly, that every great, and beyond all Measure, sudden Change, either one Way or another is pernicious.

The Stomach suffers various Ways, from the sudden Reception of too much Food, after a great Inanition of the Vessels by Abstinence; and all the other Parts of the Body will receive much more Damage, if set to Labour after a long State of Rest, than by a Change from a plentiful Diet to Inanition, provided, however, the Body is indulged with Rest upon this Change.

If therefore a sudden Transition is made from Exercise, and Labour, to Indolence and Inactivity, the Stomach must be suffered to rest in Proportion from the Fatigue of Digestion; otherwise, for Want of this Precaution, the Body will

not fail to suffer, either by an universal Heaviness, or some other Disorder.

I have been very copious on this Subject of Alteration in Diet, either one Way or another, because of its great Importance, not only in general, but with Respect to the particular Subject we are upon, that is, a Mutation from an Inanition of the Vessels to Sorbitions in acute Diseases. A Change there must be, according to my Opinion, but by no Means to Sorbitions, before the morbid Matter is concocted; or some Sign, either evaculatory or stimulating, appears about the Intestines, or about the Hypochondria, which shall presently be described.

Obstinate and continual Want of Sleep is the Cause of Cruelties, and Indigestion, both as to Meat and Drink; but a Change to the Contrary, dissolves the Body, and induces Debility, and Heaviness of the Head.

RULES for the USE of WINE, WINE and WATER, WATER, OXYMEL, and BATHS.

The several Sorts of Wines, as the Sweet, Generous, White, and Black, as also Honey and Water, Wine, and Oxymel, are distinguished with regard to acute Diseases, in the Manner following: Sweet Wines are not so subject to make the Head heavy and intoxicate, as the more generous, but are more productive of Stools. Yet they augment Tumors of the Viscera, as of the Liver, and Spleen, more than the other, and are not proper for bilious Constitutions, because in these they increase Thirst. They also generate Flatulencies in the superior Intestines, which do not affect the lower, as they might be supposed to do, for Flatulencies caused by sweet Wines are not of a penetrating Quality, but remain about the Hypochondria; sweet Wines do not, however, provoke Urine as the generous White Wines; but more powerfully promote Expectoration; but it is to be remarked, that if sweet Wine causes Thirst when drank, it increases Expectoration less than the other, but if it causes no Thirst, more.

Generous White Wine has received the greatest Part of its Praise and Censure in the Account of Sweet Wine. It better penetrates to the Bladder than the other, is a Diuretic and powerfully breaks through Obstructions [αποκαθαρτικόν] and must therefore be very good in acute Diseases. For though it be less fit for other Purposes than the former, yet its Faculty of purging by Urine frees the Body from Diseases, if it be managed properly. These Rules will hold good in regard to the Advantages and Prejudices attending the Use of Wine; though they were unknown to former Physicians.

Deep-coloured and black austere Wines may be used in these Distempers under the following Limitations, that is, if the Head is not affected with a Heaviness, there is no Delirium, if Expectoration is free, if there is no Stoppage of Urine, and the Excrements be somewhat moist, and like Abrasions [ἐξουμανθήρεα]. Under these and the like Circumstances especially, we may venture to change White Wine for these.

We are also to take Notice, that Wine, well diluted with Water, is less hurtful to the superior Parts, and those near the Bladder; but Wine, less diluted, is best for the Parts about the Intestines.

OF HYDROMEL, or HONEY and WATER.

But Hydromel [μελιζεννα] drank throughout the Course of the Disease, in acute Distempers, is less proper for such as abound with Bile, or have an Intumescence of the Viscera [αποεργασίαν καὶ μεγαλύναντον τῶν ὀργάνων] than for others. However it does not excite Thirst so much as sweet Wine, but mollifies the Lungs, and promotes Expectoration moderately [αἰσίου ἀναγωγῆς] and mitigates a Cough. It has also somewhat of a saponaceous Quality, which is subject to render the Spit more viscid than it ought to be. Hydromel is also a good Diuretic, provided there be no Impediment in the Viscera. It promotes also the Discharge of bilious Excrements by Stools; which are sometimes laudable, at other Times too much saturated with pure Bile, and frothy, particularly in bilious Constitutions, and those who labour under Obstructions in the Viscera [μεγαλύναντον τῶν ὀργάνων].

Hydromel then, much diluted, is better adapted to promote Expectoration, and to mollify the Lungs; but the least diluted is most effectual in purging downward frothy Excrements, and such as are too hot, and too much saturated with pure Bile.

N n n

In this Manner great Numbers of People of Distinction, whose Affluence enables them to live without Labour, and Exercise, contract Distempers, both acute and chronic, which destroy them before the Period which their Constitutions would, with good Management, permit them to arrive at. For having spent their Youth in a Series of Rural Sports, which require strong Exercise, when fatiated with these, they on a sudden become indolent, and make an imprudent Transition from strong Exercise to Inactivity; mean Time, however, they preserve that Appetite which they had before acquired by Labour and Exercise, and which was an Happiness to the animal System, and produces Obstructions, the Causes of all Distempers whatever.

These Gentlemen would find their Account in continuing a Degree of Exercise sufficient to digest, perfectly assimilate, and at last tribute an Abstinence in Proportion to the Diminution of Exercise.

This Sentence seems misplaced, as it has no Relation to what immediately precedes it. In all Probability it should come in amongst the Examples of the Inconvenience of sudden Changes.

Bile. But it must be confessed, that such Sorts of Stools are attended with some Inconveniences, for they do not allay the burning Heat of the Hypochondria, but rather increase it, and cause a Restlessness, and continual Tossings of the Limbs, as also an Exulceration of the Intestines and Anus, for which Remedies will hereafter be specified.

In these Distempers, therefore, discarding forbile Aliments, if we make Use of Hydromel instead of all other Drink, you may practise with Success, and seldom have the Mortification of miscarrying. In what Cases it is proper, and where not, and for what Reasons, has, in a great Measure, been explained already.

But Hydromel is condemned for reducing those who drink it to an extreme Weakness, the Consequence of which is thought to be Death, in a very short Time. Now this Censure was passed upon it, on Account of those who starved themselves to Death; for some there are, who make it their only Drink, as if this was the proper Use of it. This is not, however, the true State of the Case, for Hydromel drank even alone, is much stronger than Water, unless it happens to purge. And it is, in some Respects, stronger than white, thin, small, and unfragrant [αἰσίου] Wines, and, in some Respects, weaker. For there is a great Difference betwixt the Meracidity [ἀξεντορία] of Wine, and that of Honey, if you compare them with regard to Strength. Let a Person drink double the Quantity of Wine that he takes of Honey, he will certainly find himself much stronger from the Honey than from the Wine, unless the former purges him, and incomparably more Excrements will be produced from the Honey, than from the Wine. Yet if any one should drink Hydromel after Ptisan, it would produce in him an extraordinary Repletion and Inflation, which would have no friendly Influence upon the Viscera about the Hypochondria; whereas, if it were drank before the Ptisan, it would have no such bad Effects, but would in some Measure be of Service.

Hydromel boiled has a much finer Aspect than when crude; for it becomes bright, fine, white, and pellucid; and yet I do not know, that it acquires any new Virtue; for it is no sweeter than the crude, if the Honey was good; but it is weaker, and produces fewer Excrements, which are Properties no way necessary to Hydromel, in order to its Usefulness. Boiled Hydromel is fittest for Use, if the Honey is bad, impure, black, and ill-scented, for the Boiling, in a great Measure, corrects these ill Qualities.

Of OXYMEL.

The Drink, called *Oxymel*, you will find to be beneficial in these Distempers on several Accounts; for it promotes free Expectoration, and renders Respiration easy. We must however have Regard to the following Considerations in giving it: That which is extremely acid, must have some very considerable Effect upon the Spit which is not brought up without Difficulty; now if it dislodges and renders lubricous that, which adhering to the Bronchia causes a Wheezing, and Alteration of Voice, and if it dilates the Bronchia, it must considerably ease the Lungs, because it relaxes them. If, I say, it is capable of these good Effects, it must necessarily be exceedingly beneficial. But sometimes the Contrary happens, and what is highly acid, is so far from promoting Expectoration, that it renders the Spit more glutinous, and so does Mischief. And those are worst affected by it in this Manner, who, besides other bad Symptoms, can neither cough nor spit out what is contained in the Bronchia. In this Case then we are to consider the Strength of the Patient, and, if Things are in a promising Situation, to give a little of it very warm, beginning with a small Quantity, and proceeding gently, never exhibiting too much at one Time. What is but a little acid moistens the Mouth and Throat, brings up Spit, allays Thirst, and is beneficial to the Hypochondria, and the subjacent Viscera. For it prevents any Mischief from the Honey, by correcting what is bilious in it; it discusses Flatulencies [φούλους καταρρέοντων] and provokes Urine; yet it fills the lower Part of the Intestine with too much Moisture, and causes Abrasions. Sometimes, however, it is prejudicial in acute Disorders, especially as it prevents a Flatus from making its Way through the Body, [φύσαν κινῶν ἀγανισθῆναι] and forces it to recur upwards [παλινδρομῆναι πάλιν] besides it weakens the Body, and refrigerates the extreme Parts. And these are all the ill Effects of Oxymel that are worth Notice. It is convenient to be given, a little of it to drink at Night, upon an empty Stomach, before the Sorbition [σὺρβιον] though there is no Reason why it may not be given, at a considerable Distance of Time after Supper. As to those, whose Regimen consists of Fluids only, without forbile Food, I esteem it not proper for them to be perpetually taking Oxymel, especially because of the Abrasion and Exasperation of the Intestines, to which they are the more subject for their being void of Excrements, and still more on Account of the Inanition of the Vessels. Add to this, that it may subtract something from the strengthening Properties of Hydromel.

But if any one should fancy, that the frequent Use of Oxymel might be of Service in all Distempers, let him make it with a very little Vinegar, just enough to give it a Taste, for then what might be hurtful in it, will be rendered innocent, and its beneficial Qualities will be preserved intire.

In short, the acid Quality of Vinegar renders it more proper for bilious than melancholy Constitutions. For the Bile, as being bitter, is dissolved, and converted into Phlegm when exalted by Vinegar; but Melancholy is fermented, elevated, and multiplied by it, [αὐξανθαι] for Vinegar increases Melancholy. But Vinegar is far more prejudicial to Women than to Men, for it is productive of Pains in the Uterus.

Of WATER.

As to drinking of Water in acute Diseases, I know not to what Purpose it can serve; for it neither mitigates the Cough in a Peripneumony, nor is it an Expectorant [ἐκσπυρῶν] but is worse, in these Respects, than other Liquors for constant Use. But a little Water drank betwixt the Doses of Oxymel and Hydromel may promote Expectoration, as it induces an Alteration in these Liquors, and promotes their good Effects, for it dilutes them in the Stomach. In other Respects, Water is not good to quench the Thirst, but increases it; and in a bilious Constitution, it turns to Bile, it is bad for the Hypochondria, and more than usually mischievous, bilious, and weakening, when it arrives at the inferior Intestines; it increases the Heat of the Liver and Spleen, when they are inflamed, and fluctuating causes an uneasy Sensation in the Stomach and Intestines. For, by Reason of its Coldness and Indigestibility, it passes slowly, and neither produces Stools, nor provokes Urine. It is somewhat hurtful also, because it is by Nature void of Excrements. But if it be drank when the Feet are cold, it causes these Inconveniencies in a greater Degree, as Circumstances incline it to this or that bad Effect.

However in Disorders which threaten a vehement Oppression of the Head, or a Delirium, we are totally to abstain from Wine, and in such Cases it will be best to give Water, or, if any Wine is allowed, it must be very small white Wines, that have not the least Flavour, and a small Quantity of Water must be drank after it, by which Means the Strength of the Wine will have the less Effect upon the Brain and Senses. But the proper Subjects for drinking Water, with the right Seasons for indulging them in, or restraining them from the free Use of it, and when it is to be drank cold, and when warm, has been in Part declared before, and shall be more fully specified in its Place.

As to other Kinds of Liquors such as that made of Barley [καριθῶν] or those which are made from green Herbs, Raisins, or Husks of Grapes, or are prepared from Wheat, Cnicus [κνίκου], Holy Thistle [ἁγίου θύσου] Myrtle-berries, Pomegranates, and other Things, the proper Seasons of using these shall be assigned them under the Disease itself in which they may be serviceable, and we shall take the same Method with regard to other compound Medicines.

Of BATHING.

Bathing might be useful in many Distempers, in some by frequent Use, in some otherwise; and sometimes it cannot be used so frequently as it ought, for Want of Conveniences; for we shall find in few Houses the necessary Preparations with suitable Attendance; and, unless a Man be well and thoroughly washed, he may receive considerable Injury. The Bathing-room should be without Smoak; there should be great Plenty of Water, and the Ablutions should be frequent, but not over copious unless the Case requires it. Deterfion, I think, may very well be omitted; but if it must be used, it ought to be done hot, and the Patient must be well rubbed with a deterfory Medicine [σμήγμα] in a much more copious Manner than is generally thought necessary, and must have Plenty of Water poured upon him, and that Water expeditiously changed for fresh. The Way to the Solium should be short, and made easy both for going in, and coming out. The Person who bathes, ought to be composed and silent, and do nothing himself, but suffer others to wash and rub him. Water also of different Degrees of Heat must be in Readiness [μετακείμενα] the Perfusions are to be quick, and the Sponge is to be used instead of the Strigil, and the Body is not to be quite dry, before it is anointed. But the Head ought to be dried, as much as is possible, by rubbing it with a Sponge; and neither the Extremities, nor the Head, nor any Part of the Body ought to be refrigerated. The Bath is not to be used just after a Sorbition or Drinking, nor are Aliments or Drink to be taken just after Bathing. Great Consideration is here to be taken of the Patient, as whether he was a great Lover of Bathing, or accustomed to it while in Health; for such are the more desirous of the Bath, and find themselves the better for Bathing, and are not so well without it.

The Bath, generally speaking, is more proper in a Peripneumony, than a burning Fever, for it mitigates the Pain of the Side, Breast, and Back, maturates and brings up the Spit, facilitates,

itates Respiration, and relieves Lassitudes, being a Mollifier of the Limbs, and outer Skin, provoking Urine, resolving Heaviness of the Head, and moistening the Nostrils.

These are the Advantages to be reaped from Bathing, where all necessary Accommodations are in Readiness; but when one or more of the Requisites are wanting, it is to be apprehended that this Kind of Remedy may do more Hurt than Good; for a Negligence of the Attendants in any one Circumstance is capable of considerable Mischief.

In Distempers where the Belly is unseasonably loose, Bathing is not at all proper, nor where it is unseasonably costive, without previously relaxing it. Persons much enfeebled are not to bathe, nor those who are affected with a Nausea, Vomiting, or bilious Eructations; or who have an Hæmorrhage at the Nose, except it was in less Quantity than the Occasion required; and you know the Occasions. But if the Hæmorrhage was too little, it will be convenient to bathe, whether it be for the Benefit of the whole Body, in other Respects, or only for the Sake of the Head.

When there is, therefore, a convenient Apparatus, and the Patient seems well able to bear it, Bathing may be used every Day, and it will not be amiss if those who are fond of Bathing, use it twice a Day. Those who feed on whole Ptisan, can with more Safety venture upon the Bath, than such as make Use of the Cremor only, though it may on some Occasions be allowed to the last. But Bathing is least proper for such as take only Fluids, though there are Occasions when even these may be permitted to bathe.

From what has been wrote upon this Subject, it may be readily understood under what Kind of Regimen Bathing may be beneficial, and with what it will not agree. Bathing can never be proper for such as are in Want of Necessaries, or Conveniences, to render it of Service to them; but such as are plentifully furnished with whatever may be commodious for this Purpose, may bathe, provided the Symptoms of the present Disorder render it proper, and likely to be of Service.

OF FEVERS, and FEBRILE DISEASES.

The Summer produces a Burning Fever [*καυσός*] when the Veins, being parched and dried by the Fervor of the Season, attract to themselves an acrid and bilious Ichor [*ιχὼρ*]. A violent Fever attends with great Pain, and a Sense of Lassitude in the Bones. It generally happens after a long Journey, and long Thirst, when the dried Veins attract to themselves hot and acrimonious Rheums.

Under this Disorder the Tongue becomes rough and dry, and very black; the Parts about the Belly are affected with a biting Pain; the Excrements are very liquid, and of a pale Colour; there is a vehement Thirst, and Want of Sleep, and sometimes a Delirium.

Let the Patient have as much Water, and boiled Hydromel, much diluted, as he will drink; if there be a Bitterness in the Mouth, it will be proper to give an Emetic and Clyster; if these do not procure Stools, purge him with Asses Milk boiled. Give nothing salt or acrimonious, for the Case will not bear it, nor any forbile Liquor, till the critical Day be past. If there happens a considerable Hæmorrhage from the Nose, or genuine critical Sweats; with white and thick Urine, and a

light Sediment; or if an Abscess be formed, there is a Solution of the Disease. If there be a Solution without these Symptoms, the Patient will relapse, or be seized with a Pain in the Hips or Legs, and will spit a gross Matter, if he recovers.

There is another Kind of Burning Fever, which is attended with a Looseness, an intense Thirst, a rough, dry, and saltish Tongue, a Suppression [*ἀποκρίσις*] of Urine, Want of Sleep, and Coldness of the Extremities.

This Disease is never critically determined without an Hæmorrhage from the Nose, or an Abscess about the Neck, or a Pain of the Legs, with a Spitting of gross Matter after the Looseness stops, or a Pain at the Ischium, or a Lividness of the Pudendum. The Tension of a Testicle also is a Symptom of an approaching Crisis. Give the Patient attractive, forbile Aliment.

In acute Diseases, if the Distemper be violent, and the Patients strong; and in the Flower of their Age, bleed. In a Quinsy [*σώριον*] or any pleuritic Disorder, promote Expectoration with soft Linctuses. If the Patient appears weakened by too plentiful Bleeding, instead of repeating it, administer a Clyster every third Day, till he is out of Danger, and wants no farther Remedy but Abstinence.

Tumors of the Hypochondria not caused by an Interception of the Spirits, (*perhaps Hysterics*) Distentions of the Diaphragm, a laborious Respiration, with a dry Orthopnea, and without any internal Suppuration, but proceeding from an Interception of the Breath (*a Straitness of the Ramifications of the Aspera Arteria, preventing the Ingress of the Air*) but particularly violent Pains of the Liver, Oppressions of the Spleen, other Inflammations, and Disorders that are caused by painful Tumors in the Parts above the Diaphragm; all these cannot be resolved by Purging at first, but are more tractable, if the Cure is began by Bleeding. After this proceed to Clysters, unless the Distemper be very violent; but Regard must be had to the Safety and moderate Operation of Cathartics, which are made Choice of after Bleeding.

Whoever, in the Beginning of an inflammatory Disease, attempts the Cure by Cathartics, does not in the least diminish the Tension, and Inflammation of the Part affected; for the Distemper, in this State of Crudity, will not yield to such Medicines; on the contrary, this Method of Treatment liquefies and wastes the sound Parts, which would otherwise resist the Distemper; and when the Body is in this Manner weakened, the Disease gets Ground, till at last it becomes incurable.

OF THE CATALEPSIS.

When a Person is suddenly taken speechless, without manifest Cause, or any evident great Disorder, it proceeds from a Stagnation of the Blood in the Veins [*στάσις αἱμορροίας*]. In this Case open the internal Vein of the right Arm, and take away more or less Blood, according to the Age and Habit of Body. This Disorder is generally accompanied with a Redness of the Face, fixed Eyes, distended Hands, Grinding of the Teeth, Palpitations, Contraction of the Jaws, Coldness of the Extremities, and an Interception of the Pulse. When a Pain comes on, there is an Afflux of black Bile, and acrimonious Humours to the Part. The internal Parts are affected with a biting Pain, as well as the Blood-vessels, which are also extremely

* There is a remarkable Blunder at this Place in the Edition of *Foetus* of 1657.

* This Sentence admirably expresses the Consequences of an alkaline Putrefaction; and the subsequent Account of a *Burning Fever*, as he calls it, is inferior to none given by later Authors.

* Galen could not understand what is here meant by *Attractive*; and indeed it is not very easy to find the true Sense of it.

* Sydenham has the following Passages, the Hints of which were, probably, taken from the great Author before us, and, no Doubt, Experience made him afterwards sensible of the Truth and Importance of the Doctrine here delivered.

We should not omit, that if the State of the Patient requires both Bleeding and Vomiting, it is safest to bleed first, and give the Vomit afterwards; otherwise there would be Danger, that whilst the Blood-vessels are greatly distended, the violent Motion in Vomiting might burst the Vessels of the Lungs, or hurt the Brain, and occasion a Vomiting of Blood, or a mortal Apoplexy; of which I could give some Instances, if it were proper; but my Design is only to caution. *Sydenham, de Morbis Acutis.*

But in the first Stage of epidemic Diseases, of whatsoever Kind they be, great Care must be had not to purge before Bleeding. For the Diseases, which arise from an epidemic Constitution of the Air, are either actually Fevers, or upon the least Occasion degenerate into Fevers; so that a Fever may easily be caused by the Disturbance raised in the Blood and Juices by the mildest Purgative; and the Heat succeeding it, which Nature had otherwise expelled by the usual Evacuations of the morbid Matter; as, for Instance, by a Catarrh, or an epidemic Cough, or by a Diarrhoea, when the epidemic Fever has a Tendency to that Discharge. The same may be said of any other Constitution of the Air, that disposes the Body to some peculiar Fever; which does not always actually happen, because Nature expels the morbid Matter from the Blood by some suitable Evacuation. This I affirm to be Fact, though the present Practice is to exhibit Cathartics before Bleeding, or, which is still more dangerous, without Bleeding at all.

For, though it may be objected, that, by Bleeding before Purging, the foul Humours contained in the first Passages are propelled into the empty Veins, yet it is most certain, that the Evacuation which precedes Bleeding cannot make Amends for the Injury, which the Blood receives from the Tumult raised therein by the Cathartic. And it must be owned, that a Purge, taken immediately after Bleeding, works much more gently, and heats and agitates the Blood less, than it usually does when exhibited before Bleeding: And I am apt to think that Numbers, and Children especially, have perished for Want of knowing this, or through Neglect of it.

And this I have learned from a long Course of Experience, which is the surest Guide in these Cases; and, unless Practice be regulated thereby, it were better to discard the Art: For the Lives of Men are but too much trifled with, on the one Hand, by Empirics, who are ignorant of the History of Diseases, and the Method of Cure, and only provided with Receipts; and, on the other Hand, by such idle Pretenders, as rely wholly upon Theory; whence both together destroy greater Numbers, than the Diseases would without their Assistance.

But that Method of Practice, and that only, will relieve the Patient, which deduces the Indications of Cure from the Phenomena of Diseases, and afterwards confirms them by Experience; and by this Means the great HIPPOCRATES merited the highest Reputation. *Sydenham Epistola Prima Responsoria.*

These Rules with Respect to Bleeding in acute Disorders, before Cathartics are exhibited, are of infinite Importance in the Practice of Physic; and it is much to be lamented, that they are not more regarded; for I am satisfied that Thousands are destroyed by an Ignorance, or Neglect of these salutary Cautions. I should therefore recommend it to Practitioners of every Class to have some Regard to the Authority of Hippocrates, the first and best medicinal Author, the greatest and most solid Genius that, perhaps, any Age has produced, the Preserver of Thousands yet unborn; and let them remember, that his Precepts have in this Instance, as well as many others, received the Sanction of Sydenham, the best practical Writer since his Time.

ly dried, and contracted, and being moreover inflamed, they attract the Humours to them which are set a float. Hence the Blood being corrupted, and the Circulation obstructed and prevented from being carried on in the natural Conduits, Stagnations are caused, of which Refrigerations, Vertigoes, Loss of Voice, Oppression of the Head [*καρφαλα*] and Convulsions, are the Consequences, when they affect the Heart, Liver, or Vena Cava [*τὴν φλέβα*]. Hence proceed Epilepsies, and Palsies, when the noble Parts above-mentioned are thus disordered by a Flow of Humours, and dried for Want of a proper Circulation.

For such Patients, certainly the best Thing we can do is, immediately after Fomentation, to open a Vein, while the affected Spirits, and Humours are a float, for then are Remedies of the greatest Efficacy. When the Patient is a little recruited after Bleeding, a Vomit will be proper, unless he is before much relieved, always having Regard to a Crisis. And if Stools are not procured by a Clyster, purge with Asses Milk boiled, in a Quantity not less than six Pints, or, if the Constitution is robust, more than eight may be given.

Of a QUINCY.

The Quinzy happens frequently in Winter or Spring, by the Defluxion of a Multitude of viscous Humours upon the Jugular Veins, which attract the more, on Account of their extraordinary Size. This cold and viscid Humour obstructs, and renders impervious all the Passages of the Blood, and Spirits, condenses the Blood near it on every Side, coagulates it, and causes it to stagnate, being by Nature cold, and inclined to generate Obstructions.

Hence the Patients are suffocated, their Tongues are livid, round, and bent back in their Mouths, because of the Tumesfaction of the Veins underneath; an Incision being made in the Uvula, which is also called *uvula*, a large Vein, appears on each Side. These Veins, when thus turgid with Humours, press upon the Tongue, which, on Account of its Dryness, Rarity, and Sponginess, is susceptible of Impressions from the adjacent Veins, and readily imbibes the Humours with which they abound; and hence it is changed from flat to round, from well coloured, to livid, from moist, to dry, and from flexible, to stiff, inasmuch that the Patient is in Danger of Suffocation, without immediate Relief, which is to be given by Bleeding in both Arms, and opening the Veins under the Tongue, by Lambdatives capable of incising the Humours, by hot Gargarisms, and evacuating a Part of the Humours by an increased Discharge of Saliva⁷; and by shaving the Head. A Cerate should also be applied to the Head and Neck, and over this Wool, and the external Parts must be fomented with soft Sponges, wrung out of warm Water. The Drink ought to be Water and Hydromel, but by no Means cold; or Cremor of Ptilan, when the Danger is judged from the Crisis, to be over.

In Summer, or Autumn, when Humours descend from the Head, which are hot and acrimonious, as participating of the Heat and Acrimony of the Season; they corrode, exulcerate, and fill with Spirits, and an Orthopnoea, with a great Dryness, succeeds. In this Case, the Fauces, if inspected, manifest no Tumor, the Muscles on the back Part of the Neck are fixed, as in a Tetanus; the Voice is broken, Respiration small, frequent, and not performed without Difficulty; there is an Exulceration of the Aspera Arteria, with an Inflammation of the Lungs, inasmuch that they cannot readily admit the external Air; and if the Disease do not spontaneously tend to the external Parts of the Neck, it is the more terrible, and fatal, on Account of the Season of the Year, and because it owes its Origin to hot and acrid Humours.²

MISCELLANEOUS OBSERVATIONS WITH REGARD TO FEVERS.

If a Fever seizes a Person whilst the old Excrements are retained, or immediately after new Food is received, whether accompanied with a Pain of the Side, or not, the Patient is to rest, till the Food is descended into the lower Intestines; mean Time, let his Drink be Oxymel. When a Heaviness is perceived at his Loins, purge the Belly with a Clyster, or a Cathartic. After Purging, let him take first forbile Aliment, and drink Hydromel; after this, he may proceed to vegetable Food, and boiled Fish, with a little diluted Wine at Night, and diluted Hydromel in the Day-time. If the Discharges of Wind are very foetid, a Suppository or Clyster will be of Service. If otherwise, he must continue the Use of Oxymel, till the Excrement descends into the inferior Intestines, and then let a Clyster be administered.

If a burning Fever seizes whilst the Belly is laxative, if Purging appears proper, defer it the three first Days, and give the Cathartic on the fourth. After Purging, give forbile Aliment, observing the Approach of the Fever Fits, so as never to give it when the Fit has actually seized, or is just coming on, but when it ceases, and is intirely gone off, and the Disorder is at the greatest Distance from the Access of the succeeding Pa-

roxysm. But give no Drink, nor forbile Aliment, nor any Thing of that Kind, whilst the Feet are cold; but esteem it as a Matter of the greatest Importance, to wait till they are thoroughly hot, and then give what you think most proper; for the Coldness of the Feet is universally a Sign of the Approach of the Paroxysm; at which Time, if you load the Stomach with any Thing, you will do Wrong upon all Accounts, for the Disorder will hereby be considerably increased. But when the Fit is over, the Feet, on the contrary, grow hotter than the rest of the Body; and as the Feet are refrigerated, the Fever increases, and a Fire is kindled in the Thorax, which imparts Flame to the Head. For all the Heat rushing together, and exhaling to the Head, it is not at all strange that the Feet, which are by Nature of a nervous, and not fleshy Substance, should be refrigerated. Besides, their great Distance from the hot Parts contributes to their Refrigeration, when the Heat is collected in the Thorax. Again, it is consonant to Reason, that the Feet should grow hot, when the febrile Paroxysm is resolved and utterly dispersed. At this Time, the Head and Thorax are refrigerated, and for that Reason Food is to be given. For, when the Feet are cold, the Stomach must necessarily suffer with too much Heat. Hence Sickness and Nausea, distended Hypochondria, and Restlessness, because of the internal Agitation, as also a Delirium, and Pain; add to this, that the Patient is affected with Vellications, and Inclinations to vomit, and if what is discharged by Vomit is bad, Pain succeeds. But when the Heat descends to the Feet, and the Urine is discharged freely, though no Sweat arises, all Things are composed, and then it is proper to give forbile Aliment, which at other Times is pernicious.

In such who have their Belly laxative during the whole Course of a Fever, take care to keep their Feet not less warm than the rest of the Body, by warming them, covering them with Cerates, and rolling them with Swaths. But if they are spontaneously hot, warming Applications are not necessary, unless so far as may preserve them from Refrigeration. In this Case, let the Patient drink cold Water, or Hydromel, in small Quantities.

As for such as have their Bellies laxative in Fevers, and are delirious, many of these pick the Bed-cloths, rub their Noses, return quick [*κατὰ βραχὺ*] Answers to what they are asked, and talk nothing that is rational, but utterly incoherent. These Symptoms I imagine arise from black Bile. In this Case, if the Stools be liquid and colliquative, cooler and thicker Sorbitions, in my Opinion, are proper to be given, and Drinks fit to stop a Looseness, but rather vinous than astringent.

As for those who, in Fevers, from the Beginning, are affected with a Vertigo, and Pulsation in the Head, and make a thin Urine, we are to expect a considerable Exacerbation of the Fever about the Crisis; nor is it a Wonder if they become delirious.

Those who in the Beginning make cloudy or thick Urine, are to be purged, provided nothing contradicts. But such as make thin Urine in the Beginning, are by no Means to be purged, but may, if it shall be thought fit, have a Clyster administered; these latter are to be treated in the following Manner:

Let the Patient be enjoined a strict Rest; let him be anointed, and equally covered with Cloths; let his Drink be diluted Hydromel, and let him sup the Cremor of Ptilan at Evening. Evacuate him with Clysters in the Beginning, but avoid Purging; for if you raise any Commotions about the Stomach, the Concoction of the Urine will be hindered, and the Fever considerably prolonged without Sweat or Crisis. Permit no forbile Aliment to be given at the Approach of the Crisis, when the Perturbation is at the Height, but defer it till the Patient grows easier, and mends. The Crises of all Fevers are to be observed, and forbile Aliments, at that Time, are to be strictly prohibited.

These Sorts of Fevers, generally continue a long Time, and, if attended with a Coldness of the Feet, usually terminate in Abscesses, about the Ears or Neck. If no such Coldness attends, other Alterations are more likely to happen, as an Hemorrhage from the Nose, and sometimes a Diarrhoea. Those who labour under Fevers attended with great Anxiety and Distention of the Hypochondria, with Restlessness, so as not to be able to lie a Moment in the same Place, and Coldness in all their Extremities, require the greatest Care and Watchfulness over them. The Method of treating them is to give them nothing but Oxymel diluted; and to keep them from all forbile Aliments, till the Fever is abated, and the Urine appears concocted. The Patient is to lie in a dark Chamber, on a very soft Bed, to endure for a long Time the same Posture of Decubiture, and to avoid as much as is possible all Jactation of the Body, for in so doing, he will find himself principally relieved. Moreover, mollify the Hypochondria with Linseed, applied to them, as hot as it can be endured, and boiled in Water and Oil, taking particular Care that it is not grown cold when laid on.

Probable

⁷ Thus Galen interprets *βραχὺ*. It is observable that Sydenham's Method of Practice is nearly the same as that here specified.
² This Account of a very dangerous Sort of Quinzy, has been adapted by most succeeding Authors on this Subject.

Probable Prognostics may be drawn from the Urine: Those which are turbid, and pale, are better, but the thin and black, are much worse: Their frequent Alteration indicates a long Duration of the Fever, which consequently must be irregular, and undergo many Changes, either for the better or the worse. These anomalous Fevers are to be let alone, till they come to some Confidence, and Regularity, and then they are to be opposed by a proper Regimen, and a convenient Method of Cure, always having a due Regard to whatever Nature produces. Even the Countenances of the Sick are various, and worthy of Notice; it is therefore the Duty of every Physician, to be watchful that no Circumstance escapes his Observation, whether it manifests itself by outward Appearances, or may be discovered by Reasoning; nor must any of those be neglected, which may be expected to happen at equal, or unequal Numbers of Days.

First, then, odd Days are to be suspected, because these produce Alterations in the Distemper, either for the better or for the worse. Observe, therefore, the first Day when the Patient was taken ill, and whence and when the Disease began, which is esteemed the first and principal Thing to be considered. After this, the Sick must be examined, and all Things duly weighed and considered; first, enquire how he finds his Head, whether it be free from Pain, and whether he has no Sense of Gravity in it. Then as to his Sides, and Hypochondria, ask him whether they are free from Pain; the Hypochondria, in particular, whether they are affected with any Uneasiness, or Intumescence, or Obliquity, (*that is, whether they are more swelled on one Side than the other*) or Fulness; whether there be a Pain of the Side, and that Pain be attended with a Cough, Gripes, or Uneasiness of the Belly.

If any of these Symptoms affect the Hypochondria, the most proper Remedy is a laxative Clyster, and let the Patient drink boiled Hydromel pretty hot; examine also whether the Patient be subject to faint when he rises up, and whether he respires without Difficulty. The Stools also are to be regarded; and Notice taken if they are remarkably tinged with a black Colour, or are sincere, as in a State of Health; observe also, whether there be an Exacerbation of the Fever on the third Day.

After considering whatever happens on the three first Days in these Distempers, there are other Things that must come under Examination. Thus, if the fourth Day produce any of the same Symptoms as the third, the Case is attended with Danger.

As to the Signs, black Stools prognosticate Death; but such as are like those of Persons in Health, if they appear every Day the same, are Signs of Recovery.

If a Stool cannot be procured by a Suppository, and nevertheless Respiration is easy, but the Patient faints when he sits up, or lies in Bed, and this happens at the Beginning of the Fever, a Delirium is to be expected, whether the Patient be a Man, or a Woman, that is thus affected.

The Hands also are to be observed; for if they tremble, an Hæmorrhage from the Nose may be expected.

Inspect likewise the Nostrils, and observe whether the Breath passes equally free through both; and if much of it passes through the Nose, Convulsions usually follow; in which Case Death is to be expected; and it is of Importance to a Physician to make sure Prognostics.

If a Fever happens in the Winter, attended with Roughness of the Tongue, and a Delirium, though there is a Remission of the Disease, the Patient is however to be kept extremely low, and to be just supported with Water, and Hydromel, and Cremor of Ptisan (*χυρός*); for there it is dangerous to rely on the Remission of such Fevers, because Signs of this Nature shew the Patient to be in a hazardous State. When you are well acquainted with these Things, make Predictions, if you please, always, however, with great Circumspection.

In Fevers, if there appears any formidable Symptom on the fifth Day, or there happens a sudden Diarrhoea, or Fainting, or Loss of Voice, or Convulsions, or Hiccups, which render the Patient extremely restless; if a Sweat breaks out about the upper Lip, the Forehead, and the Part of the Neck behind the Head; the Persons who labour under these Symptoms, die in a very short Time, as it were, asthmatic (*πνευμασθικός*).

Those who in Fevers are affected with Tubercles on their Legs (*οστά φυμαλιδία*) which continue a long Time without Maturation, the Fever still persevering; and who are moreover seized with a Suffocation in the Throat (*πνιγμός φάρυγγος*) no Tumor appearing about that Part, and the Tubercles still remaining crude (*καὶ μὴ σφιδά*) are usually seized with an Hæmorrhage from the Nose, which if it be copious prognosticates a Solution of the Disease; if not, that it will be of long Duration; and the less the Hæmorrhage, the Distemper will be worse, and longer in Proportion. If the Patient is tolerably easy, with respect to other Things, he may expect Pains about

his Feet. But if Pain seizes the Foot, and grows excessive, and is attended with Inflammation, which remains without Resolution, the Pain, by Degrees, will penetrate to the Neck, the Clavicle, the Shoulder, the Breast, and the Hip, (*ἀσθρα*) whence this last must necessarily be affected with Tubercles; if these disappear, and the Hands are contracted, or unsteady, the Patient soon grows convulsed and delirious; Pustules (*φουλάκια*) also, and red Spots (*ἰσχυματά*) appear upon his Eye-brows, the Eye-lids swell, and approach each other, a dry Inflammation succeeds, the Eye swells extremely, and now the Delirium increases exceedingly; the Night, however, produces an Exacerbation of the Delirium, more than the Day. An unequal Number of Days favours the Production of the Symptoms above-mentioned, more than one that is equal; but whenever they appear, they are alike of bad Presage.

If you intend to purge such Patients at the Beginning, it must be done before the fifth Day, provided a Murmuring is perceived in the Intestines; otherwise omit it. But if there is a Murmuring, and the Excrements are bilious, purge gently with Scammony; as to the rest of the Treatment, abstain, as much as the Case will permit, from Liquors, and Sorbitions, till after the fourteenth Day, and the Fever begins to remit; for this Method will promote the Cure.

In a Fever, if there be a Failure of the Voice about the fourteenth Day, it portends no quick Solution nor Deliverance to the Patient, but the long Continuance of the Disorder; if it happens precisely on the fourteenth Day, still the longer will the Disease prevail.

If the Patient in a Fever on the fourth Day, finds some Difficulty in speaking, and has thin bilious Stools, he usually falls into a Delirium.

It is also of Importance to consider the Consequences of many Things which occur.

In acute Diseases, which happen in Summer and Autumn, a sudden Discharge of a few Drops of Blood (from the Nose) indicates a great Resistance (*συνεία*) and Inflammation of the Vessels, and the Appearance of a thin Urine the next Day. And if the Patient be in the Vigour of his Age, inured to Exercise, carous, or of a Constitution inclined to Melancholy, or his Hands shake with Drinking, you may safely prognosticate a Delirium or Convulsions; which, if they happen on even Days, are the more favourable, but, on critical Days, are pernicious, unless the Patient is relieved by a copious Hæmorrhage from the Nose, or the hæmorrhoidal Veins; or by a Suppuration, Translocation of the morbid Matter, critical Tumor, or Pains about the Hypochondria, Testicles or Legs; for a Solution of these, paves the Way to Expectoration, and the Discharge of a thick, smooth, and white Urine.

In a Fever, attended with Hiccups, let the Patient take the Juice of Silphium, and wild Carrot, beat up with Oxymel; and give him Galbanum in Honey, with Cummin, by Way of Laxative; after these, he may be allowed strained Juice of Ptisan. In this Case, the Patient cannot escape, unless he is relieved by critical Sweats, regular Sleep, and the Discharge of a thick and acrid Urine, except the Disease terminates in an Abscess. An Eclegma may be prepared of Pine-nut Kernels, and Myrrh; and let the Sick drink very little Oxymel; but, if he be very thirsty, give him Barley-water.

In a Peripneumony, or Pleurisy, we are to consider whether they are attended with an acute Fever; whether the Pain lies in one or both Sides; whether the Patient labours for Breath; whether there be a Cough, and of what Kind the Spit, whether reddish, livid, thin, frothy, florid, or in any Respect different from what usually happens in such Cases. The Patients are to be treated after the following Method:

If the Pain verges towards the Clavicle, or the Breast, or Arm; open the inner Vein of the Arm, on the Side where the Pain lies, and take away as much Blood as the Habit of Body, the Season of the Year, together with the Age and Complexion of the Person will permit; and the more plentifully, and with the greater Confidence, if the Pain be acute, even to the Fainting of the Patient. After this, let a Clyster be given.

But if the Pain is situated under the Thorax, and is very intense, exhibit a Purge. Whilst it works, give nothing; but when the Medicine has finished its Operation, let the Patient take some Oxymel. Purge on the fourth Day; but the three first Days make Use of Clysters, and then, if these give no Relief, purge gently; after this, let due Care be taken of the Patient, till the Fever disappears, and the seventh Day is arrived. If then the Danger appears to be over, proceed thus: First, exhibit a little Juice of Ptisan, mixed with Honey. Afterwards, if the Spit comes up with Ease, Respiration is easy, and the Pain of the Side is no longer sensible, give a somewhat larger Quantity, made a little thicker, twice in a Day.

If the Disease be more obstinate, the Drink must be less in Quantity, with a little forbile Food; that is, the Juice of Ptisan prepared thin, and given but once in a Day, and that at

O o o

the

the Time when it is at the best, which may be known by the Urine. But in these Distempers, forbile Food is not to be allowed till a Concoction is manifest in the Urine and Spit. And if the Patient has been purged much, his Diet must be the thinner, and the less in Quantity, for he will not be able to sleep, because of the Inanition of the Vessels, nor digest as he would otherwise, nor have Strength to sustain the Shock of the Crisis. But when Crudities are brought to a Colliquation, and what resists (*Nature*) is expelled, nothing will afterwards interfere with a more plentiful Use of these. Now the Spit is distinguished to be concocted, when it is like Pus, and the Urine, when it deposits a reddish Sediment like (*the Meal of*) Vetches.

In other Pains of the Sides, it is proper enough to apply warm Fomentations and Cerates, and to anoint the Legs and Loins with warm Oil or Fat; but on the Hypochondria lay a Cataplasim of Linseed, that may extend as far as the Breast.

A Peripneumony, in its Vigour, admits of no Relief, without a Discharge by Expectoration, and is dangerous, if accompanied with a Difficulty of Breathing, a Discharge of thin and acrid Urine, with Sweats about the Neck and Head; for these are fatal, as proceeding from a Suffocation, and the Strength and Fury of the prevailing Distemper, unless when there is a plentiful Discharge of thick Urine, or a concocted Matter is expectorated; for if any Thing of this Kind happens, there is a Solution of the Disease.

An Eclegma for the Peripneumony is prepared of Pine-nut Kernels, and Galbanum with Attic Honey: For a Pleurisy, in the Beginning, when the Pain is urgent, boil Southernwood, Pepper, and black Hellebore in Oxymel, and give the Patient. A Decoction of Panax (*ginseng*) in Oxymel, strained and drank, is good in Affections of the Liver, and Pains about the Diaphragm. Give what is intended to operate by Stool or Urine in Wine and Honey; but it may sometimes be adviseable to give Cathartics, with a plentiful Draught of diluted Hydromel.

When a Dyfentery ceases, it is succeeded by an Abscess, or some Sort of Tumor, unless it terminates in a Fever, or in Sweats, whilst the Urine is thick, white, and smooth; or it may end in a Tertian, or in a Varix, or fix upon the Testicle, or Legs, or the Hip.

In a bilious Fever the Accession of the Jaundice, with a Shivering before the seventh Day, gives a Solution to the Disease; but if it comes out of Season, and without a Rigour, it is fatal.

Convulsions about the Loins, and a Stagnation of the Blood on Account of a Redundance of melancholy Humours, whenever they happen, are solved by Phlebotomy. But when the Body is drawn vehemently forwards by convulsive Contractions of the Muscles, and Sweats are raised about the Neck and Face; the Violence of the Pain stimulating, and shrivelling the Psoas Muscles, which being considerably thick, sustain the Spine of the Back, in that Part where the largest Nerves take their Rise, and are extended to the Feet, unless the Patient be seized with a Fever, and a Sleep, and then makes a well concocted Urine, and falls into critical Sweats, let him drink generous Cretic Wines, and eat boiled Meal. Anoint him also with emollient Cerates, and bathe his Legs in a Tub of warm Water, and afterwards wrap them up in Cloths as far as the Feet, and in like Manner cover the Arms down to the Fingers. Lay also a warm Skin, spread with Fat and Cerate, over the Loins, large enough to reach from the Neck to the Haunches, and to come over before. Fomentations also with Bladders may be used at Intervals, with Affusions of warm Water, after which the Patient, being well wrapt up in Linnen, is to be laid to rest.

Beware of too much Purging; but if the Belly has been coftive for a considerable Time, use a Suppository; and if this answers the Purpose, it relieves the Patient; if not, let him drink fragrant Wine medicated with the bruised Root of Bryony and wild Carrot in the Morning fasting, before Affusions of Water; and after these, let him immediately eat heartily of boiled Meal warm, drinking afterwards at Pleasure Wine well tempered. If this Method answers the Intention, it is well; if not, Danger may be prognosticated.

All Diseases admit of a Solution, either by the Mouth, or the Belly, or the urinary Glands, or some other Emunctory; but all critical Discharges are accompanied with Sweats.

In Case a Rheum descends from the Head, Hellebore is the proper Remedy; but to such as labour under an Abscess, a Rupture of a Vessel, the ill Effects of Intemperance, or who, from some other powerful Cause, are affected with a Suppuration, Hellebore is by no Means to be given; for it can do no Good, and if the Patient be worse, is sure to bear the Blame. But if the Body be languishing, or there be a Pain in the Head, or a Stuffing of the Ears and Nostrils, or a Spitting, or a Heaviness of the Knees, or the Body smell more than

usual; you may prescribe it, provided that none of the aforementioned Symptoms proceeds from Excess of Drinking, or Venery, from Sorrow, Cares, or Want of Sleep; if any of these are in Fault, the Method of Cure must be suited to the Cause.

Pains in the Sides, Back, Loins, and Hips, and whatever manifestly cause a painful Respiration, are sometimes the Effects of Travelling; though sometimes also the Pains in the Loins and Hips proceed from a Crapula (*Overloading the Stomach*) or flatulent Food: To these may be added a Dysury; now all these together with a Stuffing of the Head, and a Hoarseness, are often caused by Fatigue in travelling.

Many Signs worthy of Notice arise from the Method of Diet, according as a Person deviates from that which has been habitual to him. If any one makes a Dinner, who never used to dine, his Belly swells considerably, and a Sleepiness, together with a Sense of Fulness, oppresses him; and if besides he sups as usual, he finds his Belly disordered. Such Persons would do well to sleep immediately after Bathing, and when they rise, to walk gently for a considerable Time; if by these Means Stools are procured, let him make a Supper, and drink a little Wine, but not much diluted. But if there are no Stools, the best Way is to anoint the Body with warm Oil; and in Case of Thirst, to drink a little white, or sweet Wine diluted, and immediately afterwards to betake themselves to Rest, where, if they cannot sleep, let them continue at Rest longer. In other Respects, let such a Diet be directed as is proper for a Crapula.

As to Drinks, those which are watery are flow of Passage, and gather round, and float about the Hypochondria, not readily passing off by Urine. Whoever fills himself with such Liquors cannot be quick at the Dispatch of any Work that requires great Efforts, Strength, or Agility of Body. In such a Case, the best Way in general is to be still, and rest, till such Fluids are concocted together with the Food. On the contrary, the stronger, or more austere Sorts of Drink cause Palpitations in the Body, and Pulsations in the Head. Those who are disordered by such an Excess are relieved by Sleep, and supping some such warm Liquor, as is most agreeable to the Palate.

Fasting is bad for the Head-ach and Crapula. Those who eat but once in a Day grow weak; their Urine is hot, from an unnatural Exinanition of the Vessels; there is a Saltiness and Bitterness in their Mouth; they tremble when they are about any Work, the temporal Arteries are distended; nor can they digest their Supper so well as if they had dined. It will be proper for such to drink less than usual, and to eat Maza made pretty liquid, instead of Bread, and among their Greens to use Docks, or Mallows, or Ptisan, hulled Barley, or Beet. At Table, let them after Eating drink a moderate Quantity of Wine well diluted, and after Supper take a gentle Walk, till a Secretion being made, they have Occasion to evacuate by Urine: Let them feed also on boiled Fish.

Foods also evidently manifest their Qualities by their Effects: Thus Garlick generates Flatulencies, and Heat in the Thorax, causes Heaviness of the Head, and Anxiety, and, if there happens to be any habitual Pain, it will not fail to increase it. But it provokes Urine, which is a good Quality; it is best eaten before a premeditated hard Drinking or Debauch.

Cheese breeds Flatulencies, and is astringent; it dries the Food, is a crude and undigestible Sort of Aliment, and very bad for such to eat who have filled themselves with Drink.

Pulse of all Sorts is flatulent, whether raw or boiled, or fried, whether macerated or green; and they ought not to be eaten without other Food. Every Kind has its peculiar Faults.

Chick-pease, whether raw, or baked, generate Flatulencies, and cause Pain.

Lentils unhusked are astringent, and cause violent and frequent Contractions of the Heart [*ἀνταρ*]. Lupines are the most harmless of this Class.

Silphium, both the Plant and Juice, is very quick in passing through the Body, with some, but very slow in others who are not used to it, and breeds what they call *Dry Choler*, especially if it be eaten with Cheese or Beef. For Beef exasperates melancholy Affections, because it is insuperable by the digestive Organs, and not easy to be dissolved by the Action of the Stomach. But these Inconveniencies are best avoided by thoroughly boiling it, and eating it stale.

Goats-flesh, besides that it has all the Faults of Beef, is more subject to breed Crudities, Flatulencies, Eructations, and Choler. That which is most fragrant, firm, and is grateful to the Palate, is the best, and ought to be thoroughly boiled, and eaten cold. On the Contrary, what is disagreeable, rank, and hard, is the worst, especially if fresh killed. It is best also in Summer, and worst in Autumn.

^a The Commentators and Interpreters have conjured up a Difficulty, where there appears to be none. They seem to think the Word *ἐξωδιν* should be wrote *ἐξωδιν*, which they derive from *ἐξω*. The Extremity of the Os Sacrum. In my Opinion, Hippocrates expresses very plainly the Psoas Muscles, for which *ἐξωδιν* seems a very proper Name, because of their Vicinity to the Kidnies, Ureters, and Bladder, the Organs employed about the Secretion, and Expulsion of the (*ἐξω*) Urine.

^b This is a very judicious Observation. It is certain that the Juices after Fasting contract an Alcalescence, for Want of being diluted with fresh Chyle; and hence the Symptoms mentioned by Hippocrates in this Place.

Swines-flesh is bad when eaten either too raw, or over done, for then it is subject to breed Cholera, and create Uneasiness. Sows-flesh is however the most excellent of all others, and of this the choicest is what is neither extremely fat nor lean, nor of the Age of an old Victim, and it is best when eaten without the Skin, and somewhat cold.

In a dry Cholera [*χολέρα ξηρή*] the Belly is inflated, and a Murmuring in the Intestines is perceived; the Sides and Loins are in Pain, and nothing passes by Stool, but the Patient is entirely costive.

In this Disorder beware of giving an Emetic, but let your Care be to discharge the Belly of its Contents downwards. For this End as speedily as may be, administer a warm Clyster, rendered as emollient as possible, by an Admixture of Fat, and, after well anointing the Patient, conduct him into a plentiful Bath of hot Water, and placing him in the Solium [*σολίον*] pour the Water on him by Degrees. During this Treatment in the Bath, if he can have the Benefit of a Stool, there is a Solution of the Disease. Sleep also will do him Good, and Drinking of thin old Wine, not mixed with Water. Give him also Oil that he may rest, have a Stool, and so get quit of his Distemper; but keep him from all Sorts of Food. If the Pain does not remit, let him drink Asses-Milk till it purge him. If the Excrements are liquid and bilious, and the Patient is afflicted with Gripes, Vomiting, and Fainting, the best Way is to enjoin a strict Rest, and to exhibit Hydromel, so as not to return it by Vomit.

Of Dropsies there are two Kinds; the first, which comes under the Flesh [*ὑποσφαιδίου*] when it once attacks, is incurable; the other is attended with Flatulencies, and the Patient is very fortunate if he gets a Cure, which must be attempted principally by hard Labour, Fomentations, and Temperance. Let him eat dry and acrid Food, which will not only cause him to make Plenty of Urine, but also strengthen him in a great Measure. If he is afflicted with a Difficulty of Breathing, and it be the Summer Season, and he in the Vigour of his Age, and in his full Strength, it will be proper to take some Blood from the Arm. Afterwards let him eat hot Bread dipt in Black Wine and Oil, and drink as little as possible, but use hard Labour and Exercise, and eat well fed Swines-flesh, boiled in Vinegar, that he might be the better able to support himself under his fatiguing Walks, which ought to be against Places of steep Ascent.

Such as have the lower Belly hot, are subject to sharp and irregular Stools, and to a Colliquation; if their Strength be firm, they ought to have a Dose of white Hellebore, in order to make a Revulsion; but if weak, the Juice of Sitanian [*σιτανίου*] Wheat is to be given, made thick and then cooled, or else Gruel of Lentils, or Bread baked in the Embers [*ἐν κάρφισι*] or Fish, which must be boiled for one that is feverish, but roasted for others. Black Wine also is to be given to one that has no Fever, otherwise Water in which have been macerated Medlars, or Myrtle-Berries, as Quinces, or Services, or Dates, or the Fruit of the Wild Vine. If the Patient be affected with Gripes, without a Fever, let him drink Cows-milk warm, a small Quantity at first, and increased every Time afterwards; or take Linfeed, and the Meal of roasted Wheat, and Egyptian Beans, first stripped of their bitter Husks, grind these, macerate them, and give the Mixture to drink; let him also eat Eggs half roasted, the finest Wheat-flour [*σικυδάρις*] Millet, and Alica [*χολύδα*] boiled in Milk. These are to be eaten cold, after they are boiled; and other Meats and Drinks of the same Nature with the above-mentioned are to be used.

With Respect to Regimen, it is a Point of the greatest Importance to watch and observe the proper Seasons for giving Aliment in acute and chronical Cases; and for this Purpose to remark the Intensions, and Remissions of Fevers, that you may find, and improve, the Opportunities when Food is by no Means proper, and when it may safely be offered, and to know at what Time the Disease is farthest from its greatest Degree of Exacerbation.

Have Regard also to Persons affected with an Head-ach, whether it proceeds from Exercise, as Running, Travelling, Hunting, or any other unseasonable Labour, or Venereal Commerce. Observe also the State of the Ill-coloured, the Hoarse, those who are affected with Disorders of the Spleen, those whose Blood is deficient, the Asthmatic, those who are afflicted with a dry Cough, or Thirst, or Flatulencies, or Stagnations of the Blood. Such as have their Hypochondria, Sides, or Back distended, or are benumbed or dim-sighted, those who are troubled with Noise in the Ears, or an Incontinence of Urine, or the Jaundice; those whose Stools are crude, who labour under copious Hæmorrhages from the Nose, or hæmorrhoidal Veins, or are molested with Inflations, or suffer vehement and intolerable Pains, from which they can by no Means free themselves. None of these above-mentioned Patients are to be purged; for Purging would be dangerous, and can do no Good; besides, it prevents a Crisis, and deprives Nature of the Means of assisting herself. But if it be proper to bleed in any of these Cases, first render the Belly firm,

and then proceed to take away Blood, to enjoin Abstinence, and to forbid Wine; the Cure is to be prosecuted afterwards by a convenient Regimen of Diet, and moist Fomentations. But if the Patient appears to be costive, relax the Belly with a gentle Clyster; or if you think Purging necessary, you may with Safety effect it upwards with Hellebore, but prescribe Purging downwards in none of these Cases.

But the best Way is to treat such Patients with Diuretics, and Diaphoretics, and to order them Walking, and Friction, though but gentle, lest the Habit should become more dense; and if they lie in Bed, let others rub them.

If the Distemper affects the Thorax above the Diaphragm, the most proper Posture for the Patient is to sit upright, and to recline as little as possible, till his Strength is increased; and while he sits, let him be well rubbed with Plenty of warm Oil for a considerable Time together.

But if the Pain lies in the Belly below the Diaphragm, the best Situation is Lying along, without moving the Body at all, except by Friction.

Diseases of the lower Belly which have their proper Solution by Urine and Sweat, if they are moderately moveable, are spontaneously solved when slight; but the more considerable are of pernicious Consequence; for the Patients either die, or fall into some other Distemper before they recover their Health. But Diseases of this Kind generally fix themselves upon some particular Part.

A POTION for a DROPSY.

Take three Cantharides, and pulling off their Heads, Feet, and Wings, bruise the Bodies in a Quarter of a Pint of Water, and give it the Patient to drink. When the Medicine begins to operate, let him use an Embrocation of warm Water. He is to drink it fasting, being first anointed, and let him eat hot Bread and Oil.

To stop an HÆMORRHAGE.

Wet some Wool with the Juice of the Fig, and apply it to the Artery on the Inside of the Nose, or put some Runnet intorted into the Nostrils, or thrust up Calcitis with your Finger, compressing the Cartilages of the Nose on the Outside. Loosen the Belly also with Asses Milk boiled, and let the Head be shaved, and Refrigerants afterwards be applied to it, if the Season be hot.

Sesamoides purgeth upwards, if the Weight of a Dram and half of it bruised be taken in Oxymel. It is also mixed with the Hellebores, so as to be a Third of the Composition, which by that Means is rendered less suffocating.

The SUTURE for a TRICHOSIS.

Take a Needle which hath an Eye, and thrust the Point through the upper acuminate and tense Part of the Eye-lid, downwards, and repass it from the inner Part upwards, then fastening the extended Thread upon the Place with a Knot, let it rest till it falls off. If this be sufficient, it is well; if not, the same Operation must be repeated.

In like Manner are the Hæmorrhoids be treated, that is, by passing through them a Needle with a very thick Thread made of greasy Wool, and fastening it with a Knot, the Largeness of which will contribute to the Cure; and when they are thus compressed, apply a Suppurative; but use no Embrocation till they fall off; however, let one remain always. When the Patient has recovered Strength, purge him with Hellebore, and let him use Exercise and Sweating. The first of these should be a great deal of Friction in the Morning; but let him avoid Running, Drunkenness, and all acrimonious Food, except Oroganum. Let him vomit once in seven Days, or three Times in a Month, for by these Means he will acquire an excellent Habit of Body. Let his Wine be yellow (deep-coloured) austere, diluted, and little in Quantity.

For Persons affected with INTERNAL SUPPURATIONS.

Cut the Bulb of Squills, and boil them in Water, and when they are very well done, throw away the Liquor, and add a second Water, in which boil them over again, till they appear thoroughly boiled, and are soft to the Touch. This done, bruise and mash them, and mix therewith Cummin, roasted white Sesamums, and new Almonds, reduce these to a proper Consistence with Honey, and give them as a Lambitive, and after this a Draught of sweet Wine. For forbile Food let them take the Measure of a small Acetabulum [$\frac{1}{8}$ of a Pint, *κελευστριον*] of white Poppy [*ρουν*] bruised, and macerate and boil it in Water wherein fetanious Meal has been washed, and then sweetening the same with Honey, let him take it warm, and so pass the Day; after which, with due Consideration of what may ensue, give him his Supper.

For a DYSENTERY.

Take a Quarter of a Pint of Beans cleansed, and twelve Sprigs of Maddar bruised, and boil them together, and with something oily make it into an Eclegma, and give it the Patient.

For the EYES.

Take Spodium [*oreum*] wash it, and afterwards work it well like a dry Mass of Meal; then levigate and moisten it with the austere Juice of bitter unripe Grapes; let it dry in the Sun, and as there is Occasion moisten it, so as to make it of the Consistence of an Ointment. When it is grown dry, levigate it, then apply it to the Eyes, and sprinkle it in their Corners.

For moist EYES.

Take of Ebony one Dram, of burnt Brass one Dram and half; levigate them on a Stone, and add half a Dram of Saffron; these being all reduced to a fine Powder, pour on it half a Pint of Attic sweet Wine, and after it has been exposed to the Sun, cover it, and when it is digested, use it.

For PAINS of the EYES.

Take of Calcitis one Dram, Grapes when a Third of the Juice is expressed, Myrrh and Saffron bruised, and mixing them with Must, digest them in the Sun, and therewith anoint the affected Parts. It ought to be kept in a Copper Vessel.

To know the STRANGULATION of the UTERUS (*Hysterics*).

Pinch the Patient with two Fingers, and if there is any Sign of Sensation, it is a Strangulation; if none, it is a Convulsion.

For the DROPSY.

Give the Quantity of a round Attic Acetabulum (*petasus*) of Meconium (*Petty Spurge*) for a Dose. Take of the Scoria of Brass as much as will cover the Breadth of three Probes, give it a Consistence with setanian Meal, and having levigated it, exhibit it in the Form of Pills. They purge Water by Stool, and clear the Belly of Excrements. Drop the Juice of Tithymallus upon dried Figs, seven Drops on a Fig, and set them aside in a new Vessel for the Use of the Patient, to the Purpose aforesaid, to whom they must be given just before his Meals. Bruise also petty Spurge (*anemone*) and put Water to it; then, after straining it, make it up with Meal, wet with Honey, into a Cake, which bake, and give your hydropical Patients to eat, who are to drink after it sweet Wine diluted, or Hydromel likewise diluted. But gather the Meconium that comes away with the Excrements, and lay it aside carefully.

ALCALISATIO. *Alcalisation*. It imports the Impregnating any Thing with an alkaline Salt, as Spirit of Wine.

ALCANALI. An *Antidote*, so called in Italian. It is of good Use in burning Fevers, simple and double Tertians, and in continued Fevers, the Lipyria, Semitertian, and, in a Word, every feverish Disorder, and is thus prepared:

Take of Citrine, Chebule, and Indian Myrabolans, each Sort seven Drams; of Purslane-seeds and purple Violets, each an Ounce and half; of Beleric and Emblic Myrobalans, each one Dram seven Grains; of Mastich, one Dram one Scruple; of Oxyphoenicum (interpreted by the Commentator *Tamarindi*) three Ounces; of wild Colocynthis, Hermodactyls, each two Drams four Grains; of Cassia Fistula cleaned, four Ounces. Then take of Violets, an Ounce and half, and two Pints of Water, and let them boil to a Third; strain it thro' a Bag, and put the Cassia Fistula and the Tamarinds into the Liquor, work them well with your Hands, and, after straining all the Juice through a Bag, let the Liquor stand. After this take another Portion of such Liquor, and put in it of Sugar one Pound and half, and let them boil to the Thickness of Honey; add to them the Liquor of the Cassia Fistula and the Tamarinds, and let all boil together to the Thickness of Honey. Lastly add to this all the above-mentioned Ingredients well bruised. The Dose is three Drams in warm Water; or you may give two or three Scruples in an Infusion of Rhubarb warm, or in Rose-water, fasting. *Myrsus, Sect. 1. Cap. 24.*

ALCANNA. A Plant thus distinguished:

Alcanna, Offic. *Ligustrum Indicum seu Alcanna Manihondi*, Herm. Mus. Zeyl. 6. 65. *Ligustri species 2. Alcanna dicta*, Bont. 143. *Ligustrum Orientale, sive Cyprus Dioscoridis & Plinii*, Park. Theat. 1447. Raii Hist. 2. 1603. *Ligustrum Egyptianum latifolium & angustifolium*, C. B. Pin. 476. *Ligustrum Egyptianum, Cyprus Græcorum, Elhamne Arabum*, J. B. 1. 541. Chab. 41. *Ligustri species*, Comm. Flor. Mal. 161. *Baccifera Indica baccis oblongis in umbellæ formam dispositis*, Raii Hist. 2. 1634. EASTERN PRIVET. Dale.

This is the *Kenna* of the Turks and Moors. The Leaf, when reduced to a yellow Powder, is used for a Cosmetic by the Natives; namely, by the Men to dye their Beards red, and by Women to dye their Nails of the same Colour; in order to which they make it into a Sort of PASTE, with Juice of Lemons. Its medicinal Virtues are Emmenagogue and Hysterical, and accordingly it is used in the Eastern Countries, to cause Abortion, and to bring away dead Children. *Geoffroy*.

The Account Dioscorides gives of this Plant, which he calls *Cyprus*, is as follows:

The *Cyprus* is a Tree, the Leaves on whose Branches are like those of the Olive, but broader, softer, and greener. The

Flowers are white, mossy, and scented; the Seed black like that of the Elder-tree. The fairest grows about Ascalon and Canopus.

The Leaves have an astringent Quality, by which they heal Ulcers in the Mouth, being chewed therein, and are good for Carbuncles, and other fiery Inflammations, if applied in a Cataplasm. The Decoction of them is used to wash Burns. The Leaves bruised, and moistened with the Juice of Dyers Weed (*reseda*) turn the Hair of a yellow Colour. The Flowers, bruised in Vinegar, and applied to the Forehead, ease the Pains of the Head.

The *Cyprine Ointment*, which is prepared of the Flowers, has the Virtue of warming and mollifying the Nerves, and is sweet-scented, being a Composition of Simples of a hot and fiery Quality. *Dioscorides, Lib. 1. C. 124.*

The *Cyprus* is a Tree in Egypt, that has Leaves like those of the Ziziphus, Seed like Coriander, and a white scented Flower. They boil this last in Oil, and express what they call the *Cyprus* (an Oil) which is sold in Quantities of five Pound (*Pretium ei in Libras quinque*). The best, in Point of Fragrance, comes from Canopica on the Banks of the Nile, the next in Goodness from Ascalon in Judea, and the third from the Isle of Cyprus. Some say it is the same Tree which they call in Italy *Ligustrum*. *Pliny, L. 12. C. 24.*

Pliny has the same Virtues of Dioscorides, and adds that the Leaves are applied to the Stomach when disordered, and their Juice to the Uterus in Hysterics; that the fresh Leaves chewed heal running Ulcers in the Head as well as in the Mouth, a Collection of Humours, and Condylomata. The Flowers burnt in a crude earthen Pot, cure Noma, and putrid Ulcers, either used alone, or with Honey. The Smell of the Flowers provokes Sleep. *Pliny, L. 23. C. 4.*

ALCANNA also signifies the same as *Ischyocolla*, *Isinglass*. *Johnson*.

ALCAOL. Rulandus, and from him Johnson, interpret this *Lac Acetosum sive Mercurius*. By *Lac Acetosum*, I suppose they mean the *Lac Philosophorum*, or Solvent for the Preparation of the Philosophers Stone.

ALCAR. *Admag*. Galen explains this by *Bolusma*, *Help*, *Assistance*. It signifies also a Remedy. *Foesius*.

ALCARA. *A Cucurbit*. Rulandus.

ALCE. *The Elk*.

This is a wild Beast, furnished with Horns, as big as a Horse, it is bearded and covered with long Hairs from the Top of the Head to the Shoulders; its Colour is commonly grey, or whitish; the Head is very large, its Eyes sparkling, its Lips are large and thick, its Teeth are moderate, its Ears are long and large, its Horns are branched like those of a Fallow Deer, weighing at least twelve Pounds the two, which Horns they lose yearly; the Female has none at all, its Belly is as large as that of a Cow, its Tail is very little, its Legs are long and slender, its Feet are black, its Hoofs divided like those of an Ox; the Flesh is very hard, the Back is covered with Hairs like the fine grey Hairs of a Mouse; this Animal is found in Poland, in Prussia, in Sweden, in Norway, and Canada; it is timorous and casts itself into the Water when they hunt it, but it is very strong, his Lust is like that of the Stag. It is subject to the Epilepsy, and they relate that, when it is in a Fit, it cures itself by rubbing its Ears with the Hoof of its hind left Leg: It is for this Reason they esteem the hind left Leg in Medicine much more than the right. Its Hoof is in Use, called *Ungula Alcis*, it should be chosen weighty, compact, smooth, bright, and black; it contains a great deal of volatile Salt and Oil.

They use the Hoof of an *Elk* as a Cure for the Epilepsy taken internally; they hang a little Piece at the Neck, and they make of it Rings to wear on the Finger for the same Distemper, but these Amulets produce no Effect.

The other Feet of *Elks* are as good as the left hind Foot, for the Effect proceeds only from the volatile Salt of which there is as much in one as the other. *Lemery de Drogues*.

Some People eat the Flesh as Venison. The Nerves are used against the Cramp, by binding the affected Part with them. *Pomet*.

ALCEA. A Plant of the Mallow Kind, thus called by Authors:

Adxia, Dioscoridis. *Alcea*, Offic. *Alcea vulgaris*, J. B. 2. 953. Raii Hist. 1. 604. Synop. 3. 252. Dill. Cat. Giss. 144. *Alcea vulgaris major*, C. B. Pin. 316. *Alcea vulgaris sive Malva verbenacea*, Park. Theat. 301. *Alcea vulgaris*, Mer. Pin. 3. Merc. Bot. 17. Phyt. Brit. 3. *Alcea vulgaris major flore ex rubro roseo*, Tourn. Inst. 97. Boerh. Ind. A. 270. Hist. Oxon. 2. 527. *Malva verbenacea*, Ger. 785. Emac. 931. VERVAIN-MALLOW. Dale.

Alcea is a Kind of Wild Mallows, with Leaves deeply cut like those of Vervain (*leg. Boragin*) and three or four Stalks covered with a Rind much like Hemp. It bears a small Flower like a Rose. The Roots are white, broad, five or six in Number, and near a Cubit in Length. *Dioscorides, Lib. 3. Cap. 164.*

This is a Species of Mallow, and differs from the Common, in having its Stalks more hairy, and growing more erect; the lower

lower Leaves are smaller and roundish, cut in about the Edges, and growing on long Foot-stalks; the higher they grow, the Foot-stalks are the shorter. The upper Leaves are cut into five deep Laciniae or Segments, the Flowers are larger, paler, and not striated like those of the common Mallow. The Cheese-like Seed-vessel is larger and blacker; the Root is hard and woody, spreading in the Ground.

It grows in the Hedges, and flowers in May and June, and through the greatest Part of Summer.

The Roots drank in Wine or Water cure the Dysentery and Ruptures. *Diosc. L. 3. C. 164.*

Alcea is a Species of Wild Mallows; drank in Wine, especially the Root, it cures the Dysentery, and Corrosions of the Intestines. *Paulus Aegineta, L. 7. C. 3.*

Alcea is a good Digestive, is emollient, and stops Bleeding. It is used in Clysters, and Fomentations, and is taken at the Mouth also to correct the Acrimony of Urine. *Lemery de Drogues.*

It is of the Number of Emollients, and is an Ingredient in Plaisters. It is in great Vogue among Empirics for Dimness of Sight, and a Decoction of it cures the Gripes. It is a very proper Remedy for all Pains attended with Heat. *Dale.*

Miller enumerates the eight following Species:

1. *Alcea vulgaris major, flore ex rubro-roseo*, C. B. P. 316. Greater Vervain-mallow, with a Rose-coloured Flower.

2. *Alcea vulgaris major, flore candidiore*, C. B. P. 316. Greater Vervain-mallow, with a white Flower.

3. *Alcea folio rotundo laciniato*, C. B. P. 316. Vervain-mallow, with a round cut Leaf.

4. *Alcea tenuifolia crispa*, J. B. II. 1067. Narrow-curved leaved Vervain-mallow.

5. *Alcea Cannabina*, C. B. P. 316. Hemp-leaved Mallow.

6. *Alcea Afra frutescens, grossulariae folio flore parvo rubro*, Boerh. Ind. Alt. African shrubby Vervain-mallow, with Gooseberry Leaves; and small red Flowers.

7. *Alcea Africana arborescens malvae folio hirsuto, flore parvo purpureo*, Till. African Tree-like Vervain-mallow, with hairy Mallow-leaves and small purple Flowers.

8. *Alcea Afra frutescens, grossulariae folio ampliore, unguibus florum atro-rubentibus*, Aët. Phil. African shrubby Vervain-mallow, with larger Gooseberry Leaves, and dark-red Spots at the Bottom of the Flowers.

ALCEA INDICA.

It has a large pentapetalous Flower, and a pretty big seminal Vessel, divided into five Cells containing Kidney-like Seeds.

Bamia Moschata, Offic. *Alcea sive Bamia Moschata Egyptiaca*, Breyn. Prod. I. 2. *Alcea Egyptiaca Moschata*, Park. Theat. 301. *Alcea Egyptiaca villosa*, C. B. Pin. 317. Raii Hist. 2. 1066. *Bamia*, *Belmuscus Honorio Bello*, Chab. 302. *Althea Egyptiaca Moschata Abel Mosch dicta*, Hist. Oxon. 2. 533. *Abel Mosch vulgò*, Herm. Hort. Lugd. Bat. 25. *Mosch, id est, Bamia Moschata*, Alp. Exot. 197. *Ketmia Egyptiaca semine Moschata*, Tourn. Inst. 100. Boerh. Ind. A. 272. MOSCH-SEED.

It grows in Egypt. The Seeds are used, which are of a smutty Colour, Kidney like, and of a very fragrant Smell, like Musk. The Egyptians dry them slightly, and mix the Powder in their Coffee, to make it more effectual for the strengthening of their Head, Stomach, and Heart. We use it in Fumigations. *Dale.*

ALCEBRIS VIVUM. The same as *Sulphur Vivum*. *Rulandus*, who also calls it *ALNERIC*, *ANERIT*, and *ANERIC*.

ALCEDO. The King's Fisher. A Bird thus distinguished by Authors:

Ispida, Offic. Aldr. Ornith. 3. 518. Gesn. de Avib. 513. *Jonf. de Avib. 107. Ispida, an veterum Halcyon?* Will. Ornith. 101. Raii Ornith. 146. *Ejusd. Synop. A. 48. Ispida, Alcyon fluviatilis, vulgò Piscator Regis*, Charlt. Exer. III. *Alcedo*, Schrod. 5. 314. *Halcedo muta*, Bellon. des Oyse, 219. *Dale.*

It is a little Sea-bird, somewhat like a Quail, of different Colours, as blue, purple, red, or yellow; its Beak is long and small, of a yellowish Colour; they build their Nests among Reeds, or upon Rocks on the Shore; it lives upon small Fish; it lays its Eggs in Winter when the Weather is serene. They pretend that it is a happy Omen of calm and fair Weather.

It contains a great deal of volatile Salt.

This Bird dried, and hanged to Childrens Necks, preserves them from the Epilepsy, but a more certain Effect is to be produced by giving a Scruple every Day in Powder at the Mouths, in Betony-water.

The white dried Nests of Birds which the People of Siam and other Travellers bring into France, are those of the Indian King's Fishers, and principally of those which breed on the Coasts of the Kingdom of Cambia. Their Nests are in the Shape of round Bowls, their Substance is of a white Froth which they discharge from their Bills when they are going to breed, and which hardens by the Heat of the Sun, the Taste of these Nests

is insipid, and glutinous. The Chinese look upon them as Dainties, and eat them boiled with Ginger.

They are esteemed Restoratives, and are said to strengthen the Stomach. *Lemery de Drogues.*

Pomet adds, that the Chinese are such Lovers of these Birds' nests, that it is almost incredible what Quantities are sent to Pequim, the Capital of China. They are usually valued at fifty Tabers the Hundred, which is about six hundred Livres, or fifty Pounds of our Money. These Nests were formerly little known, and it was believed that they were made of the Froth of the Sea; but since the People of Siam have introduced them they are become very common.

ALCHACHIL. A Name for *Rosemary*. *Dale.*

ALCHARITH, or ALECHARITH. *Quicksilver*. *Johnston. Castellus.*

ALCHEMIA, or ALCHYMIA. *Alchemy*. It imports that Branch of Chymistry, which relates particularly to the Transmutation of Metals. The Arabic Particle AL added to it by Way of Eminence, distinguishes it from vulgar Chymistry.

It was common for the Orientals to denote the Excellence of any Thing by representing it as more particularly belonging to the Supreme Being. Thus the *Mountains of God*, are only Mountains eminently high; and the *Rivers of God*, are Rivers of great Depth and Breadth. In like Manner I should suspect *Alchemy* to signify the Chymistry of God, as *Alla* is the Arabian Name for the Supreme Being. See CHYMIA. See AL.

ALCHIMELECH. The Egyptian *Melilot*.

Melilotus Egyptia Alchimelech vocata, J. B. *Melilotus Egyptiaca*, Park. *Melilotus Corniculis reflexis minor*, C. B.

The Plant spreads itself on the Ground, being small, and gently creeping, seldom or never raising itself in Height. Its Leaves are like those of Trefoil, only lesser. The Flowers are small, copious, long, growing in Clusters, of the Colour of Saffron, sweet-scented, from whence are produced small oblique Pods, containing a minute round Seed, of a blackish Colour, inclining to red, not quite void of Smell, and of a bitterish astringent Taste. *Raii Hist. Plant.*

ALCHIEN. In the *Theatrum Chymicum*, Vol. 5. we meet with this Word. It would be much more easy to transcribe the Explanation of it from the Book quoted above, as *Castellus* has done, than to understand what the Author means. If it has any real Meaning, it should seem to signify that Power in Nature by which all Corruption and Generation are effected.

ALCHIMILLA. A Plant thus called:

Alchimilla, Offic. Ger. 802. Emac. 949. Raii Hist. I. 208. Synop. 66. *Alchimilla vulgaris*, C. B. 319. Tourn. Inst. 508. Boerh. Ind. A. 2. 92. Dill. Cat. 67. *Alchimilla major vulgaris*, Park. 538. *Alchimilla perennis viridis major, foliis ex luteo virentibus*, Hist. Oxon. 2. 195. *Pes leonis sive Alchimilla*, J. B. 2. 3981. Chab. 172. LADY'S MANTLE. *Dale.*

The Leaves of Ladies Mantle, upon their first Springing up from the Root, are plaited or folded together, of a whitish green Colour, covered with a short fine Down, having eight Corners, and when spread open, in Shape something like Mallows, but much neater and more elegantly ferrated about the Edges; the Stalks are weak, seldom standing upright, somewhat hairy, and clothed with the like Leaves, but smaller, and having shorter Foot-stalks, bearing at the Tops Clusters of greenish Flowers, of eight Leaves a Piece, with yellow Stamina in the Middle, each Flower producing two small Seeds. The Root is pretty thick, of a black Colour on the Outside, with many Fibres. It grows in Meadow and Pasture Grounds, but rarely about London. It flowers in May.

It contains a great deal of Phlegm, and Oil, and a moderate Quantity of Salt. *Lemery de Drogues.*

The Leaves are chiefly used. This Plant is reckoned among the principal vulnerary ones, being drying and binding, incrustating and consolidating, and of great Force to stop inward Bleeding, the immoderate Flux of the Menfes, and the Fluor Albus, and is frequently prescribed in Wound-drinks, and Traumatic Apozems, and for Ruptures of all Kinds. The Leaves, outwardly applied, are commended for lank, flagging Breasts, to bring them to a greater Firmness, and a smaller Compass. *Miller, Bot. Off. Boerhaave.*

Lemery adds, that it is deterfive and astringent, it serves in a Decoction for Soreness of the Lungs. *Lemery de Drogues.*

The Species of this Herb are:

1. *Alchimilla vulgaris*. C. B. Common Ladies Mantle.

2. *Alchimilla Alpina, pubescens, minor*. H. R. Par. The lesser woolly Ladies Mantle.

3. *Alchimilla Alpina, quinquefolia folio subtus argenteo*. Tourn. The Alpine five-leaved Ladies Mantle, with the under Part of the Leaves white.

4. *Alchimilla minor*. Mor. Hort. Reg. Bles. The lesser Ladies Mantle.

5. *Alchimilla Alpina pentaphyllea minima, lobis fimbriatis*, Boet. Mus. Par. 2. 18. Least five-leaved Ladies Mantle of the Alps, with fringed Leaves.

6. *Alchimilla montana minima*, Col. Par. 1. 146. Least Mountain Ladies Mantle, commonly called Parsley Breakstone.

7. *Alchimilla supina, gramineo folio, minore flore*, Tourn. Low Grass-leaved Ladies Mantle, with a smaller Flower.

8. *Alchimilla erecta, gramineo folio, minore flore*, Tourn. Upright Grass-leaved Ladies Mantle, with a smaller Flower.

9. *Alchimilla gramineo folio, majori flore*, Tourn. Grass-leaved Ladies Mantle with a larger Flower.

10. *Alchimilla linariae folio, calyce florum albo*, Tourn. Ladies Mantle with a Toad-flax Leaf, and a white Flower-cup.

11. *Alchimilla linariae folio, calyce florum subluteo*, Tourn. Ladies Mantle with a Toad-flaxed Leaf, and a yellowish Flower-cup.

12. *Alchimilla orientalis, linariae folio brevissimo, calyce florum albo*, Tourn. Cor. Eastern Ladies Mantle, with a very short Toad-flaxed Leaf, and a white Flower-cup.

13. *Alchimilla Græca, kali folio, calyce florum albido*, Tourn. Cor. Greek Ladies Mantle, with a Glass-wort Leaf, and a whitish Flower-cup. *Miller's Dict. and Suppl.*

ALCHITRAM, or ALCHIERAM. It signifies Oil of Juniper; or Tar; or prepared Arsenic. *Rulandus.*

ALCHITRAN. This also is Oil of Juniper, according to *Rulandus*, who gives it another Signification, [*Fæx Destillationis*, I suppose he means the Fæces left after the Distillation of some Bodies. In this Sense, it seems to differ from Caput Mortuum, as this is dry, whereas *Alchitran* is moist, or fluid, in some Degree. *Castellus*, from *Libavius*, gives it another Signification, and says it signifies a Sort of Salt; he derives the Word from *χρησά, a Pot*, by which it should be Pot-ash.

The same Author says, *Alchytran* is the Name of a Medicine for the Teeth, taken Notice of by *Mesuae*.

ALCHITURA. *Tar. Johnson.*

ALCHOLLEA. A Sort of Food, common amongst the Western Moors: It is made of Beef, Mutton, or Camel's Flesh, but chiefly Beef, which they cut all in long Slices, salt it well, and let it lie twenty-four Hours in the Pickle. Then they remove it out of those Tubs, or Jars, into others, with Water, and when it has lain a Night, they take it out, and put it on Ropes in the Sun and Air to dry; when it is thoroughly dried and hard, they cut it into Pieces of two or three Inches long, and throw it into a Pan, or Cauldron, which is ready with boiling Oil and Suet, sufficient to hold it, where it boils till it be very clear and red, if one cuts it; which taken out, they set it to drain: When all is thus done, it stands till cool, and Jars are prepared to put it up in, pouring the Liquor they fried it in upon it; as soon as it is thoroughly cold, they stop it up close. It will keep two Years; it will be hard, and the hardest they look upon to be best done. This they dish up cold; sometimes fried with Eggs and Garlick; sometimes stewed, and Lemons squeezed on it. It is very good any Way, either hot or cold. *Philos. Transact.*

ALCHIMIA. See ALCHEMIA.

ALCIBIADIUM. It is a Name for the ECHIUM, which see. *Blancard.*

ALCIMAD. *Antimony. Rulandus.*

ALCIOT. The same as ACHIOTL, which see.

ALCOB. Sal Ammoniac. *Rulandus.*

ALCOCALUM. The *Cinara, Artichoke. Blancard.*

ALCOEL. *Rulandus* explains this by *Lac Acetosum*.

ALCOFOL. *Antimony. Castellus* from *Rulandus, Johnson, and Dorneus.*

ALCOHOL, or rather *Al-Ka-hol*, as it ought to be wrote, is an Arabian Word, which signifies a fine impalpable Powder which the Women of the East make use of as a Kind of Fucus.

Dr. Shaw, in his Travels, speaking of the Women of Barbary, says, that none of these Ladies take themselves to be completely dressed, till they have tinged the Hair, and Edges of their Eye-Lids, with [*Al-Ka-hol*] the Powder of Lead-Ore. Now as this Operation is performed by dipping first in the Powder a small wooden Bodkin of the Thickness of a Quill, and then drawing it afterwards, through the Eye-lids, over the Ball of the Eye, we shall have a lively Image of what the Prophet (*Jer. 4. 30.*) may be supposed to mean by *renting the Eyes with (שֹׁן Lead-Ore) painting*. The sooty Colour, which is in this Manner communicated to the Eyes, is thought to add a wonderful Gracefulness to Persons of all Complexions. The Practice of it, no Doubt, is of great Antiquity: For beside the Instance already taken Notice of, we find, that when *Jezebel* is said (*2 Kings 9. 30.*) to have painted her Face, the original Words are עֲיִנֶיהָ בַּשֹּׁן *she adjusted (or set off) her Eyes with the Powder of Lead-Ore*. The like Ornament was made Use of, not only by other Eastern Nations, but by the Greeks and Romans also, as appears from ancient Authors. Among other Things relating to the Egyptian Women, I have likewise seen taken out of the Catacombs at Sakara a Joint of a common Reed, which contained one of the Bodkins, and an Ounce, or more, of the Powder that I have described; both of them agreeable to the Fashion and Custom of this Time.

This ingenious Gentleman informs us, that this Word is rendered by *Golius* and others, *Stibium*, *Antimonii Species*; and sometimes *Collyrium*. The Hebrew כֹּחַל *Cabhal*, has the same Interpretation; and the Verb, כֹּחַלָה, joined with עֲיִנֶיהָ *Ezek.*

23. 40. is rendered, *thou paintedst thy Eyes*. שֹׁן (from whence probably the Latin *Fucus*) is taken in the like Signification, being rendered *Antimonium, Stibium*, quo ad tingenda nigrore cilia, seu ad venustandos oculos, peculiariter utebantur, color subniger ex pulveribus Stibii confectus. *Schindl. Lex. St. Jerom* likewise, upon these Words, בָּפֹהֶם אֲבִנֵּי. *Is. 54. 11.* which we render (*I will lay*) *thy Stones with fair Colours*, takes Notice, quod omnes præter LXX. similiter transtulerunt, viz. (*Sternam*) in *Stibio lapides tuos*, in similitudinem comptæ mulieris, quæ oculos pingit stibio, ut pulchritudinem significet civitatis. שֹׁן therefore, and כֹּחַל denoting the same mineral Substance, or *Collyrium*, it may be presumed, that what is called to this Day by the latter of these Names (which is a rich Lead-Ore, pounded into an impalpable Powder) was the Mineral which they always made Use of.

I cannot determine whether the learned Author is right or not, with Respect to the Powder called *Alcohol*, which he tells us is Black-Lead. Other Authors, however, inform us, that the Powder made Use of by the Women, to set off the Eyes, was prepared from *Antimony*.

But we may be pretty certain, that from this exceeding fine Powder, the Word *Alcohol* has been borrowed, and applied to any other Substance reduced to the utmost Degree of Purity, and from which all impure and heterogeneous Particles have been separated.

Hence Spirit of Wine, brought by Art to the highest Degree of Strength and Perfection, is also called *Alcohol*.

As *Alcohol* therefore is the most compleat, and perfect Offspring of vegetable Fermentation, I shall in this Place give the intire Process by which it is produced from *Boerhaave*.

There is scarcely any Thing of greater Antiquity in Natural History, more common in civil Life, or more frequent in Chymistry, than Fermentation; so that we may fairly say with the famous *Bellini*, all Things are full of Ferments, but especially among the Chymists. Nay, if you will believe *Van Helmont*, the Virtue of Ferments alone is the sole Cause of all real Transmutations. But such round and general Assertions confound the Ideas of Things; for if every Mutation be owing to Fermentation, then Fermentation will be as general a Word as Mutation, by which Means, the true Names of Things are lost. This Confusion has been complained of by Men of the best Sense, who have long desired a particular Dissertation on this Subject, which I shall now endeavour to give.

I. By the Word *Fermentation*, I mean that intestine Motion excited in Vegetables, by which they are changed in such a Manner, that the first Thing which arises from them in Distillation is an acrid Liquor, miscible with Water, of a warm aromatic Taste, inflammable like Oil, thin, and volatile; or else, acrid, acid, extinguishing Fire and Flame, thin, and less volatile.

By this Definition, the Word *Fermentation* is so limited, as to comprehend all that occurs in a true Fermentation, exclusively of every Thing to which it cannot be properly, though it is too often applied.

In every Fermentation, as long as it continues, there is an intestine Motion in the whole Mass, and every Part of it. I call it intestine, because it is excited chiefly by internal Principles, which are inherent in the Vegetable. Some Degree of Heat, I confess, is here necessary; but this would not excite a true Fermentation in the Matter, if it were not previously of itself disposed to ferment. For if you take Water, Spirits, Oil, or Salts, and give them the same Degree of Heat, yet you will never bring them to a Fermentation. I say farther, that this intestine Motion can only be excited in Vegetables, for hitherto we have met with no Instance of a Fermentation in Animals, except when they had received into their Bodies vegetable Matter, which they had not yet assimilated and transformed into their own Nature. As for Fossils, I do not remember that ever I observed in them any Motions tending to Fermentation, though Authors of very great Repute have made no Scruple to assert it. It is the Office of Reason rightly to distinguish between Things, and therefore I was obliged to take my Definition from the Effect, because every true and perfect Fermentation terminates in a Spirit, or an Acid. That we may put an End at last to this Confusion, I would ask the judicious Chymists, whether this Action of Vegetables, which I have thus described, is to be called Fermentation? Certainly, none disputes it. I insist then to know, whether, for Distinction sake, and to obey the Laws of Order, we ought not to call all those Actions, which do not produce the Effects assigned, by some other Names? I think Reason teaches us so to do. I shall then make a wide Distinction between Fermentation and Putrefaction, because this latter, though it be also an intestine Motion in Vegetables, yet for its ultimate Effect generates putrid Oils, and foetid, alkaline, volatile Salts. Putrefaction of the Humours of Animals is also a proper intestine Motion, but then it never produces an Acid, or an inflammable Spirit, but phosphorical Matter only, and consequently is quite different from every Kind of Fermentation; for I cannot allow any Thing to come under this Name, which does not generate either an inflammable Spirit, or an Acid, for Fear of Confusion.

In a Word, none of the various Kinds of Effervescences ought, under any Pretence, to pass for Fermentation, though they may come under the Title of intestine Motions, and may be often observed even in pure, vegetable Substances, as we see in very strong Vinegar, and a fixed alkaline Salt.

II. Every fermented vegetable Liquor, which in Distillation first yields a Spirit that is inflammable, and may be mixed with Water, I shall distinguish by the Name of *Wine*, from whatever vegetable Matter it is produced. The Word will bear this Signification; for Tacitus, with great Propriety of Speech in the Latin Tongue, says, that the Germans made Wine of corrupted Corn [Malt]. All such fermented Liquors therefore, from whatever Vegetables they are prepared, I shall call *Wine*, without any Distinction. And again, every vegetable Liquor, fermented in such a Manner as in the first Distillation to yield an acid Liquor extinguishing Fire, I shall call *Vinegar*; whencesoever derived. Hence the whole Effect of a perfect Fermentation, will be the Production either of Wine or Vinegar.

III. I call a fermentable Body such a one, as by the Action described, N^o 1. may be so changed, as to be capable of producing the Wine or Vinegar, described N^o 2. But as this was never observed but in the vegetable Kingdom, I am obliged to allow nothing but Vegetables to be fermentable, though it will hereafter appear that they are not all so.

IV. I call by the Name of *Ferment*, that Body, which being intimately mixed with the fermentable Vegetable, N^o 3. excites, increases, and promotes the Fermentation described, N^o 1. Hence it appears at first Sight, that all such Ferments belong to the Class of Vegetables.

V. The fermentable Vegetables, N^o 3. are in great Variety. These therefore are to be distributed into as many Classes, as they require different Methods of Fermentation; nor can we here, with any Propriety, admit of more or less. Thus, as we must treat Rye in one Manner to produce Wine from it, and the fresh expressed Juice of Grapes in another; so it is absolutely necessary to distribute these two Vegetables into different Classes: On the contrary, as Wheat, Barley, and Oats, require the very same Management as Rye, for this Purpose; hence, in this Respect, there must be no Distinction made betwixt these, but they must all be referred to the same Class. Mean Time, however, it is necessary to observe, that all Vegetables are not disposed to ferment; for such as abound with a native, alkaline Salt, or are easily changed into it, are unfit for Fermentation, but incline to Putrefaction. Of this I was convinced, when but a Novice in these Matters, by Experiments on Onions and Turneps, having in vain tried to extract such a Spirit as is produced by Fermentation as a Medicine for the Stone, for I obtained an alkaline, foetid, volatile Salt, with a Spirit of the same Kind, instead of a true fermented Spirit. Hence, though all Fermentables will undergo Putrefaction, yet all Putrescibles will not ferment. In Vegetables therefore, in this respect, there is a very great Difference.

VI. These Things being duly considered, we refer to the first Class of Fermentables all those Seeds of Vegetables, which when ripe and dry, are reducible by Trituration to a fine Powder, called Meal, and not to an oily Paste. Hither also I refer those Seeds, which though they abound with a pinguious Oil, yet may be so changed by Art, as to be converted into a Meal of a less oleous Quality. These farinaceous Fermentables require a threefold Subdivision.

1. The first comprehends ripe Seeds of culmiferous, graminifolious, spicated Plants, called Corn, as Oats, Indian Wheat, Grass, Barley, Lacrymæ Jobi, Millet, Rice, Canary-Grass, Wheat of all Sorts; and Rye. To these; as being much of the same Nature, may be added Buck-Wheat, and Flax, and on Account of their near Affinity, the Seeds of all the Cucumber Kind, as Citruls, Cucumbers, Gourds, the Counter-Poison; Musk-Melons, the male Balsam Apple, Pompions, and the like. Under this Head too we may rank the Seeds of Lettuce, or any other Plant of the same Nature.

2. The Seeds of almost all the leguminous, podded Plants, with the papilionaceous, or any other Flower, as Judas's Tree, Broom, Spanish Broom, Furz, Crotonaria, Dwarf-Broom, Crimson Grass Vetch, Shrub Trefoil, Stinking-Bean-Trefoil, Kidney-Beans, Melilot, Trefoil, Fenugreek, Rest-Harrow, Medich-Fodder, Medicago, the Nettle-Tree, Bastard Acacia, Bastard Sena, Coronilla, Barba Jovis, Pease, Everlasting Pease, Clymenum, Tares, Lentils, yellow Vetchlings, Beans, Goats-Rue, Bitter-Vetch, Liquorice, Saint-Foin, Chiches, Ladies-Fingers, Lupines, Emereus, (Scorpion Sena) Birds-Foot, French Honey-Suckle, Hatcher Vetch, Horse-shoe Vetch, Scorpionwort, Astragalus, Acacia, Cassia, Sena.

3. Nuts not too oily, as all Kinds of Almonds, Filberds, Chestnuts, Horse-Chestnuts, Walnuts, Cocoa-Nuts, and Pistach Nuts; which when they abound with too great a Quantity of Oil, must by some Method or other be drained of it, which is best done by letting them begin to shoot, and then scorching them.

VII. The second Class of Fermentables comprehends all the pulposus Fruits, as they are called, whose ripe Juice is of an acid Sweet: Of this Kind are all Cherries, both Sorts of Gooseberries, Mulberries, Raspberries, Elder-berries, and Grapes of all Kinds, all acidish Apples, all Pears, Oranges, Seville and China, Citrons, Lemons, Apricots, Peaches, Plums, Medlars, and the like, if they do not incline to a foetid alkaline Putrefaction.

VIII. In the third Class are contained particularly all succulent Herbs, and all their Parts, as Flowers, Leaves, Roots, and Stalks, if they are disposed to grow acid, rather than putrid.

IX. The fourth Class contains the fresh, native Juices expressed from Vegetables, and especially from their Fruits, N^o 7, 8. Hither also we must refer that thin Liquor which distills from Incisions made in some Trees, as the Birch, Walnut, and Vine, particularly in the Spring-Season: For all these Juices usually undergo a spontaneous Fermentation, and then have their Nature quite altered by exchanging their acidish, stimulating, refrigerating Quality for one which is heating, inebriating, and vinous. Helmont the elder, recommends the Water that distills from the wounded Birch in March, when new, or kept from corrupting, as a Secret for the Stone: And Mr. Boyle, from his own, and other People's Experience, assures us of its Efficacy in that Distemper; but he found, that though the fresh was of Service, yet it had quite altered its Nature by Fermentation.

X. To the fifth Class belong such vegetable Juices, as being generated, and inspissated by Nature, are changed into a saponaceous Sort of Substance in the Form of a saline and pinguious Coagulum: Of this Sort are Manna, Honey, Cassia, Sugar, and all other Things of this Kind, which are not balsamic, gummy, resinous, or oily.

XI. I am in Doubt, whether we should refer the Waters of Rivers to a sixth Class: These seem, indeed, to be common Lixiviums, impregnated with all Kinds of Vegetables which fall into them, are resolved in them, and at last intimately united with them. River-waters derived into the Ditches of populous Cities are mixed with the fresh, fermentative Liquors of Vegetables cast into them, and therefore, if they are put up in Casks, which were once used for Malt-Liquor, Wine, or Vinegar, may conceal a great Quantity of Spirits for a long Time. And hence, when they come under the Equator, or within the torrid Zones, by being exposed to so great a Degree of Heat, they may be exalted into a Kind of Fermentation. To the foregoing six Classes, I think, may be reduced all Bodies susceptible of Fermentation, if they are managed after various Manners suited to their different Natures.

XII. In the Bodies contained in the first five Classes, there are required some physical Conditions to render them the fittest for Fermentation; as,

1. The most perfect Maturity designed by Nature in their Kind: For all Seeds and Fruits, which are brought to such a Perfection, that if sown in a fertile Soil, and at the right Season, they will produce a Plant of their own Kind, are fit for this Operation. But when they are crude, harsh, and watery, they are certainly less disposed for it. The rough Juice of unripe Grapes, or Crabs, is but little disposed for Fermentation, though the expressed Juice of them, when they are ripe, ferments spontaneously; and the Case is commonly the same in others.

2. A moderate Degree of Oiliness is also necessary; for very oily Substances grow rancid, rather than ferment, and those without Oil are unfit for Fermentation. Hence very fat Almonds, if they are pounded, are less liable to be affected in this Manner; but when they are carefully beaten up to a Milk with a great deal of Water, they usually become disposed for it. And when they are macerated in Water, and are just ready to shoot, the great Diminution of their Oil renders them fit for Fermentation.

3. They must not be too rough and astringent; for such Substances are with Difficulty excited to this Action: Thus the Juice of Bistort, Tormentil, and the like, can scarcely be raised to a Fermentation.

4. It is one of the chief Properties of a fermentable Substance to be dissoluble in Water: Hence Barks, Woods, and Roots, so long as they exist in these Forms, will not be changed in this Manner, though their expressed Juice, being then miscible with Water, will ferment very readily.

XIII. Ferments are principally,

1. All such Substances as are spontaneously very prone to Fermentation themselves, and therefore are soon excited without any other Ferment: Of this Kind in particular are the Juices of ripe Summer-Fruits, which are so much disposed to Fermentation, that they can hardly be kept from it, but by the Help of such Substances as have the Power of restraining it. Dough also, made of Flour, and worked with Water, if it lies in a warm Place, cannot be prevented from fermenting. We need not therefore be solicitous about this first Sort of Ferment, since Nature every where supplies us with it abundantly.

2. Fresh

2. Fresh Yeast, or Flowers of Malt-Liquor, or Wine, which work up to the Top in the very Action of Fermentation; for if this light, frothy Matter be mixed with other fermentable Substances, it wonderfully promotes their Fermentation, provided it be fresh, and not fallen.

3. The same Matter, afterwards grown heavier, and subsided to the Bottom, if it is not too stale, still retains its former Virtue, though it is less active than before; for these Lees being mixed by stirring excite a new Fermentation in their own Liquor, and usually do the like in others.

4. Cassia, Manna, Honey, Sugar, and the like inspissated Juices.

5. The acid, mealy, fermented, Leaven of the Bakers. For if fresh, sweet, Wheaten Flour, be kept in a dry Place, and secured from Insects, it may be preserved for Years without Corruption; but if it be kneaded with Water into a soft, sweet Dough of a good Consistence, and set aside slightly covered in a warm Place, it begins, within the Space of an Hour, to open, and swell on all Sides, to be full of Bubbles, to lose its Smell, Taste, and Tenacity, and acquire an Acidity, in which State passing under the proper Appellation of *Syn, Ferment*, it gave the first Name to the whole Operation, because if this Leaven is mixed with fresh Dough not yet fermented, it will make it ferment much the sooner, and more effectually. Hence it appears, that a Ferment may be soon prepared, without the Help of one pre-existent.

6. The Residuum of former fermented Liquors, which stick to the Sides of the Casks. For the Vessels being thoroughly penetrated and seasoned by the Subtlety of the Liquors they formerly held, are extremely adapted to excite a speedy and brisk Fermentation in any fresh Liquors that are put into them.

7. Among Ferments, we may also, reckon, though with less Propriety, the beaten White of an Egg, for it performs the Office of a Ferment in the following Case:—When some fermentable Liquors are so diluted and thin, that they too easily discharge the Air and Spirits, which both excite and keep up a Fermentation, and consequently do not retain them long enough to change their fermentable into a fermented State, the White of an Egg, mixed with the Liquid, by its Tenacity, sufficiently inspissates it for the inviscating and detaining the active Spirits so long as it is requisite. Here indeed, it does not act properly as a Ferment, being itself not far from Putrefaction, but only assists the Causes of Fermentation, by preventing their too speedy Exhalation. The same Thing therefore may be easily effected by other viscid Substances; for which Reason,

8. Some have added Salts, as well acid and austere, as alkaline; but in this they have Respect only to particular Cases, as in the former. Thus, when fermentable Substances have so great a Quantity of Acid in them, as to impede their Fermentation, it is observed, that a prudent Addition of a small Quantity of an alkaline Salt, will promote the Operation. And again, when any Thing subputrid has happened to be generated in the fermentable Matter, a proper Addition of a little Acid, has restored a Disposition to Fermentation. Hence it appears, that these are not Ferments in themselves, nor so much as Fermentables, but in some certain Circumstances by removing the Impediment to it, they become Promoters of Fermentation. Tartar however, if it is good, may in some Respects be accounted a Ferment.

9. It is observed, that the most austere Bodies have sometimes, by their Admixture, procured a Fermentability, in some Subjects which they have been known to hinder in others. Hence Quinces, unripe Medlars, rough Cherries, and the like, have been referred to the Class of Ferments, though never properly and justly; but when the fermentable Liquor is of itself too thin, weak, and watery, and therefore wants an Addition of somewhat rough, to enable it the better to retain its volatile Spirits.

XIV. We are now to consider the Preparations which fermentable Substances require to make them ferment more successfully. Those which fall under the first Class require, for this Purpose, a very particular Management, for,

1. As for farinaceous Seeds, when they are ripe, and in their utmost Perfection, dry, and intire, if they are then, in a warm Season, first infused in Rain-Water, particularly what falls in the Spring, contained in large Vessels, and are there suffered to lie till they are swelled, and have imbibed as much Water as they can, this is called Maceration.

2. The Corn being thus soaked, is taken out of the Water, and laid in large Heaps in an open airy Place. In a short Time there spontaneously arises in these Heaps a genial Warmth, by the Assistance of which the vital Powers of the Seed are quickened and rendered active, and begin to shoot, by putting forth their seminal Leaves, and the Rudiments of Roots. In this State, there is a great deal of Caution necessary, that the Corn, by too great an *Æstuation*, may not begin to putrefy, and that by too much germinating and growing out into Leaves and

Roots it may not consume its mealy Substance; for the Fermentation that comes afterwards always succeeds, in Proportion to the right Management of the Germination, which must be carried on to a certain Point, and no farther.

3. As soon as the Germination is sufficiently advanced through the whole Heap, the Corn must be immediately spread abroad, that it may continue no longer in a State of *Æstuation*, but be ventilated, cooled, and dried in a Place pervious to the Winds, especially the North-Wind. By this Means, its farther Germination is immediately stopped, the farinaceous Part being attenuated by the Operation, but not consumed. The Corn thus prepared, is slowly conveyed down a Pipe very much heated, which expeditiously dries it to a very gentle Degree of Torrefaction. This is what Tacitus calls *Fruentum corruptum* [corrupted Corn] and what now goes by the Name of *Malt*. The principal Alteration which the Corn undergoes by this Operation is, that its Viscosity is wholly attenuated; so that though the native Corn will not dissolve in boiling Water, that which has undergone this Operation, is of so loose a Contexture, as most likely to be dissolved, and to have its Medulla quite exhausted by it: For crude Wheat, by chewing, will be reduced to a Glue, which can scarcely be attenuated, by long retaining it in the Mouth; but Wheat made into Malt, and broken under the Teeth, totally dissolves, and gently melts away in the Saliva. Besides, the Malt in making acquires a soft, sweet Taste, which was not in the Wheat before. When this Malt is to be used, they grind it into a Meal, which is then called *ground Malt*. What I have observed of Wheat, is found to be true of all the Seeds in the first Class of Fermentables. Thus if Beans, turgid with Maceration, are cast into a Heap, and suffered to heat till they germinate, and are afterwards dried expeditiously with a pretty strong Heat, and then ground, they will yield the same Phenomena.

XV. The Preparation of the second Class of Fermentables, is concerned about the soft pulpy Fruits, in treading, pressing, and pounding them, by which Means their Juice is separated from them with a considerable Froth. But if their Substance be of a harder Kind, they may be boiled in Water, and afterwards reduced to a soft Pulp, as is often practised with Apples and Pears. If they are pretty dry, they may be rasped to a Powder, and then pounded with Water to a Pulp, as in the tuberous Roots of the *Corona Solis*, Potatoes, and the like, in which there is not much Tendency to Putrefaction; for if that be the Case, then instead of fermenting, they will putrefy.

XVI. Such as belong to the third Class, are beat into a Pulp whilst they are fresh and juicy, adding only a small Quantity of Water, to make it of a thinner Consistence, and then they are sufficiently prepared.

XVII. As for Bodies of the fourth and fifth Class, if they are of themselves too thick, they must be diluted with such a Quantity of Water, as will produce a Liquor capable of supporting a new-laid Egg: Hence, if these native Juices are too thin and watry, and you want a well fermented Liquor, take your Juice when it is newest, and has had no Fermentation, and boil it over a gentle Fire, in a very wide and shallow Vessel, till it has acquired a proper Thickness. If it be not thus treated, it will hardly ferment, or generate many Spirits. But if it be naturally too thick, it is reduced by Water to a just Consistence, as aforesaid, for in its first State, it will hardly turn spirituous, but readily degenerate into an Acid. Sugar that is dry, will remain unchanged in warm Weather; but if it be reduced to the Consistence of Cream, it ferments violently, and is converted into a Liquor that plentifully abounds with Spirits. And the same Thing is true of Honey, &c.

XVIII. The next Thing to be considered, is the Quantity of the Ferment that is necessary to be mixed with fermentable Substances, after they are properly prepared, that the Fermentation may proceed the more successfully. Here observe, that

The Preparations of the first Class reduced to Malt, in the Summer, scarcely require the Assistance of any Ferment, but are of themselves sufficiently, and often too much, disposed to Fermentation. In Winter, however, the Addition of some Ferment is necessary, as well as an artificial Heat, without which they would not be put into Motion. Hence again, if you take Care to keep them in a very warm Place, they will require, though in Winter, but little Ferment, about an Ounce of Yeast, for Instance, to twenty Pounds; or Honey or Sugar in the same Proportion; or Baker's Leaven in double the Quantity.

The second Class of Fermentables scarce ever want the Assistance of a Ferment, unless the Weather happens to be too cold, on which Account, if the Fermentation proceeds too slowly, you may add a little Yeast.

The third Class, in Summer Time, especially if it be pretty warm, readily enough ferment of themselves: In Winter, if the Fermentation is checked, it may be promoted by the Addition of Sugar, or Honey.

Nor in the fourth Class, are Ferments often necessary, for these Bodies, if the Weather is favourable, ferment so violently, that they can scarcely be kept within Bounds; especially if the

the Weather be very hot, and the Fruits have had a fine Season for ripening.

The fifth Class very rarely want the Use of Ferments, they rather acting the Part of Ferments themselves. You need only raise an artificial Heat, and maintain it in one constant Degree. Hence therefore, we see, that upon the Whole, Ferments are not so necessary, as is generally imagined.

XIX. After Fermentables of what Kind soever have been prepared, and diluted with a sufficient Quantity of Water in the Manner explained, let them be poured into an oaken Cask, well seasoned with a Liquor of the same Kind fermented in it before. Let the Vessel stand in a Heat, between sixty and seventy Degrees, and let the Bung-hole be left open; that the Air may pass freely in and out, or only covered with a Bit of Flannel to prevent any Insects from falling into it.

XX. I took a glass Cucurbit, the biggest I could get, and placed it upright in a wooden Box in such a Manner, that by putting a small Quantity of Fire at the Bottom of the Chest, I could keep it in an equal Degree of Heat. I then filled it to three Quarters of its Capacity, with a crude fermentable Matter, properly prepared for Fermentation, covering its Orifice slightly with Flannel, and keeping up a Heat but of betwixt sixty and seventy Degrees, even in the Winter Season; and it was pleasant to observe the Phenomena that followed, which in this Way lie open to Observation, always happen in the same Manner, and make up the whole History of Fermentation.

1. The Mass, which at first is at Rest, and takes up a certain Space in the Vessel, begins insensibly to swell, rarefy, to be elevated, and conceive an intestine Motion through all its Parts, which discovers itself by the strange Whirling of the Liquor, upwards, downwards, and sideways, nor ceases though the Impetus changes every Moment. In the mean Time Bubbles appear to be generated in every Part of the Mass, which with a strong Tendency endeavour to ascend, sometimes bursting as they rise, or else at the Surface, with a hissing Noise. Hence the whole Matter grows frothy, but the Surface in particular, and with a Noise, like that of Ebullition, there is discharged an acrid Spirit, that affects the Nostrils with its Acrimony, is acidish, wonderfully elastic, incoercible, bursting by its immense Force almost all Vessels in which it is confined, nor in these Respects is it to be equalled by any Thing that I am acquainted with. Hence the great Helmont thought proper to distinguish it by a particular Name, and therefore called it *Gas Sylvestris*.

2. Whilst these Things proceed in this Manner, the thicker Part of the fermentable Mass begins to be separated from the thinner, and is thrown up to the Top, where it is collected in a thick, spongy Crust, which accurately covers the Liquid underneath, and confines and repels its more active Parts, so that they cannot easily exhale before they have performed their proper Office. And then it is very entertaining to see, how great and constant an Agitation there is through every the least Particle of the more liquid Part that lies under the incumbent tenacious Crust. Certainly, we can scarcely conceive a greater Attrition than arises from the rapid Agitation of these Corpuscles among one another. And hence it comes to pass, that the Crust being elevated and separated by the repeated Explosions, there frequently bursts out a Vapour through the Clefts with a considerable Noise; upon which the Crust presently falling down closes again; and confines, as before, the active Principles, so that they cannot too easily exhale and be dissipated. And indeed, the Formation, and Continuance of this Crust, tends above all Things, to bring about a perfect Fermentation.

3. In the Midst of these Observations one cannot but take Notice that whereas all the thick Part of the fermentable Matter was at first carried up, and collected at the Top, there are now some Parts at the Bottom of the Crust, which growing less rare, and being no longer supported by those rare Bubbles that rendered them light, begin to descend through the liquid Part, are agitated upwards and downwards, form Bubbles about them, by their Assistance rise, and then by their Disposition sink again, and when it has happened alternately in this Manner for a good While, at last subside to the Bottom, and remain at Rest. Then other Globules take their Turn, and play the same Part, and when it has thus proceeded for some Time, it often happens, that the whole upper Crust, now grown heavier, and less rare, on Account of the exploded Spirits, sinks down at once, and soon after rises again, almost intire, and that with such an Impetus, as is hardly credible to one who has not seen it. When the whole Crust is perfectly dissipated and sunk to the Bottom, the Fermentation ceases, though the same Degree of Heat is still continued; a clear, thin, light Liquor swims at Top, and the Fæces subside to the Bottom.

4. Hence in every true Fermentation, the fermentable Matter is at first of an unequal Consistence, but afterwards separated into two Parts, the more liquid, which is undermost, and the more solid Crust, which covers it. This Crust, so long as it keeps the upper Place, is called the *Flowers* of the fermentable Liquor, or *Yeast*, and is the most convenient and serviceable

of all Ferments. But, secondly, in the second Stage of Fermentation it is separated into three Parts, the Flowers at Top, the Liquid in the Middle, and a third Part, which begins to fall and be collected at the Bottom, under the Title of the *Fæces*, which are the thicker and heavier Part now quite exhausted of that Principle which caused the Fermentation. And, lastly, in the third Stage it is again divided into two Parts, the Upper, which is clear, fine, and thin, and called *Wine*; and the Lower, which is thick, and lies at the Bottom, named the *Lees* or *Mother of Wine*.

5. But there is nothing more surprising, or more carefully to be observed in this Affair of Fermentation, than that prodigious *Spiritus Sylvestris*, which rushes out with such an Impetus, when the Fermentation is at the Height; nor is there any Poison that I am acquainted with, that is so subtle, swift, and fatal; for if a very large Vessel full of the best fermentable Must, in the Height of Fermentation, should discharge this Spirit through a small Vent-hole in the upper Part, and the strongest Man should but once draw this Vapour into his Nostrils, he would drop down dead that very Moment; or if he drew in but a little, he would be taken with an Apoplexy; if still less, he would be deprived of his Understanding, and be a meer Idiot the rest of his Life, or else become paralytic. And hence the like Misfortune happens to those who are imprudently busy in close Wine-vaults, where the Wines are fermenting in the Time of Vintage. For this Reason, these Places ought to be purified by Fires, and aired by setting the Windows open. From Sugar dissolved in Water, and its Froth first fermented, we have an Account of a Spirit produced, which being drawn into the Lungs, in a very small Quantity, in an Instant stopped all Respiration, exciting an intolerable Asthma. *Phil. Trans. Ab. Vol. 2.* Let Physicians then consider the Force of Liquor drank in the very Act of Fermentation; and how violent that Spirit may be, which in Summer is generated in the human Body, from a too free Use of Summer-fruits, when very ripe, if by a convulsive Constriction of the Stomach they are prevented from passing any farther, and, by being kept in a warm Place, acquire and exert an extreme Elasticity and Acrimony. Hence in *Alcohol* there still remains a good deal of this Poison, and therefore if the Vapour of it be taken into the Nose in a great Quantity, and for a long Time, it causes the greatest Degree of Drunkenness, or a slight Apoplexy. If it be used too freely internally, it affects the Brain and Nerves particularly, and their Functions. In Chymistry we are still at a Loss from whence this Spirit arises. We know, indeed, it is the Production of an actual and present Fermentation; nor do we know that such a one is generated in any other Way; but we cannot conceive how it causes Death, without any Disease, or how it affects the Cerebrum, Cerebellum, or Nerves, without Matter, or without any visible Alteration, either in the Solids or Fluids.

As soon as the Fermentation is over, it is proper to close the Vessel, and let the fermented Liquor rest a While upon its Lees, for it will still consume much of them, and assimilate them to itself, and so be stronger, more spirituous, and much fitter for Distillation.

XXI. The Time necessary for completing a perfect Fermentation can scarce be determined exactly, as depending upon the Place where the Vessel stands, the Season of the Year, the Heat, and Wind it is exposed to, and the Nature of the fermentable Matter itself. In Africa, the Liquor of the Palm-tree passes through this Operation in the Space of a few Hours. In Asia too the Business is very soon over; but in the Northern Countries it proceeds but very slowly. The hot Summer Season quickens, the Winter checks it. The South-Wind promotes, the North-Wind retards it. The expressed Juice of Grapes and Sugar ferment suddenly and violently; other Fermentables more slowly. It is easy, however, to know when a perfect Fermentation is at an End, which is, when all the Phenomena mentioned have appeared in the Order described, and at last cease spontaneously; and then the Vessel must be immediately stopped, and the fermented Liquor kept upon its Lees; for otherwise the Spirit generated by the Fermentation, would in a short Time exhale, and leave the Liquor vapid, and good for nothing; whereas if the Liquor is kept quiet in a Vessel well stopped, it grows gradually finer, more subtle, and fuller of Spirit. Thus the fresh expressed Juice of Grapes may, by boiling, be inspissated without losing any of its Virtue; but after Fermentation, if it be only exposed to the cold Air, it is soon exhausted of all its Spirits.

XXII. The Liquor prepared by a complete Fermentation, has in all Ages, amongst all Nations, and in every Language, from whatever Matter it is produced, been called by the Name of *Wine*. Now the Nature of Wine is known by the following Marks which are common to every Sort of it:

1. It has a Faculty of producing a Temulency in the Functions of the animal Spirits and Actions. This is what it effects while it quickens, refreshes, exhilarates, disposes a Person to Mirth and Frolics, to be talkative, to rhyme and dance, then

proves an Incentive to the hidden and peculiar Passions of each Breast, reveals Secrets, and lays a Man open; and at last disorders, debilitates, takes away spontaneous Motion, so that neither Foot, Hand, Tongue, nor Reason can exercise their proper Offices; the Consequences of which are Sleepiness, Palsies, Apoplexies, and Death. This is a Property peculiar to Wine, nor is there any Thing like it in any other Body that I am acquainted with; for Henbane, Tobacco, Opium, and the Thorn-apple, whilst they affect the Brain, act in quite a different Manner. And this Faculty is much the same in every Sort of Wine; for Malt-liquor, Mead, Cyder, Perry, and Wine made with Gooseberries, Grapes, or any Sort of Berries, have constantly the same Effect; so that this surprising Power is solely the Effect of Fermentation.

2. But Fermentation likewise changes vegetable Juices from their relaxing, resolving, saponaceous, refrigerating, and for the most Part purging Quality, into one that corroborates, thickens the Humours, dries, and heats. Farinaceous Substances reduced with Water to a crude Pap, the inspissated fresh Infusion of Malt, before it is fermented into Beer, Mulsium, Syrups made with Sugar, Manna, or the Pulps of Cassia diluted with Water, the fresh expressed Juices of full-ripe Summer-fruits, and fresh fermentable Herbs at their Maturity; any of these too freely drank, produce windy Disorders in the Bowels, excite a Diarrhoea, and make a Person chilly. But when by proper Fermentation they are made into Beer, Mead, and Wine, how very different are their Powers and Effects! They retain nothing of their former Disposition, but all Things are become new. The fresh Juice of perfectly ripe Grapes is perhaps the most powerful Dissolvent of Humours we are acquainted with, and if used immoderately, often brings on a fatal Dysentery; and an Infusion of Malt inspissated by boiling (Sweet-wort) drank plentifully, has the same Effect. But strong, old Wine from the former, or generous old Beer from the latter, or the distilled Spirit from either of them, but especially *Alcohol*, is a good Antidote against the former.

3. Another perfectly singular Property of Fermentation is that from the fermented Matter it produces a Liquor, called a *fermented Spirit*, which has this particular Quality, that it is convertible into a lucid Flame, and at the same Time capable of being thoroughly mixed with Water, and yet quite of a different Nature from the Spiritus Sylvestris before described, which seems to be produced in the very Act of Fermentation, and lost at the same Time. This Liquor has scarce any Thing else like it. For the volatile inflammable Spirit, which I once saw in a very dangerous Manner burst out of the Retort in the Distillation of Phosphorus, would not be diluted and extinguished with Water. And what arises from large Quantities of human Excrements, thoroughly putrefied in a close Place, and takes Fire, and bursts into a violent and very dangerous Flame upon the Application of a Candle, seems to be of the same Nature, but horribly foetid. Oily Substances, when urged with the last Degree of Fire in Distillation, send forth white-bluish Fumes, which, upon holding a lighted Match to them, will also take Fire, but these return to an Oil, or a Phosphorus, that will not mix with Water. So that upon a careful and thorough Examination, I have not been able to discover any Liquor, which would absolutely, and spontaneously, as it were, mix with Water, and was at the same Time convertible into a pure Flame, except what is produced by the Fermentation above described.

4. Another Effect of Fermentation is the Generation of the Wine-stone, commonly called *Tartar*. I confess, that this is not produced from all Sorts of Wine; for it is neither generated from the best Malt-liquor, Mead, nor many other Sorts of fermented Liquors. From some Vegetables, indeed, this is formed good and pure, but then only when they have been converted into a Wine by a perfect Fermentation, and are intirely defecated. Hence, therefore, I always esteem Tartar as a peculiar Production of Fermentation, and think, it should be called the *Oily essential Salt of the Wine*, and be absolutely distinguished from the Mother or Lees.

5. Fermentation also induces a surprising Alteration in the Smell, Taste, native, and artificial Virtues of Things. The cohobated Water of fresh Rosemary, for Instance, differs in every Property from what is drawn from it after it is fermented with Honey. The Must fresh pressed from mature Rhenish Grapes, that grow exposed to the Sun upon the Sides of Mountains, is of an exceeding sweet Taste, but when perfectly fermented and grown fine in the Cask, it has a grateful and acrimonious Acidity. Other Wines which are not thoroughly fermented, but have their Fermentation checked, keep their Sweetness, but very easily relapse into a Fermentation, and when it is finished turn acid. That Aloes and Colocynth, by Fermentation, lose their Bitterness, is an Observation of Wedelius, *Art. Lips.* 1686.

6. Fermentation also produces a new Smell, Taste, and Virtue, which are properly called *Vinous*. Even Meal, Sugar, and Honey, produce something that is acid, warm, and rich.

7. Fermentation generates these Spirits either from a Matter which was before of a different Nature, or from the Oil of

the Plant. This last is indeed very probable. But then from which of the Oils have they their Origin? Almost all the Chymists say, from their essential Oil. But by what Experiment they are able to determine this, I own, I cannot comprehend; for the Spiritus Rector, which forms the essential Oil, is lost in the Fermenting. In fermented Matter, deprived of its Spirit by Distillation, there remains a considerable Quantity of Oil; and yet I could never excite a new Fermentation in the Residuum, nor by any Art extract more such Spirits from it. In every fermentable Substance, therefore, there is naturally only a certain Part which is disposed for the Generation of Spirits, in a determinate Quantity, by Fermentation. But there is yet another Thing which deserves Consideration, and that is, that the finest and most thoroughly fermented Wine generates white Tartar, which is full of a perfectly inflammable, and most penetrating Oil, and yet you can by no chymical Operation produce inflammable Spirits from this, as you can abundantly from the Wine. Hence it appears, that the Matter which is convertible into these Spirits by Fermentation, is of a singular Nature. But as Fermentation, thus productive of these Spirits, is every where at Work; there must of Consequence be vast Quantities of these Spirits generated, which are either consumed by Animals, or dissipated into the Air. The Saliva, Blood, and Urine of Animals, who constantly use these Spirits, hardly, indeed, afford any Spirits in Distillation; but then there is never wanting in Nature proper Matter for producing more, let but Fermentation come in to its Assistance. But Fermentation generates also something saline; since an Acid is here produced which is considerably volatile, though less so than the Spirit. Thus from Vinegar there rises a volatile Acid and somewhat pinguious Salt, which the unfermented Matter did not afford. The Spirits themselves which are generated by Fermentation, have somewhat in them of this volatile Acid. Hence the Oils, and acid Salts of fermentable Bodies, seem to be attenuated, rendered volatile, and united by Fermentation, and to be consumed in a certain Quantity. Thus if I distil unfermented Rosemary with Water, I obtain an Oil, which has the true Smell and Taste of the Rosemary, and a milky Water impregnated with the same Qualities. If I ferment it with Honey, and then distil it before the Fermentation is completed, it affords a white, thick, opaque, pinguious distilled Water, richly endued with the Virtues of the Rosemary, together with some Oil swimming at the Top, though in a smaller Quantity than before. But if it be first completely fermented, and afterwards distilled, you draw off an excellent pellucid Spirit of Rosemary, that will mix with Water, and is endued with great medicinal Virtues; but the former essential Oil appears no longer.

8. This Spirit produced by Fermentation, which partakes of the Oil, becomes by this Operation more volatile than Water itself; whereas the essential Oil, before the Operation, was not so volatile as Water; but the Vegetable might, by a gentle Heat, be deprived of all its Water, no Oil ascending with it.

XXIII. The Circumstances necessary to a successful Fermentation are principally these:

1. It is requisite that the fermenting Liquor should remain at Rest, that the Crust which forms itself at the Top may keep intire; for to be continually stirring, and mixing it with the Liquor underneath, prevents a perfect Fermentation.

2. There must be a free Ingress and Egress of the common Air, which must also be intimately mixed with the fermentable Matter, by treading, kneading, or pressing, otherwise the Fermentation will not proceed.

3. A Degree of Heat between forty, and at most eighty.

4. The Spring and Autumn in particular, are said to favour this Operation, when those Vegetables are in Flower, from which the Wine was made. Hence the Wine of Grapes is reputed to grow foul, and easily ferment again, when the Vine is in Blossom.

XXIV. The Checks to Fermentation, by which it is either impeded after it is began, or intirely stopped, are as follow:

1. The acid Vapour of burning Sulphur long included, and in a considerable Quantity, with that Air which is in the Cask above the fermenting Liquor. For if a Vessel first thoroughly penetrated and replete with this Vapour, receives the fermenting Liquor, and the upper empty Part be afterwards filled with the same Vapour, and carefully stopped, you will prevent any farther Fermentation, which, after some Time, may be revived by proper Means and restrained by the same Fumes. The same Effect follows from mixing a large Quantity of a strong Acid with the fermenting Matter. The Acids of Alum, Nitre, Salt, Sulphur, and Vitriol, prevent Fermentation, but at the same Time spoil the Liquors.

2. Alkaline Salts also, if they are mixed in great Quantities with fermenting Liquors, excite for the present a very consider-

considerable Effervescence, but that soon ceasing leaves the Liquor incapable of farther Agitation, its Nature being so utterly destroyed, that it can scarcely be afterwards raised to a Fermentation, but rather tends to Putrefaction. Hence it appears, that Alkalies are a greater Obstacle to Fermentation than Acids, the former destroying or suffocating all the Acid. Wherefore,

3. All Bodies intirely absorbent of Acids, if mixed with fermenting Liquors in a proper Quantity, after a short Struggle and Effervescence, put a Stop to this Operation; Chalk, Crabs-eyes, Coral, Pearls, Oyster-shells, Iron, Lead, and Tin, have this Effect.

4. Stopping the Vessel so closely, that nothing can pass in or out, provided the Vessel be so strong as not to be burst by the Force of the included Liquor. This is evident in new Ale put into very strong Bottles, where the Admission of Air converts the Fermentation, so long suffocated, and prevented, into the most violent Effervescence, and discovers a prodigious collected Force. The same Thing happens also in Casks, for there is a constant Struggle and Renitency between the fermenting Body and its containing Vessel.

5. A great Degree of Cold destroys all Fermentation, for under thirty-six Degrees of Heat it will hardly make any Progress.

6. Nor is too much Heat a less Obstacle to it, which, if it exceeds ninety Degrees, rather dissipates the active Principles of Fermentables, than assists and quickens them. Hence an Exhalation under a greater Degree of Heat insipifies Fluids to a Degree of Density, unfit for Fermentation. Boiling has a much quicker Effect, so that the richest Juice of Grapes, which can hardly be kept from fermenting, will by quick Boiling lose all its Disposition to ferment, and be converted into a Mass that will rest for Years without Alteration.

7. The Separation of the elastic Air, by Means of Boyle's Air-pump, during the Absence of which, this fermentative Motion intirely ceases.

8. Lastly, an extraordinary Condensation of the same Air with the fermentable Matter absolutely prevents both the Beginning, and Progress of Fermentation.

XXV. After Liquors thoroughly fermented have been kept some Time in a cool Place, together with their Flowers, and Fæces, and in Vessels very closely stopped, and pretty full, and by this Means having acquired more Spirits are proper for Distillation, it is advisable to sti them about, and mix them with their Lees, for they will then give out their Spirits in far greater Abundance. But then you ought to take Care that the Lees in Distillation do not subside to the Bottom of the Still, and being there condensed and burnt, affect the whole Liquor with an Empyreuma. For this Reason the Liquor must be kept stirring with a Stick, till it is ready to boil, by which Means the Lees being equally mixed, and afterwards kept in Motion by the Heat, there will be a perfect Mixture of the thicker Parts with the thinner. By this Method then you will obtain the Spirits, as well from the Fæces, as the Liquor itself, and will in the best Manner provide against an Empyreuma. But if the Liquors have rested some Time before the Distillation, there is less Danger of their ascending in Flatulencies, or rising out of the Still; whereas, if you go about to distil them when they are just fermented, the Impetus of Fermentation that still remains often carries them up when they come to boil violently, and so disturbs the whole Operation. At the Beginning, therefore, it is necessary to proceed with Caution.

XXVI. An Empyreuma is prevented:

1. By rubbing the Bottom and Sides of the Still with some pinguious oily Matter, before you pour in the Liquor.

2. By constantly stirring the Matter till the supervening Heat causes a thorough Mixture, and so prevents the thicker Parts from collecting and sticking to the Bottom.

3. Nothing more prevents an Ambustion or Empyreuma, than boiling Water briskly in the Still, and immediately after pouring in your Liquor at once; for then the hot Vapour filling the Cavity of the Still, will hinder the fermented Liquor from gathering and fixing to the Sides.

XXVII. If the whole fermented Matter consisting of the Flowers, the middle Liquor, and the Mother, which were first well kept and distinguished, are very carefully mixed before Distillation, you will extract good Spirits.

XXVIII. When your Liquor is heated to such a Degree, as to be just ready to boil, you must beware of the first Impetus. This is best guarded against, by leaving the Still one third empty, and covering the Aperture of the Still with a thin Cloth, before you fix on the Head, and then managing the Fire in such a Manner, that the Drops shall fall quick one after another. In this Manner your Distillation will go on safely, and after it is thus continued for some Time, it may with due Caution be somewhat increased, so as to obtain in the most commodious Manner all the Spirits. The thinner, and purer Liquors, indeed, as Mead, Wine, and old Beer, do not require so

much Caution; but in farinaceous Substances, distilled after a perfect Fermentation, you cannot be too careful. The former you may at once venture to distil in such a Manner, that the Spirits shall almost run through the Worm in a full Stream.

XXIX. In the Distillation of fermented Substances in the Manner described, there first comes over an acrid, heating, and pungent Liquor, of a very particular penetrating Taste, called *Spirituos*, and of an extremely active and volatile Nature, in which it is exceeded by very few Bodies; for a pure alkaline Spirit that flies off in Fumes from Tin, Glauber's Spirit of Nitre, and his Spirit of Sea-salt, and a pure volatile alkaline Salt, are all that are known to have a greater Degree of Volatility. This Liquor, when it is very much heated, readily takes Fire upon the Application of Flame to it, and will almost totally consume. Taken internally, it causes Drunkenness, Stupor, and Apoplexy. In a moderate Dose it wonderfully raises the Spirits. It very speedily heals Punctures, Dilacerations, and Pains of the Nerves. All animal and vegetable Substances put into it, are intirely preserved from Putrefaction, only somewhat altered in their Colour. If you dissolve a little of the finest Sugar in it, when it is not perfectly free from Water, the pellucid Liquor thus made, preserves the most tender Bodies. If it is diluted with Water, and then used warm as a Fomentation, with Sal Ammoniac and Vinegar, there is nothing, perhaps, that more effectually resolves Coagulations, dissolves inspissated Humours, prevents the Spreading of a Gangrene, and causes a Separation of the unsound Parts, or dries up a Defluxion of thin Humours more effectually. This Liquor is called *Spirit of Wine*, and that Part of it which comes over the very first, is called the *Præcursor*.

XXX. When this Spirit is all drawn off, if you urge the Residuum with the same Fire, in the same Vessels, you will obtain a Fluid which is less volatile, acetose, acid, astringent, cooling, nauseous, and foetid. At the Bottom will remain some thick Fæces, which by no Means nor Method can ever be brought to ferment again, and yield new Spirits, though from the Consistence of them one would expect it. But if you expose this Residuum to a very strong Fire, you may draw from it a foetid, empyreumatical Oil.

XXXI. If the Lees of any fermented Substance after Distillation are dried and burnt in an open Fire, they are converted into salt Ashes, from which may be obtained a sub-alkaline, or alkaline Salt. Hence it evidently appears, that the most perfect Fermentation is not able to render volatile that Matter of Vegetables, which is fixed by being burnt, and which is convertible into an essential Salt by proper Operations before Burning.

MEAL and MALT, worked together with a proper QUANTITY of WATER, ferment.

I. Having premised the general Doctrine of Fermentation, it will be proper to give some Examples of it, that the Manner in which both Art and Nature proceed may be understood. You are then to observe, that there are two different Ways of Operation; by the first of these Beer, or Wine of Corn, is prepared, and from thence Spirit of Wine; by the second, a Spirit is drawn immediately from fermented Corn, in the same Manner as it is from Beer. In the first Method, upon ground Malt you pour Water almost scalding hot, mix them well together, and let them infuse for three or four Hours; by which Infusion the Malt will impregnate the Water with its starchy Part, which would not have been effected by crude Meal. The Liquor then being drawn off from the Malt, must be boiled till it is reduced to a proper Thickness; and this Decoction, in this State, is emollient, loosens the Belly, purges, cools, and resists Inflammation. If, when this Liquor is cool, you mix with it some strong Ale-yeast, or Grounds, and let it stand in a warm Place, in a Vessel with the Bung-hole open, there will arise a violent Fermentation, which being quite compleated, the Liquor is immediately strained cold through a Cloth, and stopped up very close in its Cask, and becomes very good Beer. But in order to preserve it for a considerable Time, and prevent its growing sour, you must add a certain Quantity of some very bitter Herbs to it whilst it is boiling. If this Decoction of Malt then is made sufficiently bitter, boiled to a proper Thickness, perfectly fermented, stopped up very close, and put into a Cellar, and, after it has been kept a considerable Time, is distilled, it will the first Time yield as fine a Spirit of Wine as you can obtain from any Sort of Wine by any Art whatever; which will be exceedingly fragrant; nor have any the least disagreeable Smell. I learnt by Experience that there is scarce any Difference betwixt such Beer and the most generous Wine, and could not help wondering, that this Art should be very well known and practised in all Ages of which we have any Account. Thus Diodorus Siculus tells us, L. 1. That in those Countries, where there were no Vines, King Osiris taught the Inhabitants to make a Liquor from Barley, which in the Fragrance of its Smell, and Sweetness of its Taste, was not much inferior to Wine. Herodotus also in Euterpe mentions an Ale, or Wine, made from Barley, *Ζύθος* and *κρηνη* *πυρρα*. And Tacitus, de Mor. Germ. says, they had a Liquor prepared from corrupted Barley, or Wheat, which resembled Wine. And according-

ing to Aetius *Barley*, signifies Barley wetted, till it begins to germinate, and then dried together with the germinating Shoots.

II. The same Thing is performed in another and more common Way, as follows: They take of ground Malt fourteen Pounds, of Rye Meal seven, which are mixed and worked well together with hot Rain-water, till they are reduced to a Liquid of a moderate Thinness; this they put in an oaken Cask, which is placed in a wooden Chest, that it may keep in the Heat of Summer. It ferments briskly enough, and they leave it to itself till the Crust, which during the Fermentation is formed at the Top, disappears, and subsides to the Bottom. They then stop up the Cask, and let it stand for some Time, till the Liquor at the Top becomes clear, and acidish, and at the Bottom there is collected a large Quantity of a farinaceous Matter, not glutinous, but fit for Distillation.

MALT and MEAL fermented, and then distilled into INFLAMMABLE SPIRITS and VINEGAR.

I. Put a Pint of boiling Water into the Still, and make Fire enough to keep it in a State of Ebullition, and then pour in the Malt and Meal well fermented, taking Care first to shake and mix them very accurately, till the Still be two Thirds full. Then kindle a Fire, and at the same Time keep the Liquor continually stirring with a Stick, that the thicker Part may not gather at the Bottom, but the Whole continue as thoroughly mixed as possible. When it is grown so hot as to be just ready to boil, fix on the Head, and manage the Fire in such a Manner that the Head may be very hot, and the Spirit may distil pretty fast through the Worm. There comes out a clear, thin, spirituous Liquor. This must be watched carefully, to observe how long it continues to come off, and must be kept by itself.

II. This being quite drawn off, there rises an acidish, disagreeable, nauseous, white Liquor, in which there is nothing of the warm, spirituous Taste of the former, and which, if you draw it any farther, begins to grow foetid.

REMARK.

This first Liquor is that which in the History of Fermentation is described under the Character of a Spirit produced by Fermentation.

The DEPURATION of the SPIRITUOUS LIQUORS produced by FERMENTATION.

I. Take any fermented Spirits that have been once distilled, fill a Still two Thirds full with them, and distil them with a moderate Fire, so as to make them come over in a constant, little Stream, or just to make the Liquor boil. There will first come off a very clear, thin, fragrant Liquor, of a spirituous Flavour. Often remove your Receiver, to taste whether the same Liquor still continues to rise. When this ceases, change your Receiver, and keep this Spirit, which is called by the Chymists *Rectified Spirit of Wine*, by itself in Vessels very closely stopped. The Spirits which come over first are always the best.

II. When, therefore, in the Progress of the Distillation, there come off acidish, white, and watery Liquors, they must be taken and set apart, that they may not mix with the first. These rise in considerable Quantities, and go by the Name of a *Phlegm*, containing but very little Spirit.

III. There remains in the Bottom of the Still a Liquor that is somewhat thick, opaque, pinguious, acid, of a disagreeable Smell, and perfectly aqueous with Respect to Spirits. When pure Wine is distilled in this Manner, this Liquor thus remaining is always red, and of a roughish Taste, which Colour and Flavour are owing principally to the oaken Casks in which such Sorts of Liquors are kept, where they extract the oily and resinous Parts of the Wood; for when they are first distilled, they have neither that Colour, Smell, nor Taste, but acquire them by standing in these Vessels, and get rid of them again by Rectification.

REMARKS.

I. Hence we understand the Method by which these Spirits may be so depurated as to be obtained at last almost pure and alone; for the oftener they are rectified in this Manner, the more simple they are, depositing in every Distillation a watery, acidish Phlegm: By this Means, however, though you have them gradually purer and purer, yet they will always retain some Water.

II. Hence too we learn that the Spirit of Wine, sold commonly in the Shops, under the Name of *Brandy*, consists of four Parts, intirely distinct from one another: For it contains, First, the simple fermented Spirits; Secondly, a pure Water, which may be separated from it alone; Thirdly, a certain acetose, fermented Acid, which rises in the first Distillation of Spirit of Wine, and pretty tenaciously remains united with it, but may be accurately disengaged from it; and, Lastly, a small Quantity of a somewhat foetid Oil, which always discovers itself upon mixing Spirit of Wine, simple or rectified, with a dry, fixed Alkali, or upon drawing the Spirit from the same by Distillation. And hence it has happened, that the Chymists,

not sufficiently attending to this in their Use of common Spirit of Wine, have been surpris'd with Phenomena which they did not expect, and which were not so properly owing to the pure Spirit of Wine, as to other Bodies mixed with it. But these may be produced by other Causes, whereas this Spirit is the Effect of Fermentation alone.

III. There have been Authors of Note among the Chymists, who observing an Acid almost constantly intermixed with these Spirits, have hence asserted, that these Spirits are acid; and are generated from an Acid. But if we consult Reason in the Case, it will perhaps appear otherwise: And certainly those most pure and simple Spirits, when they are distilled from off a fixed alkaline Salt, are utterly void of all Acids that are known to us, and yet they are very good and genuine. I allow; then, that these Spirits are not produced, except from Vegetables, and not from these, but when they are grown somewhat acid by Fermentation; and yet so it is, that these Spirits are not acid, but generated from acescent Matter. We cannot, therefore, with Justice assert, that these Spirits are acid or alkaline, but that they are of a peculiar Nature, and like nothing else.

IV. This Spirit exalted to its ultimate Perfection, by this Method of Rectification, will still always continue compounded.

ALCOHOL prepared from FERMENTED SPIRITS, without any ADDITION.

I. Take any fermented Spirit, especially one that is rectified, and with a gentle Heat, not exceeding a hundred Degrees, draw it half off in a tall, narrow, glass Cucurbit; the Half that thus rises first, treat again in the same Manner with very clean Glasses, and repeat this, till the Residuum that is left in the Cucurbit appears as strong as that which is drawn off. This Spirit is what goes commonly by the Name of *Alcohol of Wine*, and is looked upon as a most pure and simple Spirit that has nothing heterogeneous, no not so much as any watery Phlegm mixed with it. This was the Method made Use of by the ancient Chymists: However, more exact Researches made by later Chymists have discovered, that some Water still remains concealed in these Spirits, and to this is owing the ill Success of those Experiments, where *Alcohol* unmixed with Water is necessary. Besides, this tedious Operation takes up a great deal of precious Time, for which Reason the industrious Chymists were not at Rest, till they had discovered some more expeditious Method of preparing pure *Alcohol*, which they found might be done in the following Manner:

II. They contrived a Furnace, wherein a pretty large Still might be set in a Bath of Water, which could receive no more than two hundred and fourteen Degrees of Heat. They filled two Thirds of the Still with common Spirit of Wine, and fitted it with an Alembic that had a long, small, upright Tube, which bent backwards, and had its Extremity inserted into the Mouth of a Worm. The Distillation then begins with making the Water in the Bath boil, which makes the Spirit in the Still boil more briskly; by which Means, the Spirit alone being able to rise to such a Height, and through so narrow a Tube, will distil by itself, so long as there remains any of it in the Liquor. But as soon as the pure Spirit ceases to come over, the watery Phlegm not being able to ascend, the Distillation will be finished: And thus you will have, the first Time, and in two or three Hours, as much *Alcohol* as you could obtain by the preceding Method in the Space of a Month. No-body, therefore, should be without this Apparatus, who has Occasion for a large Quantity of *Alcohol* in his chymical Operations. Upon a nice Examination, however, it is found, that even in this Way, there was still somewhat, though indeed a very small Quantity, of Water, intermixed with the *Alcohol*, which in Distillation, perhaps, might be carried up by the Spirits. For this Reason, I repeated the Distillation first with the *Alcohol* alone in the same Furnace, and I had then an *Alcohol*, which appeared with all the Marks of Purity, but yet was found to retain some Water. Hence, therefore, I am induced to believe, that the Spirit can never, by this Method, be absolutely separated from the Water, though it must be acknowledged, that the Quantity of Water that remains after this Operation is as little as possible.

III. For this Reason, I afterwards performed the Distillation in the following Manner: I took the *Alcohol* which rises the first Time in the Method described; with this I filled a Still half full, and added half a Pound of the purest, hottest, dryest, decrepitated Sea-salt; then putting on the Alembic, and making all very close, I let them continue thus for the Space of twelve Hours, in a gentle Heat, so as by no Means to make the *Alcohol* boil. I then began the Distillation, and the two first Ounces of *Alcohol* that came over I kept by themselves, lest there should be any watery Vapour in the Tube of the Alembic, or the Worm, which would be easily brought away by these first two Ounces. The first two Thirds of the following *Alcohol* I received into a very clean, dry, glass Vessel, and kept by themselves in Bottles very carefully stopped. Then I drew off the rest as before, and kept these last Spirits also by themselves. There remained in the Still a moist Salt, which attracted to itself the Water from the

the *Alcohol*, and retained it so tenaciously, that though acted upon by the Heat of boiling Water, it would not part with it; and suffer it to rise with the *Alcohol*. Nor does the Salt, prepared in this Manner, make any Alteration in the *Alcohol*, by mixing itself with it, because it is decrepitated, and put in hot. By this Method, in a very short Time, may be prepared the purest *Alcohol* for any chymical Purposes.

REMARKS.

I. *Alcohol*, brought to this Degree of Perfection, is the lightest Fluid next to Air, perfectly transparent, very thin, most simple, totally inflammable, without producing any Smoke, or diffusing any disagreeable Smell whilst it is burning; is exceedingly volatile, without leaving any Fæces; absolutely immutable in Distillation; extremely expandible by Heat; very easily disposed to Ebullition by Fire; of a very pleasant Smell, and of a particular grateful Taste. All the Humours of the human Body, that we are acquainted with, it coagulates in an Instant, except the pure Water, and Urine, whilst it hardens all the solid Parts, and thus preserves both from Putrefaction, or spontaneous Colliquation: It preserves the Bodies of Insects, Fish, Birds, and other Animals that are put into it, from Corruption, or Alteration, for Ages, if closely stopped: With Water, Vinegar, any acid Liquors, Oils, and pure, volatile, alkaline Salts, it suffers itself to be mixed, and that nearly with an equable Mixture; and gummy and resinous Substances it dissolves. So that we are acquainted with no Liquid, produced either by Nature or the Art of Chymistry, that is capable of being united with more Bodies than is *Alcohol*. But in a particular Manner it proves an excellent Vehicle for the Spiritus Rector of Vegetables, which by uniting with it may be extracted from its proper Body, retained, and applied to medicinal, and other Uses. The great Masters of Chymistry, distinguished by the Title of *Adepts*, are supposed, in their Description of the artificial Preparation of this perfect *Alcohol*, to have shadowed out the Preparation of the Philosophers Stone: But it is certain, that this *Alcohol* owes its Origin to Fermentation alone, nor can be prepared in any other Manner whatever.

II. In the human Body, by its Smell, Taste, and Vapour, it wonderfully quickens, gratefully affects, and invigorates the animal, natural, and vital Spirits, Nerves and Brain: Hence it exhilarates the Mind and Senses, makes a Person brisk and agile, and proceeding through various Degrees, at last causes Drunkenness, which, as it here comes on very suddenly, so likewise it goes off in the same Manner. The Blood, its Serum, and other thin Juices it coagulates in an Instant, and hence being drank imprudently, it is said to have killed Persons on the Spot. Applied externally, it dries, and corroborates the Vessels, and coagulates the Fluids contained in them, wherever it can penetrate. The Extremities of the Nerves where it can reach it instantly dries, contracts, and deprives of all Sense and Motion. Hence it appears, how imprudently, and often, how unhappily, *Alcohol*, either pure or impregnated with aromatic Spirits, Camphire, or the like, dissolved in it, and ordered to be applied hot, and enforced with Friction, is made use of as a Fomentation in chirurgical Cases. I would advise, therefore, to be cautious upon these Occasions, lest under a specious Pretence of Vivification, Calcification, Resolution, Diffipation, and Restoration of Agility, you obtain no other Effects than what I just now ascribed to these Spirits. In Wounds, Ulcers, and other visible Disorders, pure *Alcohol* performs the very same Thing, viz. coagulates, dries, and burns the Nerves. It is true indeed, it takes from the Nerves all Sense of Pain; but then at the same Time it destroys all their Use. And it has the same Effect, in mitigating Punctures or Dilacerations of the same Parts. It stops Bleeding at once by contracting the Vessels; and coagulating the Blood, where it is applied, but with the concomitant Circumstances just mentioned. Hence, therefore, it is a very speedy, and often an excellent Remedy in these Cases, though always attended with some Inconveniences.

III. From what has been said then, we learn what Effect pure *Alcohol* has upon animal or vegetable Substances immersed in it. For it dissolves into itself, and extracts whatever is oily in them; whence they become attenuated, contracted, and often corrugated. In this Manner the Preparations of the Parts of Animals have often been observed to be changed: And aromatic Flowers, Leaves, and Fruits are thus affected from the same Cause. Small Birds in their Feathers, and other little Animals covered with hard Scales, immersed in hot *Alcohol*, are preserved in their full Beauty, because this Attenuation, though it really happens, is concealed under their Feathers and Scales. These Animals being macerated for some Time in the purest *Alcohol*, till they are thoroughly penetrated by it, and then taken out, and dried in a hot, but not fervid, Oven, and afterwards put into glass Vessels, and intirely debarred from any Communication with the external Air, may be kept in their proper Form for Ages, to the very great Advantage both of Natural and Medicinal History, because they afford lively and certain Characters by which they may be known.

IV. Since there are infinite, and oftentimes very inviting, Occasions in which Chymists and other Artificers stand in need

of the true and purest *Alcohol*, the least Remainder of Water rendering the Operation unsuccessful, it is absolutely necessary we should have some Marks by which we may be able to distinguish, whether our *Alcohol* be pure or not: The principal of these are,

1. If the supposed *Alcohol* contains any Oil dissolved in it, and so equably distributed through it, that it is no Ways perceptible, then upon the Pouring of Water into it the Mixture will grow white, and the Oil will separate from the *Alcohol*.

2. If any Thing of an Acid lies concealed in *Alcohol*, a little of it mixed with the alkaline Spirit of Sal Ammoniac will discover the Acid by an Effervescence, for otherwise there would be only a simple Coagulation.

3. If there be any Thing of an Alkali intermixed, it will appear by the Effervescence excited by the Affusion of an Acid: And as for other Salts, they are seldom found in it.

4. But it is a Matter of greater Difficulty to discover whether there be any Water intermixed with it; and therefore Chymists have contrived certain Methods, by which this may be also determined. The first was the repeated Labour of so many Distillations, which they thought sufficient Grounds for them to presume that they were in Possession of pure simple Spirits, without the Admixture of any Phlegm; but, as I took Notice before, I could never by this Method obtain pure *Alcohol*; but it would to the last retain something of Phlegm. Secondly, they put some *Alcohol* into a very clean, dry Spoon, and, heating it, set it on Fire in a Place where there was not the least Wind, and if after the *Alcohol* was burnt out, there was no Moisture left in the Spoon, they pronounced it pure *Alcohol*. Some more curious Persons, however, by other Experiments, discovered, that by the Action of the Flame, the Water that lay concealed in the *Alcohol*, might be dispersed into the Air, and consequently that the Absence of Water in the Spoon, after the Consumption of the *Alcohol*, was no certain Proof, that there was none contained in it; before it was set on Fire. In the third Place, therefore, they took some of the best Gun-powder, and, drying it very carefully put a little of it into a clean and very dry Spoon, and poured some *Alcohol* upon it, which being heated, they just stirred it in the very Surface, and letting it burn down in a very quiet Place, if the Powder continued dry enough to take Fire by the Flame when just spent, they concluded that the *Alcohol* was pure: But against this Experiment there lies the very same Objection as against the former. These two last Methods, therefore, when they succeed, demonstrate, that the *Alcohol* is in a very great Degree, but not absolutely free from Water. In the fourth and last Place, therefore, there has been another Way discovered, by which it may be certainly known whether *Alcohol* contains any Water or not, which is this: Take a chymical Vial, with a long narrow Neck, the Bulb of which will hold four, or six Ounces of *Alcohol*. Fill this Two-thirds full with the *Alcohol* you intend to examine, into which throw a Dram of the purest and driest Salt of Tartar, coming very hot out of the Fire; then mix them by shaking them together, and set them over the Fire till the *Alcohol* is just ready to boil. Being thus shaken and heated, if the Salt of Tartar remains perfectly dry, without the least Sign of Moisture, we are sure that there is no Water in this *Alcohol*. By intermixing this Salt of Tartar, I have been enabled to discover Water in what has been taken for the best of *Alcohol*: For I took some *Alcohol*, which had burnt intirely away, and had set Fire to Gun-powder, and upon putting such an alkaline Salt into it, I perceived by the Moisture it acquired, that there was still some Water in it: And again, I took some *Alcohol*, in which there was a fixed Alkali that had remained dry for a long Time, and was still so, when I just put a Drop or two of Water to it, and though the Salt had continued very dry so long, it soon after grew moist from so small a Quantity of Water, and appeared in oily Streaks running down the Sides of the Glass.

Hence the singular Nature of *Alcohol* is abundantly determined by its individual Properties; especially if to what has been said you add this Observation, that such an *Alcohol* is not visible whilst it distils through the Alembic: For it neither forms dewy Drops like Water, nor runs down in Striae like strong Spirit of Wine, but it is quite invisible; which Property was not unknown to the ancient Chymists as evidently appears by their Writings. This, then, is the ultimate Effect of Fermentation, for it is scarce possible to carry this *Alcohol* to any greater Perfection, or, indeed, to make any Alteration in it.

THE PRODUCTION OF ALCOHOL BY ALKALIES.

I. Because a good Quantity of pure *Alcohol* is often wanted on a sudden, when there is no chymical Apparatus ready for preparing it, and the Purpose may well enough be answered, though there should, by Chance, some fixed *Alkali* be mixed with the Liquor, the Industry of the Chymists has found out the following Method of preparing it: To common Spirit of Wine they pour a third Part of its Weight of the purest and driest Pot-ash, which presently sinks to the Bottom. Upon shaking the Vessel, the Salt immediately grows moist, and begins

to dissolve at the Bottom, whilst a thin red Liquor swims at the Top; and the more they are shaken, the greater is the Dissolution underneath, and the Separation upwards; nor is it ever possible to make them mix, but as soon as ever they come to rest, they immediately collect themselves into two perfectly distinct Strata. And here the stronger the Spirit of Wine is, the greater will be the Quantity of the upper Liquor; and so on the contrary.

II. Let the Vessel rest for some Time, that the Liquors may become intirely separated, and then by a gentle Inclination of the Vessel pour off the upper Liquor into another clean, dry Cucurbit, taking as much Care as you can, that none of the lower runs in with it. At the same Time let there be ready a fixed, *alkaline* Salt, very well dried by the Fire, and let it be put, while it is yet hot, into the Cucurbit, which contains the first Spirit that has been once already drained of its Water. Let them be shaken together, the Cucurbit being stopped, for a considerable Time, and you will perceive the dry Salt to contract a little Moisture; you are then to persist in shaking them together, till you observe that no more of the Salt will be dissolved, but that there swims at the Top a red limpid Liquor, which will be so much the purer, as the *alkaline* Salt was drier and hotter, and the longer it was shaken with the Liquor. This done, pour off the Liquor into a tall dry Bolt-head, and cast therein a little more of the driest and purest *alkaline* Salt, as hot as may be, and set them in an hundred Degrees of Heat, shaking them about very frequently; and if the Salt does not then grow at all moist, the *Alcohol* will be perfectly freed from its Water; but then it will have a red Colour, a Taste not simple, and a somewhat disagreeable Smell, and by its Effervescence with Acids, and its lixivious Taste, will evidently discover the Presence of a latent *Alkali*.

In this Operation there always appears a pinguious Oil, which separates itself from the Spirit of Wine, or the Pot-ash, or perhaps from both, and has a foetid Smell. Besides, the fixed *Alkali* here used, by absorbing and uniting with itself the Acid which was in the Spirit of Wine, is altered in its Nature, and at last becomes a compound and pretty volatile Salt. Here I found, that when this Salt had been frequently used, and still dried after every Operation, it became at last almost of the Nature of the Terra Foliata Tartari, and intirely unfit for any Purpose, where there was required a fixed *Alkali*.

III. *Alcohol*, thus prepared, and distilled in a Cucurbit, over a gentle Fire, becomes sufficiently pure, and fit for almost all Purposes that require a simple *Alcohol*. It is true indeed, there will be somewhat *subcalescent* still united with it, though this too may be removed, by cautiously adding a few Drops of Oil of Vitriol before the Distillation, and proceeding so long as there is any Effervescence excited, and no longer; for if you then distil it, your *Alcohol* is reckoned to be pure.

IV. Hence also it appears, that the Separation of pure *Alcohol* is not so easy as some People pretend: For in Distillation there is a somewhat acid, and a watery Liquid, which intimately adheres to the Spirit, and which closely unites itself with the *Alkali* that is added to it. Therefore, we need not be surprised, that some very curious Experiments, which require the purest *Alcohol*, do so seldom succeed. And hence it is plain, that an *alkaline* Salt will often properly dispose *Alcohol* for particular Operations, either as it frees it from its Water, Acid, and Oil, or as it impregnates it with an *alkaline* Quality, and thus improves its dissolving Power. We must have a due Regard, therefore, to all these Considerations, before we can determine its Effects. *Boerhaav. Chym.*

Thus I have traced the Preparation of *Alcohol* from the Vegetable from which it is generated, through all the succeeding Processes necessary for its Production. And because all vinous Liquors borrow their intoxicating Qualities, and all their Properties wherein they differ from other Fluids, from the *Alcohol* which resides in them, I shall make some Remarks, with Respect to the Uses generally made of them in common Life.

First, then, as vinous Liquors have Effects upon animal Bodies, nearly allied to those of the Gas Sylvestre, or incoercible Spirit which flies off from fermenting Liquors, it seems near a Certainty, that fermented Liquors inebriate, and produce all their deleterious Effects by a Portion of this Gas Sylvestre residing in them.

Hence appears the Imprudence, I should rather say Madness, of those who take into their Stomachs large Quantities of a Fluid strongly impregnated with the most subtle and penetrating Poison known in Nature, and which we find by daily Experience never fails to disorder, and if persisted in, to destroy the animal Machine. The Frequency of this Practice is amazing, and would scarcely be credible, if it was not common. I should think myself happy, if any Thing I could say would put the least Check to this bestial Crime, to which it is astonishing there should be any Temptation, for I am satisfied, that this alone destroys more Lives than the Accidents of War, added to all the Distempers with which Providence has thought proper to afflict Mankind; and it is very remarkable, that besides the

Distempers produced by drinking spirituous Liquors, an habitual Use of these renders all Diseases from other Causes more difficult to cure.

It is certain, that fermented Liquors are deleterious, in Proportion to their Strength, that is, in Proportion to the poisonous Spirit or Gas they contain. However, though small fermented Liquors do not immediately manifest their Effects, yet I think it is not to be doubted, but that an habitual Use of even these must in the End induce an Alteration in the Constitution to its Disadvantage. I am sensible, a Habit of drinking these Liquors renders them somewhat necessary, and makes it difficult to leave them off, and sometimes even dangerous. It is therefore a great Imprudence in People of Condition, to inure their Children to the Use of Wine, and other fermented Liquors, from their most tender Years.

If we consider *Alcohol* as acting upon the Stomach only, and at the same Time reflect upon what is observed above with Respect to its Operation on the Nerves, which is, that it dries and contracts them, and deprives them of all Sensation and Motion, we shall readily perceive, that if taken in the Stomach, when it is empty especially, they must necessarily, by their proper Action, take away that Sensation which we call Hunger, and destroy that Elasticity of the Fibres of the Stomach, which is absolutely necessary to the Digestion of the Aliment. To these Inconveniencies arising from the internal Use of *Alcohol* it may be added, that it coagulates animal Juices, and consequently all the Fluids it finds in the Stomach, I mean, those Fluids which are separated in the Glands of the Mouth, Fauces, and Stomach, and which are designed by Nature to promote the Solution of the Aliment; now when these are coagulated, and rendered viscid, they are utterly unfit to promote the above-mentioned Solution, but rather prevent it. Every one that has seen a Person, much habituated to drinking Drams, take a Vomit, must have observed him to discharge from his Stomach great Quantities of a viscid roapy Jelly.

If we consider spirituous Liquors as a Solvent of the Aliment, we shall find it so far from being fit to promote this Solution, that it greatly contributes to prevent it, for it hardens animal and vegetable Substances, and hinders their Solution in the Stomach, for the very same Reasons, that it prevents their Putrefaction out of it.

It would be well if spirituous Liquors had any Virtues to make Amends for the Havock and Destruction they make in the World. And, to do them Justice, I believe, that rough austere red Wines may be of Service for bracing up a relaxed Habit, and promoting Digestion vitiated by an accidental Laxity of the Organs subservient thereto; and that the more penetrating white Wines, well diluted, may be of Service as Medicines. The particular Cases are taken Notice of under the Article *ALCALI* from Hippocrates, and are also mentioned under the several Disorders wherein they are useful.

But with Respect to any Thing more spirituous than Wine, there is scarcely any Case wherein they can be of sufficient Service to compensate for the great Mischiefs they produce; inasmuch that every Person who drinks a Dram, seems to me guilty of a greater Indiscretion, than if he set Fire to his House; and for the same Reasons, Cordial-waters are the most dangerous Furniture for a Closet, particularly as there is something like Fascination in them, which obliges the Possessor to make Use of them, to the Destruction both of Health and Intellects.

On this Account, I cannot forbear admiring the great Wisdom of Mahomet, who has strictly forbid his Followers the Use of fermented Liquors, for better Reasons than are generally apprehended.

However *Alcohol*, and fermented Spirits in general, are of good Service externally applied in many Cases. Thus Spirit of Wine, especially camphorated, is a very good Addition to Fomentations designed to resolve Inflammations, whether external or internal.

Wine used as a Fetus, or applied externally, cools, and allays the Heat of the Parts, notwithstanding it warms taken internally. Spirit of Wine does the same. Pliny says, it is the Nature of Wine to warm the Viscera taken internally, but to cool externally applied. *Harris Dissert. Chyrurg.*

Hippocrates says, that Ulcers should be washed with nothing but Wine. *Galen, L. 3. Methodi, Cap. 4.* says, Wine is the best Medicament for Ulcers. Dioscorides says, that Wine in Lana succida, is a good Application for Wounds and Inflammations. Dr. Harris from his own Experience affirms, that linnen Cloths dipped in warm Spirit of Wine, often cure Burns from scalding Water, melted Pitch, Fire, and Gunpowder, better and sooner than all other Applications. He gives an Instance of a Boy that was blinded by a Drop of Pitch falling into his Eye, and of another blinded by Gunpowder, who both recovered their Sight the very next Day, by a Fetus of warm Spirit of Wine. *Harris Dissert. Chyrurg.*

Dr. Harris also affirms, that warm Wine is the best Application for Wounds, Ulcers, and Inflammations, especially those of the most sensible Parts, that are full of Nerves, Tendons, and Blood.

Blood-vessels, as the Fingers and Toes, where Incisions and Punctures often cause great Pain, and endanger a Mortification.

The Turks, who are ignorant generally of Surgery, unless perhaps some wandering Jew practises it amongst them, foment their Wounds, and wash them with Wine successfully.

Gangrenes will sometimes happen from unskilful Cutting Corns, or the Nails of the Toes; especially if they are exasperated with Unguents and Plaisters. Spirit of Wine and Theriaca are the best Topics in such Cases. *Harris Dissert. Chyrurg.*

Spirit of Wine used as a Fetus for a sufficient Time, and upon some Occasions repeated, extinguishes the Heat of an Erysipelas, sooner than any other Fetus whatever, whether the Erysipelas is cutaneous, true, and genuine, or spurious, more profound, and deeper in the Flesh. *Harris Dissert. Chyrurg.*

Erysipelatous Pains in Wounds and Ulcers are cured by a Fetus of Spirit of Wine. *Harris Dissert. Chyrurg.*

If Vesicatories cause great Pains, and endanger a Mortification, a Fetus of Spirit of Wine will cure them. *Harris Dissert. Chyrurg.*

Inflammations caused by Vesicatories, which are attended with violent Pains, and a blackish Colour, and which tend to a Gangrene, are easily cured by fomenting them with a linnen Cloth doubled, and dipped in hot Wine, or Spirits of Wine, and afterward applying such a Cloth wetted with Wine, or Spirit of Wine upon the Part, without Plaisters, or unctuous Medicines. *Harris Dissert. Chyrurg.*

There is a Species of Colic, which Women are subject to, which is extremely painful, and is sometimes fixed on the right Side, sometimes on the left, below the Navel, without Vomittings. Dr. Harris says this is cured in a Day's Time, or on the same Day, by an Application of doubled linnen Cloth dipped in very hot Spirits of Wine, and continued a long Time, even where Narcotics are useless, or sometimes noxious. *Harris Dissert. Chyrurg.*

This I have frequently found of great Efficacy, in the Case the Doctor mentions. As this Author was a Man of undoubted Integrity, his Authority has the greater Weight.

Pure Alcohol is the best of Stiptics, for being received upon linnen Tents, whilst it is almost hot, and is pressed upon a bleeding Wound, and covered over with a Hogs-Bladder oiled, the Hæmorrhage will presently be stopped; and the Dressings may be kept on three Days, in which Time the bleeding Vessels usually concreate together. *Boerhaave.*

As to the Antiquity of Alcohol, those who are solicitous about raising the Character of Homer, by attributing to him all Sorts of Knowledge, are furnished with a very good Opportunity of making him a most excellent Chymist. This great Author, speaking of the Wine with which Ulysses made Polyphemus drunk, says it was given him by Maron, and that it was so strong, that though mixed with forty Times the Quantity of Water, yet retained a great Fragrance. If this was not a poetical Exaggeration, Wine like this must be stronger than any Alcohol known at this Day. But, in reality, we meet with nothing like Spirit of Wine before the thirteenth Century, when Thaddæus takes Notice of it. And some little Time after, Arnaldus de Villa Nova mentions it in very high Terms, under the Title of *Aqua Vini*. It is certain, that the thirteenth and fourteenth Centuries were remarkable for many considerable Discoveries; but as the Tree of Knowledge brought Death originally into the World, so the Period above-mentioned, together with an Increase of Knowledge, introduced Gun-powder, the Pox, and Brandy, the most pernicious of the three by many Degrees.

All that Set of Alchymists in general, who acquired the Name of *Adepti*, speak much of Spirits of Wine, as a Thing used in the Preparation of their secret Menstruums; and hence Weidenfeld was of Opinion, that we only wanted the Preparation of their true philosophical Spirit of Wine, in order to be let into all their Secrets. But Boerhaave seems inclined to think, the Spirit which we are acquainted with answers the Characters of that used by the old Chymists in every Respect, except that theirs is said to dissolve Salts, which ours will not do. But he makes a Doubt, whether this depends upon our Ignorance of their true Spirit, or our Want of knowing their Method of preparing Salts, in order to render them thus soluble.

ALCOHOL, considered as a MENSTRUUM, dissolves

1. All true vegetable Refins.
2. Most Sorts of Gum Refins.
3. Pure, volatile, Alkaline Salts.
4. Pure, fixed, Alkaline Salts, when rendered extremely dry.
5. Most saponaceous Substances.
6. Sulphurs, when opened by Alkaline Salts.

But ALCOHOL will not act upon

1. Native compound Salts, as Sea-Salt, Nitre, and Sal Ammoniac.
2. Nor Sulphur, unless opened by Alkaline Salts.

3. Nor Earth, Mercury, Metals, Semimetals, Stones, nor Gems.

ALCOL. Vinegar. *Rulandus.*

ALCOLA. The same as Aphtha, in the Phrase of Avicenna. See APHTHA.

In the Language of Paracelsus, *Alcola* is the Tartar, or Excrement of Urine, whether it appears in the Form of Sediment, Sand, or viscous Mucilage. Hence

ALCOLITA, is by this Author applied to signify Urine. *Castellus.*

ALCOLISMUS. The Reducing any Substance to fine Particles by Corrosion, or otherwise. *Rulandus.*

ALCONE. Brass. *Rulandus.*

ACOR. Burnt Copper. *Rulandus.*

ALCORE. A Sort of Stone, having Spots in it resembling Silver. *Rulandus.*

ALCTE. *Aster.* Erotian says this is the Name of a Plant mentioned by Hippocrates. Foësius thinks he means *aster*, The Elder.

ALCUBD, or ALUMBATR. *Rulandus* explains this Butyrum crudum, crude Butter, which Johnson, and Castellus transcribe, without any farther Explanation.

ALCUBRITH, ALCUR, or ALUZAR. Sulphur. *Rulandus.*

ALCYONIUM, *Bastard Sponge.* Is a Sort of spongy Plant which is found in the Sea, or upon the Shore, or rather a Froth of the Sea, which is hardened by the Heat of the Sun, and of different Shapes and Colours.

What those Bodies are, which the Greeks call *Alcyonia*, and whence they have their Original, has been a controverted Point among the Botanists, and is not yet decided. Pliny writes that they are the Nests of some Sort of Birds, that build in the Sea. Imperatus would have them to be nothing but Bits of Straws and Hair conglobated into a Mass by the Agitation of the Waters. Schrochius affirms they are produced of Reeds, and their Leaves, and that in several which he cut open, he found the very Plant, the Reed, rolled up and inclosed in the Middle. Dioscorides reckons five Species. The first is called

Alcyonium durum, Offic. *Alcyonium durum* sive primum *Dioscoridis Imperato*, C. B. 368. Tourn. Inst. 576. *Alcyonium spongiosum Officinarum*, J. B. 3. 816. Chab. 579. Raii Hist. i. 82. Hist. Oxon. 3. 654. *Alcyonium spongiosum Dioscoridis, flavum marinum quorundam*, Donat. ii. *Alcyonium primum Dioscoridis*, Calc. Mus. 21. *Alcyonium, seu eorum ruscum*, Worm. 48. HARD BASTARD SPONGE. Dale.

It resembles in some Measure a Sponge; but it is hard, leavy, and of a sour Taste, and disagreeable Smell, like a Fish. It is commonly found on the Sea Shore. *Lemery des Drogues.*

The second is called

Farrago, Offic. *Aristot. Farrago australis, Alcyonium secundum Dioscoridis*, C. B. Pin. 368. *Vescaria marina nigra, Farrago Aristotelis quorundam*, J. B. 3. 818. Chab. 580. Dale.

It is called by Lemery (*Farrago australis*, C. B.) It is light, porous as a Sponge, and smells like the Alga. *Lemery des Drogues.*

The third is called

Alcyonium vermiculatum, Offic. *Alcyonium vermiculare Imperatorum*, C. B. 368. *Alcyonium vermiculare*, Imperat. 639. Hist. Oxon. 3. 654. *Alcyonium tertium Dioscoridis*, Cæsalpin. 608. *Alcyonium vermiculatum purpureum candidum, & flavescens*, Tourn. Inst. 576. VERMICULATE BASTARD SPONGE. Dale.

It is called by Lemery *Milesum*.

It is in the Form of little Worms, of a purple Colour, sometimes white, and other Times yellow, and they give it the Name of *Alcyonium vermiculare*. *Lemery des Drogues.*

The fourth is called

Alcyonium stuposum, Offic. *Alcyonium stuposum Imperatorum*, J. B. 3. 817. Raii Hist. i. 82. *Alcyonium stuposum*, Imp. 640. Tourn. Inst. 576. *Alcyonium stuposum dictum*, Chab. 579. *Alcyonium stuposum vel quartum Dioscoridis & Imperatorum*, C. B. 368. Hist. Oxon. 3. 654. THREADY BASTARD SPONGE. Dale.

Called by Lemery *Alcyonium molle*. It is light and soft, resembling greasy Wool [*laine grasse*]. *Lemery des Drogues.*

The fifth is called

Alcyonium tuberosum, Offic. J. B. 3. 817. Raii Hist. i. 82. Hist. Oxon. 3. 654. *Alcyonium tuberosum fœcis formâ*, Imp. 641. Tourn. Inst. 576. *Alcyonium formâ fructus alicujus fœcis*, C. B. 368. TUBEROSE BASTARD SPONGE. Dale.

It is called by Lemery, *Alcyonium foraminosum*. It is somewhat like a Mushroom, soft to the Touch without Side, of a sharp Taste, but rough within, and porous like the Pumice-stone, without Smell.

There are, besides these, a great many other Kinds.

They contain a great deal of Oil and Salt; some more than others. *Lemery des Drogues.*

PREPARATION OF ALCYONIUM.

To calcine any Species of these *Alcyonia*, put them in an earthen Pot never burnt, with a little Salt, and having well luted the Mouth, set it in the Furnace, and when the Pot is thoroughly baked, take it out, and lay it up for Use; it is washed like the *Cadmia*. *Diösc. Lib. 5. Cap. 136.*

All the *Alcyonia* are deterfive and discussive, and of an acrid Quality; but the Milesian, or Vermiform, is the best; wherefore, when it is burnt, it cures the Alopecia, and cleanses the Skin from the Impetigo and Vitiligo. That with a smooth Superficies is the strongest, as not only deterging, but excoriating; but that which is like greasy Wool, is the weakest of all. *Æginet. Lib. 7. Cap. 3.*

The first and second Sort are proper for the Erysipelas, the Ring-Worms, the Itch, the Leprosy, and all other Disorders of the Skin, to take away Freckles from the Face, being externally applied in Powder, or in Decoction.

The third is esteemed good to excite Urine; to expel the Stone of the Kidnies and Bladder; to remove Obstructions of the Spleen, and for the Dropsy; it may be taken in Powder, or in Decoction. Being burnt, it makes the Hair grow, if applied to the Part, mixed with a little Wine.

The fourth is resolvent.

The fifth is proper to clean the Teeth, and if it is calcined with Salt, it makes a Depilatory, or Remedy to destroy Hair. *Lemery des Drogues.*

ALDABARAM. A Name for the Sesamoid Bones of the Great Toe. See **ALBADARA**. See **SESAMOIDÆA**.

ALEC, or **ALECH**. *Vitriol. Rulandus. Johnson.*

ALECHARITH. *Mercury. Johnson.*

ALECTORIA, or **LAPIS ALECTORIUS**. From *ἄλεκτος*, a Cock. A Gem fabled to be found in the Stomach of a Cock, some say of a Capon, after it is four Years old. It is said to be as clear as Crystal, or Rock-water, and about the Size of a Bean. Many chimerical Virtues are attributed to this Stone, as that it renders the Possessor rich, eloquent, and courageous, that it increases venereal Vigour, and procures Friends. If a Woman possesses it, some Authors assure us, that she must of Necessity be very beautiful and charming in the Eyes of the Men. Pliny says, Milo of Crotona was invincible only because he had this Gem in his Possession, and carried it about him in his Combats. It has also, as it is reported, the Power of quenching Thirst, and mitigating Heat, if held in the Mouth. *Rulandus. Pliny. Gul. Menens.*

ALECTOROLOPHUS. A Plant thus distinguished:

Alectorolophos, Offic. *Crista galli*, Ger. 912. Emac. 1071. Chab. 467. Mer. Pin. 31. Rivin. Irr. M. 92. Dill. Cat. Giff. 80. *Crista galli fœmina*, J. B. 3. 436. Buxb. 88. *Crista galli pratensis humilior, comâ fuscâ*, Rupp. Flor. Jen. 194. *Pedicularis sive Crista galli lutea*, Park. Theat. 719. Raii Hist. 1. 769. Synop. 3. 284. *Pedicularis pratensis lutea, vel Crista galli*, C. B. Pin. 163. Tourn. Inst. 172. Elem. Bot. 141. Boerh. Ind. A. 235. Hist. Oxon. 3. 426. *Pedicularis pratensis lutea, sive Crista galli, Herbariorum*, Merc. Bot. 1. 57. Phyt. Brit. 89. **YELLOW RATTLE**. Dale.

Alectorolophos, which among us goes by the Name of *Crest* (*Crista*) has Leaves like a Cock's Comb, or Crest, many in Number, a slender Stalk, and black Seed. *Pliny, Lib. 21. Cap. 5.*

Obel writes, that this Herb is called *Pedicularis* for its poisonous Qualities, and because it infests the Meadows, and is an Enemy to Lice. On the Contrary, Dodonæus calls it *Pedicularis* from its Effect, which is to breed Plenty of Lice upon the Cattle which feed in the Pastures where it grows. But to me the Leaves of this Plant seem, by their Furrows, to be very like the Back of a Louse, and thence perhaps it took its Name.

From a small, white, single Root, that sends forth some collateral Sprays, and is not deep in the Ground, there shoots up a Stalk, for the most Part single, a Foot high, stiff, smooth, square, strait, slender, light, oftentimes variegated with black Spots and Streaks, and towards the Top of a purplish Colour. It is divided into several Branches, which stand opposite, and are encompassed by two Leaves, without Pedicles, wide at the Base, and growing narrower by Degrees, to the very Top, of a Finger's Length, sharp-pointed, indented at the Edges, resembling a Cock's Comb, a remarkable Vein running on the Right and Left to each Indenture. From the Midst of the Leaves proceed small Branches by Pairs, or two standing opposite. On the Tops of the Stalk and the Branches grow small Flowers close set, in the Form of an Ear, or Spike, and proceeding in like Manner from the Leaves, a single one from each Sinus; with very short Pedicles. The Flower-cup is turgid, compressed, and cut just within the Edge into four acute Segments. The Flowers are monopetalous, yellow, in Shape resembling a Hood, which incloses and hides from View a slender Style, with four Chives, and their Apices. The Flower falling off, the Cup swells into a vastly larger Vesicle, which contains within itself and compresses a large Seed-vessel, divided in the Middle into two Cells, which hold several Seeds closely compressed, and surrounded with a membranaceous Border of a dusky Colour. When the Seed is ripe, the membranous

Cells on a sudden fall asunder and gape wide, and shine when they are dry.

It flowers in June, and the Seed is ripe in a short Time, and then immediately falls off, and the Plant soon after withers away to the very Root.

It grows chiefly in the barren Sort of Pastures, and oftentimes in Plowed Fields, being of no Use, but hurtful in both Situations. *Raii Hist.*

Boiled with husked Beans, and sweetened with Honey, it is good for a Cough. It also cures Dimness of Sight, for which Purpose they cast a whole Seed into the Eye, where it causes no Disorder, but takes off the Mist or Cloud upon itself. It changes Colour, and from Black begins to turn white, then swells, and comes out of itself. *Plin. Lib. 21. Cap. 5.*

Besides the Fore-mentioned, Ray enumerates,

1. *Crista Galli Mas*. J. B. The Male *Crista Galli* of John Bauhin. It differs from the Female in Tallness, growing sometimes to the Height of a Foot and half, has a stronger Stalk, broader Leaves, and much larger Flowers, is whiter at the Tops, and has hairy Vesicles. It grows together with the Female in the Meadows about Geneva.

2. *Crista Galli spicata flore luteo magno Messanensis*. The spiked *Crista Galli* of Messina, with a large yellow Flower.

3. *Trizago Apula Unicaulis, variegata (Tetrastachys)* Col. *Crista Galli spicata Flore vario ex albo & purpureo*. An *Antirrhinum Folio serrato*, J. B. The *Apulian Trizago* with a single Stalk, the *Tetrastachys* of Columna; the spiked *Crista Galli* with the white and purple Flower. Qu. Whether the *Antirrhenum*, with a serrated Leaf, of John Bauhine?

4. *Pedicularis pratensis rubra vulgaris*, Park. *Pratensis purpurea*, C. B. *Pedicularis*, Ger. *Pedicularis, quibusdam Crista Galli Flore rubro*, J. B. **RED RATTLE**.

The Flowers, as in the common *Crista Galli*, spring forth from lax, smooth Vesicles, but not so much compressed, furrowed, and of a deep Green, a little inclining to Red, and are of a red Colour, seldom of a Carnation or White. The upper Lip has a Beak, and conceals within its two Cells four yellow Apices, deeply set with a purplish Style; the lower is deeply cut or jagged into three exactly round Lobes. The Leaves have something resembling *Filipendula*, but are much smaller, and more nicely cut at the Edges, are of a green or light red Colour, and stand on weak, hollow, angulous Stalks, eight or nine Inches high. The Root is somewhat bitterish, white, furrowed, shaped like that of Parsley, scarce as big as one's little Finger, but runs out in small Fibres. From the Top of the Root spring forth broad, thick, sharp-pointed Leaves, serrated round the Edges, from the Middle of which the other Leaves together with the Stalk arise. The first Leaves of the new-sprung Plant are so like the Oak-fern, both in Shape and Incisions, that some would take them for the same. The Seed is of a sooty Colour, and round, contained in large, falcated Vesicles, which run out with a Sort of Beak.

It grows in Meadows, Pastures, and on Heaths, wherever the Ground is moist and boggy, in great Plenty, all over England.

5. *Pedicularis palustris rubra elatior*. An *Pedicularis Campestri prior species Tragæ*. The red, tall *Pedicularis* of the Marshes. Qu. Whether it be the first Species of the Field *Pedicularis* of Tragus?

This Herb, if we may believe Tragus, eaten by the Cattle, breeds such Swarms of Lice about them, that they are not to be cured without great Trouble and Danger.

6. *Crista Galli montana, Floribus pallidis in spicam congestis*. The *Crista Galli* of the Mountains, with a Spike of pale Flowers.

7. *Pedicularis major Dalechampii*, J. B. *Alpina Filicis Folio major*, C. B. *Major Alpina*. The larger *Pedicularis* of Dalechampius, John Bauhine. The greater Alpine Sort, with the Fern-leaf, Gaspar Bauhine. The greater Alpine Sort of Parkinson.

8. *Filipendula montana altera*, C. B. *Montana mollior altera*, Park. *Alectorolophus II*. Clus. Hist. One of the two Mountain *Filipendulas* of C. B. The softer of the two Mountain Species of Parkinson. The eleventh Species of *Alectorolophus* in Clusius.

9. *Pedicularis Bulbosa*, J. B. *Filipendula montana Flore Pediculariæ*, C. B. *Filipendula montana major albida*, Park. *Alectorolophus Alpinus major*. I. Clus. *Filipendula montana*, Ger. The bulbous *Pedicularis* of J. B. The Mountain *Filipendula*, with the Flower of *Pedicularia*, C. B. The greater white Mountain *Filipendula* of Park. The first Species of the greater Alpine *Alectorolophus* of Clusius. The Mountain *Filipendula* of Gerard.

10. *Pedicularis Alpina lutea*, C. B. Park. *Alpina Flore luteo, Radice nigra*, J. B. The yellow Alpine *Pedicularis* of C. B. and Parkinson. The Alpine *Pedicularis*, with a yellow Flower, and a black Root, of J. B.

11. *Crista Galli umbellata*, C. B. Prod. *Galli lutea umbellata*, Park. The umbelliferous *Crista Galli*, in Gaspar Bauhine's Prodromus. The yellow umbelliferous *Crista Galli* of Parkinson.

12. *Crista Galli angustifolia montana*, C. B. Park. The narrow-leaved Mountain *Crista Galli* of C. Bauhin and Parkinson. *Raii Hist.*

ALEFANTES. Rulandus explains this by *Flos Salis*.

ALEIMMA. *Ἀλειμμα*. An Ointment or Liniment, any unctuous or greasy Topic, that has no Wax in the Composition, to give it a greater Consistence.

ALEION. *Ἀλειον*. An Epithet applied by Hippocrates to Water. It signifies *copious*. *Gorræus*.

ALEIPHA. *Ἀλειφα*. It signifies the Oil of Vegetables, and Fat of Animals. It farther signifies any Sort of medicated Oil, that is, Oil impregnated with aromatic, or fragrant Vegetables, prepared for anointing the Body, and therefore of such a Consistence as is proper for this Purpose; consequently no Wax enters the Composition of an *Aleipha*, nor Powders in Quantities sufficient to render it too thick.

Hippocrates, and all the Antients, abound with Ointments, which they applied not only as Topics to particular Parts, but with a Design of inducing some Alteration in the general Habit, as we may learn from their almost universal Use of them in all Distempers, both acute and chronic. And it is remarkable, that they frequently relaxed the Skin by warm Baths before the Application of their Oils, with a View of gaining a more easy Admission to the Particles of Oil into the Habit.

It is amazing that this Practice which the Antients recommend so strongly, and from which it is evident they found great Advantages, should so far have grown into Disuse, as to be seldom or never taken any Notice of by the Moderns in the Cure of Distempers, though it seems to be of Importance enough to deserve the Regard of every Practitioner. I am afraid this is not the only Instance of a Disadvantage arising from a Dependence on Theory, so far as to proscribe from Practice whatever has not suited with the crude and imperfect Ideas we conceive of the Operation of natural or artificial Bodies, without consulting Experience, the only Thing which should guide us, and which is capable of determining, whether the Theories we form are just, or otherwise.

I think the following Fact will make it highly probable, that Physicians have done extremely wrong, to neglect so much as they have, the general or particular Use of Oils.

The Year before the Viper-catchers discovered that the common Salad Oil was their grand Secret for curing the Bite of a Viper, I employed these People to get a considerable Number of Vipers, in order to make some Experiments. Accordingly a great many Chickens, and some Cats were bitten, some of which were cured, and others suffered to die of their Wounds. Upon dissecting those which died I observed, that the Blood all along the Course of the Vessel which was wounded by the Viper, was coagulated like Jelly, looked black, and stagnated, and the nearer it approached the Heart, the wider was the Coagulation, Lividness, and Stagnation, spread. If then the Poison of a Viper produces deleterious Effects by causing a Stagnation of the Blood, it seems plain, that Oil must cure the Disorders depending upon such a venomous Bite, by resolving the Coagulations already made, and preventing more from being formed.

It is, I confess, a Secret to me, how Oil performs these salutary Resolutions of coagulated Blood, for I can form no satisfactory Idea of its mechanical Way of acting, in order to produce such an Effect. I am sensible it has been said, that the *Saline Spiculæ of the Viperine Poison are enveloped and blunted by the viscid Particles of Oil*; but this gives me no Satisfaction, for by any Thing which appears, it may or may not be so. But let this Resolution be brought about by any mechanical Means whatever, if Oil applied externally is capable of resolving coagulated Blood, and of hindering the Blood from running into Concretions, in one Instance, it occurs to me, that it may probably have the same Effect in other Cases, where the Blood has a Tendency to stagnate and coagulate. And if so, universal Unctions may, in an inflammatory State of the whole Blood, be of great Use; as particular Unctions may be, when particular Parts are inflamed, that is, where the Blood stagnates, and coagulates. In Confirmation of this, it must be remembered, that Relaxing the Solids is the most effectual Method of removing Inflammations, and that Oil is known to relax in a great Degree.

Hence we may form a Judgment of their Opinions who forbid the Application of Oils to inflammatory Tumors, where the Intention is to discuss, for Fear it should obstruct the Pores; for though the Pores should be obstructed by the Application of Oils, if these Oils resolve and prevent Coagulations, their good Effects will more than over-balance the Mischief which may arise from their Obstructing the Pores.

ALELAION. *Ἀλλαιον*. An Application made Use of by Galen in lax Tumors. It consists of Oil beat up with Salt. *Foefius*.

ALEMA. *Ἀλειμμα*. Boiled Meal.

ALEMBACI. *Ἀλειμμα*. Burnt Lead. *Rulandus*.

ALEMBIC. Rulandus explains this *Mercury*.

ALEMBICUS. The Derivation of this Word is half Arabic, half Greek. It comes from the Word *Ἀμβίς*, which is

again derived from *Ἀνάλω* for *Ἀναλίσσω*, to ascend, the Arabic Particle *Al* being added to it. In Latin Seneca calls it, *Miliarium*. In English an *Alembic*, or *Lembic*.

Before the Use of Retorts became so common as they have been for some Years, the most general Way of distilling was to put the Matter to be distilled into a Vessel, called a *Body*, and to fit a Head to it, in order to receive the Vapour, which there condensing into a Liqueur, is conveyed by a Canal, called the *Rostrum*, or *Beak*, from the Head into the Receiver. This Head is properly the *Alembic*, and is called *Alembicus Rostratus*, to distinguish it from another Sort of *Alembic*, called *Alembicus Cæcus*, a blind *Alembic*, which is without a Pipe, or Canal, and is destined to receive Substances of a dryer Nature, which are sublimed into it out of the Body. Sometimes also the *Alembic* is perforated at the Top, in order to permit a Part of the Vapour to escape. Thus is *Alembic* properly the Head of a Distilling-vessel, but it is now frequently used to signify the whole Apparatus.

ALEMBROTH. In a Treatise printed in the *Theatrum Chymicum*, Vol. 4. called *Super Tractatum, Mer Fugi dum bibit*, *Alembroth* is said to be a Chaldee Word, importing *Clavis Artis*, the Key of Art. Rulandus explains this by *Sal Mercurii*, or *Sal Philosophorum & Artis*. Castellus says it is called also *Elembrot*, and *Sal Fusoris*, or *Sal Fixionis*. Some Sorts of this are prepared artificially, but that from which the others seem to have taken their Name is said to be produced naturally in Cyprus, and to be got in the Form and Colour of concremented Blood. *Alembroth desiccatum* is explained by Rulandus, *Salt of Tartar*. Hence *Alembroth* should seem to signify a fixed Alkaline Salt, either natural, or artificial, which are all very useful in opening the Bodies of Metals, destroying their Sulphurs, and promoting their Separation from the Ore.

ALEMZADAT. *Sal Ammoniac*. *Rulandus*.

ALENON. *Ἀλενον*. *Gorræus* says Aetius calls Oil of Almonds *Ἀλενον ἔλαιον*.

ALEOPHANGINÆ PILULÆ. A Pill directed by the College, thus prepared:

Take of Cinnamon, Cloves, the lesser Cardamoms, Nutmegs, Mace, Calamus Aromaticus, Carpopalsam, or in its Defect Juniper Berries, Schoenanth, yellow Sanders, Galangals, and red Rose-Leaves, each half an Ounce: Let these be grossly powdered, and a Tincture be drawn from them with Spirit of Wine, in a glass Vessel close stopped, enough to strain off three Pints, in which dissolve one Pound of the finest Aloes, and to it add of Mastich and Myrrh in Powder, each half an Ounce; of Saffron, two Drams; of Peruvian Balsam, half a Dram; and reduce the Whole into a due Consistence for Pills, by Evaporation of the superfluous Moisture over an Heat of warm Ashes. *London Dispensatory*.

"The Quantities of some of the Ingredients are somewhat diminished to what they were before. These are the *Pilule Aromaticæ* of Mesue. Zwelfer is very large in his Animadversions upon this Composition, which in the *Augustan Dispensatory* a little differs from this, and he is very elaborate in its Correction. He directs to draw the aromatic Part of the Ingredients off by two or three Cohobations with five or six Ounces of Spirit of Wine by a Retort, which is to be saved, and a Decoction made of the Residuum in plain Water, in which the Aloes is to be dissolved and evaporated, and then the Myrrh, Mastich, and Saffron to be put to it, with the aromatic Spirit before drawn; or else to take such Aromatics as have not their essential Oils in the Shops, and manage thus; and put a due Proportion of those essential Oils, which are drawn, to the Whole at last, which seems to be the better Way. This is directed in the *Pharmacopœia Regia* with Hellebore, and intitled, *Pilule Aleophanginæ Capitales & Stomachicæ*, but they are now out of Use." *Quincy's Note*.

This Medicine is imitated from Lampon's Hiera, described by Galen, L. 8. *de Compositione Medicamentorum*, C. 2.

ALEORE. *Ἀλεωρη*. From *ἀλῶ*, to avoid or escape, is used by Hippocrates to signify that Ease which a Person finds from the Abatement or Intermision of any Distemper; *Ἄνεσις γὰρ ἰσχυρὴ καὶ μὴ παύσασθαι μετὰ τὴν ἀλῶρη*, "The Remission of any Disorder administers great Ease or Relief to the Patient." *Prognostics*, Sect. 1.

ALEOS. *Ἀλεός*. Taken as an Adjective, signifies *heaped, crowded, condensed, or continued*, and in this Sense is used by Hippocrates, who, speaking of the Epimenia; says, *Ἄλλ' αὖτις παύσασθαι ἐν ἀλεός*. "But if they flow in great Quantities and without Intermision." And a Line or two after, *καὶ ἄλλα ἐπιπίπτει, ἄρχεται τε ἵσται μετὰ τὴν ἀλῶρη*. "If they come down very fast, the Party will be of a pallid Countenance; so long as she is thus affected." *De Morb. Mulier*, L. 1.

Taken as a Substantive, it is interpreted by Hesychius and others, by the Words *Θέρμη*, *Ἑσθέρμη*, Heat, Warmth; and is derived by them from *Ἀλῶ*, Heat.

ALES. "Αλός. An Adjective, which like *ἀλός*, signifies *beaped, condensed, crowded*. In this Sense it is applied by Hippocrates to the Excrements in the Case of Polemarchus's Wife, in the seventh Book of his *Epidemics*.

It also sometimes signifies *contracted*, as, *τὸν μήτραν ἀλὸν ἰστίαν*. "The Womb being contracted." *De Morb. Mulier. L. 1.*

The Chymists likewise give this Name to a compound Salt.

ALES CRUDUM, *Crude Ales*, is those Drops which often fall in the Night Time in the Month of June. *Johnson*.

ALESCH. *Alumen plumosum. Plumose Alum.* See **ALUMEN**.

ALETON. "Ἀλέτων. Meal, as Erotian and Hesychius explain it. It seems derived from *ἀλέω*, to grind, and to import the Meal of any Sort of Corn. This Word is frequently made Use of by Hippocrates. Thus *de Virtus Ratione, Lib. 2.* he says, "Ἀλέτων καθαρίων συνόμενα ἐν ὕδατι ψύχει. Pure Meal drank in Water refrigerates. And a little after he informs us that Meal, *ἄλλω*, drank in Milk is more subject to purge than when taken in Water. In the second Book of *Epidemics* the same Author, speaking of the *Cefophagus* a little obscurely, says, "Ἀλέτων ὡς βεγ-
πύσαντος διδύμου, καὶ ὅτιον ἀγένητον, give very hot Meal, and unmixed Wine. The Interpreters translate *διδύμου* by *apponito*, as if Hippocrates directed a Cataplasm of Meal and Wine, which seems a Mistake in this Place, though in others he orders Cataplasms of Meal (*ἄλετων*) for particular Purposes.

ALEURON, "Ἀλεύρον, Meal. From *ἀλέω*, to grind. It strictly signifies the Meal of Wheat, but is applied by Hippocrates to the Meal of Lentils, or of the Seeds of Darnel.

ALEXANDER. A Physician of the sixth Century was named *Trallianus*, from *Tralles*, a City of Lydia where he was born. He was equally happy in all the Circumstances of his Birth, for *Tralles* was famous for the Purity of its Dialect, and his Father *Stephanus* was by Profession a Physician, whose Tenderness probably enforced his Instructions, and contributed much to the Advancement of his Son's Studies.

Alexander having been some Time taught by his Father, either after his Death, or in Hopes that as every Man of Eminence has some Excellencies peculiar to himself, the Precepts of another Master might afford him new Light, became the Disciple of another Physician, the Father of that *Cosmas* at whose Request he compiled his Book, and made such Advances in Physic, as procured him when he engaged in Practice the highest Reputation; a Reputation so extensive that not only at Rome, but wherever he travelled, he was consulted and applied to as the greatest Master of his Art, and became known by the Title of **ALEXANDER THE PHYSICIAN**.

His Claim to this honorary Appellation appears to have been founded not upon popular Caprice, or some single Instances of accidental Success, to one or other of which many have been indebted both for their Honours and their Riches, but to extensive Knowledge, and judicious Practice. He is the only Writer of the later Ages who has ventured to form his own Plan, or who can claim the Character of an original Author.

His Method is accurate and perspicuous; he begins with the Distempers of the Head, and descends to all the Parts of the Body in their natural Order. His Account of the Diagnostics is remarkably exact, and his Method of Cure for the most Part rational and salutary.

Without engaging in Disquisitions relating to the *Materia Medica*, Anatomy, or Surgery, he confines himself to the Description of Diseases, which seems to be his peculiar Excellency, and the Method of Cure, which the Multiplicity of his Practice enabled him to lay down with more Accuracy and Certainty, than those whose Learning was less assisted by Experience. Of many Cases he has left exact Histories, with a regular Detail of the Succession of the Symptoms, and the Application of his Medicines.

It is to be observed to his Honour that his Omission of Surgery was not the Effect of his Ignorance of that Science, but of his Knowledge of the Art of Writing, and his Conviction of the Necessity of one simple uniform Plan. He had observed how much Digressions into remote Enquiries, and a Mixture of different Subjects, had contributed to the Obscurity of Writings intended to promote Science, and therefore proposed, as he informs us, to treat of Fractures and the Diseases of Eyes in separate Books.

His intire Omission of the Distempers of Women, is another Instance of the Accuracy of his Method. As those Disorders proceed from the peculiar Structure and Functions of the Parts, he probably imagined, that they had no Place in a general Treatise of Physic, and that by enlarging his Scheme he should only perplex it.

Whether he intended another Treatise on Female Diseases, or whether he lived to execute his other Designs, it is now impossible to discover; but as he wrote the Books which now remain in his old Age, when he could no longer support the Fatigue of Practice, it is more probable that he did not live to finish his Designs than that any of his Works could perish.

He appears through his whole Works to have attended diligently not only the Instructions of his Predecessors, but to the Precepts of far greater Certainty, the Dictates of Reason,

and the Evidence of Experience. He seems to have adventured to use violent Methods in Extremities, yet not wantonly to have sported with Life. He frequently deviates from the received Practice, and perhaps the Introduction of *Steel in Substance* may be justly ascribed to him, since it is mentioned by no earlier Author.

Alexander's Learning and Judgment did not exempt him from some Weaknesses, from which it might be justly expected that either his Reason should have preserved him, or his Experience set him free.

He is strongly inclined to believe whatever has been told of the Efficacy of Medicines, and seems never to suspect either Weakness or Imposture. Nor is the Power of Medicines the only Object of his Credulity, which extends even to the Efficacy of Amulets and Charms, and he mentions some Remedies of this Sort for the Ague, Stone, Gout, and Colic. Those whose Reverence for Antiquity produces in them a Regard even for the Follies and Superstitions of antient Times, may here gratify their Curiosity with a Quotation from *Ostanes*, one of the old Persian Magi.

It is useless either to inquire into the Reasons of this Depravation of *Alexander's* Understanding, or to extenuate his Error, by enumerating the learned and wise Men that have been misled by Superstition. The Causes of Error are innumerable, and therefore cannot be particularly pointed out, and to produce Testimonies in Favour of Folly, is at least to contribute very little to its Extirpation.

It is probable from some of these Charms, which consist of Passages from the Bible that *Alexander* was a Christian; but if this Proof of his Religion be allowed, it evinces likewise, what is no Advancement of his Character, that he had learned his Religion with a very slight Attention.

Whatever might have been his Character as a Man, he has deserved as a Writer much more Applause than he commonly receives, and perhaps he is in Merit the next of the Greek Authors to *Aretæus* and *Hippocrates*.

THE EDITIONS OF ALEXANDER'S WORKS are

In Greek, *Parisis apud Robertum Stephanum, 1548, Fol. cum Castigationibus Jacobi Goupili.*

An old barbarous Latin Translation, in the Opinion of *Fabricius*, from some Arabic Translation, under the Title of *Alexandri Yatros Practica*, of which there have been many Editions, as *Lugduni, 1504. 4to. Papiæ, 1512. 8vo. Venetiis, 1522. Fol.*

Albanus Torinus afterwards put this into better Latin, but this was not a Translation from the Greek, but a Metaphrasis of the barbarous Translation above-mentioned. It was published, *Basil. apud Henricum Petri, 1533. Fol. and 1541. Fol.*

Johannes Guinterius Andernacus translated the Greek into Latin. Of this Translation there have been the following Editions:

Argentorati apud Remigium Guidonem, 1549. 8vo.

Lugduni apud Antonium Vincentium, 1560. 12mo.

Lugduni, 1575, cum Johannis Molinæi Annotationibus.

This Translation is also amongst the *Medicæ Artis Principes*, published by *Stevens*.

Many detached Pieces have also been published amongst Collections of Authors upon different Medicinal Subjects.

There is a small Treatise, *ὑπὲρ ἐντέρας*, of Worms, which is ascribed to *Alexander* by *Mercurialis*, and is addressed by *Alexander* to his Friend *Theodorus*. This is published amongst some of the Works of *Mercurialis*, and is inserted by *Fabricius* in his *Bibliotheca Græca*, in Greek and Latin, at the End of his Article of *Alexander*. It is not printed amongst his other Works.

There were many Physicians of this Name before *Alexander Trallianus*, but we know of nothing remarkable relating to them.

ALEXANDRIA. A Name of the *Daphne* (*Bay-tree*) it is hot, acrid, and bitterish; whence it provokes Urine and the Menes. The *Daphnoides* (*Periwinkle*) has the same Qualities, and so has the *Chamædaphne* (*Spurge-laurel*) which is also eaten. *P. Eginet. L. 7. C. 3.*

ALEXANDRI ANTIDOTUS AUREA. *Alexander's golden Antidote*, excellent for Defluxions from the Head, for it immediately alleviates the Pain of it, stops Tears from the Eyes, and cures the Tooth-ach, not only drank but laid on the Place. It perfectly relieves those who are taken with a sudden Fit of an Epilepsy, composes the extravagant Gestures of mad People, and is admirable for all Kinds of Pain in the Head. It is good for coughing, consumptive, cardiac, and asthmatic Patients. It wonderfully relieves such as vomit Blood, from some inward Erosion, is good for the Palsy, and Disorders of the Viscera and Sides, breaks the Stone, cures the Strangury and Difficulty of Urine, and all Disorders of the Uterus; gives Relief in Quotidian, Tertian, and Quartan Agues, if taken before the Fit. Whoever shall accustom himself to this Antidote, will never be subject to the Apoplexy nor Colic. It is prepared in this Manner:

Take of Afarabacca, Henbane, Carpobalsamum, each two Drams and a half; of Cloves, Opium, Myrrh, Cyperus, each two Drams; of Opobalsamum, Indian Leaf, Cinnamon, Zedoary, Ginger, Costus, Coral, Cassia, Euphorbia, Gum Tragacanth, Frankincense, Styrax Calamita, Celtic Nard, Spignel, Hartwort, Mustard, Saxifrage, Dill, Anise, each one Dram; of Xylaloes, Rheum Ponticum, Alipta Moschata, Castor, Spikenard, Galangals, Opoponax, Anacardium, Mastic, crude Sulphur, Peony, Eringo, Pulp of Dates, red and white Hermodactyls, Roses, Thyme, Acorus, Pennyroyal, Gentian, the Bark of the Root of Mandrake, Germander, Valerian, Bishops Weed, Bay-Berries, long and white Pepper, Xylobalsamum, Carnabadium (that is, according to the Commentator, Ethiopian Cummin) Macedonian Parsley-seeds, Lovage, the Seeds of Rue, and Sinon (a Sort of wild Parsley, according to the Commentator) of each a Dram and half; of pure Gold, pure Silver, Pearls not perforated, the Blatta Byzantina, the Bone of the Stag's Heart, of each the Quantity of fourteen Grains of Wheat; of Sapphire, Emerald, and Jasper Stones, each one Dram; of Hasle-nut, two Drams; of Pelitory of Spain, Shavings of Ivory, Calamus odoratus, each the Quantity of twenty-nine Grains of Wheat; of Honey or Sugar a sufficient Quantity. The Dose is the Quantity of an Hasle-nut. *Myrepsus, Sect. I. Cap. 1.*

ALEXANDRI REGIS COLLYRIUM SICCUM, *King Alexander's dry Medicine for the Eyes*, was composed of Saffron, Celtic Nard, and Terra Ampelitis (a Sort of bituminous Coal). *Actius, Tetr. 2. C. 39.*

ALEXANDRINUM EMPLASTRUM VIRIDE. A Plaister described by Celsus, *L. 5. C. 19.* and by him recommended as a Drawer.

Take of Plumose Alum, one Ounce twenty Grains; Sal Ammoniac, seven Drams seventeen Grains and a half; Squama Eris, two Ounces forty Grains; of Myrrh and Frankincense, each two Ounces, two Drams, forty-five Grains; of Wax, one Pound, seven Ounces, four Drams, fifteen Grains; of Colophonian or Pine-resin, two Pounds, five Drams, fifty-five Grains; of Oil, half a Pint; of Vinegar, a Pint.

ALEXANTHI, or ALTINGAT. Rulandus explains this *Flos Eris, Flowers of Copper*, perhaps the Rust.

ALEXASTHÆ. *Ἀλεξασθῆς*. Erotian and Hesychius explain it by the Word *ἰατρικόν*, to bring Aid, repel, succour; and thus it is used by Hippocrates, *Ἀλ. ὅτι τοῖς ἐνδεδυσμένοις τοῖς ἰατρικῶν ἰατρικῶν*, by this Regimen therefore such must be relieved. *De Salub. Vict. Rat.*

ALEXICACON. An Amulet, said to be powerful against Poisons. From *ἀλεξέω*, to repel, and *κακόν*, Evil. *Blancard.*

ALEXION. This Physician lived in the Time of Cicero and Atticus, and had a great Share in the Friendship of both those illustrious Persons. He died before Cicero, and was very much lamented by him, as appears from what Cicero himself writes to Atticus on that Occasion: "O factum male de Alexione! incredibile est quantā me molestia affecerit; nec me hercule ex ea parte maximē quod plerique mecum; ad quem igitur te Medicum conferes? Quid mihi jam Medico? Aut si opus est, tanta inopia est? Amorem erga me, humanitatem, suavitatemque desidero; etiam illud; quid est quod non pertimescendum sit, cum hominem temperantem, summum Medicum, tantus improviso morbus oppresserit? Sed ad hæc omnia una consolatio est, quod ea conditione nati sumus; ut nihil quod homini accidere possit recusare debeamus."—*Epistol. ad Attic. Lib. 15. Cap. 1.*—What a Misfortune is the Death of Alexion! I cannot express how deeply I am affected by it; not for that Reason which chiefly afflicts others; their being at a Loss what Physician they shall apply themselves to. For what Occasion have I for a Physician? Or if I had, is there so great a Scarcity of them; No,—what I lament is the warm and sincere Friend, the generous, humane Man; and the agreeable Companion. Besides, what has not one to fear; when we see it in the Power of a Disease to snatch away, so suddenly, a Man of his Temperance and consummate Skill in Physic? But for all these Things we have only one Consolation, namely, that we are born into the World on this Condition; that we submit to all those Accidents to which human Nature is subject.—What Cicero says here gives us a very advantageous Idea of this Physician. It is a Loss to the World that we have no farther Particulars concerning him.

ALEXIPHARMACA. From *ἀλεξέω*, to repel or drive away, and *φάρμακον*, properly a Poison. *Alexipharmics*. An *Alexipharmic* seems originally to have signified a Remedy to expel, or prevent the ill Effects of Poisons taken internally, and this is Galen's Explanation. But since some amongst the Moderns had conjured up a chimerical Poison, in order to inflame or otherwise affect the imaginary animal Spirits in acute Distempers,

Alexipharmics have been understood to mean Remedies adapted to expel this Poison by the cutaneous Pores, in the Form of Sweat. Hence it appears, that *Alexipharmics* mean just the same as *Sudorifics*. I am persuaded that no Theory was ever introduced into Medicine without very ill Effects upon Practice; but that which paved the Way for *Alexipharmics* has exerted extraordinary Heroisms, and made uncommon Havock amongst Mankind.

Hippocrates in his Treatise *de Ratione Victus in Acutis*, has the following Passage: *Whoever in the Beginning of an inflammatory Disease attempts the Cure by Cathartics, does not in the least diminish the Tension and Inflammation of the Part affected; for the Distemper in this State of Crudity, will not yield to such Medicines; on the contrary, this Method of Treatment liquefies and wastes the sound Parts, which would otherwise resist the Distemper; and when the Body is in this Manner weakened, the Disease gets Ground, till at last it becomes incurable.* Though this is said with a great deal of Justice and Propriety, I am persuaded it may with stronger Reason be applied to Sudorifics, that is, to *Alexipharmics*, which frequently do a great deal of Mischief. And indeed there is nothing in which the lower Class of Practitioners in Physic make more fatal Errors, than in the Use of *Alexipharmics*, which I have frequently known exhibited to young People of plethoric Habits, in the very Beginning of Fevers, and even without previous Evacuations.

About the Year 1723; 1724, or 1725, a Fever appeared with uncommon Violence, and was more universal than any I have ever known, and by this great Numbers of working People perished, insomuch that in many Countries scarcely enough were left to gather in the Fruits of the Earth; and this Sort of Fever continued for many Years after. In this Disorder it was remarkable, that a warm Regimen, or hot Medicines, seldom or never failed to render the Fever continual, and keep it so, bringing on Deliria, and all Symptoms of Malignity; whereas a cool Regimen, with Evacuations by Bleeding, and Purging with Caution, and an intire Abstinence from hot Medicines, almost always brought the Fever to a regular Intermision, and then the Bark effectually took it off. As I had an Opportunity of seeing a great Number of Patients under this Fever, I was abundantly convinced, that more died of *Alexipharmics* than of the Distemper itself.

But that I may not appear singular with Respect to this Sort of Medicine, I shall give the Opinion of the illustrious Hoffman upon this Subject, who having just before mentioned Cathartics goes on thus:

There is another Set of Evacuants which carry off the more subtle Parts of the morbid Matter, by the Pores of the Skin, in a plentiful, less offensive, gentle, and more imperceptible Manner. The Remedies most conducive to this are called *Sudorifics*, and by the Greeks *Hydrotics*; by whose Operation a sensible Moisture is perspired through the cutaneous Glands. Of the vegetable Kind the most efficacious, for this Purpose, are the Roots of a very acrid, penetrating, oily Taste, as those of Angelica, the different Species of Master-wort, Butter-burr, Elecampañe, Lovage, Swallow-wort, Valerian, Contrayerva, Virginia Snake-root, Lignum Guajacum, and Sassafras, with their Barks. In the mineral Kingdom crude Antimony, Regulus Antimonii medicinalis, volatile Tincture of Sulphur, prepared of Quick-lime, Sal Ammoniac and Sulphur, corrected and fixed Sulphur of Antimony, and also the Mixture simple. Likewise Venice Treacle, its Essence, Spirit, and Water; all Spirits and volatile Salts prepared from the Parts of Animals, particularly Harts-horn, Ivory, and Earth-worms, Spiritus Buffii, Tartar, Silk, Soot, the Essences of Woods, and the distilled fetid Oils, as fetid Oil of Harts-horn dissolved in Spirit of Wine.

These nobler Medicines, of the sudorific Kind, owe the Virtue of their Operation to the Power they possess of increasing the Systaltic Motion of the Heart, and the Elasticity of the Arteries, as to the Number and Force of their Vibrations, by which Means, a greater Velocity being added to the Circulation, they protrude the perspirable Matter through the outward and porous Substance of the Skin. This they perform either by a subtle, acrid, hot Oil, as the Roots above-mentioned, which are also called *Alexipharmics*; or by a volatile empyreumatic Salt of an igneous Nature, such as are all the Spirits, volatile Salts, and Oils from Animals; or by an acrid, resinous Salt, more or less fixed, as the Root of white Burnet, Guajacum and its Bark, Contrayerva, Virginia Snake-root; or lastly, they act, and that very powerfully, by Means of a very fine mineral Salt and Sulphur, by which they rouse the nervous Fibres to a violent Motion; and for this Purpose a very small Dose is sufficient. Thus a single Grain of our diaphoretic Mercury, or two or three Grains of fixed Sulphur of Antimony will raise a Sweat over every Part of the Body. A Decoction of the Woods, or a Decoction of crude Antimony with the Woods, also Regulus Antimonii medicinalis have the same Effect.

I. These strong Sudorifics, though given in a larger Quantity, will by no Means raise a Sweat, unless the Body is prepar-

ed for it; that is, unless the porous Substance of the Skin be sufficiently open and lax, or unless the Blood be enough diluted. Wherefore if any one, in the Cure of a Disease, thinks Sweating required, it will be necessary for him to give the above-mentioned Sudorifics with a sufficient Quantity of some Liquid to dilute the Blood; for Example, a weak Tea, or a Decoction of Barley; and that the Pores of the Skin may obtain a due Relaxation, the Person to be sweated should be put into a warm Bed, or hot Stove, or into a Bath, especially a Vapour-bath, that so a plentiful Sweat may be excited.

II. These very active Sudorifics rarely find a Place in Medicine, and are not to be administered except with singular Caution. For a Sweat never arises in a healthful and natural State, unless the Blood is put into an extraordinary Motion; nor when this happens, is it a Sign of Health, like insensible Perspiration, the Matter of which is void of Acrimony, watery, of Kin to the nutritious Juices, and almost without either Taste or Smell, and differs very much from Sweat, which is of a salt Taste, a foetid Smell, and approaches the Nature of Urine. Besides, these Sudorifics excite a great Commotion, and notable Orgasm; for they act not with Moderation but Rapidity, whence it comes to pass, that in Bodies full of Blood, or contaminated Serum, by impelling the Fluids with too much Violence to the small and narrow Vessels, they bring on dangerous and acute Symptoms, occasioned by the Inflammation and Redundance of Humours. But they are most hurtful where the Primæ Viæ are obstructed by a Load of vitious Humours, where the Body is costive, and when they are administered immediately after a violent Fit of Anger. By this pernicious Practice, I have known them more than once occasion arthritic and rheumatic Pains, slow and hectic Fevers, which have proved of long Continuance, and been attended with imminent Danger.

III. In all acute Diseases, as inflammatory and scarlet Fevers, Sudorifics are to be intirely banished, or, at least, to be administered very seldom, and that with the greatest Caution. For I have often observed that the promiscuous Use of Alexipharmics, as the Custom too generally prevails, has only served to increase Heat, Anxiety, and the Violence of the Symptoms. These Remedies are called *Alexipharmics*, as are also all those of the theriacal Kind, from a Virtue attributed to them of resisting Poisons and malignant Humours, for which Reason they are highly extolled by Physicians in the Plague, and other contagious Distempers. But the Truth is, they are much more powerful for the Prevention than Cure of these Diseases, especially when an epidemical and malignant Distemper owes its Birth to an over-wet, foggy, cloudy Season, which has been long destitute of the East and North Winds, or to a Deluge or Inundation of Waters. For in this Case it will be much better and safer to give them in Wine-vinegar diluted with Water, or to infuse the sudorific Roots in Vinegar, which by this Means being impregnated with their alexipharmic Virtue, two or three Spoonfuls may be drank in any convenient aqueous Vehicle. The Aqua prophylactica Sylvii is also of admirable Use at a Time when such Distempers are abroad.

It is to be remarked, That the East and North Winds, by bringing with them plentifully an Acid, render the Air more cool and active, and destroy Contagion. See AER.

IV. But Sweating is very serviceable in those Diseases which proceed from external Cold, and obstructed Perspiration, as in Catarrhs, Rheumatisms, Fluxes, Stoppages of the Head, Coughs, and glandular Tumors: Also when Danger is apprehended from a Person's having drank a large Quantity of any cold Liquor, when very hot, or in a Sweat. But then they should be administered in the Beginning of these Disorders, and in such Cases Bezoardic Tincture, or Spiritus Bezoardicus Buffii, mixed with our anodyne Liquor is of excellent Use. Nor is a Sudorific of less Service in the Beginning of any infectious Distemper, taken immediately after a mild Emetic; and for this Purpose may be used Bezoardic Vinegar, or the Bezoardic Powder, with a little Camphire, which is the chief of *Alexipharmics*.

V. Likewise in those Diseases which have their Seat in the porous and fibrous Substance of the Skin, and consist of an acrid viscid Matter, which destroys and deforms its Texture, as an inveterate Itch, the Ring-worm, Leprosy, and venereal Pustules and Ulcers, a plentiful Sweat may be excited to great Advantage, with proper Remedies. The same may be also practised in arthritic and rheumatic Pains in any Part of the Body, for by this Means the acrid, viscid, and stagnating Serum, which adheres to the nervous Membranes, is thrown off and discharged. For the same Reason in all those Diseases which are called *cold*, as in Dropsies of every Kind, the cold Scurvy, Pox, settled Gout, Sciatica, Palsy, and others of the same Nature, Sudorifics are of great Efficacy; because they promote and restore the Elasticity and contractile Power of the Heart and Vessels, which in Disorders of this Kind are very much depressed, and increase the Circulation of the Blood, for the better Separation of the morbid Matter. But this Course must be persisted in for some Time.

VI. Sudorifics always operate best, when taken in a sufficient Quantity of some warm Liquid. Celsus, in the sixth Chapter

of his third Book, commends warm Water for this Purpose: His Words are these, *Si Nota est Sudoris venturi, tum demum calidam Aquam Potui dare oportet, cujus salubris Effectus est, si Sudorem per omnia Membra effundit.* 'When you perceive the Sweat coming you should give warm Water to drink, which hath a most healthful Effect, if it excite a Sweat over the whole Body.' It is notorious that this is procured in the most plentiful Manner by a Decoction of the Woods, whose Use in venereal Cases, and other cold Distempers, cannot be enough commended. I have also known several Country People happily cured of Intermittent Fevers, and Tertian and Quartan Agues, by taking a few Hours before the Fit a Vomit, and immediately after it a Sudorific (observing a Regimen) of Rob of Elder, Salt of Tartar, and a few Corns of Pepper, mixed together in a Spoonful or two of Brandy.

In the Passage above quoted Celsus only advises to promote a Sweat when the Marks of one approaching are evident.

Diaphoretics are inferior in their Power of acting to Sudorifics, but much superior to them in their healthful Qualities, which gently increase and promote Perspiration. Of these the chief in the vegetable Kingdom, are the Roots of China, Sarsaparilla, the Carline Thistle, and Gentian. Of Herbs, the holy Thistle intire, its Seed and all the Preparations from it, whether Essences, Waters, Extracts, or Salts; Water Germander, the Elder, and Dwarf-Elder, with its Flowers, Rob, and Water; also Fumitory, Scabious, Saffron, the Flowers of Marygold, and Opium. In the animal Kingdom, all Bones, Horns and Teeth of Animals, whether rasped, or burnt to Ashes and chymically prepared, especially those belonging to the Stag; the Stones, Shells, and Claws of Crabs. Of Earths, all sealed Earths, and different Kinds of Marle, and the Bolus Fabrilis. Of Salts, the Salts of Plants procured by Burning, and Nitre. Of precious and exotic Stones, the Petra di Porco, and the Eastern and Western Bezoar Stone. Of Minerals and chymical Preparations, the Flowers and Milk of Sulphur, Cinnamon, native, common, and that of Antimony; diaphoretic Antimony, Cerufs of Antimony, Magistery of Antimony, the Bezoardic Mineral, Tinctura Temperata of Antimony, prepared from the Regulus and Salt of Tartar, and Poterius's Antihectic. Of Compounds, Goa Stone, which is compounded of oriental Bezoar, Tragacanth, and Ambergrise; Sennertus's Bezoardic Powder, the English and Pannonian red Powder, Dorncrellius's Cordial, our mineral anodyne Liquor, Wine Vinegar, or distilled Vinegar, with Elder Flowers, or Crab Stones infused in it; our Pulvis Polychrestus Diaphoreticus, Theriaca Coelestis, Liquid Laudanum, and Wildegansius's Pills.

The Operation of Diaphoretics is manifold and various; for either they act in a privative Manner, by absorbing and changing the Acid in the Primæ Viæ, which, carried into the Blood, depresses its Spirituosity, Fluidity, and intestine Motion, of which Kind are all the Earths of an alkaline Nature: Or by imbibing the superfluous Moisture, and bracing the relaxed Fibres, as the sealed Earths, Boles and Marles; also Bones and Horns, both those burnt and those chymically prepared, and the Unicorn Stone: Or by relaxing and mollifying, in Diseases of the Skin, its contracted Superficies by their mild anodyne and vaporous Sulphur, as the different Species of Elder, especially the Flowers, Saffron and its Extract, the Flowers of red Poppy or Corn-Rose, our anodyne, mineral Liquor, the Emulsions of Poppy-seed, corrected Opizates, particularly the Theriaca Coelestis, Wildegansius's Pills, and Liquid Laudanum prepared as directed by Sydenham: Or by composing and quieting the too violent intestine Motion of the Blood, as the Remedies of the nitrous Kind, corrected by being joined with the more fixed Diaphoretics; also Spirit of Nitre dulcified, Emulsions of the four greater cold Seeds, and the milder Acids, as Juice of Lemons and Vinegar: Or lastly in a positive Manner, by gently stimulating the Fibres and languid Vessels, of which Sort are the holy Thistle, Water Germander, Fumitory, China, Sarsaparilla, lesser Centory, Scabious, Carline Thistle, and Gentian.

I. Now as this Evacuation of the finer Parts of the morbid Matter through the Pores of the Skin, by insensible Transpiration, is of all others the most healthful; and as an Obstruction thereof is the Occasion of many Maladies; so the Use of Diaphoretics, which promote this cutaneous Excretion, is certainly very great, universal, and almost infallible, in almost all Diseases, even those which, from their present Symptoms, we are not thoroughly acquainted with; so that a Physician can by no Means be without them. For an increased Circulation of the Blood, and an enlarged Perspiration, are the grand Mediums and Instruments of Nature, by which the morbid Matter in any Disease is corrected, digested, resolved, and at last thrown off, and the Distemper cured without Danger. Particularly in all acute Diseases, as Fevers and Inflammations of all Kinds, these alone given in some convenient Vehicle, in small Doses, and continued for some Time, answer every Intention of Cure, and are in Truth the best Discutients and Purifiers of the Mass of Blood.

II. Because excessive Heat, especially in Summer, and in choleric and bilious Constitutions, also in choleric and bilious Fevers, dries too much, consumes Moisture, and hinders Perspiration, acidulated and nitrous Remedies, and particularly Crabs-eyes

eyes with Nitre, given in a Julap of diaphoretic Waters and Syrup of Citron-juice, by moderating the too great Heat, and procuring a plentiful Diaphoresis, give great Relief to the Patient.

III. When through the Violence of any Disorder the Skin is dry and without Moisture, and its Pores become narrow and contracted, it is always best to join some mild Anodynes and Antispasmodics to the Diaphoretics; and in this Case our anodyne mineral Liquor, mixed to the Quantity of three Parts with one Part of Spiritus Bezoardicus Buffii, is of admirable Virtue, as is also the fixed diaphoretic Powder, a little nitrous, with Cinnabar, and one or two Grains of Wildegansius's Pill, as is witnessed in many Instances by Ettmuller, in his Dissertation on the diaphoretic Virtue of Opium.

IV. Diaphoretic Powders have this peculiar Property, that they not only promote Perspiration, but also often exert a loosening and remarkably diuretic Virtue. This I can affirm from manifold Experience, that our bezoardic polychrest Powder, being taken in the Morning or Afternoon, if it meets with acid Juices in the Primæ Viæ, will give four or five Stools, which in old Men and Hypochondriacs is attended with great Advantage. The same being given at going to Bed, if the Skin is not properly disposed to admit of a Sweat, as in the Beginning of Catarrhs, will work off by a large Discharge of Urine; but where the Skin is sufficiently disposed to a Diaphoresis, a plentiful Sweat frequently ensues.

V. In acute Diseases and Fevers, where but little Acid is lodged in the Primæ Viæ, it will be safer and of more Service to give the fixed and earthy Diaphoretics in a small Quantity, and well mixed with Syrup of Citron-juice, or Wine Vinegar, because Vinegar alone will not coagulate with Water, but often resolves and throws off the stagnating Blood, especially if joined with Diaphoretics. *Frideric. Hoffman. Medicinæ Rationalis Systematica.*

Thus Hoffman very justly distinguishes betwixt Sudorifics or Alexipharmics, and Diaphoretics; Alexipharmics being such Medicines as excite a great Degree of Motion and Heat, and a considerable Orgasm in the Body, which tend to extort profuse Sweats, and do a disagreeable, and prejudicial Violence to Nature, who is by this Means deprived of a great deal of the more fluid Part of the Blood, which otherwise might be of great Use in preserving the whole Mass in a State of Fluidity, in promoting the Solution of the stagnating, and obstructing Humours, and assisting in the Expulsion of the morbid Matter out of the Limits of the Circulation; whereas Diaphoretics are Medicines endued with a gently stimulating, and perhaps resolute Virtue, by which they aid and assist Nature in carrying on her own salutary Purposes, without any Tendency to divert her from her Method, or to do any Violence.

In order to account for the very sudden Effects which some Alexipharmics have in raising a Sweat, before they can possibly be supposed to enter into the Blood, we must reflect, that Alexipharmics consist of very penetrating and stimulating Particles. Now when these act upon the nervous Coats of the Stomach, the Stimulation thereby caused derives a greater Influx of the nervous Fluid (if any such there be) into these Nerves, and all the correspondent Branches of Nerves proceeding from the same Trunk. Now the Stomach receives a great many Nerves from the descending Trunks of the Par Vagum, and some Branches immediately from the Plexus Cardiacus, formed by the same Par Vagum, and situated a little above the Heart, from which Plexus, the Heart is furnished with Nerves. Whatever therefore stimulates the Nerves of the Stomach, must also affect the Nerves of the Heart, the Consequence of which is, that the Force and Frequency of the Contractions of the Heart must be increased, and of Course the general Heat of the Fluids circulating by Means of such Contraction, because the Motion and Friction is greater than before. The Blood thus circulating with an increased Velocity, must be impelled more frequently and with more Force towards the Surface of the Skin, and hence an increased Evacuation by the cutaneous Pores. I am far from being certain that what is generally understood by the *Animal Spirits*, or nervous Fluid, really exist in Nature, but let the immediate Vehicles of Sensation and Motion be whatever they will, what I have said with Respect to the Stimulation of the Nerves must hold true.

ALEXIPPUS, was one of the Physicians of Alexander the Great; who, as Plutarch informs us, wrote him a Letter of Thanks, on Account of his having recovered Peucestas from a dangerous Disease.

ALEXIPYRETICUM, ALEXIPYRETOS, and ALEXIPYRETUM. From *ἀλεξω*, to drive away, and *πυρετός*, a Fever. It signifies any Remedy for a Fever.

ALEXIR. A Medicine chymically prepared; an Elixir. *Rulandus. Johnson.*

ALEXITERIA. *Ἀλεξίτηρια*. Alexiterials. In Hippocrates, and indeed strictly (*Ἀλεξίτηρια*) Alexiteria signifies nothing more than *Helps*, or *Remedies*. Thus in the first Book on the Diseases of Women, the Author having mentioned Asses Milk and Wine as proper in a particular State of the Uterus, add

καὶ τὸ ἄσιν ἀλεξίτηρια, and other Remedies. Thus also in his Treatise on Regimen in acute Diseases, having just before taken Notice of some bad Symptoms arising from the continual Use of Hydromel in acute Cases, he says, *ἀλεξίτηρια δὲ τῶν γυναικῶν, The Remedies for these shall be specified.*

But later Writers applied Alexiteria to external Remedies against the Bites of venomous Animals, and even to Amulets and Charms, directed to be wore with a View of preventing the ill Consequences of Poisons, Incantations, and Fascination.

It is said by some Authors, that Alexiterials differ from Alexipharmics thus: Alexipharmics signify Medicines against Poisons taken internally; whereas Alexiterials are Remedies against the Poisons of venomous Animals inflicted externally. Hence the Word has been said to be derived from *ἀλεξω*, to drive away, or *repel*, and *θηρ*, a wild, or *poisonous Beast*; but this seems without any Foundation, for *Ἀλεξίτηρια* seems to import exactly the same as *βονθήματα*, *Helps*, *Aids*, *Remedies*, as *ἀνέκασθαι* is in Signification the same as *βονθῆσαι*, to help, aid, or assist. And thus both are explained by Galen.

Our College Dispensatory give a Water under the Title of Alexiterial Milk-Water, and some Troches under the Name of Trochisci Alexiterii, Alexiterial Troches.

AQUA LACTIS ALEXITERIA, Alexiterial Milk-Water:

Take of the Leaves of Meadow-sweet, Carduus Benedictus, and Goats-rue, each six Handfuls; of Mint and Wormwood, each five Handfuls; of Rue, three Handfuls; of Angelica, two Handfuls. Pour three Gallons of new Milk upon the Ingredients when bruised, and distil in a Bath or a Sand-heat.

TROCHISCI ALEXITERII, Alexiterial Troches:

Take of Zedoary-root, of the Virginian Snake-root, and of the Powder of Crab's Claws, each one Dram and half; of the outer Bark of Citrons dried, and of Angelica-seeds, each one Dram; of Armenian Bole, half a Dram; and of white Sugar-candy the Weight of the Whole. Let them be all made into a fine Powder; and then, with a sufficient Quantity of the Mucilage of Gum Tragacanth made in Treacle-water, work them into a Paste fit for Troches.

These are transcribed into the first Edition of the College Dispensatory from Renodæus, much in the same Manner as Schroder hath also got them in his *Pharmacopœia Medico-Chymica*, and it was continued down to the last of the College without the Emendations here, though much corrected to what it was before. The Virginian Snake-root here is intirely new, and many Things are left out which not only made the Medicine too nauseous for this Form, especially the Gentian; but also lessened the Proportions of the most efficacious Ingredients, and frustrated the main Intention, which seems originally to have been contrived as a Preservative against pestilential Contagions. *Quincy's London Dispensatory.*

ALEZARAM. (*Lotura Plumbi*) The Washing of Lead: *Rulandus. Johnson.*

ALFACTA. Distillation. *Rulandus. Johnson.*

ALFADIDAM. The Scoria of Gold, Iron, or Copper: It also signifies Burnt Copper. *Castellus* from *Rulandus* and *Johnson.*

ALFASIT, or ALUASIT (*Testa*) an earthen Pot. *Rulandus.*

ALFATIDA. Burnt Copper, or (*Laminatura*) the Lamina or Scales of Copper. *Rulandus. Johnson.*

ALFATIDE. Sal Ammoniac. *Rulandus.*

ALFESERA, or ALPHESERA, is the Name of a Confection described by Mesue, and said to be good in spasmodic Affections of the Nerves. From the Arabic Particle *Al*, and the Word *Fesera*, or *Phesera*, the Root of the *Vitis Alba*. *Castellus.*

ALFOI. Sal Ammoniac. *Castellus* from *Rulandus.*

ALFUSA. Tutty. *Castellus* from *Rulandus.*

ALGA. A Sea-plant thus named by Authors:

Πικρὸν θαλάσσιον; Dioscor. Alga, Offic. GRASS WRACK. Ger. Emac. 1569. Alga, & Ulva; Chab. 569. Alga anguifolia variorum, C. B. 364. J. B. 3. 794. Raii Hist. 1. 75. Fucus marinus, sive Alga marina graminea, WRAKE, OR SEA WEED, OR GRASSE, Park. 1291. Hist. Oxon. 3. 647. Raii Synop. 7. GRASS WRACK. Dale.

There are three Kinds of Alga; one broad, another oblong and reddish, and the third white, which grows in Crete along the Sea-shore, bears a good Flower, and is not subject to Putrefaction.

All the Kinds are of a cooling Nature, and effectual in Cataplasms; for the Gout, and Inflammations. But they are to be used while they are moist. Nicander gives the red Sort a Place amongst the Alexipharmics, and some have taken it for the Fucus which Women use to give themselves a false Colour, but this last is a Root of that Name which serves them for the said Purpose. *Dioscor. L. 4. C. 100. copied by Oribasius Med. Coll. Lib. 12.*

Alga, *Sea-weed*, called also *Beta maritima*, *Sea Moss*, and *Chorda*; is compounded of a terreftrious and aqueous Substance, both cold, for it is astringent to the Taste, and refrigerating to the Touch. *Orib. Med. Col. Lib. 15. Cap. 1.*

Taken green and wet just out of the Sea, it is an extraordinary Cooler, with a moderate Astringency. *Orib. de Virt. Simpl. L. 2. C. 1. Aetius, Tetr. 1. Serm. 1.*

Alga is a Kind of Plant which grows in the Water. There are several Kinds of it. The most Part shoot out their Leaves like Grass, the rest like Hairs.

The common *Alga* is a Sea Plant, its Leaves are about a Foot and half long, smooth, soft, and easy to break, sometimes white, sometimes red, or of an obscure green, narrow, but some narrower than others. This Plant grows in great Quantities along the Shore of the Mediterranean Sea, and elsewhere. The Countrymen dry it, and it serves for Fodder for their Oxen and other Cattle, and obtain from it a very good Manure for the Earth.

They also make Glass of it as with the Kali, for it contains a great Deal of Salt.

It is aperitive, vulnerary, and desiccative, it is also esteemed good to kill Lice and Flees. *Lemery de Drogues.*

ALGALI. *Nitre. Rulandus. Johnson.*

ALGAMET. *Coals. Rulandus. Johnson.*

ALGARAB, or GARAB. *An Anchilops. Avicenna. Senert, Tom. 2. See ANCHILOPS.*

ALGAROT. See ALGEROTH.

ALGATIA. (*Cibetta*) *Civet. Johnson.*

ALGEDO. A Name of an Accident which sometimes happens in a Gonorrhœa, of which Cockburn gives the following Account:

Amongst the various Accidents that happen in the Course of a Gonorrhœa, none is attended with more violent Pain, and more dire Consequences, than a Running stopping soon after it appears, which we may properly call the *Algedo*; yet I do not find that any Author has offered any Observation of this Kind to the World; which Neglect very much arraigns their Sincerity, or the Accurateness, at least, they pretend to, in relating the various Appearances that occur in the Practice of a Gonorrhœa. Musitanus alone suggests the Symptom, but injudiciously places it among those that precede a Caruncle. For he alledges that we may apprehend a growing Caruncle, *Ex prægressâ sædâ Gonorrhœâ, quâ modò Stranguriam, modò Dysuriam, jam Ischuriam infert.* But I have observed, that if the Running does not proceed after the common Manner already related, but continues to be in a small Quantity, as it always shews itself at first; or if it stops without any sensible and obvious Cause of an improper Administration; in that Case there is often an intense Inflammation on the Glands, and an insufferable Pain striking into the Anus, sometimes into the Testicles, without their being in the least swelled, and most commonly into the Bladder, which last Pain is always attended with a frequent Desire of making Water; but it is made in a very small Quantity, and with much Difficulty. These Symptoms thus related become very manifest from the Nature of a Gonorrhœa, and of the Liquor of the Lacunæ. For let the infected Liquor of the Lacunæ be tied up by Applications or Administrations of any Kind, or become grosser on a sickly Account, so that the Stimulus of the Corruption does not excite the Quantity of the Efflux in a due Proportion; in that Case the Liquor is still more corrupted, and becomes more sharp. Now this sharp Liquor being constantly applied in the excretory Ducts of the Glands, to the membranous Coat of the Urethra, excites Pain and an Inflammation.

Pain being thus made in the Urethra, we may easily conceive how it is propagated into the Bladder, and other Parts mentioned above; for the Urethra is a continued Duct to the Neck of the Bladder, and the Inflammation is very readily carried its Length, and communicated to the Bladder, and with it the Pain. This is likewise the Reason that the Vasa Deferentia and Vesiculæ Seminales, that open into the Urethra, partake of this Inflammation, and communicate the Pain into the Testicles: As also, that the Pain is conveyed into the Anus by the Means of the accelerating Muscles of the Penis, which terminate in that Part.

But to explain these Symptoms more particularly, that the Design we have in curing may become more obvious and direct, we will begin with accounting for the frequent Desire of making Water; and why it is voided with great Pain, and in a small Quantity. The Reason of this Symptom is, that the Neck of the Bladder being vastly inflamed, it is vehemently stimulated by the Saltiness of the Water, and by this Stimulating a frequent Desire of discharging it is excited. The Bladder itself being also inflamed, it cannot be so easily applied for expelling the Urine, and therefore it is thrown out in a smaller Quantity; and, upon both Accounts, is made with great Pain. Moreover the Neck of the Bladder being thickened by the Inflammation, it is opened or dilated with great Difficulty, and therefore the Urine is neither freely expelled, nor without great Pain.

The frequent Irritating the Bladder with the sharp Urine is the Reason why the quick and repeated Pain in making Water is a more constant Symptom of the Stoppage of the corrupted Matter, than are either the Pain in the Anus or in the Testicles, though the Pain in these is produced as really by the Pain in the Urethra as that in the Bladder, but not so directly. For Pain made in contiguous Parts is occasioned by the Stimulus or Compression of adjacent Parts that are affected; so that the derived Pain is equally owing to the Inflammation, as is the Pain in the Part originally affected. Daily Experience affords us various and sensible Examples of Pain derived to a contiguous Part from another that is first hurt. A Pain any way produced in a Finger is not only propagated by the common bending Muscles that may send a Branch to some Distance, and thus be carried directly a great Length up the Arm, but it likewise affects other Muscles in the same Contiguity, and reaches farther than the Origine of any of the Muscles of the Fingers, and may be propagated to Parts very distant from that first affected with Pain.

But which is more surprising, contiguous Parts affected mutually by the Inflammation of either, not only receive Impressions of Pain from each other, but will even adhere and stick to one another. The Adhesion of the Lungs to the Pleura is an Affection of this Kind, as is the Adhesion of an Intestine to the Peritonæum, and such Adhesions of many other Parts that have often been found in dissecting Bodies, especially those that were morbid or sickly.

All these grievous Symptoms being produced by the retarded Efflux of the Liquor of the Lacunæ, notwithstanding that is sharp and corrupted, and commonly flows in a greater Quantity upon that Account; yet as this Liquor is found at present in a small Quantity, for Reasons afterwards to be assigned, it acquires the greatest Degree of Corruption possible, and that by its not running off in the ordinary Quantity. Now as this very sharp Liquor is constantly applied to the Urethra by its continuing in the Lacunæ, which run parallel to its inner Coat, the Pain is rendered more and more intense. Our Inquiry therefore must be, why this Efflux is retarded, notwithstanding that the Liquor is more sharp, or is indued with a greater Stimulus, a Cause we formerly found sufficient for exciting a Running. It will easily be believed that Injections and Medicines, that are any thing astringent, inwardly administered have sufficient Power to check the Discharge of the corrupted Liquor; nay, Medicines of such Qualities are esteemed so sufficient a Cause, that seldom any other has been assigned for the Interruption; so that we may assert, that these Medicines are sometimes the Occasion of checking the free Efflux of the Liquor of the Lacunæ, though it be corrupted, and were otherwise sharp enough to produce a Running.

But another Cause never yet assigned for producing such a Stoppage, is when the Liquor of the Lacunæ, even in this its corrupted State, acquires an extraordinary Grossness, and on that Account becomes incapable to flow, or flows only in a very inconsiderable Quantity. This Grossness of the Liquor of the Lacunæ is acquired from a Grossness in the Blood itself in a great many Diseases, as in a Cold, a Fever, &c. The Way how this Grossness is formed by a Cold or a Fever, is obvious from the general Defect of Secretions at that Time; inso-much that Hippocrates observes that Ulcers, and I have observed that Issues, very commonly dry up in the Beginning of a Fever. And in great Colds, when a Fever is generating, and in several other Distempers, the Liquor of the Lacunæ is become so gross, that the Quantity of its Efflux is but moderately augmented; though it being corrupted it stimulates the Glands and their excretory Ducts, and for that Reason ought to increase its Quantity considerably: Hence it is that the Pain, and all the above-mentioned Evils or Misfortunes are produced.

Some very good Practitioners, who have been apprised of the great Danger and Difficulty that arises from the slow Running in this Circumstance of a Fever, have attributed the Slowness of a Running, or the Smallness of its Quantity, to the Heat of the Fever, which they supposed did lick up the Matter of the Running; but this slow Efflux is truly an Unaptness in the Liquors to run off, and that because of their Thickness.

Because an inward Shanker sometimes suppresses the Running, it may give some Suspicion of its being an Occasion of this terrible Symptom; but Shankers seldom give any great Pain, nor do they infect the Liquor of the Lacunæ till they begin to dissolve; and this Liquor not being infected during the Hardness of the Shanker, there is not naturally any Pain produced on that Account, or Shankers in the Urethra never produce this painful Symptom. All this is manifest from the Experience of inward Shankers.

From what has been said it plainly appears, that the Inflammation and Pain in the Urethra, in the Glands, Bladder, Testicles, and in the Anus, are altogether the Consequences of this sharp Liquor's being pent up in the Lacunæ; and therefore, that in curing these Symptoms, little or no Regard is to be had to the Inflammation in the mentioned Parts, but rather to what may make the pent up Liquor flow. Indeed the Folly of endeavouring to cure Diseases, by taking Aim at their Symptoms,

is as conspicuous in the present Case, as it can be in any other whatsoever: So that Bleeding, Emulsions, and other cool Administrations that most readily occur to French Surgeons, are of no manner of Use. But Bathing, that commonly goes along with the former, is of great Use; though not for cooling an Inflammation, as they think, it really satisfying the principal End and Design of unlocking the Lacunæ, and giving a Passage to the stagnating Liquor. So vastly different is a Practice managed upon Analogy, and a blind Experience, and when our Experience is directed by Reason.

And therefore, as the Indication of Cure is always best drawn from the Nature of the Disease, I will endeavour to deduce the Method of Cure from the Nature of this Symptom thus explained, which being occasioned by the Discharge out of the Lacunæ being very little or nothing at all; and that upon the Account of the extraordinary Grossness their Liquor acquires, either on Account of the present State of the Blood, or that the Blood and the Liquor of the Lacunæ are become thicker by the Means of Medicines that bring this Quality of Thickness upon the Blood. The Method of Cure therefore consists in destroying the mentioned Grossness of these Liquors, which will be found more easily done when this Thickness is acquired by Medicines, than when it is occasioned by the Mearis expressed, while I investigated the Symptoms of Inflammation and Pain.

In conducting the Practice of Physicians for relieving these Symptoms, I cannot proceed in the Method of giving the Designs and Prescriptions of other Authors, none other having spoke of this Accident before me, and on that Account we have not any Method for curing what either they never observed; or they were afraid to relate Symptoms so surprising, and at the same Time so new, lest the first should cast some Reflection on their Judgment in treating, or the last on their Skill in discerning them. But as I am sure that no such Symptom has been mentioned among Physicians, so the Mistakes I might be under in first apprehending it, give more Credit to the rest of the Relation to Men of Worth and ingenious Physicians.

HISTORY I.

In August 1716, I was sent for to visit a Patient who had been long ill of a Gonorrhœa, which had been checked by an Injection made with Plantain Water, Honey of Roses, and Sugar of Lead. He had it once checked before he brought it from a foreign Country. As I found the Running of a very green Colour, and the Glans very much inflamed, I was persuaded that the Inflammation was continued from about the first Lacunæ down to the Neck of the Bladder, so that the best Course was to excite the Running.

For this Purpose I prescribed him a Scruple of Æthiops Antimonialis with ten Grains of Gum Guaiacum, to be taken every Night going to Bed, and in two or three Days the Running increased, and his Pains vanished.

HISTORY II.

It was in August 1716 that I found the *Algado*, when a Gentleman put himself under my Care to be cured of a Gonorrhœa; but finding he was ill of a continual Fever, I recommended it to him to return to his Lodging and to go to Bed.

Next Morning his Running was in a very small Quantity, though it had then appeared five Days; the Glans was prodigiously inflamed, and the Fever of a low Sort, that was like to hold him a Fortnight, or three Weeks.

I told him that in his Circumstances no Method for curing a Gonorrhœa could agree with the Practice of the Fever, excepting that by a proper Injection; but something extraordinary appearing in the Running, I was not willing to make Use of this new Method in a Case liable to a great Variety of Accidents, whereby both I and the Method might be exposed to much Obloquy; and as the Infection could not creep into the Blood by neglecting to cure it, the safest Course we could take was for curing the Fever.

Our Matters went very successfully while we pursued this View, but I was surprised that the Running did not increase as the Fever came to its State; but was rather less, and the Gentleman began then to complain of a Pain in making Water, and that he had often Occasion to make it. In a Fortnight the Fever went off, but my Patient was not yet in a Condition to enter upon any Course for the Gonorrhœa, which continued to be as was related at the Beginning. When he had been three or four Days about the House, and the Season of the Year warm, he was tempted to go out a walking in an adjacent Garden, though the Wind was Easterly, and the Garden on the River Side. He took Cold; and the Pain and Desire of making Water increased so vehemently, that he could not sleep, but sent early next Morning for me.

When I had considered these Symptoms, I found the Bladder was inflamed, but did not dream of this Inflammation being derived from some other Part, and therefore I ordered him Emulsions, Bathing, to be bled, and Clysters, on Account of this Inflammation. Moreover, the Pain being excessive, he sometimes took Clysters in a very small Quantity, in which were five Grains of Opium, to procure a little Quiet and Re-

spite from it. But as these Methods and Applications afforded small Relief, I was joined with another Physician, who agreeing with me, about the Opinion I had of the Bladder being inflamed, we pursued the former View with Changes of Medicines, and with as little Success.

The Pain darting some Time into the Anus, gave the other Physician some Suspicion of the Piles, but I thought it passed into that Part from the Bladder, as I did believe the Pain he found sometimes in some one of his Testicles likewise did: Nay, after every Day suspecting a new Disease, this Physician, at length, suspected his having a Carnosity, which I convinced him to be impossible in so little a Time; yet these Differences occasioned Mention to be made of having Assistance from a Surgeon, which I readily agreed to, and was mightily pleased with the Person he named, though he was a Stranger to me, he having a very good Character, both for his Honesty and Skill.

But before we met, the Disease shewed itself, for in the Water, appeared a great deal of Running, and of a Slough; so that afterwards we found we could have no other End to pursue, than that of exciting the Running. The Surgeon confessed he never had any such Case, but that the Matter of the Gonorrhœa had been licked up by the Fever. I added, that the Fever had certainly hindered the Running, as I have formerly explained, together with the mentioned Symptoms of Pain in the Bladder, Anus and Testicles; but when this Surgeon and I were met alone at this Patient's Lodging, I offered my Opinion about the true Cause of all such Accidents, which he generously acquiesced in, and told me, he had long entertained a like Opinion. He took Occasion, likewise, to declare to my Patient, that no Method could have been taken for the Gonorrhœa, that would not put him in Danger of his Life, or have ended in the Lues Venerea.

The Method therefore we took to provoke the Running, was by giving mercurial Medicines, and purging them off.

Take Calomel fifteen Grains,
Solid Laudanum one Grain;
Conserve of Hipps, enough to make a Bolus, to be taken going to Bed, and to be repeated the two succeeding Nights.

Take of Gereons Decoction of Senna, four Ounces,
Calabrian Manna, half an Ounce; make a Potion, to be taken the Morning after the last Bolus.

He proceeded in this Method almost a Month, before he was free from Pain. In all that Time, his Running never was in a great Quantity. He was obliged to persist taking the Emulsions, Broth, and other soft Liquors that were formerly prescribed for the Inflammation, which were proper enough to ease this Symptom, though not to cure it. When the Pain and Difficulty in making Water were removed, the small Gonorrhœa was cured by one of the common Forms.

HISTORY III.

In the same Month of August, 1716, I received a Letter from a Gentleman in the Country, desiring my Advice for an intolerable Pain he had when he made Water; and the frequent Desire he had to make it; which he always did in a very little Quantity. He told me, that he often was afflicted with the Pain in his Testicles, or in the Anus, when it was not working about his Bladder. He found he had a Gonorrhœa in the Morning, which stopped by Noon, and ever since that Time he had been tortured with Pain.

These Symptoms increased so fast upon him, before he could expect an Answer to his Letter, that he forthwith came to London, and made me a Witness of his Torment. But as it was manifest that the Pain was occasioned by stopping of the Gonorrhœa, and this by an excessive Cold; I endeavoured to excite the Running, and that by the mentioned Method of Calomel Boluses he took four Evenings successively, which were afterwards purged off next Morning after he had taken every Bolus. His Drink was as soft as we could contrive, but not diuretical, and his Diet was chiefly Broth; yet we found no Manner of Respite from these terrible Symptoms in a Fortnight. And therefore I ordered mercurial Medicines of greater Efficacy, and that he should take a Bolus every other Evening made with eight Grains of Turbith Mineral; which neither purging nor vomiting him, each Dose was augmented to fourteen Grains in the Turn of a Fortnight; which very great Dose would purge him twice or thrice, but never vomited him: I would gladly have put him into a Salivation, rather than have continued in a Course of so vast Doses of so rough a Medicine; but some Business he had then depending did not admit of it, so that I was forced to proceed in this Method for a Month or five Weeks before he found any Benefit from it. After that Time he had no Darting into the Anus, he made his Water very freely and without Pain, but he suspected that he sometimes found a Darting into one of his Testicles. It ran a little for three or four Days, but it afterwards ceased of itself.

When our Matters were brought to this Pass, I had him purged four or five several Times, intermitting always a Day between the Purging; and after he had taken this Physick I ordered him fifteen Grains of Turpeth Mineral twice a Week for a Fortnight. After all, he drank a very strong Decoction of the Woods for six Weeks together.

Notwithstanding the great Quantity of Mercury this Gentleman had taken, which he took as well as the Diet-drink with the utmost Exactness of Diet, and Manner of Living, he broke out all over his Body four Months after he had finished this Course; yet he found nothing to complain of, but that he had at Times a small darting Pain in some one of his Testicles. This Misfortune put us under the Necessity of a Salivation for a more perfect Cure, and his Affairs now favouring this Method, he went straight under that Course.

He spit about two Quarts every Day for about a Month, and about a Quart in a Day for three Weeks more; in the last Part of this Time he felt no Manner of Pain; yet in less than six Weeks after the Salivation, he broke out again in his Legs and Arms, but was cured by the diaphoretic Mercury of Paracelsus. *Cockburn of a Gonorrhœa.*

ALGEMA. *Ἀλγῆμα.* Uneasiness, Pain. The Word is also often used by Hippocrates, to signify the Disease whence the Pain proceeds. This Author makes Use of the Word in a Multitude of Places.

ALGEMET. *Coals. Rulandus.*

ALGERIÆ, ALGERIE. *(Calc.) Lime. Rulandus. John-Jon.*

ALGEROTH. *(Mercurius Vitæ) Mercury of Life.* A Preparation of Antimony and Sublimate, so named from *Algerothos*, a Physician of Verona. *Castellus.*

ALGOIDES. An aquatic Plant of which Monsieur Vaillant gives the following Account:

Algoides vulgaris, Potamogeton capillaceum, Capitulis ad Alas trifidis. B. Pin. 193. Prod. 101. Raii Hist. 1. 190. N° 12. Item, *Potamogeton Affinis, Graminisfolia, aquatica.* Raii ibidem, N° 13. Itemque *Potamogeton omnium minimum, Graminis Facie capillaceum, Filiculis curvulis binis, ternis, Dorso dentato.* Hort. Cath. ejusdem Raii Hist. 3. 122. *Potamogeton similis, ramosa, & ad Genicula polyceratos.* Pluk. Tab. 102. fig. 7. *Equisetum polygonoides, Aquis innatans, Potamogetonis tenuisfoliæ Facie, ad Genicula vasculiferum.* Hist. Oxon. 3. 621. N° 20.

It is strange that a Plant, so common in our Waters, should not be mentioned in the *History of those Plants which grow in the Country about Paris.*

It is to be observed, 1. that though Ray be not one of those Botanists who love to multiply the Species of Plants without Necessity, he has yet made three of this one, as you see by the Quotations of the different Synonyma. 2. That though among the Characters he gives of the *Potamogeton* he had mentioned the Growing of the Flowers in Form of an Ear, and though he had observed that those of this Plant, whose Structure he did not know, were dispersed along the Stalks and Branches, yet he scrupled not to reduce it under that Kind, from whence he should in Truth have excluded it both in the last Edition of his *Synopsis*, and in that of his *Methodus*. 3. If this Author saw no more than two, three, or at most but four Pods, or Cornicula (so he names what I call *Capsula*) at each Joint of the Plant, it was because he had the Fortune only to meet with one or two that happened to be no better furnished, for they have commonly five and sometimes six at a Joint.

The *Algoides* is a Species of aquatic Plants, with imperfect and hermaphrodite Flowers. Each Flower proceeds from the Wing of a Leaf, and commonly consists only of a Testicle, or Stamen, and some Ovaries disposed in a circular Order, which become so many solid monosperm Seed-vessels. The Leaves are simple, intire, without a Pedicle, and for the most Part stand opposite by Pairs.

We know only one Species of *Algoides*.

It grows at the Bottom of Waters, and because its Leaves resemble those of *Alga*, I suppose it took the Name of *Algoides*. *Memoires de l'Academie Royale des Sciences Ann. 1719.*

ALGOS. *Ἀλγος.* The same as **ALGEMA**, which see.

ALHAGI. This is the *Agul & Almagi Arabibus, Planta spinosa Mannam resiciens.* J. B. *Genista spartium spinosum Foliis Polygona.* C. B. *Spinosum Syriacum.* Park. The PLANT THORNY BROOME OF SYRIA.

It rises a Cubit or more in Height, and is set very thick round with a great Number of exceeding sharp, slender, pliant Thorns, on which grow divers Flowers of a purple Colour. When these fall off, they are succeeded by small, long, reddish Pods (like those of the *Scorpius*) full of Seeds of the same Colour.

The Inhabitants of Aleppo gather from it a new Kind of Manna, the Grains of which are somewhat larger than Coriander.

It is bushed round with an almost infinite Number of small, smooth Branches, which disperse themselves from the Trunk in a very beautiful Order, and are for the most Part overspread with Dodder, after the Manner of *Thyme*. At the Joints of

the Thorns grow the Leaves, which are ash-coloured, oblong, and of a polygonal Shape. The Root is long and of a purple Colour.

The Manna, gathered from this Shrub, is called by the Arabians *Terenabin*, or *Trangebin*.

It is found in Persia, and in the Neighbourhood of Aleppo; also about Kacka a City in Mesopotamia.

The Leaves are of a hot drying Nature, and the Natives use the Flowers as a Purgative, one Handful of which boiled in Water suffices for a Dose. *Raii Hist. Plant.*

ALHANDAL. *Colocynth.* See **COLOCYNTHIS**.

Our College Dispensatory directs a Troche under the Name of *Trochisci Albandal*, as follows:

Take of white Colocynth Pulp cleared from its Seeds, and cut small, of Gum Arabac, Tragacanth, and Bdellium, each six Drams. Let the Gums be macerated for three or four Days in a sufficient Quantity of Rose-Water, so that they may be dissolved in it; and with the fore-mentioned Pulp let all together be beat up into a Consistence for Troches.

"This Contrivance is as old as Mesue, and hath been but little varied in all the Hands it hath passed through; it seems originally designed by the Gums to deaden, in some Measure, the violent Operation of the Colocynth." *Quincy's London Dispensatory.*

ALHANNA. The same as **ALANA TERRA**, which see.

ALHASEF, or ASEF. A Sort of Pustule, called also **HYDROA**, which see.

ALICA. A Food much celebrated amongst the Antients. But the various Accounts given of it by different Authors make it somewhat uncertain what it was. For some represent it as a Sort of Grain, and others as a Sort of Aliment made of Grain.

In order to give a just Idea of this Aliment, I shall insert the different Passages wherein the Antients have taken Notice of, and then give the Opinion of Salmasius concerning it.

The Greek Word is *ἄλικο*.

Alica cleaned is a proper Aliment for the Sick in Fevers. If the Stomach be firm, and the Belly bound, it is adviseable to give it in Hydromel; but if the Stomach be weak, and the Belly loose, it is best taken in Vinegar and Water. *Celsus, L. 3. C. 6.*

Alica is in the next Degree to Ptisan for Goodness, and has some few Qualities in common with it, which are the Cause that it is highly esteemed. Viscidity, Smoothness, and Pleasantness of Taste, are common to them both, but in all other Respects Ptisan exceeds *Alica*; and both of them are either simple or compounded with Honey only. *Aretæus de Acut. Morb. L. 1. C. 10.*

The Chondrus [*χόνδρος*] is made of that Sort of Zea which is called dicoccos (*double-grained*). It is more nourishing and binding than Rice, and much more agreeable to the Stomach. Boiled in Vinegar, and the Parts anointed therewith, it takes off the Lepra [*λεπρα*] amends the Roughness and Scabbiness of the Nails, and heals a beginning Ægilops. The Decoction used in a Clyster, is good for such as labour under a Dysentery accompanied with Pains. *Dioscor. L. 2. C. 118.*

Alica in other Things is like Chondrus, but binds the Belly more. *Paulus Æginet. L. 1. C. 73.*

Alica is a Kind of Wheat. We ought to be very careful in preparing those forbile Liquors which are made of it; for its Juice is mixed with Water, and requires a good deal of Boiling; whence it is apt to deceive those that prepare it, who think it is boiled enough, and so present it to the Sick who are great Sufferers by it, for it soon thickens, being of a gluey viscid Substance. Therefore putting a great deal of Water to it, boil it very well, and stir it with a Stick of Dill till it be enough, when you may throw in a little Salt, and if you add a little Oil at first, it will be never the worse. But for healthy Persons, who by Reason of a vehement Gnawing of the Stomach, or a sudden Transfit of a bilious Humour, may want a hearty Draught, let the *Alica* be boiled till it be quite soft, and then strained, and then it makes a Liquor like Ptisan, which is to be drank off. The same Way of Preparation is to be used with *Alica* after it is steeped in Water. *Oribas. Galeno-Med. Col. Lib. 4. C. 1.*

Alica ought first to be macerated in Water, and three Eights of a Pint allotted to three Pints and a half of Water, and two Pints of Milk. Let it boil gently over the Coals, and stir it, holding the Vessel in your Hand that it may not burn. But observe that the Milk is to be poured hot into it, when almost boiled enough. *Oribas. ex Dioscor. Med. Col. 4. C. 7.*

Alica is more drying than Wheaten Meal, and therefore not so proper to bring a moderate Inflammation to suppurate as the other, but is better than Wheat for humid Inflammations. *Oribas. Med. Col. Lib. 14. Cap. 37.*

Alica and Simila are of a very thick and glutinous Juice. *Oribas. Euporist. Lib. 1. Cap. 19—21.*

Wheat bruised or broken into large Fragments like *χρόδος*, *Chondrus*.

Though the Nature of the *Chondrus*, or *Alica*, sufficiently appears from what has been said, some have reckoned it among the Species of Grain, as a Sort of Wheat. Paulus Aegineta, *χρόδος οὗτος τὸ ἴδιον, The Chondrus, a Species of Grain.* And Galen, *τὸ γένος τῶν σιτηρῶν ἐστὶν ὁ χρόδος, ἡλικὸς τρέφειν τι καὶ γλυκύως ἔχει τὰ χυμῶν. Chondrus is a Kind of Wheat, sufficiently nourishing, and of a viscid Juice. Lib. i. de Aliment.* He adds that by the Antients it was called *συστάς τῇ περιουσίᾳ*, Wheat appellatively. Who cannot but admire so much Ignorance in so great a Man? He cites Hippocrates, who says, *τὸ ἐν τῷ χρόδῳ κατέσκευασμένον ἄγρος τροφικώτατον μὲν ἔσται, διαχυρὸν δὲ ἥϊον, Bread made of Alica was very nourishing, but not very easy to pass off.* Hippocrates does not speak this of such a Sort of Corn, but as the Property of a Kind of Meal, properly so called from its being coarsely ground. Bread made of this Meal, he says, was very nourishing. These were called *χρόδριται*, *Chondritai*, as the *σινυδαλίται*, *Semidalitai*, were so called, because they were made of Semidalis, which also was not a Species of Grain, but a Sort of Meal. In Galen's Time the Greeks had left off the Use of the Word *χρόδος* for *Alica*, and changed it for the Word *Alica*, corrupted *ἀλῆς*. So that they knew nothing of the antient *χρόδος*, and by that Means came to interpret it of a Species of Wheat. *Salmaſtus de Homonym. Hyles latr. Cap. 57.*

ALICES. The little red Spots in the Skin which precede the Eruption of Pustules in the Small-pox. *Castellus.*

ALICORNU. The same with **UNICORNU**, which see.

ALIENATIO MENTIS, is the same as **DELIRIUM**, which see.

ALIENUM. In a medicinal Sense it is applied to any Thing that is foreign and troublesome to the Body. Sometimes also it imports *corrupted*, but *alienatus* is generally used in this last Sense.

ALIFORMES PROCESSUS. See **PTERYGOIDES**.

ALIGULUS. A Confection. *Rulandus.*

ALILAT, or *ʿAlila*, an Arabian Word, signifying what the Assyrians call *ܠܝܠܐ*, the Jews *לילית* *Lilith*, and the Greeks *Ἑλέθυια*; and is the same as *Mater Terra*, and *Filia Lucina*, or *Luna*, the Deity that presides over Child-birth. *ʿAlila* is as you would say *אלילה* *Alilath*, whence comes *Lilith*, and also the Word *לילה* *Lailah*, signifying the Deity of the Night. *ʿAlila* is as much as to say *אליטה* *Alitha*, which also signifies a Goddess, as well as the Greek *Ἑλέθυια*, which is much the same as *אליθυיה* *Elithuia*. In the most ancient Ages, *ἕως*, or *ἑῷω*, among the Greeks, signified *Filius*, a Son. Therefore *Ἑλέθυια* was the same as *Κῆρ*, or *Filia*, a Daughter, or *Libera*; as *ἕως* was the same with *Κῆρ*, or *Liber Pater*. **𐤀𐤋𐤅** is also the Gothic Name of the Sun. The Assyrian *ܠܝܠܐ*, or *ܠܝܠܝܬܐ* *Melidbetta* signifies a *Midwife*; for Women with Child reckon by Moons. *Alilat* therefore is the same as *Lucina*.

ALIMA. A Sort of Sand, found in Gold Mines, of which they make Lead. *Rulandus.*

ALIMENTA. *Aliments.* Whatever is taken to nourish the Body, from *Ala*, to nourish.

The Nature of *Aliments*, in general, may be understood by what is said on this Subject under the Article **ACIDA**, and the Article **ALCALI**. And the Properties of particular *Aliments* are specified under their respective Names.

The Antients, particularly Galen, have been very diffuse on the Subject of *Aliments*.

As I would avoid being tedious, I shall give Hippocrates's own Abridgment of his Sentiments upon *Aliment*, I mean his *Treatise de salubri Victus Ratione*; and because Galen is too prolix, I shall insert his Doctrine from later Authors who seem to have taken great Pains to epitomise his Works, not without adding some Things from their own Fund. And I shall end this Article with some Chymical Observations made by Mr. Geoffroy the Younger, and by him communicated to the Royal Academy of Sciences.

I attribute the following short Treatise to Hippocrates; on the Authority of Galen, who thinks it certainly done by him, or his Son in Law Polybius, though even in the Time of Galen it was said by some to be wrote by others either contemporary with, or perhaps elder than Hippocrates.

But I must remark one Error which was universal amongst the Antients, which is, that they imagined the Blood to be formed from the *Aliment*, in the Liver. But this Piece of Theory has been absolutely confuted, since modern Discoveries have made the true Passage of the *Aliment*, and the real Method of the Blood's circulating, manifest.

With Respect to *Aliments*, it must be observed in general, that it is very little worth their While to consider the different Qualities of Foods, who use Exercise daily sufficient to bring them to the Verge of Lassitude, who go early at a Night to Bed, and rise soon in the Morning; for all *Aliments* supply

a good Chyle when perfectly digested, by the Assistance of Exercise and Regularity. But the Consideration of *Aliments* is a Speculation of great Importance to the Valetudinary, the Lazy, and the Riotous.

The Regimen best suited to Persons in the ordinary Way of Life [*ιδιότατος*] is to eat plentifully, and drink sparingly in the Winter Time. They ought to drink pure undiluted Wine, to eat Bread, and to have their Meat all roasted. Greens are seldom or never to be eaten during this Season: By this Method, the Body will be preserved dry and warm.

In the Spring they should bring themselves by Degrees to drink more, and have their Wine more diluted. Their vegetable Food is to be more thin, and less in Quantity. Maza is to be used instead of Bread; their animal Food is on the same Account to be diminished, and boiled Meats are to supply the Place of roasted. They are to be sparing in the Use of Greens till Summer approaches, but feed on the more thin vegetable Foods, and boiled Flesh, and some Herbs boiled, or raw; their Drink in like Manner ought to be much increased in Quantity, and much diluted. But this Change must be brought about by Degrees, that the Transition may not be too great and sudden.

In Summer the Food ought to be thin Maza [*μαζα μαλακή*] the Drink plentiful and diluted, and all the Flesh boiled. And this is the Way of Living to be chosen while Summer lasts, in order to render the Body cool and moist during this hot and dry Season, which inclines the Body to Heat and Dryness. By this Management, we guard against the Inconveniences of Summer: And by the same easy Steps as we pass from Winter to Spring, are we to proceed from Spring to Summer, in shortening our Allowance of dry Food, and increasing our Measure of Drink; but just the contrary Method must be taken as we pass on from Summer to Winter.

In Autumn our *Aliment* of the frumentaceous Kind [*σνίττα*] ought to be more in Quantity, and drier; and our animal Food [*ἑλκ*] in Proportion. Our Drink, on the contrary, is to be diminished, and to be less diluted, that so we may pass over the Winter in the most commodious Manner, when our Drink comes to be least in Quantity and undiluted, and our *Aliment* the most copious and driest, under which Regimen a Person shall enjoy a good State of Health, and be least sensible of the Severity of the Weather in this cold and humid Season of the Year.

For Persons of a full Habit of Body, whose Flesh is soft, and their Countenances ruddy, it is most advisable to use a dry Kind of Diet for the greatest Part of the Year, because their Constitutions abound with Moisture. On the contrary, they who are lean, whose Fibres are dry and tense, and whose Complexions are tawny or black, ought to feed on moist *Aliment* the most Part of the Time, as being most agreeable to the Dryness of their Bodies.

Young Persons are to chuse such Meats as are tender and moist, because their Youth inclines them to Dryness, and their Fibres are rigid. But Persons of an advanced Age are to use a dry Kind of Diet for the most Part of their Time, because Bodies at that Period of Life are soft, moist, and cold.

In general, our Regimen of Diet is to be accommodated to the Age, Season, Custom, Country, and Constitution, in such a Manner as to always guard against Attacks from Heat, or Cold; for this is the Way to live sound, and free from Diseases.

In Winter you should travel fast, in Summer slow, except in the burning Heat of the Sun. The Corpulent are to travel fastest, and the Lean slowest. In Summer you are to bathe often, in Winter but seldom; and Bathing ought to be used more frequently by lean than fat Persons. The Clothing of fat People in Winter ought to be the natural Stuff, in Summer the same dipped in Oil; but lean Persons are to observe the contrary*.

Such as are burdened with Fat, and desire to be thin, ought to take all their Exercises fasting, and afterwards to sit down to their vegetable Food, before they have recovered Breath from the Fatigue, or are cool, and then to begin with a Draught of Wine, diluted, and not too cold. Their Flesh ought to be dressed with Sesamum [oily purging Grain, *Dale.*] or some grateful preserved Vegetable, or something of that Kind, and to be very fat, that it might the sooner create a Satiety. Besides, they ought to eat but once a Day, to abstain from Bathing, to lie on a hard Bed, and to exercise themselves in walking naked as much as possible.

Lean Persons, who are willing to grow fat, ought to act directly contrary to the aforementioned Precepts, and to use no Exercise upon an empty Stomach.

As to Emetics and Clysters, observe the following Rules: During the six Winter Months use Vomiting, because this Season is more phlegmatic than the Summer Half-year, and generates such Diseases as affect the Head, and the Region above the

* This Passage perplexed Galen very much; but Dacier has taken away the Difficulty, by the Addition of three or four Words, in which he is warranted by a Manuscript in the King of France's Library.

the Diaphragm. When it is very hot, make Use of Clysters, for then it is very sultry, and the Body abounds with Choler, there is a Sensation of Weight upon the Loins and Knees, Heats arise, and griping Pains affect the Belly. The Body then wants to be refrigerated, and the Humours, which are exalted and tend upwards, ought to be drawn down from the higher Parts.

For corpulent Persons, who abound with Humidity, Clysters of a saline and thin Substance are to be prepared; to dry, lean, and feeble Bodies, fatter Clysters, and of a thicker Consistence, are best accommodated. These last are prepared with Milk, or the Decoction of Chich-pease [*ispease*] or other like Ingredients, the thin and saline Clysters are made with Brine, or Sea-water, and other Things of that Nature.

The Use of Emetics is to be regulated in the following Manner: Persons of a fat and full Habit of Body are to vomit upon an empty Stomach, after Running or Walking very fast, about the Middle of the Day. For this Purpose they may take four Ounces of Hyssop bruised in six Pints of Water, with an Addition of Vinegar and Salt, to make it the more agreeable; let them drink this first leisurely, and afterwards quicker.

They who are of a thin and weak Constitution must vomit after Eating, in the following Manner: After coming out of the hot Bath, let them take half a Pint of pure Wine, and then make a Meal on Variety of vegetable Food; but not drink either at or after Eating, abstaining from Drinking while a Man may run ten Stadiums [about an English Mile and a Quarter]. Then mix up for them three Sorts of Wine, which must be the austere, the sweet, and the sour. Let these be drank first pure, soberly, and by small Quantities; but afterwards more diluted, and by quicker and more plentiful Draughts.

Such as have accustomed themselves to vomit twice a Month had better take an Emetic two Days one after another, than every fifteenth Day; but some observe a quite contrary Method.

As for those who are subject to throw up their Victuals by Vomit, or are costive, the best Method is to eat often in a Day, and of all Kinds of Food; to have their Meat dressed all Manner of Ways, and to drink of two or three Sorts of Wine. Those who are not subject to vomit, or who have loose Bellies, ought to manage themselves by a Method directly contrary to the foregoing.

Infants are to be washed with warm Water for a long Time, and to drink Wine diluted, but by no Means cold. Let their Wine be such as will not breed Inflammations, or cause the Belly to swell; by which Means they will be the less subject to Convulsions, will grow large, and have a good healthy Colour.

Women ought, in general, to observe a dry Regimen; for dry *Aliment* is best accommodated to the Softness of their Flesh, and Wine almost pure is best for the Womb, and to nourish the Child therein.

As to Exercise, Running and Wrestling ought to be used in the Winter; in Summer but little Wrestling, and no Running, but much Walking in the cool Air is then very convenient.

Those who are tired with Running ought to wrestle; and those who are fatigued with Wrestling ought to run; for by this Means he who exercises will procure a Warmth to the fatigued Part, compose himself at Leisure, and afterwards betake himself to Rest in the most agreeable Manner.

If a Person, during a Course of Exercises, be seized with a Diarrhoea, and his Food comes off undigested, he must forbear one Third at least of those Exercises, and eat but half his usual Allowance. For it is plain, that the Stomach is destitute of sufficient Heat to concoct such a Quantity of Food. Let him eat Bread very well toasted and put into Wine; let his Drink be very little in Quantity, but of the purest and undiluted Wines, and let him not walk after Meals, of which he must make but one in a Day, while under this Regimen. By this Management the Stomach will be wonderfully warmed and cherished, and have Strength to digest whatever it receives. This Kind of Diarrhoea is most incident to such as have firm, hard Flesh, especially when they are obliged to live much upon animal Food, being naturally disposed to this Disorder, for their strait and narrow Vessels are incapable of receiving the *Aliments*. This is a very uncertain Sort of Constitution, and ready to turn either Way, never remaining long settled on a firm Basis of Health. But they who are of a thinner and more lax Habit of Body, and more hairy, bear Eating of Flesh, and sustain Labour much better, and enjoy their Health much longer, than the others. They who are troubled with Eructations, and Inflammations of the Hypochondria, from the indigested Food of the preceding Day, ought to sleep longer than ordinary, and to force themselves upon some new Exercise, to drink their Wine pure, and in larger Quantities, and at the same Time to shorten their Allowance of Food; for there are plain Indications, that the Stomach, by Reason of its Coldness and Imbecillity, is unable to digest the great Quantity of Food which it receives.

For such as labour under Thirst, less Food, and less Exercise, with the most refrigerating and diluted Wines, are most proper to be advised. They who are afflicted with Pains in the Viscera, whether from Exercise, or hard Labour, ought to be-

take themselves to Rest without Eating, and to take a Draught, which, though little in Quantity, shall be a most powerful Diuretic, that so the Vessels of the Viscera may not be distended through a Repletion, whence Tumors and Fevers arise.

Persons who labour under Disorders that proceed from the Brain are first affected with a Stupor; they make Water often, and have other Symptoms in common with those who suffer under a Strangury. These hold them for nine Days, and if there be an aqueous or mucous Discharge from the Nose or Ears there is a Solution of the Disease, and the Strangury ceases. Plenty of white Urine comes off from the Patient without Pain till the twentieth Day, at which Time the Pain of the Head leaves him, but a Dimness of Sight remains, when the Patient fixes his Eyes long on any Object.

The Man of Understanding knows that Health is the most valuable Gift to Mortals, and when attacked by Diseases has Skill enough to baffle them, and be his own Physician. Hippocrates *regi diuturnis vivens*.

The Man who takes due Care of his Health ought to know, above all Things, the Nature of *Aliments*. To say somewhat then in Relation to this Subject, *Aliments* that have an attenuating Quality open the narrow Passages, scour off the glutinous Particles that stick to Bodies, and incise and attenuate those which are gross. But if a Person accustom himself for a long Time to the Use of them, he is in Danger of being over-run with serous and bilious Humours; and if he perseveres in such a Diet, his Blood, in the End, will become melancholy. For all Foods of this Quality are apt to heat and dry to Excess, and by that Means to breed the Gravel in the Kidnies. He must abstain therefore from the continual Use of them, especially of such as are of a bilious Nature; for Meats of this Kind are only proper for those who abound with Phlegm, and crude, gross, and tenacious Juices. Many chronic Distempers have been cured merely by the Use of an attenuating Diet. And it is much better to abstain from Medicine, in Cases where we may attain our End by a Regimen; as I have known that out of many Persons labouring under the Gravel, and not a few under the Gout, who have had their Joints laid bare with Tophi, some have been perfectly cured, and others much relieved, by a strict Observance of the Rules of Diet. Some who have been a long Time afflicted with an Asthma, or Difficulty of Breathing, have been wholly released from that Disorder, or had the Intervals of their Fits very considerably lengthened. An attenuating Diet reduces an overgrown Spleen, and mollifies an hardened Liver, perfectly cures Epilepsies, if undertaken in the Beginning, and not a little moderates them, when grown inveterate. All that are irritating, or biting to the Taste, or Smell, are acrid and attenuating; and whatever is nitrous or bitter, the same has an incising Quality. But there is no small Difference, whether any of these Simples be administered in Oxymel, Vinegar, Salt, or Oil. For Vinegar and Oxymel increase their Strength; but Oil diminishes it. In the Whole, among attenuating Eatables we shall find more Medicine than *Aliment*.

Foods of an incrassating Quality afford much Nourishment, provided they are well concocted in the Stomach and Liver; nor do they fail of generating Blood of a good Juice, and yet they cause Obstructions of the Liver and Spleen, and if there be but the least Beginning of an Inflammation in the Viscera, they greatly increase it, as well as Inflammations; and scirrhous Affections, and generate Abscesses. Of this Sort of *Aliments* some there are which generate only a thick Juice, as Lentils; others a glutinous, as Mallows; some both, as Animals which are covered with a Shell. But it is a safer Way, in order to Health, to use an attenuating, than an incrassating Regimen of Diet. But because the former neither affords much Nourishment; nor gives Force and Strength to the Fibres, we may safely, though with Moderation, at proper Seasons, indulge those who live by attenuating Food in the Use of Meats that generate a thick and very nutritive Juice, especially when they find themselves to want Nourishment. Indeed such as are not concerned in publick Offices, but can use much Exercise, and sleep as long as they please, are enabled by Custom to indulge themselves in the Use of Meats that yield a thick and glutinous Juice, and especially if after a full Meal they have no Sensation of a Weight or Tension in the Hypochondria. But such as, through Age or Imbecillity, cannot use Exercise before Eating, must wholly abstain from such Food, as well as they who spend their Lives in Sloth and Idleness; for Rest of the Body is as great an Enemy to Health, as moderate Motion is a Friend.

After all, Meats of a middle Nature between attenuating and incrassating are the best and fittest to be chosen, as keeping the Blood in a due Consistence. *Aliments* of this Kind then are most accommodated to our Bodies; but such as generate bad Juice are hurtful, and always to be avoided. And you will find it the best Way to shun Variety in Foods, and the rather if they are of contrary Natures, because they will never be brought to a due Concoction. *Orib. Med. Coll. ex Galena Lib. 3. Cap. 1.*

ALIMENTS of an ATTENUATING NATURE.

Aliments of an attenuating Nature are Garlick, Onions, Leeks, Cressets, Mustard, Pepper, Alexanders, Pellitory of Spain, Origanum, Nep, Hyssop, Water-Mint, Penny-Royal, Thyme, Savory, when they are green; but dried, they become medicinal. And, generally speaking, dried Simples are stronger than the same green; and what grows on Mountains, or in dry Places, has more Virtue than what is gathered in Plains, or in Gardens. After the fore-mentioned, follow in Order Rocket, Water Parsnip, Smallage, Parsley, Basil, Radish, Cabbage, Beets, Carduus, Eringo, Nettles, Fennel, Coriander, Rue, Dill, Lovage, Cummin, Capers, the Fruit of the Turpentine-Tree, the Seeds of Caraway, of Anise, of wild Parsley, of Bishops-Weed, of Heartwort vulgar, and of Candy, and of wild Carrots, all odoriferous, acrid, and manifestly hot Simples. The Seeds of Rue and of Hemp vehemently attenuate, so as to become medicinal. Of Corn, only Barley properly belongs to this Class, and, though in an inferior Degree, wheaten Loaves baked in an Oven. From the rest you are to abstain, unless you have a Mind now and then to taste some Pease, or Lentils. But we are plentifully supplied with attenuating *Aliments* from Rock-Fish, and Mountain-Birds; for Animals that live on Mountains are of a hotter and drier Nature, and their Flesh least pituitous and glutinous. Therefore you may eat Starlings, Thrushes, Blackbirds, and Partridges, with House-Sparrows, and such small Birds as live about the Vineyards. Of Pigeons, wild ones are better than tame; and observe, in general, that Animals which are exercised, and live on dry Food, and breath a pure and free Air, are wholesomer than such as lie still, feed on humid *Aliment*, or are confined in Coops and Stalls. Of Rock-Fish, you may eat of the Rainbow-Fish, the Cock-Fish, the Old Wife, and the Scare, and, in short, whatever is of a soft and friable Flesh. But meddle not with those whose Flesh is hard and glutinous. The Cod-Fish is of a soft Flesh, but less friable than that of Rock-Fish; on the contrary, that of the Mullet is friable, but not soft. Therefore let Softness and Friability be the two Properties by which you are to judge of the Flesh of Animals; where these are in Conjunction, you may eat to Satiety; when both are absent, avoid such Fish intirely; if either be wanting, you are to eat, in such a Case, where better is not to be had, but not to Satiety. Your Cod-Fish then, and Whiting and Mullet, and other Sea-Fish may be eaten, for Want of Rock-Fish, especially with Mustard, as the Scorpion-Fish. There are some other Sorts of Fish that are endued with one of the above-mentioned Qualifications, but, by Reason of an Excess in another Property, are to be refused. For Eels, and most cartilaginous Fish, are of a soft, but, at the same Time, of a glutinous and pituitous Flesh, and are therefore hurtful to such as have Need of an attenuating Diet. Of cartilaginous Fishes, only the Cramp-Fish and Turtle are allowed, and may be eaten, when Rock-Fish cannot be procured; the Sole and Plaice have the same Properties. As to Birds, I do not forbid those who use Exercise the Eating of Hens, Pigeons, and Turtle-Doves, especially such as live in the Mountains; but they must not be fresh killed, but the Day before at least, which I would have observed of all Animals whose Flesh is moderately hard. Salted Fish attenuate and incise in an extraordinary Manner; of these, chuse such as are naturally of a tender Flesh, but the cetaceous Kind is to be avoided. Pork salted may be safely eaten with Moderation. Of autumnal Fruits, such as mollify the Belly can do no Harm; chuse therefore soft Fruits before hard, and refuse such as stay a long Time in the Body; but eat of none to Satiety. Fruits extraordinary sharp or sour are contrary to the Regimen proposed; but the most adapted to our Purpose are Figs, Walnuts, Fistic Nuts, and bitterish Almonds. Olives are of such a Nature, that I can neither commend nor disapprove of them. As for sweet Things, whether Meats or Drinks, none but Honey, I dare say, generates an exquisitely thin Juice. White and thin Wines cut gross Humours, and expel them by Urine. Whey is accounted among Things endued with an attenuating Virtue, but Oxymel is much more accommodated to the Purposes of an attenuating Diet. *Orib. Med. Col. Lib. 3. Cap. 2. ex Galeo.*

ALIMENTS of an INCRASSATING NATURE.

Things which generate thick Juices are Loaves baked under the Embers, and such as are not well made, what they call *Tragus*, Cakes made of Flour and Must, and those they call *Itria*, and whatever else is made of wheaten Meal, without Ferment, or Leaven, particularly Cakes made in a costly and artful Manner of the same. Besides these, Simila and Alica breed Plenty of a thick Juice, but Amylum moderately. Kidney-Beans are of a thick Juice, and so are Lupines, and the inner Substance of Lentils, the Seeds of Sesamum and of Hedge-Mustard, Fishes which are called *soft*, such as the Kinds of Cuttle-Fish, the Polypus, and the cetaceous Kind. The following are of an extraordinary thick Juice: Oysters, Whelks,

the Purple Fish, Escallops, the several Sorts of Cockles, Nazers, and, in one Word, all that are covered with a Shell. To these we may add Eels, Snails, Deer, and Goat; Beef; Pork, Hare, Liver, Kidnies, Testicles, Brain, spinal Marrow, Udder, Tongue, Glands, this last moderately; Milk too much boiled, all Cheese, but least when new, or made of four Milk, four Milk boiled over the Fire, Eggs boiled to a perfect Concretion, and more so when roasted, but most of all when they are fried in a Pancake; Dates, Chestnuts, Acorns, Bulbi, Turneps, Mushrooms, the Root of Arum, Truffles, Pine-Nuts, Figs not full ripe, the Pulp of a Citron, Cucumbers too freely eaten, unripe Apples. Of Wines, the sweet generate a thick Blood, especially what they call *Defrutum*; and so does Must, and thick and black Wines. *Oribas. Med. Col. Lib. 3. Cap. 3. ex Galeo.*

ALIMENTS of a MIDDLE KIND.

Meats of a middle Nature between Attenuating and Incrassating are, Bread well made, Hens, Dunghil-Cocks, Pheasants, Partridges, Pigeons, Heath-Cocks, Turtle-Doves, Thrushes, Blackbirds, and all small Birds, Fish that live about the Rocks, near the Shore, or in the Shallows of the Sea, as Sea-Gudgeons, Lampreys, Soles; in a Word, all such as do not taste slimy, nor have a rank Savour; ripe Figs, and among Greens that grow wild, Seris, which is a common Name to several Species, for which the Attics have distinct Appellations, as Lettuce, Gum Succory, Chervil, and others innumerable. To this Class of Meats belong also wild Sparrowgrass, with the tender Shoots of the Dwarf-Laurel and Bryony. And also Wines of a yellow Colour, sweet, and pellucid, as those of Chios, Lesbos, Falernum, and the Mountain-Wine of Tmolus; for all these generate a laudable and moderately thick Blood. *Idem, Cap. 4.*

ALIMENTS which generate a VISCID JUICE.

Foods generating a viscid Juice are, Wheat that is ponderous, dense, and yellow in its inner Substance; but the light, thin, and of a white Substance, has less of this Property. Simila also and Alica are very viscid Food, as likewise Tendons, and the nervous Extremities of Muscles, the Parts about the Lips, the Tongue, all Swine's Flesh, and Lamb, the Seed of Sesamum, Bulbi, and fat Dates. *Idem, Cap. 5.*

ALIMENTS generating CRUDE HUMOURS.

Green Dates to fill the Body with crude Humours, as to cause a Shivering in those who eat them, which is difficult to remove. Turneps too freely eaten; testaceous Animals of the Water, who have hard Flesh, and have lost all their salt Liquor by too much Boiling; those you call *soft*, as the Polypus, and Cuttle-Fish, and the like, with the cetaceous Kind; the Ventricle, Intestines, and Uterus of Quadrupeds; hard Glandules boiled, four Milk, Cheese, Bread fried in a Pan, Lupines, Grapes that burden the Stomach; all these Foods generate a crude Juice, and fill the Body with raw Humours. *Idem, Cap. 6.*

ALIMENTS generating COLD HUMOURS.

They who feed on Cucumbers to a Satiety must of Necessity, and by Order of Nature, fill their Bodies with cold Juices, which are not easily converted into good Blood. The like are generated by the Bellies, Intestines, and Uterus of Quadrupeds, by four Milk, Mushrooms, unripe Apples, and Bulbi. *Idem, Cap. 7.*

ALIMENTS generating PHLEGM.

Phlegm, or a merely pituitous Juice, are generated by the nervous Parts of Animals, Glandules, boiled Lamb, the Mushrooms called *Amanita*, testaceous Fish whose Flesh is soft, unripe Apples. *Idem, Cap. 8.*

ALIMENTS generating a MELANCHOLY JUICE.

Beef, and Goat's Flesh, but especially that of a He-goat, and Bull's Beef, generate a melancholy Juice; much more the Flesh of Asses, Camels, Foxes, Dogs, Hares, Wild Boars, the Flesh of terrestrial Animals salted, and their Milks. Of Sea-fish, the Tunny, the Whale, the Sea-calf, the Sea-dog, and all the cetaceous Kind, produce the like Humour. To these we may add Snails, Cabbage, Buds of Trees pickled, as those of the Lentisk, Turpentine-tree, Bramble, and Dog-rose. The Pulp of an Artichoke and Lentils are very melancholy Food. Of the same Quality are Bread made with Bran, and such as is made of Typha, and other coarse and bad Sort of Grain; so are green Wheat, Aphace, Vicie [Kinds of Vetches] and thick and black Wines. *Idem, Cap. 9.*

ALIMENTS generating a BILIOUS JUICE.

The Juice of the Artichoke is bitter, and rarefies the Bile; it is best therefore to eat the Artichoke boiled. Honey also easily changes into Bile in hot Bodies; which is also the Case with

With all sweet Wines, and sweet Food, which supply Matter for the Generation of Bile. *Idem*, Cap. 10.

ALIMENTS generating an EXCREMENTITIOUS JUICE.

Wood-Pigeons, Geese, except their Wings, all Viscera, spinal Marrow, Brain, Birds that live near Marshes, Pools, and Lowlands, Chiches, green Beans, Egyptian Beans, Pigs just farrowed, and the Young of all Animals newly fallen from their Dams; Animals that lie at Rest; Fish that live in Rivers and standing Lakes, and delight in Mud, and all Sea-fish of the ectaceous Kind, generate all of them a foul and excrementitious Juice. *Idem*, Cap. 11.

ALIMENTS void of EXCREMENTS.

The Necks, Tails, and Wings of Birds, the Flesh of wild Quadrupeds, and such as use dry Places, are void of excrementitious Matter. *Idem*, Cap. 12.

ALIMENTS full of NUTRIMENT.

The Flesh of Swine, bred up and fattened by Hand, nourishes above all other Eatables. The Brains of Oxen, their Testicles, Heart, spinal and other Marrow, the Wings of Geese, and more the Wings of Hens, the Bellies of all Birds; Snails, especially after two or three Boilings; all these afford abundant Nutriment. Of testaceous Fish those whose Flesh is hard, as Cockles, the Purple Fish, Whelks, and others of the like Sort; also the Kinds of Lobsters, Cray-fish, Crabs, Shrimps, and such like, with those called *soft*, as Polypuses, the Kinds of Cuttle-fish, and the like, nourish much; of the cartilaginous Kind, the Cramp-fish, and the Weafs, or Old Wife, nourish moderately; the Thornback, Maid, and Skate, more than these, and the Mullet and Sea-gudgeon less. Milk that is thickest nourishes more than the thinner. Of Bread made of Siligo or Simila, the former nourishes most, and next to these what is mixed with Bran. Boiled Wheat, Simila, Alica, Beans, generate Flesh not firm and close, but of a lax Texture. Chiches and Kidney-beans nourish more than Beans, and Ochri than Fenugreek. Kidney-beans nourish as much as Pease, Lupines, Chestnuts, Lentils, sweet Dates, rich and sweet Grapes, Acorns, a Sort of Turneps, called *Naveus*, and Bulbi, are all very nourishing, especially after two Boilings. Honey clarified is proper not only for Nourishment, but for the Distribution of the same; and so is Hydromel well boiled. All Wines nourish in Proportion to their Thickness; therefore red and thick Wines are best qualified to breed Blood; next to these are the Black, Sweet, and Thick, where these Properties unite as before, and after them the Red, Thick, and Astringent at once. Wine that is white, thick, and austere, is less nourishing; and Wine that is both white and thin, least of all. In short, all Foods of a thick Juice, if they are well concocted, afford much Nourishment. *Idem*, Cap. 13.

ALIMENTS which yield little NUTRIMENT.

The extreme Parts of Animals nourish little; which Property belongs also to the Uterus, Belly, Intestines, Tail, Ears, Feet, and Suet. Birds nourish less than terrestrial Animals; the Flesh of old Animals nourishes less than while they are growing. The Aliment that Fishes afford, breeds a thinner Blood, as not being in a sufficient Quantity, and soon digested. Of testaceous Fish, such as have soft Flesh, as Oysters, nourish little. Barley-bread, howsoever made, nourishes less than any other; so does the Polenta that is made of it. The same may be said of Bread mixed with Bran, or any other coarse Ingredient, and of Loti, Amylum, Maza made of Barley, Polenta, Oats, Millet, but especially Panic, Rice, green Beans, Poppy-seed, Linfeed, Clary, Hips, Juniper-berries, Myrtle-berries, Almonds, Pistaches, Plums, Peaches, Apricots, Olives, especially ripe, Hassle-nuts, but especially the largest Sort of Walnuts, Jujubes, the Fruit of the Cornel-tree, Blackberries, the Fruit of the Strawberry-tree, Zizypha (a Sort of Jujubes) common Walnuts, Winter-cherries, Capers, especially pickled with Salt, Cabbage, Beets, Docks, sharp-pointed Docks, Purslane, Night-shade, Radishes, Turneps, Mustard, Cresses, Pellitory of Spain, all young Shoots of Plants, Parsneps, Carrots, Carraway Root. Onions, Garlic, Leeks, Vine-leeks, eaten raw, afford no Nourishment, and very little after two or three Boilings. Pomegranates nourish little; as for Pears, especially the larger Kinds, I have little to say of them. Gourds afford some Nutriment, as do dried Raisins, which are austere and not fat.

Of a middle Kind between Foods that nourish much and those which nourish little, are Kidney-beans, Birds-pease, wild Vetches, Chiches, and Figs, which last give but a small Matter of Nourishment, and contrary to that of other autumnal Fruits, for they generate a lax Kind of Flesh, as well as Grapes. All Eatables that are endued, in an eminent Measure, with some medicinal Quality, which they lose in Roasting, Boiling, or any other Way of Dressing, afford but a small Pittance of Nu-

triment to the Body, after they are thus prepared, and none before. *Idem*, Cap. 14.

ALIMENTS of GOOD JUICE.

Among the vast Variety of Things we feed on, there is scarce any of better Juice than Milk. The best Milk is what is just drawn from sound Animals. Poached Eggs are a Meat of good Juice. The best are those of Hens and Pheasants, and the worst are those of Geese and Ostriches. Birds and Fishes are almost all of them reckoned to be of good Juice, except such as live in and about Marshes, and Pools, and muddy Streams, especially if the Water comes through some City, where it receives all the Filth of Baths, Kitchens, and common Sewers; or runs by some Fuller's Yard, whence it comes impregnated with the Washings and Scourings of dyed Cloaths. It is safest therefore to eat Fish that come from the Sea, where there is no Mixture of fresh Water. Such are Fish that live in the Sea, and about Rocks, for in Goodness of Juice, as well as Deliciousness of Taste, they far exceed the rest. As for such as use both Waters, as the Pollard, the Sea-wolf, the Cod, the Sea-gudgeon, Lampreys, Crabs, and Eels, you are first to inquire where they were caught, and then to judge of them by their Taste and Smell. Fish that live in impure Waters, though fatter than others, are ill tasted, and stinking, and mucous, whence they soon putrefy. And you may easily know by your Senses, that Fish are better or worse according to their Aliment. For Instance, the worst of all Mulletts are such as have fed upon Crabs; the Flesh of others is hard indeed, but of no ill Juice. The Black-cap, Turbot, Bream, Sole, Plaice, and Sea-lizard are of a middle Nature between such as have tender and such as have hard Flesh, and they afford very good Aliment to those who use no Exercise, or are of a weak Constitution; but for sound and healthy Bodies, soft and friable Aliment is most proper, and generates the best of all Juices. Quadruped Animals, if well digested, create very good Blood, especially such as are of good Juice, as the Swine in particular; for Pork, both for Savour and Concoction, is a most excellent Kind of Flesh. The best is of a middle-aged Hog, for after that Time the older the worse he grows; and the Flesh of newly farrowed Pigs is too humid, and generates Phlegm in Abundance. The Dug is of good Juice. The Liver, the Parts about the Lips, the Gristle of the Ears and Snout, and the other Extremities, the Intestines, the Uterus, and the Tail, are not of so good a Juice as the rest. The Glandules are next to the Flesh in Point of Nourishment. The Heart is of no bad Juice, the Feet are better than the Ears and Snout; for a Cartilage of perfect Animals can never be concocted, but while it is in Growth, provided it be well broken and chewed in the Mouth, it admits of Concoction. In proportion as the Flesh of other Quadrupeds is exceeded by that of Swine, their extreme Parts are to be accounted inferior to those of that Animal. The Brain of winged Animals far exceeds that of Quadrupeds. The Flesh of wild Animals is of better Juice than that of tame. Bread pure and well made is of good Juice; Alica, Ptisan well boiled, Beans, and Chestnuts are of no ill Juice. Ripe Figs, ripe Grapes hung up, are not to be condemned. Dried Figs, speedily distributed, are of good Juice, but retained long in the Stomach turn to bad Juice, and generate Lice. Eaten with Walnuts they are a very good Kind of Food; but Figs, whether green or dried, eaten with any Thing besides Walnuts, are hard of Digestion. Among Greens, Lettuce breeds good Blood, next to that is Endive. Fragrant Wines are of good Juice; the best are those of Falernum, especially the sweet Sorts, those of Chios, and the sweet yellow Mountain Wine of Tmolus. *Ibidem*, Cap. 15.

ALIMENTS of BAD JUICE.

All Aliments of bad Juice are not of the same Kind, for one Sort is cold and phlegmatic, another hot and bilious, and a third atrabilious. My Advice is to abstain from all Meats of bad Juice, however easily concocted in some Stomachs. For the bad Juice they generate is collected, and lies hid a long Time in the Veins; and, upon the least Occasion of Putrefaction, gives Rise to malignant Fevers.

Meats of bad Juice are Mutton and Goats Flesh, because of their Acrimony. The Flesh of He-goats is worst, next that of Rams, and next to this is Bull's Beef. Of all Kinds the Flesh of the castrated is the best, and that of old Animals the worst. Hare generates a thick Kind of Blood, but is however to be preferred to Beef, or Mutton, or Venison, which is of as bad a Juice as either of the foregoing. The Kidnies and Testicles of old Animals, except the Testicles of old Cocks, are of bad Juice. The Brain, spinal Marrow, Heart, Milt (though Hog's Milt least) all Viscera, fried Eggs, old Cheese, Mushrooms, and Funguses, called *Amanita*, are of bad Juice; and the safest Way is to avoid all other Sorts of Mushrooms. Fenugreek, Lentils, Tipha, [a Grain much like Rye] Oats, and Bread made of them, are of no good Juice. Olyra is as much inferior

X x x

* Swines Flesh may be agreeable to some Appetites, and does not seem difficult to digest, but it certainly supplies an excessive bad Nourishment.

ferior to Wheat, as it exceeds Tiphæ and Oats. Panic, Millet, and other like Grain, contain no good Juice. Of Fish, the Weaver, Gurnard, Hound-fish, Scorpion-fish, Banstickle, Mulletts, Ruffs, and all of the cetaceous Kind, are of bad Juice. All Summer-Fruits are of bad Juice, but Figs less than others. But dried Figs, if too freely eaten, breed no very good Blood, as appears from the Plenty of Lice which is the usual Consequence. Unripe Apples and Pears, and the Fruit of the Turpentine-tree are of bad Juice; and so are Artichokes, especially when they are hard, with Cucumbers, Pumpions, and Melons, but these last are not so bad as the rest. The Gourd is better than all of them, though this too, if it happens to corrupt in the Stomach, yields Abundance of bad Juice. Of Greens there is none of a good Juice; Lettuce, Endive, and Mallows are a Mean between Good and Bad; next to these are white Orache, Purslain, Beets, and Dock. The Roots of Gardeners Ware, such as have an acrid Taste, as Onions, Leeks, Garlick, Radishes, and Carrots, are of a bad Juice; of a middle Kind are the Roots of Cuckow-pint, Turneps called *Naveus*, and the Roots of Carraway. Basil is very bad Juice, as well as raw Turneps, Cabbage, and Bulbi, not well boiled; Leeks, Onions, Garlick, and Vine-leeks, after two Boilings, lose their bad Quality. But all Greens that are called *Wild*, are of very bad Juice, as wild Lettuce, Gum-succory, Shepherd's Needle, Chervil, Seris, and wild Succory. Thick, foetid, and austere Wines, such as is imported from Bithynia, in large Vessels, and at a low Rate, are of bad Juice; for what comes in smaller Vessels is neither good nor bad, but a Mean between both. *Ibidem*, Cap. 16.

ALIMENTS of EASY CONCOCTION.

Food of easy Concoction are, Bread made as it ought to be, all Rock-fish, the Sea-gudgeon, the Cramp-fish, and the Turtle. All Kinds of Birds are easier of Digestion than Quadrupeds, especially the Partridge, Wood-cock, Pigeons, Hens, Dung-hill Cocks, Pheasants. The Wings of Geese are easy to be concocted, but those of Hens are easier; and, in short, the Wings of those that are young and well fed, are of excellent Concoction, but very bad if lean and old. Such as are fed on Whey, the Livers of Geese, and others fattened after the same Manner, with the Testicles of Dung-hill Cocks, are very easy to be digested; so is Pork. Veal is easier of Concoction than Beef, and Kid than Goat, and the Flesh of growing than of declining Creatures. Animals that live in dry Places, are easier to be concocted than such as live in moist, and Walnuts than Hassle-nuts; Bulbi, after two Boilings, are easily digested, as well as poached and forbile Eggs, Lettuce, Endive, and Mallows, and boiled Gourd too, when it is not corrupted in the Stomach. Sweet Wine is more easily concocted than four; and in general of Things equally wholesome, the most agreeable passes best off the Stomach. *Ibidem*, Cap. 17.

ALIMENTS of DIFFICULT CONCOCTION.

Goats Flesh, Beef, and Venison, are hard of Concoction; but the hardest is the Flesh of a He-goat, the next that of a Ram, and Bull's Beef takes the third Place. The Flesh of old Animals, particularly Swine, is fibrous and dry, and therefore exceeding hard to digest. The Ventricle, Intestines, Uterus, Heart, Testicles of adult Animals, and Geese, except their Wings, are difficult of Concoction. The Flesh of Wood-pigeons, Starlings, Blackbirds, and small Birds is hard, that of Ducks and Turtle-doves is harder, but that of Peacocks and Bustards hardest of all. The Gizzards of all Birds are hard of Digestion; and they therefore who eat the Gizzard of an Ostrich, or of a Cormorant, as imagining it will strengthen their digestive Faculty, impose upon themselves, for neither is such Meat digested without much Difficulty, nor has it the least medicinal Tendency towards that End they propose from it. Snails are hard of Digestion, and so is sour Milk, especially to a cold Stomach. Old Cheese has the same Quality; but what is new, or made of sour Milk, is accounted better. The Flesh of the Purple-fish, Whelks, and other testaceous Kinds, whose Substance is hard, are difficult of Concoction. Also the Kinds of Lobsters, and Crabs, and others of that Kind, Polypuses, the Kinds of Cuttle-fish, and all those of soft Flesh, Thornbacks, Maids, Skates, Weaver, Gurnard, Hound-fish, Scorpion-fish, Banstickles, Mulletts, Ruffs, Stock-fish, Congers, Sea-eagle, Eggs roasted, boiled, fried; boiled Wheat, Tragus, coarse Meal (which is harder of Concoction than Polenta) Tiphæ, Oats, Bread made of them, Beans, Pease, Kidney-beans, small Chiches, Chiches, Rice, Lupines, Panic, Millet, and such like, Lentils, Colts-foot, Sesamum, Hedge Mustard, Chestnuts, Acorns, Apples, Pears, Figs, unripe Services, acid and austere Grapes, all Dates, Carobs, Citrons (the outer Rind of which, taken medicinally, helps Concoction, as do most Acrids) Basil, Turneps, and Bulbi, too raw, Parsnep, Carrot, Carraway-root, all Roots of Greens, and Greens themselves, except Lettuce and Endive, as well as all the foregoing, belong to the same Class. *Ibidem*, Cap. 18.

ALIMENTS AGREEABLE and CORROBORATIVE to the STOMACH.

Things grateful to the Stomach are, austere Dates, Quinces, Olives pickled with Salt (but the best are those prepared with Vinegar) austere Raisins, Grapes preserved, Walnuts more than Hassle-nuts, and especially if eaten with dried Figs. All prickly Things are moderately grateful to the Stomach. Of this Kind are Carduus, the Distaff-Thistle, St. Mary's Thistle, the Teasel, the Tragacanth, the Artichoke, the Root of Skirret boiled, Chervil, and Venus's Comb, which raw or boiled is wonderfully grateful to the Stomach; it will not bear much Boiling. Add to these Mustard, Radish, Turneps, Cresses, Pellitory of Spain, Asparagus, Butchers-broom, the Dwarf-laurel, Barberry-shrub, and Bryony. The Bulbi and Capers, pickled with Salt, excite an Appetite; the outer Rind of a Citron, taken medicinally, corroborates the Stomach. Austere Wine, especially warm, is good for an hot Intemperies of the Stomach. Of medicinal Things, Wormwood and Aloes corroborate the same Part. *Ib. C. 19.*

ALIMENTS DISAGREEABLE to the STOMACH.

Juniper-berries are hurtful to the Stomach, and much more the Fruit of the Cedar, Flower-gentle, and the Seed of the Vitex. Beets are so disagreeable to the Stomach, that the plentiful Eating of them causes a gnawing Pain in that Part. Add Dock, Basil, Turnep too raw, Blites, white Orache, except it be eaten with Oil, Vinegar, and Garum. Fenugreek and Sesamum subvert the Stomach. Milk turns acid in cold Stomachs, and nidorous in hot; hence it is justly forbidden in Fevers. Milk drank with Honey excites Vomiting. Pumpions not well concocted usually bring on bilious Disorders. They are proper to provoke Vomiting, before they are corrupted, for if a Person feeds plentifully on them, and takes no Aliment of a good Juice afterwards, they will be sure to give him a Vomit; the same Property belongs to Melons. All Brains, and Marrow of Bones are ungrateful to the Stomach, and create Nauseas. Black and austere, as well as thick and new Wines, easily turn acid, and excite Vomiting. Of medicinal Things Southernwood, Seawormwood, and Aphronitrum, are disagreeable to the Stomach. *Ibidem*, Cap. 20.

ALIMENTS HURTFUL to the HEAD.

Things noxious to the Head are Mulberries, Blackberries, the Fruit of the Strawberry-tree, of the Cedar, Hemp-seed, the Root of Spignel, all Sorts of Dates, Rocket, Fenugreek, and the Seed of the Vitex. Wine that is yellow and austere hurts the Head, and affects the Mind, more than what is black and austere. Fragrant Wine also flies to the Head, but this Wine causes no Pain in the Head, nor stimulates the Nerves; and what they call *ἀνυσσός* even easeth the Pain of the Head, which is caused by the Juices in the Stomach. Milk is not proper for the Head, unless it be a very firm one. Water in which Grapes have been soaked causes Head-ach. *Id. C. 21.*

ALIMENTS which cause no INFLATIONS.

Pease, Kidney-beans, Cummin, the Root and Seed of Lovage, the Seed of the Vitex, and the Fruit of Hemp, cause no Inflation. To these we may add, what would unprepared cause Inflation. Beans boiled or stewed, Bulbi much or twice boiled, and eaten with Oil, Garum, and Vinegar. Clarified Honey, and Oxymel discuss Inflation. Barley Bread, however made, is inoffensive in this Respect. Of a middle Nature between Aliments which cause Inflation, and such as cause none, are Kidney-beans with some Sorts of small Pease and Chiches. *Id. Cap. 22.*

ALIMENTS which cause INFLATIONS.

Chiches, Lupines, Kidney-beans, Panic, Ochri, Millet, and the like, inflate. Beans hulled are more apt to cause Inflation when cooked by themselves than otherwise. Maza made of Polenta generates Flatuosities; but if it be well beaten and worked up, it moves the Belly, especially if some Honey be mixed with it. Malt Liquor and all Juices cause Inflation, especially the Cyrenæan, that of Satyrion, with the Juice and Root of Silphium. Figs cause a short Inflation, because they soon pass through; but when thoroughly ripe, they can hardly be said to do any Harm, no more than dried Figs. Green Dates have much the same Effect as Figs, or raw Turneps. Milk soon breeds Flatuosities in the Stomach, as well as raw Bulbi, or Honey not well purged. Sweet Wines cause long Flatuosities; but such as are both sweet and austere, and are neither distributed or digested, but remain a long Time in the upper Belly, there generate Inflation; Mustum also is a very flatuous Liquor. *Id. C. 23.*

ALIMENTS of a DETERGENT, INCISIVE, and APERITIVE QUALITY.

Detergents are Pisan, Fenugreek, Melon, Pompion, sweet Raisins, Beans, Chiches, especially the black Kind, which is also

also an excellent Lithontriptic. Capers are of pretty fine Parts, but pickled in Salt, they become a good Deterfive, and cleanse the Stomach of Phlegm, and open Obstructions of the Liver and Spleen; for which Purposes they are to be taken in Oxy-mel, Vinegar, or Oil, before any other Food. The Juice of Beets has an absterfive Faculty, and frees the Liver from Obstructions, and especially when eaten with Vinegar and Mustard. Docks too and Nettles belong to this Class, with the Roots of Wake-Robin and Asphodel, which are of fine Parts. Bulbi are deterfive, attenuating, and aperitive. On this Account, the tender Shoots of Asphodel are prescribed as a sovereign Remedy in the Jaundice. Onions, Garlick, Leeks, and Vine-Leeks attenuate and cut thick and glutinous Humours; after two or three Boilings these Simples lose their Acrimony, but retain their attenuating Virtue. Whey attenuates a thick Humour; Figs absterge; whence in nephritical Disorders much Gravel has been voided after Eating of Figs. Dried Figs attenuate and incise; whence they are great Cleaners of the Reins. Juniper-Berries cleanse the Liver and Reins, and attenuate gross and tenacious Humours in those Parts. Almonds absterge and attenuate, and scour the Viscera, and cause a free Expectoration. Pistach-Nuts are good to strengthen the Liver, and to cleanse it of those Humours which obstruct its Passages. Radish has an attenuating Virtue. Honey is of the more attenuating Nature, as it is collected from hot and dry Plants; so that even Hydromel is apt to provoke Spittle. Oxy-mel promotes the easy Discharge of other Humours besides the thick and glutinous, and cleanses the Viscera without Pain or Sickness, and has an admirable Effect in Diseases of the Breast and Lungs. Such as abound with thick Juices ought to drink thin Wines, and if distempered besides with cold Humours, are to chuse Wine that is old, thin, and acrimonious. Small Wine promotes the Discharge of Humours from the Lungs, for it corroborates, and dilutes the Juices, and is moderately incisive. Sweet Wines are proper, in acute Distempers, as a Peripneumony and Pleurisy, after a Concoction, to provoke Spitting. *Idem, Cap. 24.*

ALIMENTS which cause OBSTRUCTIONS.

Milk that contains much Whey can do no Hurt, though you feed on it never so long; but the long Use of Milk that has little Whey, and much Cheese in it, is dangerous; for it is bad for the Kidnies that are subject to the Gravel, and promotes Obstructions of the Liver, when it is predisposed to them. Dates are hurtful in Inflammations of the Liver and Spleen, as well as Figs, not from any peculiar Property, but from the Nature of sweet Things, for all sweet Things are hurtful in Obstructions, or scirrhus Disorders of the Liver and Spleen. In their own Nature they can neither do much Good nor Hurt; but in Conjunction with deterfive and incising Simples they may have a very good Effect. Hydromel is hurtful to the Viscera under a Tumor, Scirrhus, Oedema, or Inflammation, because Honey of its own Nature is soon changed into a bilious Juice. The Seeds of Poppy stop Evacuations from the Breast, and rich and sweet Dates cause Obstructions, and the green more. All Sorts of Cakes made of Honey, Meal, and Oil, and those made of Simila, are of an obstructing Nature, and augment the Spleen, and generate Gravel in the Kidnies; wheaten Meal wetted with Milk has the same Effect. Alica also is hurtful to such as labour under Obstructions of the Liver, and are subject to the Gravel in the Kidnies. Sweet Wines are obstruent, and augment Tumors in the Viscera. *Id. C. 25.*

ALIMENTS of SLOW PASSAGE.

Aliments flow in passing are all such as are made of Itria [a Sort of Cheesecakes] and Simila, fried Beans, the finest Bread, Lentils pilled, Brain, spinal Marrow, Liver, Heart, boiled Wheat, boiled Eggs, roasted more, and much more fried; Lupines, Pease, Sesamum, Hedge-mustard, Acorns, Apples, unripe Pears, the Fruit of the Carob-tree, sweet Wine, and more what is austere and black without any Sweetness; thick Wines, and all new Wines. Water is of very slow Passage. *Idem, Cap. 26.*

ALIMENTS EASILY CORRUPTED.

Peaches, Nectarins, Apricots, are easily corrupted, and so are all Summer Fruits, which being of a humid Nature are easily vitiated in the Stomach, if they are not soon discharged thence. Therefore they ought to be eaten before all other Meats, for by this Means they are soon discharged, and carry off other Things with them; but if they are eaten last of all, they corrupt, besides themselves, the rest of the Food. *Idem, Cap. 27.*

ALIMENTS NOT EASILY CORRUPTED.

Of this Property are the Chemulæ [a small Sort of Cockles] the Purple Fish, Whelks, and all testaceous Animals, whose Flesh is hard, and which are usually prescribed to such as, by Reason of ill Humours, corrupt their Food. They boil them twice or thrice in the best Water, and take them out into

another clean Water as soon as they are thought to be seasoned: To this Class also belong all Sorts of Lobsters, Crabs, Shrimps, and others of that Kind. *Idem, Cap. 28.*

ALIMENTS that LOOSEN the BELLY.

Lentils and Cabbage excite to Stool. Of Fishes, almost all the testaceous Kind are endued with contrary Qualities; for the solid Part of their Substance is slow in passing, and binds the Belly, but their humid Part provokes Excretion downward. Therefore if you boil Lentils or Cabbage, or any of the Animals before spoken of, and season the Decoction with Oil, Garum, and Pepper, and then let any one drink of the same, you will soon see the Effects of a Cathartic: Nay the very Broth of the Sea Hedge-hog, of all small Shell-fish, and of an old Cock, moves the Belly. Whoever has a Mind to reap the like Benefit from Cabbage, must take it out of the Pot, with the Liquor in which it is boiled, and clap it into Oil and Garum; it must not boil long. Coarse Bread excites to Stool, both on Account of the Quantity of Excrement it creates, and of the deterfive Quality of Bran. The Juice of Fenugreek, boiled with Honey, is good to purge off all corrupt Humours from the Intestines, and by its absterfive Virtue stimulates them to Excretion, but the Quantity of Honey must be but small, for Fear of a biting Sensation. Salted Olives eaten in Garum, before other Food, have a cathartic Virtue, as well as the Juice of testaceous Animals and small Shell-fish, which some pickle for that Purpose with Oil, Wine, and Garum. Milk, the more liquid it is, the more it loosens the Belly. Whey is a great Opener, and you may sweeten it with as much of the best Honey as the Stomach can take, and as much Salt as will make it palatable, and if you desire it should work more effectually, you must add more Salt. The Flesh of very young Animals, and their Extremities easily pass through the Body. Of cartilaginous Fishes, the Cramp-fish and Weafs are moderate Openers. Beets, Docks, Nettles, new Cheese with Honey, white Orache, Blites, Gourds, Pumpions, Melons, Figs, dried Figs, sweet Grapes, especially when full of Juice, Mulberries taken on an empty Stomach, and before other Food, very quickly pass through the Body, and make Way for the rest: But eaten after a Meal, if they meet with a vicious Juice in the Stomach, they, as well as Gourd, are very soon corrupted. New Walnuts loosen the Belly, and so will dry ones, if first soaked in Water, as well as green ones. Plums in their full Moisture are loosening; dried Plums infused in Hydromel that tastes much of the Honey, though eaten alone, are a sufficient Purge, and much more if the Hydromel be drank with them. You will be satisfied of their Virtue, if you drink sweet Wine some Space of Time after taking them, and defer your Dinner. Mulberries, Cherries, Apricots, Peaches, and all moist and aqueous Things, and, in general, all such as are no way remarkable either for Taste or Smell, if the Belly be free for Dejection, easily make their Way through the Body: But if the Belly be otherwise disposed, they stay behind the rest, nor excite the least Motion, because they have no Acrimony, nor nitrous Quality.

The Substance of these last *Aliments* is, in some Sort, a Medium between such as bind and such as loosen the Belly, inclining very little on either Hand, when they do not meet with a Body very ill disposed for Excretion, or strongly inclined to Distribution. Thus sometimes the Belly is bound, and Hydromel, when there is a quick Distribution, does not only excite the Belly to Excretion, but carries off other Foods mixed with itself. If the Distribution be slow, it immediately stimulates towards a Motion, because it has somewhat of Acrimony. Even Honey itself, sucked from the Comb, loosens the Belly; and Hydromel that has had little or no Boiling passes off without Distribution. Oxy-mel more gently stimulates the Intestines. Sweet Wine is somewhat opening, and Raisin-wine works more effectually.

ALIMENTS of a MIDDLE NATURE between PURGATIVES and EMOLLIENTS.

Aliments of this Kind are, Mercury, dressed alone, or with other Greens, and first eaten, and then the Pottage drank. Polypody also and Herb Terrible, are of the same Nature, and the Seed of this latter taken to the Quantity of a small Spoonful purges black Bile. The like Virtue is in the Seed of Holy Thistle, bruised and taken in Hydromel or Cock-broth, or mixed with Almonds, Nitre, Anise, Honey, and dried Figs. *Oribas. Synop. L. 4. Cap. 28.*

ALIMENTS which BIND the BELLY.

Austere Dates and Raisins, Mulberries, Blackberries, bind the Belly; and, more than these, Hips and Sloes. Apples of an astringent Taste are binding, but acid ones meeting with thick Juices in the Stomach, incise and separate them, and by that Means loosen the Belly; but if they are received into a clean Stomach, they render it more bound. Apples of a sweet Juice, without Acrimony, are easily distributed; but acrid ones are unfit for Distribution, and the watry and insipid are void

void of Properties, and good for nothing. What has been said of Apples may be applied to Pomegranates and Pears. Milk boiled till the Whey be consumed is not loosening, for if you quench fiery Stones in Milk, till the Whey be evaporated, the Remainder is an Astringent, and usually prescribed when the Intestines are afflicted with a growing Pain from the Acridness of their Contents. This Intention is better answered by quenching red-hot Globes of Iron in the Milk. But Milk so prepared easily curdles in the Stomach, and therefore it is usual to put Honey and Salt in it, though Water is better. Nor is it without Reason that we pour Water in the Milk, when the ferrous Part is consumed, for it is not the Humidity of the Whey, but the Acrimony that infects the Intestines, which we would get rid of. The several Kinds of Lobsters, Crabs, Shrimps, and such others as are covered with a soft Shell are binding, though less than such as are inclosed in a hard Shell. But the former have a salt Humour, and if this be left behind them in the Water, they prove no less astringent than Oysters and other hard-shelled Fish. Lentils and Cabbage twice boiled, to the Consumption of their Juice, bind the Belly. When we intend to stop a Looseness, we boil Cabbage moderately, then throwing away the first Water, pour other hot Water to it, and boil it afresh till it be dry, taking Care that no Air or cold Water come to it, for there is no making of it quite dry, boil it never so much. Pilled Lentils lose their strong astringent Quality, and are of no Efficacy in a Flux of the Stomach; but if you bruise them, and give them two Boilings, and after throwing away the first Water, put a little Salt and Garum, with some palatable Astringent, to it, you will have prepared a very pleasant and wholesome Food and Medicine. Polenta drank in austere Wine, and Rice, are Binders; and so are Panic, Millet, fried Meats, Hares Flesh, austere Wine, and yellow austere Wine. *Oribas. Collect. Medicin. L. 3. C. 31.*

ALIMENTS of an ACRID and HEATING QUALITY.

Heaters are boiled Wheat, Bread made of Wheat, Tiphia, Oats, Fenugreek, Juniper-berries, sweet Dates, sweet Apples, Sesamum, and Hedge-mustard; these provoke Thirst by their heating Quality. To these we may add Hempseed, sweet Grapes, sweet Raisins, Mallow (which heats moderately) Smallage, Alexanders, Rocket, Garden and Horse-radishes, Mustard, Cresses, and Pellitory of Spain.

Food of both an acrid and heating Nature are Parsnep, Carrot, Caraway; these are manifestly hot. Garlick, Onions, Leeks, Vine-Leeks, are sufficiently acrid, but after two or three Boilings they lose their Acrimony. Old Cheese is hot, and excites Thirst. Sweet Wine is moderately hot, and has the same Effect. The deep Yellow is hotter than the Black, but the bright Yellow is the hottest of all; the next in Degree of Heat is the deep Yellow, then the Red, next the Sweet, and lastly the White, which heats least of all; but all Wines very long kept are sufficiently heating. *Id. Cap. 32.*

ALIMENTS of a REFRIGERATING QUALITY.

In the Number of Refrigerants are Barley, howsoever prepared, Millet, Panic, Mushrooms, boiled Gourds, Melons, Cucumbers, Plums, austere and acid Grapes, and austere Raisins. Astringent Apples are of a cold and earthy Juice, but the Juice of acid ones is cold, and of fine Parts. The watry and such as have no remarkable Property, Pears, and Pomegranates, and the Fruits of many other Trees, especially such as will not endure to be kept, are of this Class. Astringent Dates have a cold Juice, and so have Lettuce and Endive, though in a moderate Degree, Purslane, Poppy-seeds, which are soporiferous, and hurtful if too freely taken, but good for thin Distillations from the Head, for which Purpose the white is best. Myrtle-berries refrigerate, but are no Astringents, being endued with an acrimonious Quality. Solanum is an effectual Refrigerant and Astringent. Water and small Wines are no manifest Heaters, and therefore may the more safely be given in Fevers. Wine that is white, austere, thick, and new, manifestly refrigerates, as well as Vinegar, which being of fine Parts, is therefore more penetrating into the inward Parts than other Refrigerants; on which Account it is an Enemy to the Nerves. Of a middle Kind of Nature between Heaters and Refrigerants are Bread made of the Fruit of the Lote-tree, Amylum, and Grapes. *Id. C. 33.*

ALIMENTS of a DRYING QUALITY.

Lentils and Cabbage are Driers alike, and for that Reason dull the Sight, except the whole Eye be moist; but the young Buds, or Coleworts, are less drying. Of other Greens the Stalk is the driest Part. But the Contrary is true of the Radish, Onion, Mustard, Cresses, Pellitory of Spain, and all those whose tender Shoots are acrid. Polenta and the Seed of the Vitex are Driers. Vetches twice boiled, and often thrown into fair Water, make a drying Food; the best Sort is the White. Roasted and boiled Meats yield a drier Aliment, boiled Meats a moister, fried Meats are of a middle Quality. Whatever is most seasoned with Wine and Garum is the driest, and what-

ever has least of these, and most of Defrutum, and is boiled in simple and pure white Broth is the moistest, or if it be boiled only in pure Water it is moister than the first. But Seeds, Greens, and Plants differ much according to the Ways of seasoning them, and though they are all drying, yet they exert more or less of that Quality according to those Ingredients with which they are mixed. *Id. Cap. 34.*

ALIMENTS of a MOISTENING QUALITY.

Pisifan, boiled Gourd, Pompions, Melons, Cucumbers, green Nuts, Plums, the Fruit of the Sycamore-tree meely moisten without Refrigeration, except they be eaten cold. Lettuce and Endive moisten too, but in a lower Degree. Purslane, Mallows, Blites, and white Orache, are the most watry of all Greens. Most Fruits are humid, especially such as will not keep. Lettuce, and Poppy-Seed, green Beans, and green Chiches, moisten, Water moistens and refrigerates, but hot Water both heats and moistens. *Id. Cap. 34.*

ALIMENTS NOXIOUS to the HEAD.

The Fruit of the Sycamore hurts the Head, Blackberries cause Head-ach, as do Dates, Rocket, and Fenugreek. Austere Wine of a deep Yellow creates Head-ach, and disorders the rational Faculties, more than black and austere Wine. Fragrant Wines have the same Effect. *Oribas. Medic. Collect. Cap. 51.*

ALIMENTS BAD for the TEETH.

The constant Use of Milk is bad for the Teeth, and causes them to rot, and loosens the Gums. Therefore, before you feed on Milk, wash your Mouth with diluted Wine; but it is better to put Honey in the Milk. *Id. C. 37.*

In treating of the Qualities of *Aliments*, we are to shew first the Nature of each Quality in general, and then to speak in particular of those belonging to the various Kinds of *Aliments*.

Of Qualities some are simple, which seem to belong to the peculiar Nature of *Aliments*, others compounded; some intense, other remiss; some so attuned as to conspire in the same Purposes with the prime efficient or constitutional Quality, others tending a different Way. If we should undertake to speak of Qualities in this Method, a Multitude of Heads would offer themselves. But waving these, and to come directly to our present Purpose:

Of Qualities, with Respect to our Sense, there is the *Sweet*, the *Fat*, the *Acid*, the *Astringent*, the *Salsuginous*, the *Bitter*, and the *Acrid*. If we fancy there are more, we shall find them, on Examination, reducible to one or other of the forementioned. For aqueous Dulcidities come under the general Epithet of *Sweet*, oily Qualities are comprehended in the *Fat*, and the austere and four are Species of the *astringent* Quality, differing only in Degree. Besides the above-mentioned there are reckoned the *aqueous* and *frumentaceous* Qualities; not that these represent any manifest Quality to our Sense, but on Account of our Familiarity with them, by taking the Word in a large Extent, have obtained that Name. The *Vinous* may be said to be a Mixture of Qualities divers Ways concurring, and admitting of innumerable Distinctions, as it inclines more or less to this or that Quality. The *Frumentaceous* is that Quality, or Property, which belongs to Seeds adapted for Bread, to Pulse, and others of that Kind. The *Aqueous* is inherent in Greens, Herbs, Fruits, and some Roots which make but a faint Impression on our Sense. On this Quality we also bestow the Epithet of *cold*, in a large Sense, comparing it with the just and equal Temperament of our own Bodies. The *dulci-aqueous* Quality, as you may call it, seems to have lost just as much of the cold Quality of simple Water, as it has acquired of Sweetness, though by Comparison with an equal Temperament, it may still be accounted, in some Measure, cold. Both indeed have a Humidity beyond a just Proportion, but the exquisitely Sweet consists in a moderate Temperament, which being intended to a more than just Proportion of Heat, loses as much of a moderate Share of Humidity. The fat and oily are temperate Qualities, and friendly to Nature, and are besides endued with a Power of relaxing the overstrained Fibres; they seem to have the Pre-eminence above the Sweet, in that Concoction is better performed upon them. Both of them by Length of Time acquire much Heat, and lose as much Humidity. The Sweet in Time degenerate into their opposite Quality, Bitterness, when their Sweetness becomes incapable of Increase. The Fat passes into the noxious, and we have no Name for the Sensation they give us under that State. Things dressed and concocted by an external Fire are in much the same State as those that struggle with and are digested by their native Heat, especially where Acridity is predominant. The acid Quality is among the cold ones, and being of fine Parts has a Power of incising, and moderately attenuating, and is no less wont to exsiccate. The Austere has a moderate Astringency, and cements, and incrassates Matter, strengthening the loose Parts; and consisting of grosser Parts, refrigerates and exsiccatates. This Quality,

Quality, in being rendered more intense, passes into the Sour, which is made up of still grosser Particles, and is a more powerful Dryer. The Salsuginous is hotter than the Sweet, and not much drier than the Fat. It seems to consist in some Measure of fine Parts, which attenuate, and consume superfluous Moisture. Being intended, or increased, it participates of the Bitter, and becomes hot and dry, and prevailing over Salts by its absterfve Faculty. Again, the Acrid is much the hottest and driest of all the Qualities, consisting of fine Parts, which easily intrude into the most profound Recesses, inciding, attenuating, opening Obstructions, and consuming Superfluities.

So much for simple Qualities in general, which being rightly comprehended, compounded ones may easily be understood; for there are a Thousand such; with their Opposites, and distinguishing Characteristics, the accurate Consideration whereof will instruct a Physician to apply them as seasonable Remedies to their Contraries. Nothing appears more evident than this to a Person well versed in the best and most useful of all Arts, who imagines and forms to himself Complications and Distinctions of Qualities and Temperaments, according to what he observes in Herbs, Fruits, and other more simple Bodies, in order to qualify himself for undertaking the Cure of various and complicated Distempers.

OF FRUMENTACEOUS ALIMENTS, and PULSE, with their DIFFERENCES.

The Frumentaceous and other Kinds, contained under the Notion of simple *Aliment*, are by no Means to be considered after the Manner of Qualities, such as those above-mentioned; unless they are found to have something like it in them, but are proved and distinguished, every one, by Concoction, Elixation, Density, or Tenuity. Some are defective in Point of Dressing and Seasoning, and by that Means hard and distasteful, and slow and difficult of Concoction. Among Animals, some of a greater Bulk than ordinary are harder, and have more of Earth in them than others, and they differ also in Respect of Health, Age, Diet, and Exercise. And all these are proved by their Suitableness to the peculiar Temperament, for the same Things do not agree with all, but this with that and not with another, Respect being had to the Constitution, and Employment, so far that if a Person be ignorant of these Differences, and how to suit them to their proper Subjects, he will in vain set about prescribing a Regimen.

Since then there is a vast Variety of *Aliments*, and a much greater in the Ways of cooking them, I think we cannot do better than begin with the most common, and what most Mortals feed upon. Wheat then (for this is the most common Food of the human Race) is but one in Kind, but admits of several specifical Differences and Properties, for one Sort is of a deep Yellow, or a denser Substance, or perhaps both; on the Contrary, another shall be white, small, furrowed, or plump. Hence you may infer Variety of Properties and Effects. The deep Yellow, or Fallow, is reckoned the hottest (for among Things of the same Kind this Colour is thought to signify the most Heat). The dense requires most Pains in working and preparing, and yields Plenty of *Aliment*; but the thin and striated owe these Properties to some Defect in their natural Powers. Persons who use Exercise ought to feed on the most solid Wheat, as their Perspiration and Waste of Spirits from all Parts is greater, and for that Reason require the stronger and more solid *Aliment*. But for such as lead an easy Life, and are discharged from Labour and Toil, the lighter Sort is most convenient, and such as is brought to a proper Degree of Maturity; for if this be wanting, it is so far weak and imperfect. Care ought to be taken that it be not tainted with noxious Effluvia from neighbouring Bodies, of which it runs great Hazard when reposed in Granaries, and that it be not mixed with other Grain. And now we are speaking of the lighter Sort, which best agrees with those who lead a sedentary Life, we ought to be somewhat particular. To eat green Wheat moderately, can hurt but moderately, for being now in its humid State, there is no Danger of its Adhesion to the Viscera, but it passeth off without any Damage. The daily Use of it parboiled may have very ill Effects; for the crude and indigested Mass very often sticks to the Viscera, whence as from an impure Spring a Multitude of Crudities are dispersed over the Body. It is much the wholesomest Way to use it thoroughly cleaned, and well boiled, as we usually eat it dressed with Oil and Fat. Of Wheat well ground, the finest Part is called the Flour [*αλευρον*] and the coarsest Part is what they call the Bran. The Meal then is a Medium between them, and the Similago is more solid as well as finer than the Polenta. Of the finest and whitest Part of the Meal they make the Bread called *Silagineus*, from *Siligo*, as the *Similagineus* is made of *Similago*, and the *Furfuraceus* [branny *αυριγιος*] after the finer Parts of the Meal are taken away. The *συνκεχυμενος* [miscellaneous] is made after the Bran only is cleaned off. All these Sorts are prepared with Salt and Leaven, or without them; and are baked either in Ovens, or heated Pans, or in hot Embers. The first two are called *ισιζαι*, and *επισαυται*, and the other

επισαυται, because in Baking they are hidden in the Embers. I think the most wholesome Way of making them is with Salt and Leaven, and that they are best baked one of the former Ways, that is, in a standing or portable Oven; for they are much the better for being free from Ashes, and other Sordes. But the Salt and Leaven are highly serviceable, in consuming whatever is recrementitious, and at the same Time imparting a Sort of Concoction, or more elegant Consistence to the Mass. For unleavened Bread is more difficult of Concoction, and requires much Exercise of Body, which does not comport with their Way of living to whom this Advice is directed. The best Bread then is the *Silagineus*, because it affords the most Nourishment; the next to this is the *Miscellaneous*; the *Similagineus* comes in the third Place, and the worst of all is the *Furfuraceus*, which yields the least Nutriment, passes soonest through the Body, and is easily converted into an atrabilious Juice. As the *Silagineus* consists of the purest Part of the Wheat, so it yields the purest *Aliment* to the Body. The *Similagineus*, as being close and compact, though it generates good Blood; certainly requires a longer Time for Concoction. The middle Sort between them, or the *Miscellaneous*, is most serviceable as well as harmless, for it is not hard of Digestion, like the *Similagineus*, nor affords such an Abundance of Nutriment as the *Silagineus*, and thereby obstructs the Passages. It is to be observed also that Bread differs much in Goodness, according to the Rate of Baking, which ought to be understood of all Eatables that require Dressing. Cakes fried in a Pan made of Meal, Water, and Oil, afford much Nutriment, and that of a solid Kind, but require a very strong Stomach, and are fitter for athletic Constitutions than others, in whom they are apt to breed crude Humours.

Next to Wheat, Barley deserves to be considered, according to the Saying of a certain Author: *Next to Bread of Wheat, give me good Maza* [a Sort of Barley-Pudding]. Barley is less nourishing, and more absterfve, than Wheat, and is besides of a cooling Nature, and exceeds, on that Account, other frumentaceous Fruits. The Cremor prepared of it is very wholesome both for healthy Persons who are of an acrid Temperament, and for feverish Patients, whom it refrigerates and moistens. If to this you add the Cremor of Almonds, they will make together an excellent Kind of Food, light of Digestion, and of good Juice; and endued besides with an attenuating and absterfve Virtue; in short, desirable upon all Accounts. The best Barley is white, and of a good Body, and does not prove itself any Way vitiated by its Smell.

Zea is reckoned among the light Kinds of Food, when thoroughly cleaned, and dressed after the Manner of a Panada. But it generates not the best of Blood, nor affords sufficient Nutriment, much less Strength to the Body; however, it deserves a Place among light Meats. Millet, though like Zea, it nourishes little, yet has an Advantage over it, in that it imparts some Kind of Firmness to the Body, and breeds Flatulencies. Beans, though absterfve and nutritive, generate a thick Blood, and a Multitude of Flatulencies besides, and are therefore, as well as the former, forbidden the Weak and Sedentary. But if Necessity at any Time requires the Use of them, they are best when made into a Gruel, which is more absterfve, and loses most of its Flatulency in the Dressing. But if you add thereto some of the carminative Seeds [*ἀρωμα*] or Honey, you will expel much of their ill Qualities out of them. Kidney Beans are worse, being accounted of a hot and earthy Nature, and Disturbers of the Brain and Spirits, causing unquiet Sleep.

Chiches yield a strengthening and moderately pure *Aliment*, though it be flatuous, and requires a strong Stomach. But the Broth made of these is valued, being absterfve and diuretic, as participating of a salsuginous Quality; wherefore this is wholesomer than the Substance of the Pulse itself. Rice is moderately hot and dry, nourishing, and obstructing the Passages; but if you allow it a sufficient Time to work off and be distributed, it produces no ill Effects. Lentils are accounted the worst Kind of Pulse, generating a thick, earthy, and atrabilious Blood. They bind the Belly, after two, three, or more Boilings, and throwing away the Liquor; but any other Way prepared, are said to increase a Looseness. We shall take our Leave of the Frumentaceous and Leguminous Kinds of Food, with observing in general, that they are accounted best while green, as retaining in that State something of Humidity; but when, by Length of Time, they have wholly lost this Property, they become gross, heavy, and earthy. And as much as juicy Things are preferred to dry, so much are boiled to be valued above raw, and Things prepared before crude and unprepared.

OF GREENS, and AUTUMNAL FRUITS, with their different SPECIES.

We are to observe, in general, that all Greens generate a thin and watery Blood, in Comparison of other *Aliments*, and that they differ from one another in Quality and Goodness of Juice, and in some remarkable Property.

Cabbage, in the first Place, is a Sort of Food, that is of a moderately hot, but more of a dry Nature. If it be boiled, and

and its Juice not exhausted, it loosens the Belly, but if you give it three or four Boilings, or more, still throwing away the Liquor, and then eat it, it has a binding Effect. And this ought not to seem strange, for the Juice of Cabbage is of an absterfitive Nature, but its Substance is astringent. It is too apt to breed an atrabilious Humour, and therefore is to be sparingly eaten.

Beet far exceeds Cabbage in Goodness, for it generates no such bad Humours as the other, and, by the nitrous Quality of its Juice, loosens the Belly; it is accounted of a moderately hot Nature. The Roots yield a stronger Nutriment, and breed a much thicker Blood, than the Green, and besides cause Flatulencies, though in other Respects they pass well through the Body, and therefore may now and then be used.

Purslane and white Orache are Greens of a cold and humid Nature, accommodated to hot Temperaments, and the hot Season of the Year. They generate a thin and watery Blood, and are hurtful to cold Constitutions.

Endive too is accounted one of the cold Eatables; it breeds a thin Blood, but much worse than white Orache. In other Respects it is agreeable to the Stomach, and strengthens the Liver by its moderately astringent Quality.

Lettuce is much colder and moister than the former, and generates a thin but florid Blood, if it be well concocted; and procures Sleep by refrigerating and moistening the Brain. However it is to be used with Caution, lest it should render the Brain too cold and moist, and so relax the due Bent of it, which is necessary for the Exercise of its Faculties.

Wild Radish is of an acrid Quality, and therefore medicinal, by inciding and attenuating the Humours in the Stomach and Viscera; it is hard enough of Concoction. The Garden Species is of a milder Nature in all Respects, for which Reason the Wild Sort is neglected, and deservedly, because, like other Acrids, it causes an Effervescence in the Blood, by communicating its Acridity; unless any one has a Mind to use it medicinally.

Smallage, Fennel, and others of that Kind, are of an hot and dry Nature; but they provoke Urine, and relieve under Oppressions, being otherwise difficult of Concoction, and rather to be used as Medicines than Food. Leeks, after Boiling, are more approved than Onions, for they lose much of their bad and acrid Juice in dressing. They are esteemed very hard of Digestion, from their fibrous Substance, but, by their natural Viscidity, render the Humours in the Breast fit for Expectoration; they are moderately diuretic.

Raw Cucumbers deserve no better Character, for they generate raw Humours, and are cold and humid to Excess, and difficult of Concoction. Pompions are a much better Food, as being allowed to ripen; though these, if they are not well digested, nor pass well through the Body, are apt to corrupt in the Stomach, and to communicate their Depravity to the Humours; but their deterfitive Quality renders them easy to work off, and they usually carry with them other bad Juices. However they breed but a thin and watery Blood, if they be never so well concocted.

Gourds eaten raw are a Medium between Cucumbers and Pompions; boiled it grows better. They afford an *Aliment* of a cold and humid Quality; and though they are much used in Medicine, they are good for little else, yielding very little Nutriment, but Plenty of watery Humours, especially when they meet with a cold Stomach.

Amanitæ, (a Species of Mushroom) Mushrooms, and Truffles are of a cold and humid Nature, and generate thick and crude Juices; they agree with hot and dry Constitutions.

Sparrow-grass is in best Repute of all Greens: It creates not the least Molestation to the Stomach in Concoction, is moderately hot, consists of fine Parts, and renders the Blood every Day purer; and if any Green provokes Urine, it is sure to do it. Wherefore I think it adviseable not only to eat it in the Spring, when it is at the best, but to keep it in Pickle all the Year, because it nourishes without Dispute, and generates a pure Blood; and is also highly serviceable in opening Obstructions of the Viscera, and attenuating the Humours contained in them. So much for Greens.

As to Fruits, we shall begin with Cherries. These, in general, are cold and moist; some of them are sweet and soft, others hard and more astringent. The first are to be chosen, as being more easy of Digestion, and passing sooner off the Stomach; the other agree best with a bilious Stomach, because they are not easily corrupted, and besides corroborate the Stomach by their astringent Virtue. But the immoderate Use of them, if they are not corrupted together with the inbred Juices, fills the Body with watery Humours.

The best Sort of Apples is what they call *Poma Regia*, which are themselves of a cold Nature; but they are esteemed Cardiacal, because they repel the smoaky and fuliginous Vapours that annoy the Heart, and thence ascend to the Brain. They are good to settle the Head after Drinking, for which Purpose the acid ones are best, as being of a cooling Nature, and by the Fineness of their Parts qualified to penetrate into the inmost Recesses. The most valuable Apples are such as will keep

during Winter; for acquiring due Maturity by Time, they are much fitter for Use, and not so easily corrupted.

Peaches and Apricots are also of a cold and humid Nature, and, when they are well digested, generate a thin and humid Blood. Besides, it is usual with them, if they pass not soon off the Stomach, to corrupt; wherefore I would advise those who cannot pass them through their Bodies without Molestation, to abstain from them, unless he can warrant the Temperament of his Body to be accommodated to such *Aliment*.

Plums are more commended than these last, as being quick in Passage; but where they are not so, which is the Case in some Constitutions, they are also liable to be corrupted.

Pomegranates, as well as other autumnal Fruits, yield light *Aliment*, and always generate a thin Blood. They are friendly to the Stomach, and blunt sharp and gnawing Juices; for which Reason they are very helpful, when Heat predominates in the Body, and the Season of the Year calls for Coolers. In other Circumstances, it would be imprudent to turn Physic into Food, especially when the Temperament runs counter to the Dictates of senseless Appetite and Custom.

Quinces are an astringent Kind of autumnal Fruit, which bind the Belly. This Effect it has on some Persons, when eaten before other Food, and a contrary one, if taken afterwards. Nor is this to be wondered at; for Astringents, by compressing the Mouth of the Stomach, forcibly protrude the *Aliment*, as we are wont to shew the like Effect upon a Bag or Leather Bottle, by squeezing them between our Hands, and thereby easily getting out their Contents, especially if they are pretty full, and their upper Part strongly compressed.

But among all these Fruits, the greatest Astringents are Services, Cornels, and Medlars, which are very much used in Medicine, and are otherwise good for the Stomach from their Astringency. But taken as *Aliment*, they generate Blood no Way laudable, and where Costiveness prevails, are very hurtful to the Head, and other Parts of the Body.

Figs and Grapes, considered as Eatables, have the Preference before all autumnal-Fruits, in that they breed better Blood, and yield more Nutriment. But even these are accounted a flatulent *Aliment*, and are supposed to generate a lax and flaccid Kind of Flesh, and to be very bad for Scirrhusities or Obstructions in the Viscera. Figs excel the other, in having a peculiar Virtue of purging the Reins of Gravel. Both of them loosen the Belly, though the Stones are binding: By Age they lose much of their recrementitious Humidity.

Chestnuts are Fruits of a cooling, drying, and moderately astringent Quality, but generate abundance of Flatulencies. It is certain that they nourish; Roasting very much abates their Flatulency, whereas they would otherwise stick in the Passages, and be very hard of Digestion.

Walnuts are accounted hot and dry; the constant Use of them very much affects the Head, and Stomach, and they are very difficult of Concoction. They are thought to be wholesomer when eaten with Figs, because by their Means they are quicker in passing through the Body.

Halle-nuts may indeed be supposed good for the Stomach, on Account of their Astringency; but are, notwithstanding, very hard to be concocted, by Reason of the Closeness of their Substance, which also renders them more binding to the Belly.

Almonds surpass the former in Goodness; but especially the Cremor and Oil drawn from them, which are well known to be effectual, as Lenitives, in Stiffness or Roughness of the Jaws and Aspera Arteria, and as Pectorals, in evacuating the Breast and Lungs of pituitous and viscid Humours. Of the Cremor boiled, is prepared a forbile Liquor, which is both nutritive and aperient, that strengthens the Reins, and thoroughly cleanses the Thorax and Viscera, but is not so well accommodated to the Stomach. Almonds eaten whole are hard of Digestion; but the Cremor of them mixed with Barley cleansed and boiled, or something of that Kind, and especially Amylum, makes an excellent Food upon all Accounts, being light, and easy of Digestion, of good Juice, and generating a fine and florid Blood.

Of QUADRUPEDS, BIRDS, and FISHES, with their SPECIES.

Of Animals, the Species of which are vastly numerous, some are terrestrial, others winged for Flying in the Air, and a third Sort live in the Water. Each of these may be distributed into Ranks or Classes, greater or lesser, according to their different Kinds. And as to Individuals, with Regard to our present Purpose, a Distinction is to be made with Respect to Age; some are young and tender, others in full Vigour, others again are worn with Age. Besides, we must distinguish between wild and tame, or domestic Animals, and between those which are used to much Exercise or Motion, and those that are used to little or none.

As for terrestrial Animals, or Quadrupeds (with which we shall begin) they are all accounted hot, beyond a moderate Degree, affording a strong *Aliment*, which generates a thick Blood, which is best accommodated to athletic Constitutions. Volatile or aerial Animals afford not so much, but a far lighter, Nourishment. They are, in some Measure, more dry and fibrous,

fibrous, and generate a thin Blood; but such as use the Water are accounted more humid and carnos than the rest. Aquatile Animals, generally speaking, are far more humid and cold, than those we have been speaking of; but there is no small Difference between them; for there is the scaly, the soft, the testaceous, and the crustaceous Kind of Fish. And of the first of these some are cetaceous, and live in the main Sea; others live about the Rocks and Shores. Again, among these, such as are of a larger Bulk, yield a more plentiful, but gross *Aliment*, whereas the smaller afford a more scanty, but purer, Measure of the same, especially the rocky Sort. And there is no less Ground for a Distinction to be made between them, with Respect to their Food. For since Sea-fish are universally preferred before such as live in fresh Waters, a Number of Differences will hence arise to be made on the foregoing Account. Fish that are Inhabitants of the Deep, and are continually tossed and dashed by the Waves, are better exercised, and feed on cleaner *Aliment*, and their Flesh is finer, and more solid, than others are able to shew; for which Reasons they nourish more, and generate a thick Blood. But Fish that get their Food in the Mouths of Rivers, or in marshy and muddy Places, or where Sinks and common Sewers discharge themselves, may indeed be fat, and savoury enough besides, but have nothing good or wholesome in them. Rock Fish, that live in pure Waters, have much better Flesh, are easy of Concoction and generate a pure and thin Blood. All soft Aquatics, as to Goodness of Juice, are preferable to many of the scaly Kind, as generating a thin and florid Blood: But they are full of Nerves, which makes them harder of Concoction than the rest, and they are also supposed to be colder, as being void of Blood. Next to the scaly and soft Kinds of Aquatics, are the Crustated, which are easier of Digestion than the Soft, and generate a thinner and purer Blood. The Testaceous are less valued, because they are never exercised or moved, for which only Reason some prefer Scallops because they alone, of all the testaceous Kind, are endued with a locomotive Faculty, or Power of shifting from Place to Place. Testaceous Aquatics breed a thin and watry Blood, and are besides hard of Digestion, and lie long in the Stomach. Many Persons chuse Fish with Scales and Bones, and they may easily persuade me that their Flesh is drier than that of others. For that a dry Thing may be found among moist is no more absurd, than to meet with a moist Thing among dry, of which latter we have Examples among Birds in the Dunghil-Cock and Pheasant, and more especially in the Goose and Duck, and all aquatic Fowl.

Now as we have said that terrestrial Animals consist of an earthy Substance with Abundance of Blood and Juice, and because it is presumed that they impart to us an *Aliment* of the same Nature with themselves, it would be advisable to chuse such as are young and tender, and some of the least in Bulk of their Kind, and not too much inured to Labour or Exercise. For as the Sluggish and Unexercised are over-run with Humidities, and excrementitious Juices, so those which are over-worked, or ever in Motion, are dry, and of little Substance; Excess is to be avoided in all Things. And there is a Difference to be made, even with Regard to the Members, or Limbs, of the same Animal, for the outer Parts thereof yield a drier and less recrementitious Juice than the inner, a smaller Limb than a greater, being so formed by Nature. There is also a Way of trying these Animals by Inspection of their Flesh, for in Proportion as the Flesh of any Animal degenerates from Whiteness, so much is the Goodness of its Juice depraved. In Animals of the same Species, it is universally observed that young ones yield a humid *Aliment*, the full-grown a firmer, hotter, and drier; and the old ones the worst of all, and such as increase an atrabilious and excrementitious Humour, in Proportion to their Bulk, and their Measure of Exercise.

Of WINE, WATER, MILK, EGGS, HONEY, OIL, SOAP, VINEGAR, JUICE OF UNRIPE GRAPES, POMEGRANATES, and SALT, with their different SORTS.

Of Wines, there is the thick, the thin, the austere, and the sweet; and of these, one is white, another of a deep Yellow, and a third red, for we need not mention the intermediate or bordering Colours. Again, some Wines will bear much Dilution with Water [*πολύσιτος*], others but little [*ὀλιγοσιτος*]. The thick are most nutritive, and generate a thick Blood, causing Obstructions in the Viscera. Thin Wines, on the contrary, are diuretic, and generate a thin Blood. Austere Wines are best accommodated to the Stomach, but nourish little; the sweet are just the contrary. White Wines are not so heating as others. The deep Yellow have the most Heat, and next to them are the red; small Wines, that require but little Dilution, and are therefore called *Oligophora*, are the lowest, and least affect the Head. For such as study only to cherish their Bodies, and keep them in good Case, rich and high-coloured Wines will best answer their Purpose; but let such as have their Health and the calm and free Course of their animal Spirits most at Heart, be content with *oligophorous*, which is white and thin, except when an extraordinary Chilness and low State of the Blood direct to the Use of more generous Liquors.

The best Water is such as no way affects the Taste, nor is standing like those in Pools or Lakes; or stagnates and corrupts, as in Marshes and low Grounds, that are impervious to the Winds. Spring-water is more commendable, as well as that which is drawn out of Wells, whose Waters are in continual Agitation. Next to these, in Point of Wholesomeness, are River-waters, if they run pure and unpolluted from common Sewers, and Ditches, that derive into them all the Filth and Sordes of the neighbouring Cities and Country. Rivers that are remarkable for their cold and chilling Quality, or are swelled with melted Snows, are especially to be avoided; likewise all such as run foul, have muddy Bottoms, or take their Course near some hot Spring. The most wholesome Water is that which is soon hot, and soon cold, and neither affects the Taste or Smell with any sensible Quality.

Milk is to be considered as consisting of the serous, the butyry, and the cheesy Parts. The serous Part or Whey, is only to be used medicinally, as a Cooler, and Loosener of the Belly; for it nourishes little or nothing, but is a Detergent. Butter, being heating, and its Humidity suspected, is noxious to the Stomach; but generates Blood, if it be well concocted. It soon changes into Bile, if it meets with a hot Constitution. The cheesy Part is earthy, hard of Digestion, and creates Obstructions, especially where the Viscera are already stuffed, or the Passages strait by Nature. Milk indeed, taken in the Whole, is a nourishing Food; though it affects the Head that is subject to Repletion. The Curd causes Obstructions in the Viscera. Goats Milk is to be preferred, as being of a thinner Substance than the Milk of Ewes or Cows. Chuse your Cheese new, and little salted; avoid all other, as being hard of Concoction, hurtful to the Stomach, causing Obstructions, and generating a thick Blood.

Hens Eggs are best, next are those of Pheasants, then of Ducks, and lastly of Geese. The best Part of the Egg is the Yolk, which affords pure and plentiful Nourishment to the Body; but the rest is harder and slower of Concoction*. As to the rest, what has been said of Animals may be said of their Eggs. The Eggs of Fishes are far inferior to those of Birds, both for Heat and Nutrimint; as their Flesh, in Goodness, is surpassed by the others. Eggs dried with Salt are hard of Digestion, and corrupt the Blood; and the same may be said of all salted Meats.

Honey is good for the Aged, and Persons of a cold Constitution, and in the Winter-season; but hurtful to bilious Constitutions, or used in Summer. For Honey being of a heating and drying Quality, and, from its Gratefulness, familiar to the Palate, where it meets with a Temperament as much too cold, beyond a moderate Rate, as itself is too hot, they must, between them, generate a pure and temperate Blood. But when two Things of the same Quality concur, as the Honey and a hot Stomach, the Degree of Heat is augmented, and the Sweetness of the Honey converts it into Bile. Some have a Way of clarifying it, and by that Means, blunting its Acrimony, take off much of its Heat. Being so prepared, and mixed with some other Kinds of Food, in Cases where Heat is not in Fault, it becomes most wholesome and medicinal, not only nourishing the Body, but gently purging the Belly.

Oil is of a moderately hot and moist Quality, but usually disagreeable to the Stomach, on Account of its Fatness, as well as other Things of an oleous and fat Quality. Wherefore though the moderate Use of it with Meats has no sensible ill Effect, an immoderate Quantity of it, as its Nature is to swim uppermost, extinguishes the retentive Faculty of the Stomach. Oil extracted from Linseed, being neither so hot nor glutinous; and of finer Parts than the other, is more easy of Digestion, and less offensive to the Stomach. Oil of Almonds surpasses them both in Goodness; being not only of finer Parts by Nature, and less incommodious to the Stomach, but an Incisive; and an excellent Pectoral, and Emollient of the Jaws. Sapa [*Rob made of Grapes*] also makes a Part of our Diet, and is not only less heating, and more nourishing, than Honey, but causes not the least Obstruction, and moderately loosens the Belly.

Vinegar, except in cold Disorders, is wholesome Sauce with Meats; for being of a cold and dry Quality, of the finest Parts, and a great Incisive, it cuts, attenuates, and absterges those ill Humours which oppress and clog the Stomach and Viscera; and where any Food of gross Parts has been received, it is attenuated, and, as it were, elaborated, by the prevailing Force of the Vinegar.

The Juices of four Grapes, called *Omphacium*, and of Pomegranates, are useful as Medicines, but unnecessary otherwise; for though the first of them be agreeable to the Stomach, yet, as it consists of gross Parts, is of a cold Nature, and binds the Belly, it must be hurtful to some Constitutions. The Juice of four Pomegranates, though it be of pretty fine Parts, a Resister of Bile, and a Cooler especially of an immoderately heated Blood and Liver, yet it is too incommodious to the Stomach to be used. The Abuse of this also binds the Belly, for the Acid has always a Mixture of the astringent Quality.

Salt,

* The Author makes a Mistake in this Place, for the White of Eggs is excellent *Aliment*, for Reasons given under the Article ALBUMEN.

Salt, used to season our Foods, is hot and dry, and moderately excites an Appetite. It exhausts and exsiccates a redundant Humidity. But the frequent Use of it is to be avoided, as it is an immoderate Dryer, increases Thirst, and corrupts the Blood. Used only as a Preserver and Relisher of our Meats, it can do but little Hurt; it is the immoderate Use of it that does the Mischief.

Of the QUANTITY of FOOD.

The Measure and Rule of Eating, in all Kinds of Food, must be such as comes short of Satiety; for then the natural Heat will prevail, and have Force sufficient to make a perfect Concoction. It will be advisable also to take our Measures from the Strength of the *Aliments*, so as when we sit down to feed upon very strong and nutritive Meats, we take Care to leave off long before our Appetite forsakes us. In Food that affords but small and light Nourishment we may freely indulge ourselves, and approach much nearer to the Bounds of Satiety, for this Sort is soon concocted, but the former stays long in the Stomach. Our Measure of Drinking must be regulated by the Dryness or Humidity of our *Aliment*. These are admirable Rules.

Whether it be best to eat TWICE a Day?

For the Preservation of Health, and the due Supporting and Recruiting of the animal Spirits, my Advice is, that the Provision for the Day be divided into three Parts, of which two are to be taken at Noon, and the third a little before Night. For, by this Method, the Brain will have the Benefit of a continual Humectation, Sleep will the more easily be procured, and the Spirits being thus cherished by a perpetual Irrigation, will hold out the longer, nor be liable to take Fire, or be refrigerated, with too long Fasting, for either of these may happen, according to the Difference of Temperaments and Seasons. But if Custom contradicts this Rule, and you are loth to spend your Time in doing the same Thing twice, let Custom, which has brought upon the natural Faculties a Habit of performing this necessary Work at such long Intervals of Time without Injury, be obeyed. Besides, the Spirits are rendered, though less firm and durable, yet brighter, by this Management. *Actuarius de Spir. Animal. Nutritione.*

One Regimen of Diet will by no Means suit with all Persons, but must differ according to Constitution, Habit, and Way of Life, or any other Circumstance that may require an Alteration. There are a thousand Differences in Constitutions, whether you consider the Structure of the whole Frame, or only of the Viscera, and consequently as many Distinctions are to be made in Diet, in order to select what is most proper for each Particular. Custom also, as an external Principle, will furnish out a great Variety on this Head. No fewer than these, but almost infinite, are the various Kinds and Measures of *Aliments* that are adapted to Individuals. One likes this, another that; and every one judges of the Fitness of an *Aliment* by his Sense, and the Effect it has upon him, and founds his Choice on Experiments, and the Testimony of his Senses, which are unerring Guides in these Matters. As to the Nature of *Aliments*, with Respect to Mankind in general, some are of good Juice [*ἰσχυρὰ*], others of bad Juice [*κακὸς χυμὸς*]. The first are such as are endued with the Virtue of generating a pure Blood; the other generate Bile, or an atrabilious Humour. Again, such *Aliments* are said to be of a crude Juice [*ἀσώχυρὰ*] which naturally generate a crude and pituitous Humour. Moreover some Sorts of *Aliments* are easy of Concoction [*ἰσχυρὰ*], others difficult [*δυσωρὴ*]. The first of these, we say, are agreeable to the Stomach, the others disagreeable and noxious to the same. Some loosen the Belly, others bind it, and every Sort is supposed to be endued with some peculiar Virtue or Property, the Reasons of which are founded in Nature. But when we say that this and that Sort of Food are so and so qualified, it must be understood with Respect to a rightly constituted and well tempered Body. Wherefore when you examine the Lists of *Aliments*, and see one consisting of Meats easy of Concoction, another of the contrary, one List of Emollients, another of Binders, &c. and are ready to object from Experience, that the Event has not answered the Virtues ascribed to them, you are not to impute it to the Ignorance of the Professors in the Art they pretend to, but to an Alteration in the Thing prescribed, which is produced in it from some Perversion or Distemperature of the whole Body, or some Part of the Viscera; for a slight Disorder in the human Frame sometimes causes a great Alteration in the natural Functions; nay, the Redundancy of any Humour may possibly work the same Effect. Proper Allowances must also be made for the Season of the Year, for Age, Calling, &c. for these may cause considerable Changes in the natural Disposition. Take Care therefore of Mistakes, when you see such and such Food pass off easily with a Man, another Sort loosen his Belly, and a third have a contrary Effect, and consider with yourself, whether, and how far towards either Extreme, by any of the fore-mentioned Causes, he is removed from a moderate Standard; for, observing this Caution, you will know how to appoint him a Regimen of Diet, that shall move Step by Step with his Advances, and di-

rectly counter to the Progress of any morbose Disposition. Contraries, you know, destroy one another, and so produce a good Effect; and Things alike are confirmed by Union. Upon the Whole, then, *Aliments* seem to vary according to the Temperaments they meet with; and if we are not able to explain in what Manner they act, or how we thus become the Subject of their Action, it is enough that we are convinced by Experience, though sometimes Reason may, perhaps, succeed in her Enquiries.

The Quantity of Food must vary according to Age, Season, Constitution, and Nature of the Food itself. Young Persons not full grown, and such as are in the Flower of their Age, demand more Sustainance; the first, as not yet arrived at their just Dimensions, want more than ordinary Nourishment; and the latter, because of the Vigour of their natural Heat, and a greater Measure of Exercise withal, have strong and quick Digestions, and therefore require as much Food as the other. But Persons in a State of Life declining to old Age, must diminish their Diet, as their Vigour decays, and their Years increase upon them; for if they load themselves with more than their natural Heat is able to concoct, Crudities are generated in Abundance, and lay the Foundation of many grievous Distempers that accompany them to the End of Life. As to Seasons, if we regard the Strength of the natural Heat, the Winter requires most *Aliment*, next to that the Spring; and a moderate Quantity agrees best with Summer. For in Winter the natural Heat retires inwards, and is supposed to augment the Force of the concoctive Faculty; but in Summer, it is weakened, and exhales, being called forth, and dissipated by the external Heat of the Season. The natural Excretions are no less to be minded, for if these do not proceed according to Custom, a proportionable Quantity of Food must be subtracted. Again, the Nature of Foods, in Respect to their Nutrition, is a Matter no less worthy of Consideration. Flesh, especially of large and full-grown Animals, is supposed to be the most nutritive of all Foods. And next to these are the younger and smaller. Inferior to these, in Point of Nourishment, are all exanguious Meats, and Vegetables in particular, which differ also as much from one another, in this Respect, as they are all surpassed by sensitive and locomotive Beings. The surest Rule, then is, when the Body wants Nourishment, to chuse such Foods as will best supply its Necessities; when it grows luxuriant, to betake ourselves to Meats of a less nourishing Kind. If the Appetite be voracious, because the extraordinary Heat of the Stomach soon consumes, or makes away with whatever comes into it, though the Body stands in no Need of Repair; in this Case, if nothing contra-indicates, Meats of small Nutrition, and of slow Concoction, are advisable. Moreover, another Consideration, of no small Importance, is the Person's Measure of Exercise and Motion. For Bodies accustomed to much and vehement Motion, stand in Need of stronger and more copious *Aliment*, than such as are indulged in Ease and Rest. Another Thing, not to be neglected, is, Whether the Belly be soluble, and the Pores free for Exhalation in the Bath, for these contribute not a little to a good Digestion, and consequently require a suitable *Aliment*. To proceed; as the Quantity and Quality of the Food, so the Times and Seasons for receiving it, are to be heedfully regarded. If Concoction be perfected, the Stomach is free for a Dinner; but if an Error be committed in Concoction, we are to beware of receiving *Aliment* upon Crudities. For when crude Juices are mingled one among another, we may reckon ourselves very fortunate, (as it rarely happens,) if we can discharge them upwards or downwards. But it generally falls out, that the ill Humours settle themselves in the Belly, or Viscera, and there breed Vertigoes, Eructations, Gripings, and other Disorders. If the Humours discharge themselves outwards into the Limbs, they are attended with all the Symptoms of a Defluxion, as the Gout in the Feet and Joints, and the consequent Disorders. Therefore he that intends a Regimen of Diet, must not determine himself to one or two Meals a Day, but to eat after perfect Concoction. For two Meals may be too much for him, and even one, if chosen of improper Meats, and his Digestion be vitiated, may be hurtful; but let him, however, feed on pure and light Food, and such as is familiar to his Temperament and Disposition. For it must be observed, that among several Sorts of Meats, of good Juice, and easy of Concoction, some are more acceptable than others, on Account of a certain grateful Propriety and Familiarity with the Stomach and Palate. Hence the same *Aliment* is not to be offered to all indiscriminately, without the least Variation; for sometimes a Defect in one Food, compared with another of better Juice, is more than compensated by the good Liking of the Appetite towards it. And this ought not to seem strange, but very reasonable, that Food with which our Body is familiarized, should prove most grateful and nutritive. For since there are various Temperaments and Qualities in *Aliments*, it is very reasonable and natural, that we should prefer such as agree with the Disposition of our own Body, or at least of our Stomach. *Actuarius de Methodo Medendi. Lib. 3. Cap. 12.*

Aliment in too great a Quantity, though of good Juice, usually causes Crudities, Vomiting, and a Looseness; *Aliment* in a less

less Quantity than Necessity requires, renders the Body empty, lean, weak, and unable to perform its accustomed Duties for Want of Spirits. *Aliment* of bad Qualities generates a *Cacochymy*, which is known by the prevailing Quality. Again, a Person oppressed with the Quantity of Food is immediately sensible of the Hurt he receives; but the Evils proceeding from Food of bad Juice are not felt under a long Time. Hence, though a Man may seem to bear bad Diet, and to come off well and unhurt, he cannot be said to have escaped whole and undamaged, but the Issue is to be expected a good while, when the Mischief at last will appear in the Form of a putrid Fever, or break out in Scabs, Tubercles, or other pruriginous Affections of the Skin. Wherefore we ought not only to take Care that our Food be moderate in Quantity, but also that this moderate Quantity offend not in Quality, that we may not feel the bad Effects of it hereafter; except in Cases that require a medicinal Diet, which ought then to be followed for the greater Security of the Patient. But an *Aliment* of bad Juice, and yet medicinal, is quite different, as to its Use, from *Aliments* to which the Body is accustomed. For in sound and temperate Constitutions, that want Nothing which is excessive in any Respect, whatever agrees not in a like moderate Commixture of its Elements, we place under the general Title of *Cacochyma*, or *Aliments* of bad Juice: But *Aliments*, which by their Excess in any Quality supply the Defect of it in our Bodies, and so reduce it to a just Temper, we call *medicinal*. *Actuarius de Methodo Medendi Lib. 3. Cap. 9.*

As the preceding Rules of *Actuarius* are generally excellent, and give many useful Hints, I could not deny myself the Satisfaction of inferring them.

In the preceding Pages I have given the Sum of what the Antients have wrote with Respect to *Aliments*. I shall now proceed to give the Sentiments of Hoffman, who has treated the Subject more scientifically, and has given better Reasons for his Assertions.

The Health of the human Body evidently depends upon the Quantity and Quality of the Blood and Juices; whence it is plain, that all those *Aliments* which preserve and maintain a just Temperament, and a due Quantity of these, are beneficial to Health, and that such as have a contrary Tendency are to be reckoned unwholesome.

For Blood of a just Temperament, and neither exceeding nor falling short in Quantity, as it circulates most easily through the Body, and is clear of all foreign Particles, is admirably adapted to nourish the Parts and increase Strength; so that it may be called the *real Treasure of Life*.

Blood of a due Temperament, and benign Quality, by its progressive as well as intestine Motion, which continue during the whole Course of Life, is not only continually wasted, but likewise acquires a morbid Disposition, and degenerates into an impure and excrementitious Mass.

Experience proves, that the Blood of those who have fasted long is converted into saline and bilious Excrements, which are discharged by Stool, Urine, and Sweat, and even loses that natural balsamic Quality which is necessary to Health, and the Mass of Humours is by this Means rendered so thin and fluid, that it becomes intirely unfit for nourishing the Parts. This appears still more plainly from continual Fevers, and hectic Disorders, the Nature of which Diseases it is to waste the Juices, and convert the most benign Humours into useless, salt, and bilious Excrements. Labour also, and Exercise, because they augment the intestine and progressive Motion of the Blood considerably, lessen the Quantity of superfluous Humours, as Persons of full plethoric Habits experience, to the no small Advantage of their Health.

Because the Blood, by its continual Motion, is wasted and converted into an excrementitious Mass, utterly unfit for nourishing the Solids, or recruiting that fine Fluid which supplies the Body with Sense and Motion, it is plain that Life and Health cannot be preserved, unless these natural Motions be continually repaired, and new Juices substituted in the Room of those thrown out of the Body as excrementitious.

The Reason is therefore plain, why People stand in Need of continual INGESTION and EGESTION, or, in other Words, of Eating, Drinking, and Evacuations, for Health cannot long be preserved, unless the Place of the corrupted Humours discharged be supplied by new Juices.

Solid Foods of a good Quality, as well as Liquors, recruit the lost Juices; and therefore all those *Aliments* that are nearly of the same Nature with the Blood, and easily mix with it, ought to be reckoned amongst wholesome *Aliments*.

Blood and Juices fit for Nourishment are of a benign Quality, of a due Temperament, and resembling a Jelly, consisting of small earthy, aqueous, oily, and easily moveable Particles, thoroughly mixed with each other: Hence all those *Aliments*, which abound with a mucilaginous Juice of a due Temperament, are most fit for SANGUIFICATION, or the Production of new Blood.

The Flesh of young Animals, their Juices, and Broths made

of them, especially of young Beef, Veal, and Mutton, afford large Quantity of Jelly, and on that Account are justly reckoned among the *Aliments* which are most quickly converted into Blood. All Sorts of the Hen Kind and Pigeons, with their Young, are likewise well disposed for Nourishment, because they afford a more subtle Jelly than the animal Flesh above-mentioned, though in a smaller Quantity.

It is worth while to observe, that the CLEAN ANIMALS, which, according to Moses, were used by the Israelites in their Sacrifices, were principally such as afforded a good and wholesome Nourishment, since they abounded more than others with nutritive mucilaginous Juices.

Broths and Jellies made of Flesh are therefore, not without Reason, prescribed for recruiting the Strength of those who either by large Hæmorrhages or violent Fevers have sustained a Loss of Blood; and People who feed much upon those mucilaginous *Aliments*, which the French above all other People in the World do, can bear to have Blood taken from them more frequently, and in larger Quantities, than People who are not so much accustomed to them.

The Chyle is the immediate Matter of the Blood, and resembles a natural Emulsion made of soft, oily, insipid, watery, and mucilaginous Particles; for this Reason all those *Aliments*, into the Composition of which Parts resembling Chyle enter, are proper for nourishing the Parts, and producing Lymph and Blood.

Milk, which is nothing but Chyle, is an universal *Aliment*, and, in Respect of Nourishment, to be preferred to all others.

And for this Reason Milk is given as the first *Aliment*, not only to Children, but to robust Animals, that their Bodies may grow the faster, and acquire Strength and Maturity the sooner; for Food that is solid, of a firm Cohesion, or hard Digestion, does not well agree with young and tender Bodies, because the Stomach and Intestines have not that Strength and Force which are necessary for the Digestion and Expulsion of solid Foods. Hence a Reason may be assigned, why some People, especially the Swiss, who are great Lovers of Milk, and make much Use of it in Food, grow so very large and tall, that scarce any Nation in Europe can surpass them in that Particular. Pliny, Tacitus, Justin, Cæsar, and Salust give us Accounts of many who by the Use of Milk have lived to a very great Age; and Galen, in *Lib. 5. Cap. 7. de Sanitate tuenda*, mentions a Man who, using no other Food than Milk, lived to more than a hundred Years. In Holland, and some Northern Countries, and likewise in Friseland, many use Milk for their ordinary Drink instead of Beer; and Ovid gives us the Sense of Antiquity with Regard to Milk in the following Lines, *Lib. 4. Fast.*

*Lacte mero Veteres usi memorantur & Herbis;
Sponte sua si quas Terra ferebat.*

All mild Seeds which abound with a milky Juice are to be reckoned among the Class of nourishing *Aliments*.

Hence appears the Reason, why Seeds and Grains of most Kinds, such as Barley, Wheat, Oats, Rye, Beans, Pease, Almonds, Chestnuts, Pine-nuts, Fistic-nuts, Rice, Mays, and Turkish Corn are extremely proper for nourishing Animals, and why the Meals of these baked into Bread are the principal and most general *Aliments* made Use of; from this likewise one may account for People's being able to live tolerably on Bread and Water only.

Among all other *Aliments* Bread holds the principal Place, nor can we possibly want it without injuring Health. Its Use is proper at all Seasons, and accommodated to all Constitutions, and may therefore properly be called an *universal Aliment*; nor can Flesh and other Substances be taken alone, and without it, since in that Case they create a Nausea.

The Texture of the Parts of Bread is admirably adapted to the Nature of the nutritious Juices; for it is mixed with mild, oily, and mucilaginous Particles, and likewise with a subtle acid Salt, which are very grateful to the Stomach, and quicken the dissolving Power of the salival and fermentative Juices. But as all Bread is not made of one and the same Grain, so one Kind of Bread is preferable to another with Regard to its healthful Qualities. The best and most nourishing Bread is made of dry Rye-meal, not very white, but mixed with the smaller and finer Parts of the Bran. For by a chymical Analysis, blackish coarse Bread upon Distillation affords more Oil, which diffuses a more agreeable Flavour, and more effectually recruits Strength, than that which is drawn from fine Bread. But that which is made of Barley, Oats, Turkish Corn, or even of Acorns or Chestnuts, is heavier on the Stomach, nor is it so effectual for repairing lost Strength. See BOMPERNICKEL.

Eggs, because they contain a very fine, balsamic, pellucid Lymph, which approaches nearest to the immediate Matter of Nourishment, therefore afford a very speedy Nourishment to the Parts.

Eggs afford a very speedy Nourishment, if they are new laid and soft, according to that Maxim of the *Schola Salernitana*, *Si sumas Ovum, melle sit atque novum, i. e. If you incline to eat*
Z z z

an Egg, let it be soft, and new laid. The Yolk contains many unctuous, fat, and sulphureous Parts; the White, on the other Hand, consists of moist, balsamic Parts like those of the Serum, so that if any Food is universal, this is certainly such, and is in a peculiar Manner adapted to increase the seminal Liquor. Eggs are of all other Things most proper when the Body, either weakened by an Effusion of Blood, or wasted by the Shocks of a Fever, requires a very speedy Supply of Nourishment. For this Reason the *Talmud* advises poached Eggs for those who have had a Vein opened. They are vastly beneficial to old Men, who stand in Need of good Nourishment, and such as may be easily digested by the Stomach. I do not, on the contrary, approve of their being used by those who have their Stomachs loaded with Bile, or any Collection of acid Humours, because the more Bodies abounding with impure Juices are nourished, the more they are injured by that very Means. They are known to be fresh by their being pellucid when exposed to a clear Light, and by their retaining their milky Liquor, after having been boiled over a strong Fire.

Cheese and Butter are universal and most excellent *Aliments*.

Since Milk is resolved into Butter and Cheese, and since the Butter contains its oily, and the Cheese its mucilaginous and terrestrial Parts, it is therefore plain that these two, especially with the Addition of Bread and Water, must be a very valuable and universal Nourishment, fit for Persons of all Ages and Constitutions. The newer Butter is, it is of Consequence at once the more grateful to the Stomach, and the more conducive to Health; but when long kept, it grows foetid and rancid. The too great or too frequent Use of it, by relaxing the Fibres of the Stomach, weakens its Tone, and excites Nauseas. Butter joined with Cheese is likewise very nourishing; but Cheese should be neither too new, nor too old. If too new, it loads the Stomach, and binds the Belly; if too old, it increases the Acrimony and Impurity of the Humours, as it is endowed with a poignant Taste, and a foetid Smell.

As the Blood, the nutritive Juice, and in general all the Parts of the Body, are made up of three Elements, viz. First of one which is sulphureous, oily, and inflammable: Secondly one of an earthy, subtle, alkaline Nature, which is nevertheless more fixed: Thirdly one of an aqueous; so the several Kinds and Virtues of *Aliments* may be most commodiously reduced to these three Classes.

Aliments of these three several Qualities, duly mixed with one another, afford a proper Nourishment for the human Body.

The Flesh of Animals, especially when roasted, affords the Body its principal Supply of the sulphureous Part; but it is to be observed, that wild Animals are preferable in this Respect, to those of the tame and domestic Kind, *because their Oils and Salts are exalted by their habitual Exercise.*

That the Flesh of Animals contains more of a subtle Oil, than Vegetables, is plain from this, that in the Summer Flesh very soon turns putrid and offensive, which is not found to be the Case with Respect to Vegetables.

Vegetables have an Acid in their Composition, and their Oils, excepting some of the hotter Herbs, are for that very Reason so much the milder. Animals, on the other Hand, have no Acid in their Composition; for all the Parts of them, subjected to Distillation, yield a subtle Oil, and a volatile Salt; and this hot Oil is what principally excites an intestine and fermentative Motion in the Blood, and proves the Occasion of the penetrating and disagreeable Smell which is felt upon Putrefaction.

The roasted Flesh either of wild Beasts, or wild Fowls, furnish the Blood with greater Store of a light sulphureous Substance, than boiled Flesh, or those of tame Animals.

The Flesh of wild Animals, and wild Fowls, is undoubtedly lighter, more subtle and oily, but fraught with a smaller Quantity of mucous balsamic Matter, than the Flesh of tame Animals; because wild Animals use more violent Exercise, breathe a freer and purer Air, and feed upon drier *Aliments*. Add to this, that by the very Roasting much of the Humidity is evaporated, by which Means the oily Principle disentangling itself from the rest of the component Parts, and being exalted by the Fire, enjoys its full Liberty, and has the Ascendant over the other Parts.

Among the *Aliments* which furnish the Blood with its humid Parts, of Animals Fish, and of Vegetables Pot-herbs, the milder Roots, and some Summer Fruits, are reckoned the principal.

Fish subjected to Distillation yields much Phlegm, little Oil, and very little volatile Salt. *This Assertion is a little too general.* See *ALCALI*.

Because Fish contains only a very small Quantity of Oil and volatile Salt, it does not so easily turn putrid as Flesh, and for this Reason is generally less hurtful in Fevers than Flesh. *I suppose Hoffman means River Fish, which have Scales.*

To the third Class of *Aliments* which supply the Blood with its fixed and earthy Parts, belong all Kinds of Grains, as the

several Kinds of Bread, Rice, Pease, Beans, Lentils, Chestnuts, Almonds, Cacao, Cheese, &c.

From what has been said it will appear, that all such *Aliments* as are of a mild Quality, and resemble the Chyle and Blood, are fit for Nourishment.

All such *Aliments* therefore as either recede from, or are quite opposite to the Nature of the Chyle and Blood, are unfit for Nourishing the Parts.

All *Aliments* in which there is too much of an Acid, are improper for Nourishment; because Milk and Blood will not mix with an Acid, which is quite opposite to their Natures, and induces a Coagulation of the circulating Juices.

Hence the Reason is plain why the too liberal Use of Salads, Summer Fruits, especially whilst crude and unripe, Vinegar, sour Ale, and Wines that abound with an Acid, are so remarkably prejudicial to Health.

No Salt whatever can be mixed with the Blood, Chyle, and Milk, for which Reason all Salts, and all Foods too highly salted, must be improper and unfit for Nourishment.

Blood and Chyle never incorporate with spirituous Liquors, but rather separate from them; whence it is easy to judge how detrimental the free Use of them is, both to Health and Nourishment.

All sweet Things, as Sugar, and Honey, have no Affinity with the Blood and Chyle, but rather recede from their Nature, since they have an exquisite Taste which the Blood, Chyle, and nutritive Juices have not.

Though sweet Substances consist of a temperate Mixture of Parts, and may on that Account seem proper for Nourishment; yet the sweet Particles are Salts of a peculiar Kind, which are dissoluble in Water; hence they cannot be joined to the Substance of the Parts, since they are liable to be dissolved by the circulating Fluids.

Aliments proper for preserving Health ought not only to contain a laudable Juice, but should likewise be easily dissolved by the Stomach. Hence it is plain, that all those Kinds of Food, which on Account of the Closeness and Compactness of their Texture are with Difficulty dissolved, are for that very Reason less conducive to Health.

The Flesh of old Animals, Flesh dried in the Smoak, hard Eggs, Sea Fish almost of all Kinds, and very coarse Bread, on Account of the rigid and complicated Texture of their Parts, are for that very Reason with some Difficulty concocted by the Stomach, and converted into Juice and Blood.

As these hard and compact Foods require much Warmth, Abundance of fermentative and salival Lymph, and a strong Stomach to disjoin and break their complicated Textures, so they do not agree but with robust Constitutions, and People that labour hard; for this Reason the Inhabitants of some Northern Countries, such as the Swedes, the Norwegians, the Laplanders, the Finlanders, the Westphalians, and the Pomeranians are not easily injured by Foods of this Kind, because their Stomachs being not only naturally vigorous, but likewise strengthened by Custom, easily dissolve and digest them.

Of Vegetables, Roots, Fruits, and Herbs, especially if eat crude, and before they are sufficiently softened by Boiling, are difficultly concocted by the Stomach, because their fibrous Texture is hard to be dissolved.

Aliments of the vegetable Kind are for that Reason likewise heavy on the Stomach, since they produce many Flatulencies which disturb and disorder the primæ Viæ.

To this Class belong all unripe Fruits, Pease, Beans, Turnips, Rape, bulbous Roots, the several Kinds of Cabbage, Garlick, Onions, Radishes, Salads prepared of Lettice and other Herbs, Pears Apples, Prunes; Honey and Water, Honey, Must, and all sweet Fruits of whatever Kinds; for such is the Nature of these that they easily run into a Fermentation, or even become sour, and by Reason of their viscid Tenacity are resolved into Fumes and Vapours.

The tenacious and glutinous Parts of Animals, among which are the Stomach, the Intestines, the Spleen, the Kidnies, the Beaks, the Vulvæ, the Ears, the Skins, and the Claws, are of hard Digestion, and with Difficulty yield to the Menstruum of the Stomach.

Fat Substances are with Difficulty digested by the Stomach, for if an Acid, with which Vegetables principally abound, be added to them they run into a Coagulum.

Fat Foods require an alkaline Liquor for breaking and disjoining their complicated Textures; for which Reason a good Deal of Bile is requisite to prevent their proving hurtful to the Stomach; for when an Acid in the Stomach attempts the Solution of fat Substances, hot sulphureous Vapours and Eructations are caused, which are very troublesome to the Alimentary Tube.

The more viscid, rancid, and old, fat Substances are, they are for that Reason so much the worse. The new and recent are better, and sooner yield to Solution and Digestion.

Hence the Reason is plain why the Fat of Beef is not so hurtful when used in the Preparation of Food, as the Fat of Mutton, or that of the Kid, the Sow, or the Goose. Hence likewise

likewise may a Reason be assigned why old Flesh such as is hardened in the Smoak, because of the Rancidity which Fat contracts, and Bacon which has acquired a Rustiness and yellow Colour, are highly improper for the Preservation of Health.

In order to the Performance of the Office of Nutrition, it is necessary that the small Mouths of the internal rough Coat of the Intestines absorb the Chyle, and convey it to the Blood; for which Reason none of those *Aliments*, which either obstruct, or too much corrugate its Mouths, can be used, without in some Measure injuring Health.

Since the effete Mass of *Aliments* drained and exhausted, by the Separation of the Chyle from it, ought by the expansive and contractive Motion of the Intestines to be thrown off from them, it must of Course follow, that all those *Aliments* are prejudicial to Health which either pass through the Intestines with Difficulty, stop their Motions, or weaken their Tone, and impair their Strength, by suppressing Excretion so necessary to Health.

All *Aliments* that are acid, astringent, mouldy, glutinous, viscid, austere, or such as easily run into a Coagulum, are for this Reason prejudicial to Health, because they weaken the Tone of the Intestines, and by that Means prevent the superfluous Fæces from being discharged.

This Characteristic of Unwholesomeness belongs to all unripe Summer Fruits, Pears, Quinces, Pomegranates, Medlars, the Fruits of the Thorn, and Myrtle, Sea Biscuits, the Crust of Bread, Bread that is mouldy, hard, too coarse, or taken warm from the Oven, all farinaceous Substances, Gruels made of Pease, Beans, Lentils, and Millet, Cakes or Bread not sufficiently fermented, Cheese eat too freely, Sheeps Milk, and in fine all milky and fat Substances; all which *Aliments* do still more remarkably hurt the Constitution, if Wine, Acids, or cold Liquors, are used along with them; for by this Means they are reduced into a firm Coagulum, which adheres immovably to the Coats of the Intestines, and incrustates the Orifices of their small absorbent Vessels; whence proceed copious Flatulencies and Spasms.

The Unwholesomeness of *Aliments* is to be estimated from their impairing the fermentative and solutive Powers of the Stomach, since by that Means Crudities are generated.

The Action of the fermentative Juice is impaired and weakened by all fat, oily, and very sweet Substances; by Honey, Hydromel, or Honey and Wine, new Grapes, Summer Fruits, green Figs. All Pulses, farinaceous Substances, Gruels made of Millet, lukewarm *Aliments*, the fibrous Roots of Pot-herbs, Cheese, and curdled Milk, all which are the more prejudicial to Health, the greater Quantities of them are taken into an empty Stomach.

Every Acid, and every Putrefaction, are prejudicial to Health; and for that Reason all *Aliments* which easily grow sour or putrid in the Stomach, may be justly reckoned unwholesome.

An Acid is equally injurious to the Primæ Viæ and to the Blood; for it destroys the alkaline and balsamic Quality of the Bile, coagulates the Chyle, and retards the Expulsion of the Excrement. Add to this, that when it is mixed with the Blood, Stagnations of the Juices, and Infarctions of the Viscera, are generated. (This Assertion is a little too general. See the Article ACETUM.) And when the first Organs of Digestion are affected by putrefied *Aliments*, and the Putrefaction extends itself towards the more internal Parts, it communicates its own bad Disposition to the most wholesome Juices. Among those Foods which by their long Continuance in the Primæ Viæ grow acid, may be reckoned all Summer Fruits, Milk, Honey, almost all Sorts of Tarts, sweet Wines of several Kinds, Must, Hydromel, and fermented Bread; and those *Aliments* which soonest grow putrid by a long Stay in the Primæ Viæ are boiled Flesh; for of all *Aliments* used by us, none have a greater Tendency to Putrefaction than Flesh. Wherefore it is for very valuable Purposes, that Nature in acute Diseases, and in Habits abounding with impure Juices, does of her own Accord loath and abhor Flesh; and those Physicians laudably assist Nature in carrying on her Design, who in Cases of that Nature forbid their Patients the Use of nourishing Broths; for *Aliments* of this Kind wonderfully add to the Putrefaction which is the formal Cause of the Malignity. For this Reason when Pestilences or other epidemical Diseases rage, it is advisable to abstain from Flesh, and use acidulated Liquors, which strongly resist Putrefaction, and by that Means prove remarkably serviceable; but this is to be understood of those Constitutions which are infirm, weakened with Fevers, or loaded with impure Juices; so that Hippocrates was very just in his Observation, That the more Bodies abounding with impure Juices are nourished, the more they are injured. Corrupted Fish, putrid Flesh, or that of Animals which laboured under any Disease, have of all other Kinds of Food the strongest and most direct Tendency to produce a Putrefaction in the Body. *Hoffman. Medicina Rationalis Systemat.*

A CHYMICAL EXAMEN of FLESH-MEATS commonly used for BROTHS. By M. Geoffroy the Younger. *Mémoires de l'Acad. Roy.* 1730.

Of all *Aliments* those derived from Vegetables must be fittest for sick Persons, because, being less complicated with Respect to their Elements, they seem to bear a greater Analogy to Nature, as M. Lemery has proved in one of his Memoirs. How reasonable soever this appears, Broths made of Flesh are established by Custom, and generally pass for the most wholesome and necessary Food in Cases of Sickness, when it is almost the only Diet in Use.

It is only by an Examen of the Principles contained in this Sort of *Aliment*, that we are qualified to give it with Discretion, so that we may avoid on the one Hand the Danger of prescribing it too freely, in Circumstances where a strict Diet is almost the only Remedy, and yet not be too sparing on the other Hand, when the Patient exhausted by long Sickness requires a gradual Augmentation of *Aliment* for the Recovery of his Strength. For our Satisfaction in this Point, and that we may know how to adjust the Proportions of such Food in whatever Cases may offer, I have made an Analysis of such Flesh-meats as are most in Use, or contain an *alimentary* Juice which is accounted salutary; such as Beef, Veal, Hens, &c. I undertook this Disquisition only because the Analysis of carnosous Foods had not been carried so far as that of Vegetables.

The late M. Dodart, whose Memory is so much respected by the Academy, and who was distinguished for his extreme Accuracy, contented himself with saying, in 1702, That he was of Opinion, with the late M. Bourdelin, that the Flesh of Animals boiled to a Jelly, and afterwards distilled, yielded no less Quantity of volatile Salts, than if they had been distilled raw. Now as it appeared that none had been so careful as to determine the Quantity of the Extract which these Jellies left after Evaporation, and what these Flesh-meats had communicated of their Principles to the Water in which they had been boiled, I undertook the Affair, with an Intention to adjust that neglected Part according to Analyses which are already well known. I proposed to myself to discover the Quantity and Quality of the Principles of the raw Flesh-meats which are put in Distillation; what Principles they impart to those solid Extracts which are made out of them by Ebullition and Evaporation; the essential Difference of those volatile Salts which are drawn from them; what Principles are yet further contained in these Meats, after they are exhausted of their Juices, and become dry; lastly, I shall determine, in another *Memoir*, the Quantity of Nutrient that is to be expected from the Bones and osseous Substances in the Dressing.

BEEF.

To begin with Beef, I took a thick Piece of the same, and having cleared it of the Fat, Bones, Cartilages, and Membranes, had it cut into Slices of a Quarter of a Pound Weight. One of these I distilled in a Bath Heat, without any Addition; it afforded two Ounces, six Drams, and thirty-six Grains of Phlegm, or Humidity, which passed into the Receiver, and the dry Flesh, which remained in the Retort, was reduced to the Weight of one Ounce, one Dram, and thirty-six Grains. The Phlegm had the Smell of Broth, and had some Characters of a volatile Salt, for it precipitated a white Powder from a Solution of corrosive sublimate Mercury, as is the Manner of pure volatile Salts; and the Phlegm that came over last in the Distillation gave yet more sensible Marks thereof, by precipitating a greater Quantity of the same Solution.

The dried Flesh, weighing as aforesaid, being placed in the Retort, in a reverberatory Furnace, in order to an Analysis, afforded a small Quantity of Phlegm, charged with a volatile Spirit, which weighed one Dram four Grains, and after that three Drams forty-six Grains of a volatile Salt, and a thick foetid Oil, which could not be separated.

The Caput Mortuum, or Substance left in the Retort, weighed three Drams thirty Grains. It was a black Coal shining, and of little Weight, which was calcined in a Crucible over a very strong Fire, and by that Means reduced to Ashes, which weighed forty Grains. These Ashes, being exposed to the Air, imbibed the Humidity which augmented their Weight. They were made into a Lixivium, which being examined afforded no Signs of an alkaline Salt, but of Sea-salt, by precipitating a white Powder from a Solution of Mercury in Spirit of Nitre. It caused no Change in the Solution of the sublimate Corrosive, except that, after it had rested some Time, it formed at the Bottom of the Vessel a Sort of Cloud, in Form of a slight Coagulum. Now hitherto we know of no Salts, except those which are of the Nature of Sal Ammoniac or Sea-salt, that precipitate a white Powder from a Solution of Mercury in Spirit of Nitre; nor any Thing, except the absorbent animal Earths that I have observed to slightly precipitate a Solution of Corrosive sublimate.

Upon

Upon four Ounces of Beef, dried in a Bath Heat, I poured the like Weight of Spirit of Wine well rectified, and let them digest together for a very long Time. The Spirit took a weak Tincture from the Flesh, and extracted from it some Drops of Oil, the Colour it had acquired was red, and it had a faint Smell. Oil of Tartar mixed with this Spirit discovered itself by an urinous Smell. Its Mixture with a Solution of Mercury in Spirit of Nitre turned it white, whence proceeded a yellowish white Precipitate. This Liquor afterwards became gritty, from the urinous Sal Ammoniac with which the Spirit of Wine was impregnated. The Experiment of mixing this Spirit of Wine with a Solution of Corrosive sublimate produced a white Precipitate, which turned a little yellow. In this last Case there would have been no Precipitation, but for the urinous volatile Salt which entered the Spirit of Wine with the Sal Ammoniac.

Four Ounces of the like Beef being boiled in a Vessel well closed with three Pints of Water, and the Boiling being renewed six Times with the like Quantity of new Water, in order to exhaust as much as possible the Juice of the Meat, I put together all the Liquors of these Dressings; the two or three last of which had only a very faint Smell of Veal-broth, evaporated them by a gentle Fire, and towards the End of the Evaporation filtrated them in order to separate the earthy Part; and there remained in the Vessel an Extract moderately solid, which very readily imbibed Humidity from the Air, and was found to weigh one Dram fifty-six Grains. Thus the Result of this Experiment is, that since four Ounces of boiled Beef afford one Dram fifty-six Grains of Extract, one Pound of the like boiled Beef must yield seven Drams eight Grains of the like Extract, besides eleven Ounces, six Drams, sixty-four Grains of Phlegm, and three Ounces two Drams of Fibres exhausted of all their Juice. This Produce may vary according to the Feeding of the Animal in good or bad Pastures, or as the Flesh we chuse for the Experiment is fresher or staler. It is to be observed, that good Beef boiled will scarce ever turn to a Jelly, if we strip the Flesh of the Membranes, Tendons, and Cartilages. Now by *Jelly* I do not mean the Extract above-mentioned, but what after Boiling becomes of itself one clear, trembling Mass when it is cold.

The Extract of this Beef, which weighed one Dram fifty-six Grains, afforded in its Analysis one Dram two Grains of volatile Salt, which adhered to the Sides of the Receiver, not in Ramifications, as is usual with volatile Salts, but in flat Crystals, shaped for the most Part like Parallelopipedons. The Spirit and Oil, which came together, after the volatile Salt, weighed thirty-eight Grains. The fixed Salt of Tartar, mixed with this volatile Salt, seemed to augment its Force, which might give Room to suspect that this last was an urinous Sal Ammoniac, and so much the more for that the Crystals of this volatile Salt had a near Resemblance to the volatile Salts of Urine, which are known to be different from other volatile Salts extracted from the Flesh of Animals.

The Caput Mortuum, or Coal which remained in the Retort, was very light and porous, and weighed but six Grains. The Lixivium thereof precipitated a white Powder from a Solution of Mercury, like the Lixivium of the Ashes of the raw Beef above-mentioned.

The six Drams thirty-six Grains of the dried Mass of Fibres, being analysed after the same Manner, yielded two Grains of volatile Salt, in the Form of common volatile Salts, which adhered to the Sides of the Receiver in Ramifications, mixed with a little fetid Oil, thick enough, but not so brown as what was extracted from the boiled Mass. The Spirit, which was of a citron Colour, being separated from its Oil, weighed thirty-six Grains. The Caput Mortuum weighed one Dram sixty Grains.

The Lixivium made after the Calcining could not alter the Solution of Mercury made with Spirit of Nitre, because, when the Fibres of this dried Beef were analysed, they were already deprived, not only of all their essential Sal Ammoniac, but also of their fixed Salt, which is of the Nature of Sea-salt; for these Salts passed off, in a great Measure, with the Oils, into the Water, during the long Boiling of the Flesh. This Lixivium had only a faint Tincture of the Colour of an Opal. The Solution of Corrosive sublimate proves that there still remains an oily Part. It is known that sulphureous Substances precipitate a black Powder from that Solution, or rather a deep Violet, which begins with an opal Colour.

It appears then by the Analysis of the boiled Mass, that there passes into the Water, during the Ebullition, a Sal Ammoniac, which we may look upon as the essential Salt of this Kind of Flesh, and which, in the Distillation of the Extract, appears under a different Form from what was extracted from the Flesh distilled raw, which was the Method of former Analyses. And it seems probable, that this Salt is the very same as is separated from the Blood by Urine after Nutrition, since the volatile Salt, which I gained by this Extract, has a near Agreement, as I made appear, with the Salt extracted by Analysis from Urine. The Salt then produced by the Extraction will be the Product of that natural Sal Ammoniac which is in Flesh-meats, and is easiest to be sublimated with that which is afterwards extracted

from the Fibres. And we may say, after this Operation, that the volatile Salts are almost constantly the Product of the Fire, since Principles so little sensible will discover themselves no farther, than as they are disclosed by the Violence of the Fire acting on the Matter by Burning or Calcining, in order to the Formation of the volatile Salts.

I have given a particular Relation of my Operations on Beef, that I might give an exact Account of my Labours, which were the same on all other Kinds of Flesh-meats which I examined, so that I need not repeat the Process in the Course of this *Memoir*.

VEAL.

Four Ounces of Flesh, cut from a Fillet of Veal, and distilled in a Bath Heat, as the Beef was, afforded two Ounces, six Drams, fifty-four Grains of Humidity; the dried Flesh weighed one Ounce, one Dram, eighteen Grains, after it had yielded out its Principles by Analysis. The Caput Mortuum weighed two Drams fifty one Grains; its Lixivium gave Marks of a Sea Salt, as did the Beef.

Four Ounces of the same Flesh boiled afforded a Substance somewhat like a Jelly, which was reduced by Extraction to two Drams thirty Grains of a pretty solid Matter, though difficult to be dried. The Mass of the dried Fibres weighed five Drams sixty-two Grains: So that one Pound of a Fillet of Veal contains eleven Ounces, six Drams, sixty-four Grains of Phlegm, one Ounce, one Dram, forty eight Grains of Extract, and two Ounces, seven Drams, thirty two Grains of Fibres dried, or intirely deprived of their Juice.

By comparing the Products of the first Operations made on Beef with the like made on Veal, I found the Veal to contain more Phlegm than the Beef, by four Ounces eighteen Grains; that it afforded forty-six Grains more of Extract, and that the dried Fibres weighed forty-six Grains less. Now since the dried Fibres weigh less than those of the Beef, and since more Phlegm and gummy Parts are thence extracted, may we not presume that the Liquids which circulate in the Body of the Calf, where they serve not only for Nutrition, but also for the Growth of the Animal not yet come to Perfection, contain Particles more disposed to become solid, than the Liquids circulating in the Beef, where they serve only for Nutrition? For the same Reason the Extract from the Veal becomes firmer than that from the Beef; because it contains a greater Quantity of those gummy Particles which are appointed to become solid for the Lengthening of the Bones, Cartilages, Tendons, &c. And it is impossible to give the same Firmness to the Extract of Beef, unless it be boiled with the Bones, Cartilages, and Membranes, which are nothing, as I may say, but a Composition of these gummy Particles.

The two Drams thirty Grains of Extract from the Veal afforded me in the Analysis one Dram twelve Grains of Spirit, Oil, and volatile Salt, which last had the urinous Character like that of Beef. The Caput Mortuum left in the Retort weighed but a Dram.

The five Drams sixty-two Grains of dried Fibres, from which the Extract was made, being put in the Reverberatory, afforded one Dram sixty-six Grains of volatile Salt, of the Character of common volatile Salts, that is, it was in Ramifications; and one Dram thirty-seven Grains of Oil and volatile Spirit; the Caput Mortuum in the Retort weighed two Drams eighteen Grains.

Here I take again the Weight of these Caput Mortuums, or Coals, in which there can be no Mistake, especially with Respect to their Weight. That of the Extract of Beef weighed but six Grains, that of the Extract of Veal seventy-two; so that there was a Difference of sixty-six Grains in the Weight of the two Coals of the Extracts.

The Coal of the dried Fibres of the Beef weighed but one Dram sixty Grains; that of the Veal two Drams eighteen Grains; here is another Difference of thirty Grains.

These two Excesses added together make a Total of ninety-six Grains of Parts, considered as solid, more in the Veal than in the Beef. These solid Parts added to the gummy Particles spoken of above, which are appointed to become solid for the Growth of the Animal, being very considerably more numerous in the Veal than in the Beef, might not one conjecture that if these Particles preserve in our Bodies, when we take them as *Aliment*, the same Disposition which they seem to have in the Body of the Animal whence they are taken, Veal must be agreeable to Children, because they are growing, and to sick Persons who are much extenuated, and have undergone a considerable Loss of Flesh; and that Beef would better agree with adult Persons and such as enjoy a perfect State of Health? But I offer this only as a Conjecture.

MUTTON.

Four Ounces of Mutton, taken from the Leg, distilled in a Bath Heat, yielded two Ounces six Drams thirty Grains of Phlegm.

The Flesh drained of its Humidity weighed one Ounce one Dram forty two Grains, which being placed in a Reverberatory, after

after it had been exhausted of its Principles, left in the Retort a Coal which weighed but two Drams thirty-six Grains; the Lixivium of which gave Marks of a Sea Salt, that is to say, it made not the least Alteration in a Solution of corrosive Sublimate, and precipitated a white Powder from a Solution of Mercury.

Four Ounces of the same Mutton-boiled, yielded two Drams fifty-eight Grains of Extract: Hence one Pound of such Flesh-must yield eleven Ounces five Drams thirty-two Grains of Phlegm, one Ounce three Drams sixteen Grains of Extract, two Ounces seven Drams twenty-four Grains of Fibres, exhausted of their Juice.

The two Drams fifty-eight Grains, distilled in a Reverberatory, afforded about as much volatile Salt as the Beef, and more than the Veal; its Crystals took a better Form. The Caput Mortuum weighed but fifty-four Grains, the Lixivium of which gave more abundant Marks of a Sea Salt than the other Flesh-meats.

The dry Fibres of this Mutton, after the Extract was made, weighed but five Drams sixty Grains; which evidently proves, that Mutton contains more nourishing Parts, and volatile Principles, than either Beef or Veal, since it leaves in its Analysis less of a fixed Matter. The Analysis of these Fibres yielded a good Quantity of volatile Salt in Ramifications, such as always results from the Analysis of the dried Fibres of Flesh-meats: The Caput Mortuum weighed two Drams, its Lixivium gave very slender Marks of a Sea Salt with Solutions of Mercury, because the greatest Part of the Salts were volatilized, or passed into a Sal Ammoniac in the Extract.

CHICKEN

This being one of the most common kinds of Flesh, eaten alone, or with other Meats dressed with it, I undertook a like Examen of it as I did of the others. I took a Chick which weighed nine Ounces four Drams forty-eight Grains; after bruising it, I boiled it in several Waters, which produced a Jelly-like Extract, which weighed seven Drams thirty-six Grains; the Flesh and Bones, dried in a Stove, as the other Flesh-meats, weighed but one Ounce six Drams forty Grains: Whence the Chick contained six Ounces six Drams forty-four Grains of Humidity. I distilled, separately, in a Reverberatory, six Drams eighteen Grains of the dry Flesh, and three Drams nine Grains of the dry Bones, which was all I could get: The Flesh yielded some volatile Salt in beautiful Ramifications; the Caput Mortuum weighed one Dram six Grains; the Lixivium of the Coal gave no Mark of a Salt.

The Bones afforded, besides the other Principles, a small Quantity of volatile Salt, of the same Figure as that of the other Sorts of Flesh: The Caput Mortuum, which weighed two Drams eight Grains, produced nothing remarkable in the Experiments made on its Lixivium.

The Extract of the Flesh, which weighed seven Drams thirty-six Grains, yielded a volatile Salt of the same Figure as that of Beef, which however would not come over without enforcing the Fire: The Caput Mortuum weighed two Drams twenty Grains; the Lixivium of it afforded some Signs of a Sea Salt.

The COCK.

An old Cock, which weighed two Pounds two Ounces six Drams, yielded four Ounces seven Drams sixty-six Grains of gummy Extract, transparent, and very dry.

A CAPON.

The Flesh of a Capon, stripped of the Fat, and weighing one Pound seven Ounces two Drams forty-eight Grains, yielded one Ounce five Drams of Extract, which it was difficult to dry.

PIGEONS.

Two young House-pigeons, which weighed fourteen Ounces, afforded an Extract solid enough to become dry; it weighed seven Drams thirty-five Grains.

The PHEASANT.

A Pheasant, of the Weight of two Pounds, afforded a saline Extract, which could not be sufficiently dried to form a solid Extract, tho' I left it a long time in the Stove: That Extract weighed two Ounces four Drams sixteen Grains; so that this Flesh furnishes more Extract, than Beef.

The PARTRIDGE.

Two Partridges, weighing one Pound two Ounces five Drams, yielded one Ounce six Drams thirty Grains of Extract, less solid than that of the Pheasant.

The TURKEY.

A Turkey, weighing nine Pounds, yielded twelve Ounces forty-three Grains of Extract, considerably solid, which could not be dried, but always continued oily, and, as it were, resinous.

The Result of all that has been said, is, that the Extract of boiled Flesh-meats ought to be looked upon as the nourishing Part afforded by the Flesh of Animals in boiling; I don't mean by this, that the Whole of it is concerned in Nutrition, because it contains also gross Particles, which, in the Work of Digestion, are separated as useless by the Organs, in greater or lesser Quantities, according to the State of the Patient: This being supposed, we are to make it appear, what Nourishment is communicated to a sick Person from the Quantity of a Gallon of common Broth.

If, according to Custom, the Boiling consists of a Slice of Beef weighing a Pound, a Pound and a half of a Fillet of Veal, with half a Capon, which may weigh fourteen Ounces; if all these Sorts of Flesh, weighing together three Pounds six Ounces, are boiled in seven Pints of Water till reduced to three Pints, in order to make six Messes, which ought to be a Jelly when the Meat is sufficiently boiled, these six Messes will contain two Ounces five Drams thirty-four Grains of Extract at least; for the total Extract of all these Meats would be more by three Drams twelve Grains, if the Boiling were repeated as I did it, when I had a mind to have out all the nourishing Juice; and if the Patient takes the whole fix in twenty-four Hours, he will consequently have received about two Ounces five Drams thirty-four Grains of Aliment, which being compared with the whole Weight of Bread and Flesh, which he may be supposed to eat in Health, appears to be more than enough: Hence the Vulgar are mistaken, in imagining that sick Persons are not sufficiently nourished with Broths.

There are Circumstances in which even Veal-water, or Chicken-water, would afford sufficient Nutriment to the Patient; for the first, which would be made with one Pound of Veal, boiled in four Pints of Water till reduced to half, would contain one Ounce one Dram forty-eight Grains of Extract; and Chicken-water, where the Chick perhaps might weigh nine Ounces four Drams and some Grains, affords seven Drams thirty-six Grains of Extract: You are also desired to take Notice, that the Oil and volatile Salts of these Extracts, which are dispersed in the Boilings, are more disengaged, and more readily pass into the Blood, than those which are still embarrassed in the gross Fibres of the Meat, and require a long Time for Digestion; not to mention, that it is easier for this Kind of Aliment, than any other, to unite with the Juices of such Plants as shall be thought proper to mix with it, in order to temper and moderate its Action in the Blood.

I shall not repeat here the Relations between Extracts of other Flesh-meats, because I have joined with this Memoir a Table, containing, in Columns, the particular Products of my Operations.

A TABLE of the PRODUCTS of EXPERIMENTS made upon FLESH-MEATS.

BEEF RAW, distilled in Balneo Mariae.			
	Oz.	Dr.	Gr.
First Water.			
Four Ounces of Beef yielded of the first Phlegm	2	6	36
The dry'd Flesh in Balneo Mariae weighed	1	15	36

The solid Extract, which grew moist at the Change of the Weather	2	1	50
--	---	---	----

Mr. Geoffroy in a Memoir for 1732, pursues his Subject, and proceeds to the Analysis of other Substances used sometimes by way of Aliment, or Medicine:

Having in my former Memoir given the Analysis of some of our most juicy Foods, I now proceed to that of the most solid Parts of Animals, which are their Bones; and having, for that Purpose, made Choice of the Bones of an Ox's Leg, because they contain little Marrow, I ordered them to be carefully stripped of their Flesh, and rasped down, taking care at the same time not to break the inner Lamina, which covers the Marrow: I put a Pound of these fine Shavings, well-dried, into a Pewter Pot, exactly covered with eight Pints of Water, with which I boiled them five several times, adding fresh Water at each Boiling, and pouring the Water of each former Boiling into a Vessel by itself: The Shavings of these Bones were reduced into a whitish Kind of Pap, and the Broth, loaded with their most subtle Parts, could not be depurated without Filtration, and that too with some Difficulty: Being put into a Silver Bason, in order to evaporate, it did not thicken into a Jelly till towards the End of the Evaporation, during which no Precipitation happened.

This Jelly, or Extract, dried readily in the Air, and was reduced into a gummy, transparent, very dry Substance, which weighed three Ounces three Drams and thirty-six Grains: I call it a gummy Substance, because it remained clear and transparent, became brittle by being dried, and, as to its external Appearance, exactly resembled the Gum produced by the extravasated Sap of Trees.

An Ounce and forty-five Grains of this Substance, subjected to Distillation, yielded three Drams and eighteen Grains of

a very white volatile Salt, which crystallized itself in Ramifications, as other volatile Salts generally do: The Caput Mortuum, remaining in the Retort, weighed only two Drams and thirty-six Grains; its Lixivium had some faint Characteristics of Sea Salt, like the Caput Mortuum of the Beef, mentioned in my first Memoir.

Four Ounces of the dry white Paste which remained upon the Filtration, when subjected to Distillation by a reverberatory Fire, yielded very little volatile Salt, which was formed into flat Crystals of the Figure of Parallelopipeds, like those procured from the Extract of the Beef Broth: The Caput Mortuum lixiviated did, upon Trial, give some Marks of a fixed Alkali; and this Substance, after a new Calcination in a close Fire, ought to be looked upon as a kind of Calx, or Lime: Its Lixivium, attentively examined, left me no room to doubt of its being possessed of the Characteristic of a fixed Alkali, since it produced a red Precipitation in a Solution of corrosive Sublimate, like well calcined Hartshorn.

HARTSHORN.

Hartshorn managed in the same Manner, and in the same Quantity with the Bones of Beef, yielded a clear Broth; which became a Jelly as soon as cold; after Evaporation it left a gummy Substance, which, when dry, weighed four Ounces two Drams and sixty-three Grains.

An Ounce and forty-five Grains of this Substance, analysed by a reverberatory Fire, yielded only two Drams of volatile Salt in Ramifications, and thirty Grains of a volatile Citron-coloured Spirit, mixed with a little fetid Oil of a deep red Colour; the Caput Mortuum weighed two Drams and thirty-six Grains; its Infusion produced a greyish white Precipitation, in a Dissolution of Mercury, and in a Solution of corrosive Sublimate.

The Mass remaining after the several Boilings, when pretty dry, weighed only nine Ounces three Drams and thirty-six Grains: Four Ounces of this Substance, subjected to an Analysis, yielded one Dram and eighteen Grains of a volatile Salt, of the same Figure with that of the Beef Broth, and, like it, loaded with an Oil and a Phlegm; which, when separated with all possible Care, weighed about a Dram: The Caput Mortuum of this Substance, which weighed three Drams and twenty-four Grains, gave in its Lixivium all the Proofs and Marks of a Sea Salt; being then freed from the Remains of its volatile Oil, by Calcination, it produced a red Precipitation in the Solution of corrosive Sublimate.

I have made the same Experiments upon Ivory, thinking it proper to compare the Results of them with those made on other bony Substances, since Ivory is often used in Ptisans, Broths, and Jellies for the Sick.

IVORY.

A Pound of Ivory Shavings produced a limpid clear Broth, which coagulated in Proportion to its cooling; but, in the Evaporation, it insensibly let fall a very fine white Earth, loaded with some Quantity of an essential Salt, which obliged me to strain the Liquor again: The gummy Part, which remained after the Evaporation of this Broth, now twice filtrated, became more dry, hard and solid, than that produced from the Bones of the Beef, but less coherent than that produced from the Hartshorn: This gummy Substance weighed four Ounces seven Drams and one Grain; and when subjected to an Analysis, it first yielded a little Phlegm, then an Orange-coloured Spirit, then a white volatile Salt in Ramifications, which weighed forty-eight Grains; the thick black Oil, which it yielded last of all, weighed, together with the Spirit, three Drams and thirty-six Grains.

The Lixivium of the Caput Mortuum, which weighed three Drams and twelve Grains, produced a white Precipitation in the Solution of Mercury, and only rendered that of the corrosive Sublimate a little turbid.

The white Paste remaining after the Filtration of the Broth, afforded no concreted volatile Salt in Distillation; it only yielded a Citron-coloured Oil, and a volatile Spirit of a bluish Colour: The Whole, taken together, weighed four Drams and thirty-six Grains. The Lixivium of the Caput Mortuum, at first rendered the Solution of corrosive Sublimate turbid, and at last produced a white Precipitation, but produced no manner of Effect upon the Solution of Mercury.

These three Analyses furnish us with a very curious Observation: One would think it more difficult to extract, by boiling, the volatile Salts from solid Substances, than from those of a tenderer Nature; yet, in boiling, they deposit in the Water their Principles, and volatile Salts, sooner, and in greater Quantities, than the Fleashes of Animals: For, in my first Analyses made last Year, tho' I had stripped, if I may so speak, those Fleashes of their Principles by boiling, yet their Fibres, when dry, yielded a considerable Quantity of volatile Salt: This, Mr. Doddard has asserted; this, Experience has confirmed. In comparing the Analysis of Beef with that of its

its Bones, we find, that six Drams and thirty-six Grains of dry Fibres, that remained of four Ounces of Flesh, have yielded two Drams of volatile Salt and Oil; whereas four Ounces of the dried white Mass, produced from boiled Bones, have yielded only three Drams and an half of Spirit, impregnated with a very little fetid Oil, and with so small a Quantity of volatile Salt, that it could not be weighed. That which, in the Analysis of Flesh Broths, appeared to me an essential Salt, probably remains closely united to the Bones during their Growth; since in the Analysis of Bones, it does not discover itself in the same Order in which the same Salts discover themselves in the Analysis of Flesh. An Extract from Flesh has first yielded me an urinous Sal Ammoniac, of the Figure of Parallelopipeds; their Fibres, a volatile Salt in Ramifications, which nevertheless was of a more fixed Nature, since it was forced out by the Violence of the Fire, which alcalizes it. The Bones of Beef, on the other hand, have, in boiling, freed themselves of the ramified volatile Salts contained in their Laminæ; and these same Laminæ, after being long boiled in Water, have yielded an urinous Sal Ammoniac, though in a small Quantity, like that which I have drawn from an Extract of Flesh. Thus one may conceive, that Bones are more easily penetrated by Water than the Fibres of Flesh, which, by their pliant yielding State, elude, as it were, the Action of that Fluid.

Hartshorn is at first a fleshy Substance, as may be observed in the small sprouting Horns of the Deer; but, in Proportion as the Horn is nourished and augmented, that which before consisted of a fibrous fleshy Substance, and a thick Skin, furnished with Vessels, becomes so dry, that the Juices not being able any longer to enter it, that Horn falls off, being thrust out by a new sprouting Horn. If an Observation of the Hartshorn was not sufficient to prove it a fleshy Substance, yet the Chymical Analysis of it would almost afford a convincing Proof, that it is so; since it is a Substance which yields Principles, which, of all others, come the nearest those of Animal Flesh: Its Extract yields a sufficient Quantity of volatile Salt, which indeed appears in Ramifications; and the gross thick Substance, that remains after Filtration, yields one Dram and eighteen Grains of volatile Salt of an urinous Nature, which is a considerable Quantity, and makes Hartshorn approach nearer to a fleshy Substance than to that of Bones, since those latter furnish scarce any of that Salt.

Ivory is a Substance which pretty much resembles Bones, and like them consists of several Laminæ, or Plates. If we saw Ivory into thin Plates, and boil them in Water, these Laminæ, or Plates, may be easily separated; for they disentangle themselves from one another, and at the same time preserve their almost circular Figure. It is probable, that the Teeth of the Elephant have not, at first, all that Solidity which we find them endowed with; that they have their Vessels corresponding to the Pivot which fills the cony Hollow of the Base of the Teeth; and that, at last, being arrived at their full Growth, which they acquire in the Way of Strata, or Layers, and in many Years, the Vessels, we now suppose, are dried up and disappear. Ivory, upon its Analysis, yields no other Principles than those of Bones; that is to say, all the volatile Salt in the Extract, and almost none in the white Mass, stripped of these Juices. Ivory contains a greater Quantity of Juice than Bones, but has nevertheless a smaller Portion of volatile Salt in it: One might assign as a Reason for this, that the Ivory comes from warm Countries; and that in its Way to the African Ports, the Heat of the Climate has insensibly dissipated the volatile Salts.

The Analysis of a Chicken confirms my Position, that the younger the Bones are, the more immediate Approaches they make to the Nature of Flesh; since three Drams and nine Grains of Chickens Bones yield thirty-five Grains of an urinous or an ammoniacal Salt; an Extract of Chicken Broth does not yield its volatile Salt but by means of a strong Fire, and that Salt resembles urinous Salts; that is, it is of the Figure of Parallelopipeds; whereas that yielded by the Fibres deprived of their Juices, was in beautiful Ramifications, and under a drier Form.

W H E Y.

I also examined Whey, and for that Purpose took twelve Pints of new Milk, without any Mixture; and after curdling it with one Dram of *Runnet*, I put it on a gentle Fire, to produce a more thorough Separation of the Whey, which, after Filtration, weighed eight Pounds; while the Curd in the mean time weighed only two Pounds and seven Ounces: After having evaporated this Whey, in *Balneo Mariæ*, almost to Dryness, (for the Whey does not become thoroughly dry, on the contrary it becomes very suddenly moist, if taken off the Fire for ever so short a time; I say, after having almost evaporated it to Dryness) its Weight was nine Ounces and twenty-four Grains.

This Extract, subjected to an Analysis, yielded Phlegm, an acid Citron-coloured Spirit, and then a pretty thick Oil;

there were, in all, four Ounces six Drams and thirty-six Grains of Liquor, without any Appearance of volatile Salt. The Caput Mortuum, which weighed three Ounces and six Grains, being exposed to the Air, became moist, and its Lixivium had the Marks of a Sea Salt. As there was enough of it to afford its Salt, I had from it cubical Crystals like those of Sal Geminae, or those of Salt regenerated by the Spirit of Salt upon the Salt of Tartar; and this is a Proof, that there is a Sea Salt in the very first Juices of Animals. The Caput Mortuum dried, and thoroughly calcined, in its Lixivium had the Marks of an Alcaline Salt, and produced a red Precipitation in a Solution of corrosive Sublimate.

As Fish are also sometimes used in making Broths, I have examined some of them.

C A R P.

Upon boiling a Pound of Carp, clear of Skin and Bones, in four Pints of Water, like other Victuals, and frequently repeating the Boilings, the Broth, filtrated, let fall a Precipitate like that of Beef; when it was evaporated to the Consumption of half, and then filtrated afresh, the dry Extract weighed one Ounce and eight Grains.

A Dram and fifty-six Grains of this Extract analysed, in order to be compared with the same Weight of Extract of Beef, yielded half a Dram of volatile Salt, distinctly formed into Ramifications; its Oil, which was of a yellow brownish Colour, and mixed with the Spirit, weighed half a Dram; and the Caput Mortuum, in the Retort, forty-eight Grains; so that there were eight Grains of Loss.

The Lixivium of the Caput Mortuum produced a white Precipitation in a Solution of Mercury, which is a Proof of its being a Sea Salt, and a greyish Precipitation in a Solution of corrosive Sublimate.

The Mass of dried Fibres weighed one Ounce six Drams and twelve Grains.

Six Drams and an half of this Mass yielded a Dram and an half of volatile Salt in Ramifications; the Oil and the Spirit weighed two Drams sixty Grains; and the Caput Mortuum, remaining in the Retort, one Dram six Grains; its Lixivium produced a white Precipitation in the Solution of corrosive Sublimate, but produced no Change in that of Mercury.

It is a common Opinion, that Fish, being nourished in Water, cannot contain so much nutritive Juice as the Flesh of Land Animals; which we may be assured of, by adverting to the following Proportions:

Beef has no less Humidity than one Ounce two Drams and sixty Grains.

Extract of Beef contains thirty-eight Grains of volatile Salt more than the Carp, and two Grains more of Oil and Spirit.

The dried Fibres of Beef, compared with those of the Carp, contain thirty-six Grains more of volatile Salt; and the Carp yields in volatile Spirit, and in fetid Oil, two Drams and twenty-four Grains more than the Beef.

P I K E.

Four Ounces of Pike's Flesh, boiled like the Carp, yielded two Drams and twenty-four Grains of solid Extract: This Extract, subjected to an Analysis, yielded forty-six Grains of a Citron-coloured Oil, mixed with the Spirit; and the volatile Salt, which came last, was of an urinous Nature, and weighed thirty Grains: The Caput Mortuum weighed one Dram eleven Grains; its Lixivium produced a white Precipitation in a Solution of Mercury, but had no Effect upon that of corrosive Sublimate: The dried Fibres, which weighed only four Drams fifty-nine Grains, yielded two Drams and fifty-six Grains of Oil and Spirit of a yellowish Colour, and sixteen Grains of a volatile urinous Salt: The Lixivium of the Caput Mortuum, which weighed one Dram fifty Grains, did at first produce a white Precipitation in a Solution of Mercury, then a yellowish one, and at last the Whole became black; being poured upon a Solution of corrosive Sublimate, it produced a white Precipitation, which, without changing, remained in the same State.

F R O G S.

Two Pounds of the Flesh of Frogs, of which I only took the Thighs, and the half of the Legs, with the small Bones, yielded a white Broth, which afforded one Ounce one Dram and thirty-six Grains of Extract, without forming itself into a Jelly. One Dram and fifty-six Grains of this Extract yielded fifty-six Grains of volatile urinous Salt, and then forty-eight Grains of volatile Spirit and Oil somewhat thick: The Caput Mortuum, which remained in the Retort, weighed thirty-six Grains: Its Lixivium produced no Effect upon the Solution of Mercury, but produced a white Precipitation in that of corrosive Sublimate.

The dried Fibres, with their Bones, weighed three Ounces four Drams and thirty-six Grains; six Drams and thirty-six

Six Grains of these Fibres yielded two Drams of volatile Salt in Ramifications, which was very dry, and half a Dram of Spirit and Oil of a deep yellow Colour: The Caput Mortuum, which remained, weighed two Drams: Its Lixivium produced no Precipitation in a Solution of Mercury, but a white one in that of the corrosive Sublimate.

TORTOISE.

A small Land Tortoise, which weighed thirteen Ounces and eighteen Grains, being separated from its Shell, the Flesh, with the Head, the Feet, and the Tail, stripped of the Skin, weighed eight Ounces, exclusive of the Intestines, which were thrown away: The Broth produced from them became a little gelatinous; and being filtrated, and evaporated to Dryness, it formed an Extract which weighed five Drams and six Grains.

In distilling it, I procured from it first a Phlegm, then a reddish volatile Spirit, and afterwards a pretty rich Oil, the Whole together weighing fifty-four Grains: The Lixivium of the Caput Mortuum, which weighed two Drams and twenty-four Grains, produced no Change in a Solution of corrosive Sublimate; but immediately produced a white Precipitation in a Solution of Mercury, and soon after a blackish grey one, because that Lixivium was loaded with Sulphur: The fleshy Fibres separated from their Juices, and the Bones, when dried, weighed six Drams and forty-eight Grains; in analysing them they yielded a Phlegm, a Spirit, and an Oil, weighing two Drams and sixty-six Grains of volatile Salt in Ramifications; the Mass, which remained in the Retort, weighed only three Drams and forty-six Grains; its Lixivium, like the before-mentioned, only produced a white Precipitation in Solution of Mercury.

LOBSTERS.

Four Ounces of Lobster, pounded and well washed, yielded a gelatinous Broth; the Extract from which, when very dry, weighed two Drams and thirty-three Grains: This Extract yielded Phlegm, a little volatile Spirit, a little Oil, and so little volatile urinous Salt, that it was impossible to collect it in order to be weighed: The Whole, taken together, weighed one Dram twenty Grains; and the Caput Mortuum, in the Retort, one Dram: Its Lixivium produced, at first, a white Precipitation in Solution of Mercury, which afterwards acquired a grey blackish Colour; but produced no Change in the Solution of corrosive Sublimate: The gross Matter from which the Extract was made, when dry, weighed six Drams and thirty-six Grains; and, when subjected to an Analysis, yielded a Phlegm, a Spirit, a fetid Oil which weighed two Drams four Grains, and a Quantity of volatile Salt; from which twenty Grains, in a dry Form, and in Ramifications, were procured: The Lixivium of the Caput Mortuum, which weighed only one Dram, produced a yellowish white Precipitation in a Solution of Mercury; but had no remarkable Effect upon that of corrosive Sublimate.

VIPERS.

As the Viper is used in Broths, in Powder and in Troches, I have examined it with such a Degree of Attention, that one may safely rely on the Detail I am now to give.

I weighed very exactly two live Vipers, and their Weight amounted to three Ounces two Drams eighteen Grains: I cut off their Heads and Tails, which weighed two Drachms and a half; in cutting them they yielded fifty-four Grains of Blood; their Skins were taken off, that so their Ovaria and Livers might be got from them: The two Skins, and Entrails, weighed four Drams and fifty-four Grains: The two Trunks, with the Eggs and Livers, weighed one Ounce six Drams and thirty-six Grains. There were thirty Grains of Loss or Evaporation. I then took a Part of another Viper to make up the two Ounces: I made a Broth of these Vipers, cut in the ordinary Manner; which, after Filtration and Evaporation, reduced itself into a gelatinous Extract, which, when dry, weighed one Dram and thirty-six Grains.

The Fibres and dry Bones, after boiling, weighed three Drams and sixty-six Grains; so there was in two Ounces of the Trunks of the Vipers, an Ounce two Drams and forty-two Grains of Phlegm.

That I might still, with the greater Accuracy, assure myself of the Weight of all the Parts of the Viper, I began to make my Observations upon fresh Vipers; and accordingly got one of the largest Kind, which weighed, when alive, three Ounces six Drams and an half.

The Head and the Tail, when cut off, weighed, together, one Dram six Grains.

The Blood, yielded by the Viper, one Dram eight Grains.

The Skin, four Drams sixty-two Grains.

The Liver, one Dram fourteen Grains.

The Heart, six Grains.

The Gall-bladder, seven Grains.

The Fat, three Drams forty-four Grains.

The Entrails, four Drams sixty Grains.

The Trunk itself, one Ounce three Drams and sixty-three Grains.

Thus there were, in the Whole, one Dram and fifty-two Grains of Humidity lost by Dissipation.

The Trunk, when dry, weighed three Drams seventy-one Grains; so that it contained seven Drams and sixty-four Grains of Humidity.

The Blood, when dry, seventeen Grains and a half; Humidity sixty-two Grains and a half.

The Heart, when dry, one Grain and a quarter; Humidity, four Grains and three quarters.

The Liver, when dry, forty-three Grains and a half; Humidity, forty-two Grains and a half.

The Gall-bladder, when dry, one Grain and a half; Humidity, five Grains and a half.

The Skin, when dry, one Dram seventeen Grains; Humidity, three Drams and forty-five Grains.

The Head and Tail, when dry, twenty-eight Grains and a half; Humidity, forty-nine Grains and a half.

The Trunk of a Viper, whose Skin was taken off, and weighed four Drams fifty-four Grains, yielded, by boiling, thirty Grains of a gelatinous Extract. The Flesh, dried and separated from the Bones, weighed sixty-seven Grains; the Bones, dried, thirty-six Grains and a half; so that the Trunk of the Viper contained two Drams sixty-four Grains and a half of Phlegm. We may be readily assured, that the ordinary Broth of a Viper, which weighs only four Drams and fifty-four Grains, is only impregnated with about thirty Grains of the Substance of the Viper; and that, when one takes the smallest Dose of Viper Powder, which is twelve Grains and a half, or three Quarters of a Grain, the Turn of the Balance being subject to vary, this is equivalent to thirty-seven Grains and a half of recent Vipers Flesh. We may also know, from this Calculation, what we ought to think of the gelatinous Parts, when drawn from the Trunks of Vipers, to be used in Troches. For, suppose we use four Ounces of the Trunks of Vipers, whose Skins are newly taken off, there may be drawn from them one Ounce fourteen Grains and a quarter Grain of Extract from the Broth, or the dried Flesh; and there will be found, of what remains, three Drams thirty-three Grains and three quarters of a Grain; and two Ounces three Drams and twenty-four Grains of Phlegm and Moisture.

A Viper's Liver and Heart, which weighed sixty-one Grains, yielded, by the Evaporation of the Broth, three Grains of a gelatinous Extract; and the Heart and Liver dried, after boiling, weighed no more than eighteen Grains and a half.

Analysis of the Extract of Viper Broth.

I took the Extract of the Broth made from two Ounces of Viper, the Heart and Liver included; it weighed one Dram and thirty-six Grains: It yielded in Oil, Spirit, and volatile Salt, of the Figure of Sal Ammoniac, fifty-four Grains: The Caput Mortuum, remaining in the Retort, weighed also fifty-four Grains; and its Lixivium had the Marks of a Sea Salt. The dried Fibres, and the Bones, which weighed three Drams and sixty-six Grains, yielded in Spirit, in Oil, and in volatile ammoniacal Salt, one Dram and fifty-four Grains. The Caput Mortuum, which weighed only two Drams and six Grains, by its Lixivium produced a white Precipitation in a Solution of Mercury.

To make the Analysis complete, I took the Bones of Vipers, which, by boiling, had been freed of all their Juice, and then of all their Fibres, by washing them thoroughly in Water. Two Ounces of these Bones, well dried, yielded, when subjected to an Analysis, two Drams and forty-four Grains of volatile Spirit and Oil. The volatile Salt, which had adhered in a dry Form to the Sides of the Vessel, and which was crystallized like the volatile Salt of Urine, was found to weigh seventy Grains. By still augmenting the Fire for five Hours, there were twelve Grains of volatile Salt in Ramifications, like that which is drawn from Hartshorn. I procured eighty-two Grains of volatile Salt, in a dry Form, from two Ounces of Viper Bones, which one would have imagined destitute of all their Principles; and this Abundance of volatile Salt is almost equal to that which is drawn from the Hartshorn. The Lixivium of the Caput Mortuum of these Bones, did not change a Solution of corrosive Sublimate, but only discovered some Marks of Sulphur.

This Analysis of the Bones of Vipers proves, that the Antients were in the right to boil Vipers, in order to draw out their Principles in the Troches destined for the Theriaca; and that the Bones have nothing noxious, nor even useless, in that Antidote; since being disentangled, and rendered friable by boiling, they furnish a Substance like Hartshorn prepared in boiling Water: But what ought to make us regard them as useful in this Composition, is, that the preceding Analysis demonstrates,

demonstrates, that they contain almost as much volatile Salt as Hartshorn.

B R E A D.

I shall close this Memoir by giving the Analysis of Bread, in order to shew how much Extract, and grosser Parts, Bread, managed like other Aliments, and prepared by reiterated Boilings, would yield; and afterwards what Principles it yields, when subjected to Distillation: But I must advertise the Reader, that the Experiments upon Bread vary according to the Differences of Breads, according as the Meal is fine or coarse, and the Bread itself high or low baked.

I chose, for my principal Experiments, a kind of Bread which, to me, appeared to have the least Mixture of heterogeneous Substances in its Composition, as having neither Barm, Milk, nor Salt. I took, at different times, four Ounces of this Bread, which was baked the Day before; I took the Crust off, because it might, as well as the Degree of baking, accelerate or retard the drying of it, which is more equally performed upon the Crumb.

Four Ounces of this Crumb, well dried, were reduced to two Ounces seven Drams and thirty-six Grains.

The Crumb and the Crust cut in small Slices, as it were for Pottage, did not diminish so considerably, by reason of the Crust, which is dry; and four Ounces of the one, and of the other, dried at the same Fire, and at the same time, weighed three Ounces and six Grains.

The Extract of it was made with all possible Care, but the Decoction could not be filtrated, though made with a pretty large Quantity of Liquor; so I was obliged to allow it to settle at every different Boiling, and put the best clarified Part of it into a Vessel by itself.

The Decoction, clarified from the Crumb of the Bread, was reduced by Evaporation into a gummy Extract, tolerably transparent, and weighing six Drams: The remaining Part, after all the Washings and Boilings were over, being rendered so dry as to break, weighed no more than one Ounce seven Drams and fifty-four Grains, or two Ounces within eighteen Grains.

The Bread which had its Crust yielded, by the same Process, an Ounce two Drams and eighteen Grains of Extract; and the Mafs, remaining after the Boilings, weighed an Ounce four Drams and fifty Grains.

The six Drams of Extract, analysed as above, yielded a Phlegm, an acid Spirit of an Orange Colour, and a fetid Oil, which, together, weighed three Drams. The Caput Mortuum weighed two Drams: Its Lixivium produced a very slight Precipitation in a Solution of Mercury in Spirit of Nitre; which indicates a light Ammoniac, or urinous Salt, since the same Lixivium produced no Effect upon a Solution of corrosive Sublimate.

The dried Paste which remained after the Boiling, and which weighed two Ounces within eighteen Grains, yielded the same Principles which the Extract did; and the Liquors drawn from it, weighed in all seven Drams and eighteen Grains. The Caput Mortuum, remaining in the Retort, weighed six Drams and forty Grains: Its Lixivium produced no Effect in the Experiments I made with it.

By these Experiments we may be assured, that in a Pound of such Bread as I have mentioned, and used the Day after baking, there will be three Ounces seven Drams and forty-eight Grains of Moisture; since that Pound, when dry, will weigh no more than twelve Ounces and twenty-four Grains; and that it will yield five Ounces and one Dram of Extract, which is probably the Matter which, by Digestion, is separated from it for the Nourishment of the Body, and six Ounces and three Drams of a gross crude Matter. *Memoires del Acad. Roy. des Sciences.*

ALINDESIS, Ἀλινδῆσις, Ἀλινδῆς, an Exercise of the Body, mentioned by Hippocrates in his second Book de Victus Ratione, Ἀλινδῆσις, πρὸς ἀνάσσειν τῇ πάλῃ διακίνησιν. Ἐρεαίνει δὲ μάλλον διὰ τὴν κίνησιν, ἢ σαρκὸς ἥσιν. "Rolling on the Ground has nearly the same Effect as Wrestling; but it dries more, because of the Dust, and is less productive of Flesh." And again, in his Treatise de Insomniis, Τεῖς δὲ μὴ ἔσω, μὴ δὲ πάλῃ, μὴ δὲ ἀλινδῆσις. "Neither let Friction, nor Wrestling, nor Rolling in the Dust be used."

This Exercise consisted in rolling in the Dust, after being anointed with Oil.

ALINTHISAR, the same as *Vua* or *Uvula Procidentia*. See *UVULA*.

ALIOCAB, Sal Ammoniac. It is also called *Alemzadar*. *Castellus* from *Rulandus*.

ALIPENOS, Ἀλιπῆνος, Ἀλιπῆνος, from a Negative, and *λιπαρῶν*, to grow fat. A Word used to express external dry Medicaments, or Remedies which had no pinguious Ingredient in their Composition; and thus it is explained by *Celsus* in the following Passage: "There are no Plasters of greater Use than those which are immediately laid to green Wounds, and called ἔρωμα by the Greeks. For they resolve Inflammations;

unless very violent, and even then they very much abate their Violence; and close and cicatrize those Wounds which suffer no Inflammation. They are made up of Ingredients that are not pinguious, and are therefore called by the Greeks Ἀλιπῆνα." *L. v. Chap. 19.* They were opposed to the Emplastra *λιπαρῶν*, which were made of pinguious Ingredients. *Galen* called them Ἀλιπῆν.

ALIPASMA, from ἀλείφω, to anoint. A Powder which, when mixed with Oil, is to be rubbed over the Body, in order to prevent Sweat. *Blancard*.

ALIPILI, Servants attending upon Baths; so called from their being employed to pull off (*Alarum Pilos*) the Hair of the Arm-pits with Tweezers.---*Castellus*. For this Purpose they also applied Plasters, called *Dropaces*, made of Pitch and Rosin, which, being torn suddenly off, pulled off the Hair together with them; or they were anointed with certain Unguents called *Pfilitbra*, which had the Power of bringing off the Hair. Hence the Men who performed this Office were called *Dropacifla* and *Alipilarii*, and the Women *Picatrices* and *Partiltria*. *Le Clerc Hist. Med.*

ALIPTÆ, (from ἀλείφω, to anoint) Servants belonging to the Baths, whose Business it was to anoint Persons after bathing. This they did at first under the Direction of the Physician, who was himself above this mean Office: Whence they were called, among the Romans, *Unctores*, or *Reunctores*, and were generally of a servile Rank, as *Pliny* testifies of *Prodicus* the *Selymbrian*, *Mediastrinis Reunctoribus vestigal invenit*. [He received Wages among the servile Herd of Anointers.] But after they had acquired a Dexterity in this very meanest Branch of the Art, they began, by Degrees, to shake off their Dependence upon the Physicians, and at last engrossed it into their own Hands; nor contented with this, assumed first the Name of *Iatroaliptræ*, and soon after that of Physicians.

This, at length, brought a Reflection upon Physicians in general, many Slaves having learnt this Art, which they practised in the Houses of the Nobility, especially among the Romans, at a very low Rate: Whence it comes to pass, that many idle People will object to Physicians, even at this Day, that they were no better than Slaves at Rome; though they cannot fix this Reproach upon any but such as our modern Waiters at the Bagnios; for these are the only true Successors of the ancient *Aliptræ*, who, while Athletic Exercises were in Fashion, managed the Business of Bathing, Friction, and Anointing."

Schulzii Hist. Med.

The London Dispensatory directs the following Troches under the Name of *Trochisci Aliptæ Moschata*, "Balsamic Troches with Musk."

Take of the purest Labdanum three Ounces; of strained Styrax one Ounce and a half; of Benjamin in Powder one Ounce; of Aloes Wood two Drams; of Ambergrease one Dram; and of Musk half a Scruple. Let the Labdanum be rubbed in a Brass Mortar with an Iron Pestle, both warm, and rubbed over with an Almond with a little Rose Water, until by Agitation it becomes dissolved: Then put in the Styrax and Benjamin, which manage the same way; and lastly, put in the Aloes Wood in Powder, with the Musk and Ambergrease dissolved together, in another Mortar with Rose Water; and when the whole Composition is almost cold, form it into Troches. *S. A.*

This is from a Prescription of *Nicolaus*, and is transcribed into the *Augustane* and College Dispensatories, with half a Dram of Camphire, which is here omitted, as giving to it a Flavour very disagreeable to most Persons.---*Quincy's London Dispensat.*

ALISMA. This is the Ἀλίσμα Dioscorid. in the Opinion of *Matthiobolus*. *Arnica* Offic. Schrod. 20. *Arnica Officinarum*, Buxb. 98. *Arnica Schroderi*, Rupp. Flor. Jen. 141. *Doronicum sive Alisma* & *Arnica Germanorum*, Cod. Med. 46. *Doronicum Germanicum*, Park. 320. *Raii Hist.* 1. 276. *Doronicum plantaginis folio alterum*, C. B. 185. *Tourn. Inst.* 487. *Boerh. Ind. A.* 100. *Hist. Oxon.* 3. 127. *Buxb.* 98. *Doronicum Germanicum foliis semper ex adverso nascentibus villosis*, J. B. 3. 19. *Chab.* 339. *Calendula Alpina*, Ger. 603. *Emac.* 740. *GERMAN LEOPARD'S BANE*. *Dale*.

Alisma is by some called *Alcea*, by others *Damaconium*, by some *Acyrus*, and again by others *Lyrus*. Its Leaves are like those of Plantain, only narrower, with the convex Side towards the Ground: It has a slender smooth Thyrsoidal Stalk above a Cubit high, and bearing small Heads at the Top; the Flowers are thin, and of a white Colour, inclined to a palish Yellow; the Roots are like those of black Hellebore, slender, scented, of an acrid and moderate fat Taste: It delights in a watery Soil. (This Description is transcribed by *Oribasius*.)

A Dram or two of the Root, taken in Wine, cures those who have eaten of the Sea Hare, or have been bit by a Toad, or drank too much Opium. It is also good for the Gripes and Dysentery,

Dysentery, either drank alone, or with an equal Quantity of Wild Carrots Seed; and is of good Efficacy in Convulsions and Hysterical Fits. The Herb binds the Belly, but provokes the Menfes, and dissolves Tumours, if applied. *Dioscorides, Lib. ii. cap. 169.*

We have found, by Experience, that the Decoction of the Root of Damasonium, or Alisma, in Water, being drank, breaks the Stone in the Kidneys. *Aetius Tetr. i. Serm. i. Tit. Damasonium.*

Alisma is the fourth Species of Doronicum; it is a Plant which sends from its Root many Leaves, resembling those of Plantain, fibrous, somewhat thick, downy; and spreading upon the Ground. From the Middle of these proceeds a downy Stem, which grows to the Height of a Foot, or a Foot and a half, bearing Leaves a great deal smaller than those at the Bottom; and at the Top a yellow radiated Flower, resembling that of Doronicum, or common Leopard's Bane, but larger: Its Seed is longish, and of a sharpish, acrid, and fragrant Smell: Its Root is reddish, surrounded with long Filaments, like that of black Hellebore; spreading under Ground; of a sharp, aromatic, and agreeable Taste: It grows in hilly Places; it contains a great deal of Salt and Oil.

It is diuretic, sudorific, and sometimes a little emetic: It dissolves coagulated Blood. *Lemery des Drogues.*

It is found by frequent Experience to be a Discussive and a Vulnerary, and is counted the very best and only Panacea for such as have hurt themselves by Falls from high Places.—*Ephem. Germ. An. 9, & 10.* The Country People use it, instead of Hellebore, for the Murrain among Cattle.—*Hoff. Cat. Abstr. Dale, p. 88.*

Tournefort mentions five Sorts of Alisma: The first is the *Alisma repens, foliis graminis & subrotundis: Damasonium radicales emittens ex geniculis. Ranunculus palustris, foliis graminis & subrotundis. Petit. Epit. pag. 47. Damasonium repens, Potamogetonis rotundifolii folio: Tab. 4. Fig. 9. Al. Ac. Reg. Sc. 1719. Vail. 46.* in the great Lake below the old Castle at Llanberys.—*Mr. Brewer.* The second is the

Alisma Cord. in Diosc. Ranunculus palustris; Plantaginis folio ampliori. Inst. 292. Plantago aquatica latifolia. C. B. Pin. 190. Plantago aquatica. J. B. 3. 787. Plantago palustris sive aquatica. Tabern. Icon. 734. Great Water-Plantain:

Tabernaemontanus has a very good Figure of it; we must not confound it with that which *Lobel* calls *Plantago aquatica; foliis Betae aut Plantaginis, flore Gallii albi*; as *C. Bauhin* does: *Lobel's* Figure gives a better Representation of the following. The third is the

Alisma angustifolium umbellatum, capitulis rotundis. Ranunculus palustris, Plantaginis folio angustiore. Inst. 292. Plantago aquatica angustifolia. C. B. Pin. 190. Plantago aquatica minor. Tabern. Icon. 734. The lesser Water-Plantain. I have not found this about London: It is common in the Moors about Cambridge.

We must not confound the *Plantago aquatica humilis, angustifolia & longifolia Lob.* with this Plant, as *C. Bauhin* has done: We need but compare the Figures of *Tabernaemontanus* and *Lobel*, to see the Difference. The fourth is the

Alisma umbellatum, foliis angustissimis. Ranunculus aquaticus; Plantaginis folio angustissimo. Inst. 292.

The Root of this Plant is a Tuft of white capillaceous Fibres: The Leaves are two or three Inches long, two or three Lines broad, pale-green, having Nerves running lengthwise, pointed, sustained by a pretty long Pedicle, insipid at first, but afterwards tasting something like Coriander: The Stalks are usually crooked, naked, one Line thick, terminated by an Umbel of Flowers, the Rays of which are an Inch and a half long; each Flower has three Petals, which are almost round, pointed, white, inclining to a Flesh-colour, with a yellow Nail: The Emplacement consists of three hollow, yellowish-green, smooth, shining Leaves, a Line and half long, pointed, channelled; each Flower has six very short Chives, each loaded with a yellow Summit; the Pointal of the Flower is a little greenish Button, which becomes afterwards three Lines diameter, and sustains several clustered Seeds, channelled, one Line long, pointed, of the same Taste with the Leaves.

It flowers in July and August: It varies according to the Soil. I have observed it at Montpellier a Foot high, and with two or three Umbels, one above another.

Clusius's Description of his *Plantago aquatica minima*, would agree well enough with this Plant, if he did not affirm, that the Fruits open into two Parts, and inclose small Seeds; which agrees better with the Damasonium. The fifth is the

Alisma humile, supinum, angustifolium. Ranunculus palustris, Plantaginis folio, humilis & supinum. Inst. 292. Plantago aquatica, humilis, angustifolia & longifolia. Lob. Icon. 300.

This Species is very well represented by *Lobel's* Figure.

ALISTELES, Sal Ammoniac. *Rulandus.*

ALITURA, Nutrition. *Blancard.*

ALKAFIAL, Antimony. *Rulandus.*

ALKAHEST. See ALCAHEST.

ALKALE, (*Oleum Gallinae*) the Fat or Oil of a Hen. *Rulandus.*

ALKALI. See ALCALI.

ALKALIA, (*Vas*) a Vessel. *Rulandus.*

ALKALID, ALKES, or ALCOB, (*Æs ustum*) burnt Brass. *Rulandus.*

ALKANT, either Mercury, or a kind of Ink. *Rulandus.*

ALKANTUM, burnt Brass, or a kind of Aromatic, or, according to some, Arsenic. *Rulandus.*

ALKANRI, or ALCANRI, the Name given by *Mefne* to a particular Electuary or Confection; now out of Use. *Castellus.*

ALKARA, or ALCARÁ, a chymical Cucurbit; called so from its Shape, which is like that of the Cucurbita or Gourd. *Rulandus.*

ALKARANUM, *Rulandus* explains this *Duénec viride.* See DUENEC.

ALKASA, the same as ALKAZOAL, or ALBÖT, which *Rulandus* interprets a Crucible.

ALKAUT, ALMARKASITA, Mercury. *Johnson*, who by a Mistake transcribes *Alcant* for *Alkaut*, from *Rulandus.*

ALKAUTUM. *Johnson*, the literal Transcriber of *Rulandus*, also mistakes this for *Alkautum.*

ALKEKENG. A Plant thus distinguished:

Alkekengi, Halicacabum; Offic. Alkekengi Officinarum; Tourn. Inst. 151. Elem. Bot. 126. Boerh. Ind. A. 2. 66. Dill. Cat. Giff. 83. Alkekengi Tournefortii, Rupp. Flor. Jen. 38. Solanum vesicarium, C. B. Pin. 166. Solanum vesicarium vulgatus repens, fructu & vesica rubra, Hist. Oxon. 3. 526. Halicacabum, Ger. 271. Emac. 342. Solanum Halicacabum vulgare, J. B. 3. 609. Chab. 522. Raii Hist. 1. 681. Solanum vesicarium sive Alkekengi, Park. Parad. 532. Halicacabum, Rivin. Halicacabum sive Alkekengi vulgare, Park. Theat. 462.

WINTER CHERRY. *Dale.*

The Root of the Winter Cherry runs creeping in the Earth, shooting out in the Spring several brownish Stalks about two Foot high, somewhat angular, about a Finger thick, and not much branched; beset with many dull-green Leaves, broad at Bottom, and ending in a sharp Point somewhat waved about the Edges; in Shape like the common Nightshade; but larger. The Flowers come forth at the setting on of the Leaves; on long Foot-stalks; each Flower being a single Leaf, divided into five Segments of a white Colour, with yellow Stamens in the Middle; when the Flower falls off, its Calyx is extended into a large thin roundish Husk or Bladder, as big as a Walnut, first greenish, and as it grows to Maturity, of a reddish Colour, including a Berry of the Bigness and Colour of a red Cherry, containing a great many small flat Seeds in a clammy pulpy Juice. They grow with us in Gardens, where they are easily propagated; it flowers in July and August; and the Fruit is ripe in September. The Leaves and Berries are used.

The Leaves are cooling; and of the Nature of common Nightshade. The Berries are a singular good Diuretic, and useful against the Gravel and Stone: Being boil'd in Milk, and sweetened with Sugar, they cure the Heat of Urine, making bloody Water, and Ulcers in the Kidneys and Bladder. They help the Jaundice; by opening the Obstructions of the Liver and Gall-bladder, and the Dropsy; by carrying off the Water through the urinary Passages.

The only official Preparation, is, the Trochisci Alkekengi. *Miller Bot. Off.*

The Berries have a vinous and most penetrating Juice, like Wine, or the Juice of Citrons; and are therefore commended in burning Fevers. The dried Berries ground to a Meal, and infused in Wine, is a principal Diuretic; and besides moves the Belly; and is the more beneficial, as there is nothing in our Body but Urine, that inclines to an alkaline Putrefaction; wherefore alkaline Diuretics are to be suspected. Half an Ounce of the dried Berries bruised, and taken as Tea or Coffee with Sugar, cleanses the Reins, corrects grumous Blood, helps the Yellow Jaundice, Strangury, Gout and Dropsy. The Smoke of the Seeds received into the Mouth, makes the Worms drop out of a hollow Tooth in a wonderful manner. *Boerhaave.*

Lemery adds, That it is good for the Nephritic Colic; it is commonly apply'd in Decoction, and dry sometimes, and sometimes pulverized.

Alkekengi, is an Arabian Name. *Lemery de Drogues, p. 26.*

The Species of this Plant are:

1. Alkekengi Officinarum. *Tourn.* Common Winter Cherry of the Shops.

2. Alkekengi Officinarum, foliis variegatis. *Tourn.* Common Winter Cherry, with variegated Leaves.

3. Alkekengi fructu parvo verticillato. *Tourn.* Winter Cherry with small Fruit, growing in Whorles round the Stalks.

4. Alkekengi Virginianum, fructu luteo. *Tourn.* Virginian Winter Cherry, with yellow Fruit.

5. Alkekengi Indicum majus. *Tourn.* Greater Indian Winter Cherry.

6. Alkekengi Americanum annuum ramosissimum, fructu ex luteo virescenti. *Houft.* American annual branching Winter Cherry, with a yellowish-green Fruit.

7. Alkekengi Americanum annuum maximum viscosum. *Houft.* The largest annual American Winter Cherry.

8. Alkekengi

8. *Alkekengi Barbadosense patulum, parvo flore, fructu amplo, mucrone productioni. Ait. Phil. N. 399.* Dwarf Barbados Winter Cherries, with a small Flower, and an ample pointed Fruit.

9. *Alkekengi Curassavicum, foliis Origani incanis, flore viete subphureo, fundo purpureo. Boerh. Ind. alt. 11. 66.* Hoary Winter Cherry from Curasso, with Origan Leaves, and Sulphur-colour'd Flowers, with purple Bottoms.

10. *Alkekengi Americanum frutescens, fructu globoso rubro, vesica atro-purpurea. Houst.* Shrubby American Winter Cherry, with a round red Fruit, having a dark-purple Bladder. *Miller, Supplement to Gard. Dict.*

The third Species of Alkekengi mentioned by *Miller*, is thus distinguished:

Σαρούχρον ὀναντισμόν. Dioscor.

Solanum somniferum, Offic. Ger. Emac. 339. Park. Theat. 345. *Solanum somniferum verticillatum*. C. B. Pin. 166. Chab. 522. Hist. Oxon. 3. 526. Comm. Flor. Mal. 253. *Solanum somniferum Antiquorum*. Alp. Exot. 71. *Solanum verticillatum*. J. B. 3. 610. Raii Hist. 1. 682. *Solanum, Alkekengi Mexicanum*. Hern. 296. *Alkekengi fructu parvo verticillato*. Tourn. Inst. 151. Elem. Bot. 126. Boerh. Ind. A. 2. 66. *Pevetti Hort. Mal. 4. 113. Baccifera Indica, floribus ad foliorum exortus, fructu sulcato decaplyreno*. Raii Hist. 2. 1632. SLEEPY NIGHTSHADE.

It is cultivated by the Botanists, and blossoms in July. The Root and Fruit are in Use: The Root has a somniferous Quality, but milder than Opium. The Fruit powerfully provokes Urine, and therefore is prescribed in hydropic Cases. Its Decoction easeth the Tooth-ach: The Juice of the Root with Honey, cures Dimness of Sight. *DALE* from *Dioscorides*.

The Winter Cherry is not a Native of England; but is cultivated commonly in Gardens for medicinal Uses.

Alkekengi Leaves are acrid and bitter: They give no Tincture of Red to the blue Paper; but the Fruit gives it a very deep one. It seems at first to be sourish, but afterwards very bitter; so that 'tis probable there may be in the Fruit a Salt, like the *Oxyfal diaphoreticum Angeli Salæ*, mix'd with a little foetid Oil, but so involv'd in the Leaves with Sulphur and terreftrial Parts, as not to be perceptible.

The Alkekengi is very aperitive and diuretic: *Dioscorides* made use of it for the Jaundice, and Suppression of Urine.

The bruising or squeezing of three or four Winter Cherries in a Glass of Wine, in hydropical Cases, and Suppression of Urine, is advised by *Arnaldus de Villa Nova* and *Casalspinus*. In Vintage-time take a sufficient Quantity of Winter Cherries and Grapes; squeeze or bruise both together to make a Must, run it up, and take four Ounces of this Wine every Morning for the Gravel. The Juice, thickened to the Consistence of an Extract, has the same Virtues. Four or five Cherries squeezed in an ordinary Emulsion, drank while in the Bath, is good for Suppression of Urine. *Brassavola* used the Juice of these Fruits in the same Disease: He affirms, That one who suffer'd exquisite Pains for three Days, was perfectly cured by it. There are Lozenges prepared of the Fruit of Alkekengi: *M. Lemery* has given an excellent Description of them: This Fruit is used in the Syrup of Succory, and the Anti-nephritic Syrup of the Royal Dispensatory. *Martyn's Tournefort*.

The Trochisci Alkekengi, Troches of Winter Cherries, is directed by the College to be prepared thus:

Take of Winter Cherries three Drams; of Gum Arabac, Tragacanth, Olibanum, Pine Nuts, Sweet Almonds, Starch, Juice of Liquorice, Armenian Bole, and White Poppy Seeds, each six Drams; of Melons, Cucumbers, Citrills, and Gourd Seed, each three Drams and an half; of the Seeds of Smallage, and white Henbane, white Amber, Lemnian Earth, and Opium, each two Drams; and make them all together into a PASTE, of a due Consistence for Troches, with a sufficient Quantity of the fresh Juice of Winter Cherries. *S. A.*

This is an old Arabian Prescription, taken originally from *Mesne*. Both the Augustane and first Dispensatories of the College have got it considerably different from what it is here, and in some respects also different from one another; but this is exactly as in the last Edition of the College. *Quincy's Lond. Dispensatory*.

ALKERMES. The *Confectio Alkermes* is thus directed by the College:

Take of the best scented Rose-water two Pints, of the Juice of Kermes Berries three Pints, of the whitest Sugar one Pound; boil them almost to the Consistence of Honey, and then stir in the Powders of Cinnamon, and Aloes Wood, both the best in their Kind, each six Drams, and make into a Confection. *S. A.*

This was originally a Composition of *Mesne*, but it hath undergone many Alterations amongst Dispensatory Writers,

and particularly those of the Faculty of Montpelier and Leyden, as may be seen in the *Pharmacopœia Regia of Zwelfer*; but they are all perplexed and injudicious Processes. The College at first received it into their Dispensatory, according to the original Prescription; but it hath, upon every Revise since, been altered, until reduced to the simple and easy manner as herein ordered. All the superfluous Ingredients, and troublesome Parts of the Process, are here rejected, and nothing retained but what is of some Efficacy to the main Intention, and easy to manage: The Omission of the Gold, indeed, may lessen it in the Esteem of such as attributed any cordial Virtues to it on that Score; but when they have learned to judge better, they will be more reconciled to it, as here ordered, without that Decoration. *Quincy's Lond. Dispensat.*

For the Virtues of the CONFECTION ALKERMES. See KERMES.

Many prefer the simple Juice of the Kermes to this Confection.

ALKIAN, is defined by the Chymists to be that Spirit which nourishes and governs a Man, by which his Food is turned into Nourishment, and Animal Generation performed, and by which Man himself subsists, or is a mixed Substance of all these together. *Theat. Chym. Tom. 5. p. 135.*

ALKIBRIC, ALCHIBRIC, ALCHIBERT, ALGIBIC, ALKIBIC, or ALCHABRIC, the same as Sulphur vivum. *Rulandus*. *Johnson* calls it *Alkibrie*. In the fifth Volume of the *Theatrum Chymicum*, p. 492. it is said by a certain anonymous Author, to be incombustible Sulphur.

ALKIEN. This Word is used in the *Theatrum Chymicum*, Vol. 5. p. 170. It is not easy to understand it by the Definition there given. The Author says, *Alkien Terra est Alkien Animalis: in finibus Terræ in lamina alta sunt Vires præparatione, sicut Vires Animalis quas vocant Medici Alkien*. Probably *Alkien Terra* is that Spirit which carries on all the Operations performed in the Earth, as *Alkien* or *Alkien Animalis* does those in Animal Bodies.

ALKIMIA. See ALCHEMIA.

ALKIN, (*Cinis clavellatus*) Pot-Ash. *Rulandus*.

ALKIR, Smoke, or Coals. *Rulandus*.

ALKITRAM, (*Pix liquida*) Tar. *Rulandus*.

ALKOEL, a very fine sort of Lead dug out of the Mines. Others affirm it to be the *Lapis Lazuli*; and others, that it is Antimony. *Rulandus*. See ALCOHOL.

ALKOL, the same as ALCOHOL, which see.

ALKOSOR, Camphire. *Rulandus*.

ALKI Plumbi, a certain sweet Preparation from Lead, perhaps *Saccharum Saturni*. *Rulandus*.

ALLA, Ale, a Liquor very well known in our own Country, the Nature of which may be comprehended from what is said under the Article ALCOHOL. As a spirituous Liquor, it must necessarily be pernicious, if taken in too large Quantities, or too frequently. It is distinguished from Beer by the Age. As Ale, properly so call'd, is not kept a sufficient Time for the remaining *Gas Sylvestre* to be destroy'd, or incorporated with the Liquor in such a manner as to lose its Elasticity, or at least a Part of it, this, as an Aliment, must be excessively windy; and we frequently find violent Colics produced by it. Some, who have drank considerable Quantities, in a short Space of Time, of very flatulent Ale, have been almost instantly kill'd by the extreme Rarefaction of this *Gas Sylvestre*, or incoercible Spirit. Others have fell into the *Cholera Morbus*, and difficultly escaped with Life.

It must, however, be allow'd, that Ale, as an acescent Fluid, must be a very proper Drink, when acalescent Aliments are used in Quantities superior to the Powers of Digestion. Ale also is esteem'd by many to be less productive of the Stone and Gravel, than Wine, or any other Liquor, Mead excepted.

Upon the Whole, Ale well prepared, and kept to a proper Age, so as to lose its flatulent Qualities, seems to be a much safer, and perhaps more healthful Liquor, than that Wine which the Merchants and Vintners are pleas'd to supply us with, which is to such a Degree sophisticated, as to make it utterly uncertain, whether a single Glass of genuine Wine is, on any Terms, to be procur'd from their Cellars.

Lemery makes the following Remarks on Ale and Beer:

There are several Sorts of Beers, which differ from one another, according to their Consistence: For some are heavy, thick, and muddy, other clear and fine. Secondly, according to their Colour; for you will find those that are pale, yellow, and red. Thirdly, according to Taste; for some are sweet and penetrating, others bitter and sharp, and some again, almost as pungent as Mustard. Lastly, they differ also according to their Age: for new Beer hath a very different Taste from that which is stale. These various Differences proceed from the Way of brewing them, from the different Countries or Climates, from the Water that is used, from the Time spent about them, and from the Ingredients put in, and the Proportions of them.

You are to chuse that Beer which is clear, of a good Colour, of a pungent and agreeable Taste, that sparkles much when you stir it, and that is neither too old, nor too new, and without any Sourness, according to these Lines:

*Non acidum sapiat Cerevisia: sit bene clara:
Et gravis sit cocta bonis: satis ac veterata.*

Beer is of an opening, fortifying, moistening and refreshing Nature: It's nourishing enough, and makes People fat, which is manifest enough in Northern Countries, where most People drink nothing but Beer, and where they are almost all fatter, bigger, and more vigorous, than those that live in Countries, where Wine is their common Drink. See how the School of *Salernum* explains the Effects of Beer.

*Crassos humores nutrit Cerevisia, vires
Præstat, & augmentat carnem, generatque cruorem.*

Beer, when drank to Excess, makes People drunk; and the Effects of it this way, last long. When 'tis too new, 'tis windy, provokes Venery, and sometimes so operates upon the Channels, that it causes a kind of Gonorrhœa, which indeed is a little dangerous; and this, perhaps, has made some People say, that the Use of Beer, is pernicious to the Reins and Nerves; tho' Experience does by no means confirm it, but on the contrary, makes this Drink to be generally very wholesome.

They extract an inflammable Spirit from Beer, like that of Wine; they also draw Phlegm, black Oil, and a Spirit from it, which is nothing but acid Salt, dissolved in the Phlegm.

Beer agrees, at all times, with any Age and Constitution; but especially more with plump and fat People, than others.

R E M A R K S.

Beer is a Liquor well known, and which by Fermentation has been made vinous: It's made of Barley, Oats, or some other Sort of Corn, which they reduce into large Meal, of which they take a certain Quantity, put it into hot Water, wherein they boil it for some time, till the Liquor has impregnated the active Principles of the Meal; after which they draw it off, and boil it again with Hops in it, or a little Wormwood, or other bitter Plants. When the Liquor is boiled enough, they stir it much, and pour it backwards and forwards, from one Vessel into another, while 'tis yet hot: Then they let it work, in order to which they put Yeast or Dregs of Beer into it, or some other fermenting Matter. Lastly, when it has been well purged and clarified by Fermentation, they put it into Tuns or Barrels, and keep it.

The working of the Beer proceeds from the essential Salts of the Corn, which rarefy, attenuate, and exalt the oily Parts of the same Corn. This Fermentation ceases, when the Salt has surmounted the Opposition made by the oily Principles; and when the gross Matters have been precipitated into the Bottom of the Vessel: This Fermentation is still more or less full of the Principles of the Corn.

Tho' we have, in this Place, but related one Way of brewing Beer, yet 'tis done several Ways; for we may say, that every Brewer has his own Method: It's enough, that we have shewed that which is most common, and most in use.

Hops, or other bitter Plants, which they put into Beer, produce good Effects therein; they help to rarefy the gross and viscous Part of the Corn. Moreover, they hinder the Beer from growing sour; for every body knows, that bitter things are very proper to consume those that are sour.

All Sorts of Waters are not alike good for brewing of Beer with; those which are very clear, cold, and vivid, such as Well and Spring Waters, are to be preferred before others; because that, being not liable to ferment, they hinder the Beer from being spoiled. In short, if Beer does work at first with too much Violence, or else if it ferments anew, after it has once worked enough, this Fermentation will make way for the spirituous Parts to fly away; and then the acid Salts which are in the Beer, extending themselves much, and getting the Ascendency, never fail to make the Liquor turn sour.

Hence it is, that the Beer which is brewed in the Northern Countries, as in *England*, *Sweden*, *Flanders*, and several Parts of *Germany*, is better, and keeps longer, than others. In short, as the Sun has but little Power in those Parts, the Waters upon that Account are colder and rawer, and do more vigorously retain the active Principles of the Corn: And by this Reason also we may perceive, that the Beer brewed in hot Countries will not keep long, and therefore 'tis not proper to brew any in *Provence*, *Dauphiné*, or *Languedoc*.

We know by Experience, that the best Time of the Year for brewing of good Beer, is in cold Weather, as the Beginning or latter End of a Winter; and that that which is brewed in Summer, does not keep so long.

Beer may be called a liquid Bread, because 'tis made of the Meal of Corn, steeped in a deal of Water: This Drink is nourishing and moistening, by reason of the oily and balsamic

Principles, which the Corn supplies it very largely with; it makes People intoxicated, when drank to Excess, because it contains many spirituous Parts, that cause Drunkenness in the same manner, as other vinous Liquors do, as we have already accounted for.

Beer that is too new, contains much viscous and acid Phlegm, which not having been sufficiently attenuated, during the Fermentation of it, causes Wind, and rarefies itself in the Bowels, by the Heat of the Body: It also causes Heat in the Urine, and even a kind of Gonorrhœa, by sticking in the urinary Passages, and strongly pricking them. These Accidents are remedied, by drinking a little Brandy, which separates and cuts this viscous Phlegm, and expels it from the Places where they were lodged: This is the Phlegm which contributes to make the Intoxication, caused by Beer, to be longer and more dangerous, than that done by *French Wine*, because it doth, in some measure, obstruct the Channels of the Brain, and bear down the Animal Spirits in such a manner, that it requires a pretty deal of Time, to bring them into their pristine State again.

The *English* prepare another Sort of Liquor, which they call Ale; it is yellowish, clear, and transparent, very pungent and subtil: It tickles the Nose and Mouth of those who drink it; somewhat like Mustard: It's very opening, and more pleasant to the Taste, than common Beer. They pretend, that there are no Hops, or other bitter Plants, put into it, and that its Strength proceeds from an extraordinary Fermentation caused therein, by the Help of some sharp and pungent Drugs. In the mean time, *Schookins*, in his Treatise of Beer, observes, that some put a few Hop-tops into their Ale, in order to qualify the over Sweetness of the Malt.

Mundy, a London Physician, speaking of Beer, says, That when this Liquor is new boiled, many put some Birch Boughs into it, in order to make it a little more pungent, and the sooner drinkable: He says also, That some others put Ground-ivy into the Vessels, wherein this Liquor is put, by the Help of which, the Liquor is fined in a little Time: They usually bottle up their Ale, and cork them well: But Care must be had, when you drink it, that you open the Bottle by Degrees; for the Liquor is rarefied to such a Degree, when the Bottle is suddenly opened, that it flies, and so is spilt.

Beer in *Latin*, is *Cerevisia*, à *Cerere*, because Corn, which *Ceres* was reputed the Goddess of by the Antients, is the Ingredient of which it is made: It's also for the same Reason, that some call it *Liquor Cereris*, the Liquor of *Ceres*.

It's also called, *Vinum Hordeaceum*, *Vinum Regionum Septentrionalium*, because 'tis made of Barley, and in the Northern Countries used instead of Wine: It may be also said, that it has this Advantage of Wine, that it may be made at all times, that it moistens, is more nourishing, and marketable. *Lemery on Foods.*

ALLABOR, ALAHABAR, ALABARI, ALCHONOR, AL-LARINOC, ALHOHONOC, ALRACHAS, ALASTROB, ALOMBA, ALOOC, ALCAMOR, Lead. *Rulandus.*

ALLABROT, a kind of factitious Salt. *Rulandus.*

ALLANTOIS, from ἀλλὰς, a Sausage, or Hogs Pudding, as we call it; because in Brutes it is long and thick.

It has been much disputed by Anatomists, whether the human Fœtus was furnish'd with an Allantois or not. But *Dr. Hale*, in the *Philosophical Transactions*, and *Monsieur Littre*, in the *Memoirs of the Academy of Sciences*, put the thing out of Dispute. I shall therefore give their Sentiments and Observations on this Subject.

I shall here give a true and exact Account of a human Allantois, as it appeared in two Subjects, still by me; one of which I observed several Years ago, and the other in *March* 1698-9.

Most of the Antients allow of one; not from their Experience of it, but because they took it for granted, that Men, and other Animals, were alike, in the *Viscera*, *Membranes*, *Vessels*, &c. *Hippocrates* says, That Twins lie in *Sinusses*, and that the *Uterus* has *Cornua*. *Galen* describes the *Navel-string* to consist of four Vessels, besides the *Urachus*, and the *Allantois* to be like a Pudding reaching from one *Cornu* of the *Uterus* to the other. In short, notwithstanding the Antients might sometimes dissect human Bodies, and although *Herophilus* and *Erasistratus* did open live Men and Women, yet it can't be found, what great Use was made of those Opportunities. For the Antients Accounts of many Parts, particularly of the *Urachus* and *Allantois*, (as to its Name, Figure, Site, &c.) agree only to their Appearance in *Brutes*. I shall say nothing of the *Allantois* in *Brutes*, since it is granted by most Anatomists to be in these Animals, and sufficiently described by *Dr. Needham*, who also first discovered Part of the *Allantois* in human Subjects; but neither he, nor any other, has taken the right Method of finding it intire; and 'tis no Wonder they could not truly describe what they never saw. *Dr. Needham* says, That after the *Amnios* is cleared, and left fixed to the *Umbilical Rope*, you may divide by the Fingers, or Knife, the remaining Part of the *Involucra* into two *Membranes*. The

Exterior he truly calls the *Chorion*, the *Interior* he takes to be the *Allantois*. But by these ways of Separation, you will presently tear the *Allantois*, and be able to discern only some small Pieces of it. Besides, the *Allantois* is at first Sight so like the *Amnios*, that many who suppose the *Amnios* double, and that its Coats are easily separable, have taken these Pieces of the *Allantois* for broken Parts of one of the Coats of the *Amnios*: Whereas having first found the Hole whence the Urine came forth, (if the *Allantois* is not too much torn) you may blow up the *Allantois* with a Pipe to its full Dimensions, and then see its true Shape, the *Fundus*, the *Cervix*, the Insertion there of the *Urachus*, its relation to the other Membranes, &c. Be the *Allantois* never so much torn, yet this way you may easily separate many Inches of it from the *Chorion* and *Amnios*: Which easy Separation demonstrates a Distinction of Membranes, since no double Membrane can be divided by the Breath alone.

Indeed *Hoboken* and *Diemerbroeck* made it a very easy thing to separate the *Allantois* from the other Membranes, only by the Fingers; but 'tis plain from their Descriptions, that they never saw one intire. Amongst other Mistakes, *Diemerbroeck* says, That the Urine of a *Fœtus* lies between the *Urinary Membrane*, and the *Chorion*; as though not contained in a distinct Bladder, but in a Cavity made partly from the *Chorion*, partly from the *Urinary Membrane*. I confess *De Graaf* tells us, That by blowing with a Pipe into a Hole made through the *Chorion*, all the Membranes of the *Secundines* will appear distinct. He has also delineated an *Allantois*, with the other Membranes, &c. as he says he found them; yet this Figure must be drawn from his own Fancy, and not from any Preparation, for these Reasons: First, Because by this way of Separation, you can only part the *Allantois* from the *Chorion*, but never see its true Dimensions, nor any Appearance of a Bladder, as the *Allantois* is, can be shew'd only by blowing into its Cavity, or by finding it full. Yet in this Figure no Sign can be observed where it was blown up, and tied, *De Graaf* also speaking of making a Hole only in the *Chorion*. Nor can this *Allantois* be supposed full of Urine, because 'tis not of the Shape of a full *Allantois*; and our Author himself calls it only the inflated Part of the *Allantois*. However, I can't conceive how the *Allantois* could remain partly filled with Air, (any more than it might with Urine) so long as till this Figure was drawn, unless some Hole was tied up, whence the Urine came forth, and the Air was blown in. Secondly, Because in this Figure the *Umbilical Rope* seems to run through both *Amnios*, and the *Allantois*, to its Insertion on the *Placenta*; whereas the *Allantois* is no-where perforated by the *Umbilical Rope*, nor does it any-where pass through the *Amnios*, but only runs under it, at the Place of its Insertion on the *Placenta*. If the *Navel-string* could be allowed to enter the *Amnios*, and to pass under it to the *Placenta*, why should it not appear (which it does not) under the *Amnios*, as well as the thin Substance of the *Allantois*? Again, according to *De Graaf's* Position of the *Secundines*, nothing could hinder a plain View of the Place where the *Navel-string* is set on the *Placenta*. This will be easily apprehended, by supposing the Part H, in my Figure, (Plate 3. Tab. 2.) to lie uppermost, the *Fundus G* and *Navel-strings* being turned over; for then the *Strings* will run over the *Allantois*, as in *De Graaf's* Cut, and its Insertion appear plain on the *Placenta*, which yet can't be discover'd in his Figure. I am sure the Whole is irregular, and I take it to be fictitious. As for the *Urinary Membrane*, it seems to be the *Allantois* of a *Colt*, (where *Needham* says, The *Umbilical Rope* runs through the *Urinary Membrane*) not less absurdly added to the *Secundines* of a human *Fœtus*, than the *Secundines* of a *Whelp* are to a like *Fœtus*, by *Vesalius*.

Lastly, 'Tis most evident, that *De Graaf* knew nothing of the true Shape of this Membrane, and that he had never seen one intire, because he consents to *Needham's* Description of it as true, which yet is false in several Particulars. For, First, The *Urinary Membrane* does not cover the whole *Fœtus*, (as he affirms) but only that Part of it which respects the *Chorion*, and does not lie on the *Placenta*; for the *Allantois* can be extended at farthest but to the Edges of the *Placenta*, where the *Amnios* and *Chorion* are so closely joined by *Fibres*, that no Membrane can come between them. Wherefore, Secondly, The *Allantois* is not every-where fastened to the *Chorion*. And consequently, Thirdly, The *Allantois* can't be of the same Shape that the other Membranes are of, nor be like the *Allantois* of a *Colt*, which contains the *Fœtus* in the *Amnios*; all which, nevertheless, *Needham* asserts. In short, Dr. *Needham* had seen only Pieces of the *Urinary Membrane*, but never an intire one, and so could only guess at the Shape, &c. of it, from what he had observed in *Mares*, and *Glanduliferous Animals*. He might have made a better Guess at the Figure, Site, &c. of a human *Allantois* from that of a *Whelp*, which does not every-where encompass the *Fœtus*; as he observes. *Bidloo*, in most of his Figures of the *Secundines*, letters some *Vestigia* of the *Urinary Membrane*; but in any of these Figures you only see broken Pieces of one, so confusedly placed, than no Idea of

its Bigness, Shape, or Situation, can be formed from them. I must confess, that oftentimes the Membranes of the *Secundines* are so torn, that no Art can exhibit an intire *Allantois*; however, among the many *Secundines* that have come under the Hands of Anatomists, several, no doubt, must have been intire enough for a fuller Discovery than they have made, had it not been, by their ways of Proceeding, (viz. by Knife, Fingers, or blowing under the *Chorion*) impossible to discover any thing plain, or satisfactory, even in the fairest Subjects.

I come now to answer the Objections of those who still deny an *Urinary Membrane* to a human *Fœtus*.

The Difficulty of finding this Membrane, is by no means an Argument against the Existence of it: But a Woman that dies big with Child, is so fair a Subject for the Discovery of three Membranes, that I wonder *Parey*, having such an Opportunity, could find but two, if he was so careful as he says he was. Dr. *Tyson* observed three Membranes some Years ago, in a like Subject. After the *Chorion* was divided, and laid aside, he saw two *Bladders*, containing Liquors of different Colours, which he pressing one towards the other, did not mix, but remained distinct. This Observation fully satisfied that great Anatomist, as to the Existence of an *Allantois*; and its Figure, Texture, Site, &c. might also have been discovered by him, had not the less curious Spectators been impatient to pass on to other Parts of the Dissection.

Some deny a *Urinary Membrane* to a human *Fœtus*, because they suppose the *Urachus* to be impervious, and that therefore there would be no Passage for the Urine, and consequently no Need of an *Allantois*. *Needham* indeed says, That he could never find any Sign of a Cavity in the *Urachus*; yet is of Opinion, that by blowing from the *Bladder*, the Air might be forced through a *Human Urachus*, as easily as he has often done it through that of a *Whelp*. I don't understand why Dr. *Needham*, and others, should insist so much upon an apparent Cavity in the *Urachus*, or expect that Air should necessarily pass through it upon blowing, and think that otherwise it cannot be fit for the assigned Office; since many Bodies, as Membranes, &c. will not admit Air, &c. yet let Water pass freely through them. It will not seem strange, that Water should pass through the Substance of the *Urachus*, if we consider, that the Cavity of the *Urachus* to the *Navel* is open, as appears by Inflation, or Injections (to say nothing of those who are mentioned to have made Water by the *Navel*); and that the rest of the *Urachus* is pervious, tho' not plainly hollow, (the Urine rather soaking gently, than running through its more strait Tubes) may be gathered from hence: First, That the Substance of the *Urachus* (as well as the Cavity of the *Allantois*) is always found turgid with a Liquor, that in Colour, Taste, and Smell, seems urinous. Secondly, That since the mucous Coat of the Intestines is demonstrated to be vascular by Mr. *Leeuwenhoeck*, therefore the mucous Substance of the *Urachus* may also be vascular. Thirdly, That Urine may as easily ouze through these mucous Vessels, as other Fluids run through vascular *Cartilages*, and *Bones*, &c. or the Chyle into *Lacteals*, (whose Orifices, as *Leeuwenhoeck* observes, will scarce admit of Particles so big as 1,000,000,000 Part of a Grain of Sand) the great Cavity of the Intestines being open at the same Time, or as easily as grosser Parts of the *Semen* pass the Tubes of the *Testicles*, whose Cavities are not more perceptible. I am sure the Urine is more assisted in its Motion by the *Detrusor Urinæ*, &c. than any of these Fluids can be by the *Heart*, or other Muscles.

Others will not admit of an *Urinary Membrane*, they thinking it would be useless, because they imagine, that when the *Bladder* is full, the Urine must be discharged at its *Cervix*, and not at its *Fundus* by the *Urachus*. But in answer to this, the Urine can never pass through the *Cervix* and *Urethra*, unless the *Abdominal Muscles* contract; because we never void Urine naturally, but by the Help of these Muscles, nothing less being able to force open the *Sphincter Vesicæ*. Now it being more than probable, that these Muscles never act before *Respiration*, no Urine can pass through the *Sphincter*, before the Child breathes. No Reason can be given, why the *Abdominal Muscles* of a *Fœtus* should voluntarily contract, since neither the Quantity nor Quality of the Urine can excite to such an Action: For when the *Bladder* is too full of Urine, it will ouze through the lax spongy Substance of the *Urachus*, being gently pressed by the *Detrusor* alone. There would arise many Inconveniencies from the voluntary Contraction of the *Abdominal Muscles* of a *Fœtus*, as voiding *Fæces* as well as Urine into the *Amnios*, which should be more prejudicial than Sweat, &c. Yet if we should suppose the *Abdominal Muscles* of a *Fœtus* to act, the Urine will however pass where it can most easily, that is through the *Urachus*, which is partly open, and altogether of such a Texture, as in no wise can hinder the passing of the Urine, much less be able to resist a considerable Force, as the *Sphincter Vesicæ* can. Besides, the *Urachus* is not only thus qualified for the Admission of Urine, but when the Mother lies down, 'tis almost upon a Level with the *Urethra*; and what has once passed the *Urachus*, cannot return by reason

feason of the Length, Situation, and peculiar Structure of it. Lastly, The *Pudendi Clausura*, sometimes happening in both Sexes, demonstrates, that then at least the Urine cannot pass through the *Urethra*.

Dionis not finding any *Allantois*, nor an *Urachus* plainly pervious, thinks there is no Need of either, on another Account. For he supposes, that the Blood which serves for the Nutrition of the *Fœtus*, is depurated from all Excrement. But I cannot apprehend, what should make this Portion of the Blood and Chyle freer from Excrement, than the rest of the *Massa Sanguinea*. There is indeed no Portion of it, which does not contain Parts unfit for *Assimilation* and *Nutrition*. Our Author would have been convinced of this Error, had he ever opened *Abortions* of five Months old or upwards, their Bladders being always full of Urine, and some *Fœces* constantly in the Intestines. 'Tis difficult to determine when this Separation of Urine first begins; but I am apt to think it much sooner than is generally supposed. Fig. 4. Plate 3. is the *Allantois* of a very small *Abortion*, which I have still by me. Since all the Parts are perfectly formed before *Impregnation*, not very long after *Impregnation* they may begin to perform their Offices. No doubt they begin as soon as there is Occasion for any Separation; and a Separation of Urine is necessary, when the *Fœtus* is first nourished by the *Umbilical Arteries*.

The Existence of an *Allantois* is denied by some who grant an *Urachus*, but will have it convey the Urine to between the *Amnios* and *Chorion*. *Diemerbroeck's* Opinion is somewhat like this, only he would have the Urine lodged between the *Urinary Membrane* and the *Chorion*. These Men don't consider, that the Urine in this Case would get into the *Amnios*, as well as the *Succus Nutritivus* of the *Chorion*, whether imbibed from the *Uterus* by the *Chorion*, or separated by its Glands. Such a *Succus Nutritivus* of the *Chorion* is granted by the Maintainers of the forecited Opinions; as well as by those who deny an *Allantois* altogether, or suppose it to have a different Figure, &c. from what *Diemerbroeck* assigns it. The Transudation (or Filtration through the Membranes) of this *Succus* seems most likely in *Mares* and *Sows*; for in a *Mare*, the *Chorion* is not joined to the *Uterus*, till she is half gone; and in a *Sow*, it does not adhere to the *Uterus*, till near the End of her going with young: But 'tis most evident, that the Urine of a *Human Fœtus* is not contained between the *Chorion* and *Amnios*, nor between the *Chorion* and *Allantois*, from the close Connection of these Coats to one another; also from the Observation of Midwives, who often find a Bladder of Water (they call it a *By-water*) offering itself before the Child, whereas the Humour of the *Amnios* is little, and of the *Chorion* much less, and of another Colour, &c. at the time of Birth: This *By-water* is taken Notice of, as an Argument for an *Allantois* by Mr. *Cowper*, to whose Assistance we owe, that the Figures belonging to these Papers appear correct.

The great *Harvey* will not allow an *Allantois* even to Brutes, and fancies the *Allantois* and the *Chorion* to be the same Membrane, that has two Names, the first from its Shape, the other from its Office, or Number of Vessels. Yet it is plain from *Galen*, and all the Antients, that they meant two distinct Membranes by the *Allantois* and *Chorion*. Dr. *Harvey* thinks, that a *Fœtus* does not void Urine, but that the Bladder contains it till the Time of Birth. What was offered against *Dionis's* Opinion, may serve for an Answer to this also. Because 'twas impossible for this diligent Anatomist not sometimes to observe an *Urinary Bladder*, he has thought of ways to explain such *Phænomena*, without granting an *Allantois*. In Sheep and Does, he had seen as it were a certain Process between the *Umbilical Arteries* full of Urine. This Process is no doubt the *Allantois*, though *Bartholinus* calls it the *Urachus*. Again, he thinks what is called by others an *Allantois*, (if it is not the *Chorion*) is some Coat accidentally formed from a Reduplication of the Membranes; because (since every Membrane is double) Nature may, upon a Streight, lodge the Urine between a Duplication. Yet he does not tell us how his Duplication is to be filled, he allowing no *Urachus*. But in short, this *Urinary Bladder* can be no Duplication of the other Membranes, since in all Animals it differs from them, as to Figure, Texture, and in having an *Urachus*, which no other Membrane has; and since every Animal that has a Bladder, must have a like Necessity for a Receptacle of Urine till born; since also the *Urachus* is ever alike inserted in the same Species of Animals, and the *Urinary Bladder* constantly the same, as to the Shape, Texture, Situation, &c. the *Urachus* and *Allantois*, with its *By-water*, can be no accidental or preternatural things.

Fig. 2. Plate 3. represents the Secundines of Twins, to shew the *Allantois*, and its Relation to other Membranes, &c. after the Parts were prepared and dried.

A A A A, Part of the *Chorion* expanded.

B B B, a Line expressing the Edges of the *Placenta*.

C C C, the *Amnios*, which is united to

D, the *Allantois*, at

E E E, the Line of Union.

F, the *Cervix* of the *Allantois*.

G, a Hole at the *Fundus* of the *Allantois*, whence the Urine came forth, and where the *Allantois* was blown up.

H, Part of that half of the *Allantois*, which lies under the Line of Union, and immediately covered the *Fœtus's*, unless it is supposed that the *Amnios* is continued under the *Allantois*.

I I, two Stiles or Probes thrust under the *Amnios*. They support the *Allantois*, and keep open the Aperture of the *Amnios*, whence the *Twins* came forth.

K, Part of the *Placenta*, with some Blood-vessels injected.

L L L L, the Arteries of the *Navel-string* filled with red Wax.

M M, the *Umbilical Veins* filled with green Wax.

N, a communicant Artery, by the means of which all the Arteries of both *Navel-strings* were filled at once; and the Veins were filled by one Injection in like manner.

O, a Pin that keeps out the *Amnios*, where, from the Edge of the *Placenta*, it runs partly to the Line of Union or Adhesion, and partly over the *Placenta*.

P, Part of the *Chorion* at the Edge of the *Placenta*, where it runs under the *Amnios* on the *Placenta*.

Q, a Pin, that by a Thread helps to pull open the Aperture of the *Amnios*.

R R R, the *Urachus*, lying between the Arteries.

a a a, Fibres or Vessels which fasten the *Allantois* to the *Chorion*.

Fig. 3. exhibits a Side-view of the same Preparation, that the Insertion of the *Urachus*, &c. may be better seen.

N. B. That A, and all the same Letters in these three Figures, denote the same Parts in every one.

S, shews the Course of the *Urachus* R at F in pricked Lines.

T, Part of the *Amnios* raised from the *Placenta*, to discover the *Placenta* K and V.

V, that Part of the *Allantois* which is below the Line of Union, near its Neck F.

Fig. 4. shews an intire *Allantois* of a very small *Abortion*.

N. B. This *Allantois* was easily separated from the other Membranes, between which it lay; and the *Amnios* remained an intire Bladder or Membrane under the *Allantois*.

Now some Object, that which is called the Line of Union, can be no real Thing: As to this, I don't know whether the *Allantois* of *Twins* may not require such a Conjunction to sustain, and keep steady, a greater Quantity of Urine; nor can I resolve, whether the *Allantois* of *Twins* (like that of a single *Fœtus* in Fig. 4.) may not be distinct, and separable from the *Amnios*, but was not discovered by me to be so, thro' want of Skill or Care. However, the Reasons why such a Line was figur'd, are these:

1. Although I used more Force, with equal Care, to separate the *Allantois* in this Place, than in any other, (where nevertheless the Separation was very easy) yet I could not divide these Membranes farther than that Line.

2. This Line seeming so regular, as to divide the *Allantois* into two equal Parts, I could not take it to be the Effect of Chance, or my Separation.

3. The Part H below the Line E E, was alike in Transparency to that Part of the *Allantois* D above it; whereas had the *Amnios* been joined to the *Allantois*, (as the Objectors suppose) the *Allantois* below this Line must have appeared thicker than that Part above it, since the *Amnios* alone is much thicker than the *Allantois*. 'Tis easy, indeed, to conceive the *Amnios* running an intire Bladder, or Membrane, under the *Allantois*, and perhaps it may be so; but I think it disingenuous to conceal what I did observe, or to make out by Fancy, what I could not discover in Fact.

Others have thought this *Allantois* to be an *Amnios* of one of the *Twins* belonging to these *Secundines*. This Objection, though it may seem plausible, yet it is of no Force. For, first, this *Allantois* is much finer to the Touch, as also much more transparent, than the other *Amnios*, which still remains stiff, whilst the much thinner *Allantois* sinks under the least Blast of Air, notwithstanding the Stiles I I, which assist it. Secondly, This *Allantois* had two visible *Urachus's*, and is of an Oviform Figure, somewhat like the common Cuts of a Man's Bladder (for a true Cut of a human Bladder I never yet saw, for it ought to be made much bigger (as it really is) at its *Cervix*, &c.); also this *Allantois* no-where touches the *Placenta*, unless at the Neck F; but on the contrary, the *Amnios* is of the same irregular Figure, as the Position, Motion, &c. of the *Fœtus* require; likewise it covers the whole internal Surface of the *Placenta*. Thirdly, They who make this Objection must suppose some Hole in this Bladder, and in the *Amnios*, through which one *Umbilical Rope* may pass from the *Placenta* to the *Fœtus*; but such a *Foramen* would be preternatural, because the *Navel-string* only runs from the *Placenta* to the *Fœtus*, under a Coat taken from the *Amnios*, and lies with the *Fœtus* in the Cavity of the *Amnios*, that is no-where perforated. Fourthly, The Hole at the *Fundus* G was scarcely wide enough to receive the End of a Man's Finger, whereas the

Twins

Twins did not want six Weeks of their full Time. Since therefore a *Fœtus* of near eight Months could not possibly pass this Orifice, this Bladder could not be an *Amnios*.

Nothing in these *Secundines* is preternatural, only some things were not before observed. Hitherto Anatomists have not allowed Twins to lie in a common *Amnios*, but supposed each *Fœtus* to have a distinct *Amnios*. The Reason of this Opinion might be, that some, denying any Urinary Membrane, called every Membrane they found (except the *Chorion*) an *Amnios*; and these, finding two Membranes in the *Secundines* of Twins, supposed them to be two *Amnios's*: That others, granting an *Allantois*, but not distinctly discovering it, but only two Membranes, also imagined them to be two *Amnios's*; both of these taking that for the *Amnios*, which might really be an *Allantois*. But since one *Chorion*, and one *Placenta*, (the *Placenta* and *Chorion* being ever of the same Number) generally serve Twins, (nay, sometimes three *Fœtus's*) why should it seem strange, that one *Amnios*, (at least sometimes) and one *Allantois*, should serve the like Number?

I am not ignorant, that *Mauriceau*, and *Diemerbroeck*, think there is an absolute Necessity for every *Fœtus* to lie in a distinct *Amnios*, and that otherwise Twins in the same Membrane would grow together, and make a Monster. *Aquapendens* farther says, That all *Ova Gemellifica* do produce some other sort of Monster; yet 'tis most certain, that *Ova Gemellifica* do exclude two perfect Chickens, however not both alive. The great *Harvey*, indeed, thinks it possible, that such an *Ovum* may produce a monstrous Chick, if its *Vitelli* are contained in the same Membrane, &c. yet does not positively say it must be so. For my Part, I cannot see any more Reason, why Twins in one *Amnios* should grow together, than that the Hands or Heels of the same *Fœtus* should grow to its own Body. How can the Humours that lubricate a single *Fœtus*, and help it to move, join two together? Since the Humours are the same, and the Parts of the same *Fœtus* as tender as those of Twins are, and lie as close to one another, as Twins do. 'Tis very observable, that among all Monsters we read of, there are very few which seem to be made of two intire Bodies joined together, and that most of these, upon Dissection, were found to have but one Heart, one Liver; whence 'tis most plain, that these Monsters (and no doubt all others) were originally Monsters in the *Ova* before Impregnation, and not so from want of the *Amnios*. Yet *Diemerbroeck* does not a little boast of having first (as he thinks) found the Reason why Twins must lie in distinct *Amnios's*: But since the Matter of Fact (sometimes at least, as in these *Secundines*, there was only one *Amnios*, and two regular *Fœtus's*) is not true, his Argument for a Necessity of two *Amnios's* for two *Fœtus's* will never prove valid, even where Twins, and two *Amnios's*, are found. Indeed any Part may be made to grow to any Part, as we see in the Cure of Hair-lips, &c. but then the Fibres must be first broke, before there can be any Union. Now I cannot conceive what should naturally break the Fibres of the Twins in the *Uterus*. But although 'tis evident, from what has been said, that Twins may be distinct in the same *Amnios*, yet there must be as many *Urachus's* as *Fœtus's*. In these *Secundines* I saw two running over the *Placenta*, to the Neck of the *Allantois*, which I communicated to some Physicians, before the Parts began to grow dry. The *Urachus* passes under the *Amnios*, as the other *Umbilical Vessels* do, and runs from that Part where the *Umbilical Rope* is set on to the *Placenta*, strait to the *Cervix F.* S describes the Course of that *Urachus* marked R, at F in the second Figure. The other *Urachus* lay about a quarter of an Inch laterally beyond that marked R in the same Figure. I mean by two *Urachus's*, two long roundish Bodies, of a depressed Figure; they seemed as big as a Knitting-needle, and were of a darker Substance than the *Placenta*, on which they lay; they appear'd, in every respect, like that Part of the Navel-string which is allowed by all Anatomists to be the *Urachus*, and in like manner shrunk in two or three Days from a mucous Substance to a mere Membrane: These two are the only intire Urinary Membranes that I have prepared. Yet in the *Secundines* that have come to my Hands, I have ever found three distinct Membranes easily separable. *Phil. Trans. abr. Vol. 4. p. 87 to 96.*

M. *Littre*, in his Observations on a monstrous Human *Fœtus* (*Mem. de l'Acad. Roy. des Sci. 1701. p. 115.*) says, That he found in the After-birth of that *Fœtus*, besides the *Chorion* and *Amnios*, a third Membrane, of the same Make as the two others, and not like a Gut, but exactly what we find in some Animals, and call *Allantoides*. This Membrane he intirely, with his Finger, and blowing, separated from the *Amnios*, and from the *Chorion*, as far as where this adheres to the *Placenta*, and even partly in that Place, but with a little more Difficulty. This third Membrane was a little thinner than the *Amnios*, but as thick as the *Chorion*; he could perceive no Blood-vessel in it, nor any Liquor between that and the *Chorion*; but betwixt it and the *Amnios*, there was half an Ounce of yellowish mucilaginous Liquor, which, he says, was probably the most glewy Part of the Urine, which, by reason of its Viscidity, could not run off with the rest at the

Rupture of the Membranes in the Birth. And perhaps it is this Matter that remaining between the two Membranes, after the thin Part is run off, glues them together, and causes them to be taken for one. Since this, he says, he found the same Membrane in several human *Fœtus's* perfectly well form'd, by taking hold of it in the same manner as he did in the monstrous *Fœtus*.

The Use of this third Membrane of the After-birth of the Human *Fœtus* is, probably, the same as that of the *Allantoides* in Animals where it is found, which is, that the Urine which cannot be contained in the Receptacles of the Kidneys, in the Ureters, nor in the Bladder, might pass from the Bladder, by the *Urachus*, to the Cavity formed by the *Amnios*, and this particular Membrane, to be there kept in Reserve till the time of Delivery. *Mem. de l'Acad. Roy. des Sci. 1701. p. 115.*

ALLELUJA, a Name for *Acetosa*, Wood-forrel. See ACETOSA.

ALLIARÆRIS, a Term used by Alchymists in their Process for preparing the Philosopher's Stone, to signify the *Æs Philosophicum*, Philosophical Copper: It is also called *Aqua Mercurii*, Water of Mercury; *Æs Album*, White Copper; *Animal Kenkel*, *Lapis & Ovum*, the Stone and the Egg; and by innumerable other Names, as appears from *Gulielmus Tectonensis*, in the second Chapter of his *Lilium de Spinis Evuls.* *Theat. Chym. Tom. iv. p. 889.*

ALLIARIA, a Plant thus distinguished:

Alliaria, Offic. Ger. 650. Emac. 794. *Raii Hist. 1. 792.* *Park. Theat. 112.* *J. B. 2. 883.* *C. B. Pin. 110.* *Mer. Pin. 4.* *Merc. Bot. 1. 17.* *Phyt. Brit. 4.* *Alliaria Matthioli*, *Rupp. Flor. Jen. 61.* *Alliaria, Alliariis*, *Chab. 281.* *Hesperis Allium redolens*, *Hist. Oxon. 2. 252.* *Raii Synop. 3. 293.* *Tourn. Inst. 222.* *Elem. Bot. 190.* *Boerh. Ind. A. 2. 17.* *Dill. Cat. Giff. 51.* *Hesperis separia allium redolens*, *Buxb. 155.* JACK BY THE HEDGE. SAUCE ALL ALONE. *Dale.*

ALLIARIA. This Plant has a small woody whitish Root, perishing every Year after giving ripe Seed; the Stalks grow to be about two Foot high, slender and striated, and a little hairy; the Leaves stand on long Foot-stalks; the lowermost are roundish, hollowed in next the Foot-stalk; those which grow on the Stalk are somewhat pointed, and waved about the Edges, thin and tender; being rubbed, they smell strong of Onions or Garlic; the Flowers grow on the Tops of the Stalks, small and white, of four Leaves a-piece, and are succeeded by long slender Pods, including small long Seeds: It grows in Hedges and Bank-sides, and flowers in May.

The Leaves are used; being hot, and of thin Parts, they provoke Urine, and are good for the Dropsy; the Juice mixed with Honey helps old Coughs; they resist Poison, and pestilential Distempers; outwardly they are used with good Success in Gangrenes. *Miller's Bot. Off.*

It contains a great deal of Essential Salt and Oil.

It is incisive, attenuating, and deterfive; good for the venomous Bites of Serpents, for the Dysentery, to strengthen the Stomach, and to abate Hysterical Vapours: It is used in Decoction. *Lemery de Drogue.*

It is esteemed an excellent Antiscorbutic, eaten by way of Sallad.

ALLIGATURA, is used by *Scribonius Largus* for Ligatura, a Bandage. *Scribon. Larg. Cap. 77. N. 209.* See LIGATURA.

ALLIOTICUM, (from *ἀλλίω*, to alter or vary) A Galenical Medicine, which alters and purifies the Blood; consisting chiefly of the Roots of Dandelion, Succory, Fennel, and Raisins; with the Herbs Endive, Common Ox-eye, Lettice, Sorrel, Fumitory, &c. *Blancard.*

ALLIUM, Garlick, a Plant well known.

There is in *Egypt* a mild Sort of Garlick, which is cultivated in Gardens, and grows after the manner of Leeks, with a single Head; this is sweet, small, and of a purplish Colour: But in other Places it is white, and has a Head composed of a Multiplicity of Cloves, called (in *Greek*) *ἀγλῖθαι*, *Agliithai*. There is also a wild Kind, called *ἐπιόσχορδον*, *Ophioscordon*. (*Vipers Garlick*.)

Garlick is of an acrid, heating, biting Nature; expels Wind, disturbs the Belly, dries the Stomach, excites Thirst, and causes Inflammations; will raise Blisters on the Skin, and dull the Sight. The *Ophioscordon*, called also *ἐλαφίσχορδον*, *Elaphoscordon*, (*Stags Garlick*) being eaten has the same Effects. Garlick, taken in Food, expels the flat Worms, and provokes Urine; and there is nothing better for the Bite of the Viper, or the Hemorrhoids, than to eat Garlick after a Glass of Wine, or to drink it bruised in the Wine. Applied outwardly as a Cataplasm, it is good for the aforesaid Purposes, and also for the Bite of a mad Dog. Taken as Food, it prevents Injuries from Change of Waters, clears the Voice (*ἀρσείας λαμπρύνει*); and eaten raw or boiled, mitigates an inveterate Cough. Drank with a Decoction of Origanum, it destroys Lice and their Nits. Burnt and mixed with Honey, and the Parts anointed therewith, it cures Lividness about the Eyes occasion'd by Blows, and the Alopecia; but for this last Affliction, there must be an Addition of Ointment of Nard. Mix'd with Salt and Oil, it

it cures the Eruption of Papulæ; and with Honey it heals the Vitiligo (ἀνίαν), the Lichenes, and Lentigines (ζάρες), and Lepra. Boiled with Pine, Resin and Frankincense, and held in the Mouth, it assuages the Tooth-ach; with Fig-leaves and Cumin, it makes a Cataplasm for the Bite of the Shrew-mouse. A Decoction of the Tops, added as an Ingredient in Inseffions, brings down the Menfes and Secundines. A Suffumigation thereof has the same Effect. Pounded into a Mass with the (Leaves of the) black Olive, which Composition they call *Myrtoton*, it provokes Urine, opens the urinary Passages, and is good for Hydropical Persons. *Dioscorides, Lib. 2. Cap. 182.*

Garlick is recommended by *Celsus* to be eaten before the Access of the Fit of the Ague, in order to take off the Shiverings. *Celsus, Lib. 3. Cap. 12.*

Garlick is mentioned, among Cicatricers of Ulcers, by *Oribasius* from *Zopyrus*. [*Med. Coll. Lib. 14. Cap. 58.*] And it heats and dries to powerfully as to expel Leeches without any other Help. *Orib. de Virt. Simp. Lib. 2. sub Scordon.*

It has something medicinal, and of bad Juice in it, which is lost in boiling. The constant Use of it is to be avoided, especially in hot Constitutions; for Eatables of such an acrimonious Quality are only fit for Persons troubled with pituitous, crude, gross, or glutinous Humours. *Ætius Tetr. 1. Serm. 1. Orib. Med. Col. Lib. 2. Cap. 27.*

The Garlick Drawing Plaister for all Hardnesses, Abscesses, Boils, Strumæ, Tumours in the Groins, Fistulas, humid Tetters, and hardened Breasts.

Take of Wax two Pounds, of Colophony and Stags Marrow each an Ounce and half, of white Nitre eight Ounces, twenty Cloves of Garlick, and four Pounds of Oil. Boil the Cloves first, peeled, in the Oil, till they are quite dry; then strain the Oil, and put thereto the liquefiable Ingredients, and afterward the Nitre pounded, and so use it.

My Method of Preparation is as follows:

Take of Wax, Colophony, Oil, each five Ounces, Nitre an Ounce and half, Stag's Marrow two Ounces, with thirty Cloves of Garlick; prepare them as before for a Plaister, to be used especially for Fistulas; for it draws out the Humour, which must be often wiped away. This alone, without any other Help, draws, incarnates, and heals or cicatrizes. *Ætius Tetr. 4. Serm. 3. Cap. 44.*

Garlick, Onions, and Leeks, are remarkable for their Acrimony, on which account they heat and attenuate the Body, and cut gross, thick Humours. After two Boilings they yield a little Nutrimment, but raw none at all. Garlick is the most difficult and aperitive. The Ampeloprasum is drier than the Leek, as growing wild. *Ægineta, Lib. 1. Cap. 76.*

Two or three Drams of Garlick, reduced to a very fine Powder, and drank in Wine, is a good Phlegmagogue. *Actuarius Meth. Med. Lib. 5. Cap. 8.*

There are several Sorts of Garlick; the first is the 1. *Allium* Offic. Ger. 141. Emac. 177. Park. Theat. 513. Raii Hist. 2. 1125. *Allium sativum*. C. B. Pin. 73. Hist. Oxon. 2. 387. Buxb. 15. Tourn. Inst. 383. Elem. Bot. 304. Boerh. Ind. A. 2. 147. Rupp. Flor. Jen. 122. *Allium vulgare & sativum*. J. B. 2. 554. GARLICK. Dale.

The Root consists of several Cloves, or small Bulbs, of a reddish white Colour, set together in a round Compass, and inclosed in one common skinny Coat or Cover, having several small Fibres at the Bottom; the Leaves are broad and long, like those of Leeks; on the Top of the Stalk, which grows two or three Foot high, stands an Umbel of small white five-leaved Flowers; the whole Plant, especially the Root, is of a very strong and offensive Smell.

Garlick is called the Countryman's Treacle, though it is not used nigh so much in England as it is in foreign Parts. It is accounted a Strengtheners of the Stomach and Bowels, an Expeller of Wind, and very good for the Colic; in Asthmas and Difficulty of breathing, it is a very good Medicine, the Root being either preserved with Sugar, or a strong Decoction of it made into a Syrup. *Miller Bot. Off.*

It grows in Gardens, and flowers in June. The Root is used, being of a heating, drying, incisive, aperient and discutitive Quality, and an Alexipharmac. Its principal Uses, internal and external, are in the flatulent Colic, Worms, Pessilence, Cough, Stone, Itch, Obstruction of Urine, Dropsy, &c. Dale.

Taken internally, it is thought to preserve from the Influence of an infected Air. It is used also externally; for, being bruised, it is applied to the Wrists in a cold Fit, or Beginning of an Intermitting Fever. It also is good to take away Corns of the Feet, being bruised and laid upon them.

Rocambole, which they call Shalotes of Spain, are the Fruit of the Garlick, which is cultivated in Spain. *Lemery de Drogues.*

It provokes Urine, it kills Worms, makes the Voice good and agreeable.

VOL. I.

It causes Pains in the Head, heats too much, and makes the Humours too sharp, and over-agitates them: It is also pernicious for those that have the Piles, and for Nurfses. *Lemery on Foods.*

Hoffman informs us, that Garlick is an effectual Remedy for that Dysentery which Sailors contract in East-India Voyages, from the Use of putrified Flesh.

Boiled in Milk, it is a popular Remedy for the Worms.

The second Sort of Garlick is the,

2. *Ophioscorodon*, Offic. Ger. Emac. 181. *Scorodoprasum alterum bulboso & convuluto capite*, Park. Theat. 872. Raii Hist. 2. 1120. *Allium sativum alterum, sive Alioprasum caulibus summo circumvoluto*. C. B. Pin. 73. Hist. Oxon. 2. 387. Tourn. Inst. 383. Elem. Bot. 304. Boerh. Ind. A. 2. 145. Rapp. Flor. Jen. 122. *Allii genus Ophioscorodon*, Chab. 201. *Allii genus, Ophioscorodon dictum quibusdam*. J. B. 2. 559. VIPERS GARLICK, ROCAMBOLE. Dale.

It is planted in Gardens, and flowers in July. The Root and Kernel are in Use, and it agrees in Virtues with the former, but is of a milder Nature. Dale.

The Ophioscorodon, which is a wild Garlick, is stronger than the Garden Sort. *Paulus Ægineta, Lib. 7. Cap. 2.*

A third Sort of Garlick is the,

3. *Scorodoprasum*, Offic. Chab. 201. Park. Theat. 872. *Scorodoprasum primum Clusii*, Ger. Emac. 180. *Scorodoprasum dictum*, J. B. 2. 558. *Allium sphaericeo capite, folio latiore, sive Scorodoprasum alterum*, C. B. Pin. 74. Tourn. Inst. 389. Boerh. Ind. A. 2. 145. *Allium maximum multis porraceis foliis latioribus, sphaericeo capite ex floribus albis confiato*, Hist. Oxon. 2. 387. *Allium montanum majus Anglicum Newtoni*, Raii Hist. 2. 1125. *Allium Holmense sphaericeo capite*, Raii Synop. 3. 570. WILD LEEKS. Dale.

The Scorodoprasum grows to the Bigness of a Leek, and partakes of the Qualities of Leeks and Garlick; and by a Mixture of their Virtues serves for the same Purposes with either of them, though with less Efficacy. The Scorodoprasum, boiled after the Manner of Leeks, grows mild and sweet, and eatable like other Greens. *Dioscorides, Lib. 2. Cap. 183.*

This Species of Garlick grows plentifully in *Holmes-Island*.

A fourth Species of Garlick is the,

4. *Ampeloprasum*, Offic. Matth. 552. Comp. 299. Lugd. 1543. Cam. Epit. 323. *Allium montanum bicornne, an Ampeloprasum*, Raii Cot. Angl. 2. 12? *Allium montanum bicornne purpureum proliferum*, Raii Synop. 3. 169. Tourn. Inst. 384. *Porrum sylvestre vinearum*, C. B. Pin. 72. Tourn. Inst. 382. Elem. Bot. 303. Garr. 376. FRENCH LACK. Dale.

It grows on Hills, in Meadows, and in the Gardens of the Botanists, and flowers in June. The Root is used, and is good against the Bites of Serpents, according to *Dioscorides*.

It has been much doubted, of late, by very good Writers, what Plant is meant by Botanists under the Name of *Ampeloprasum*; one fixing here, another there. They have been led into this Uncertainty by *Dioscorides*, in his omitting to give a Description of the *Ampeloprasum*. There are four kinds of Herbs in *Bauhine*, which have had this Name from some or other of the Botanists, out of which I have chosen the foregoing, as having the most Vouchers. Dale.

The Ampeloprasum is not so agreeable to the Stomach as the Leek, but is more healing, and more powerfully provokes Urine; it also brings down the Catamenia; and, being eaten, is good for the Bites of venomous Creatures. *Dioscorides, Lib. 2. Cap. 180.*

The Ampeloprasum differs from the Leek, just as the Wild, in all other Kinds, differs from the cultivated of the same Kind. *Oribas. Med. Col. Lib. 2. Cap. 27.*

The Ampeloprasum is drier than the Leek, as being wild; it is hot and acrimonious in a very high Degree, and therefore hurtful. It is of an incisive and deobitruent Quality, but ungrateful to the Stomach. *P. Æginet. Lib. 1. Cap. 76. & Lib. 7. Cap. 3.*

Another Species of Garlick is the

Viötoralis, Offic. Schrod. L. 4. P. 173. *Allium Alpinum*, J. B. 2. 566. Raii Hist. 2. 1122. *Allium Alpinum, Viötoralis mas quibusdam*, Chab. 203. *Allium latifolium montanum maculatum*, C. B. Pin. 74. Hist. Oxon. 2. 388. Tourn. Inst. 388. Elem. Bot. 304. Boerh. Ind. A. 2. 145. *Allium Alpinum latifolium, seu Viötoralis*. BROAD-LEAVED MOUNTAIN GARLICK. Ger. Emac. 182. Ger. 142. *Allium agninum*, Park. Theat. 872. *Moly Alpinum latifolium maculatum*, Rupp. Flor. Jen. 122. SPOTTED RAMSONS, Dale.

It may be met with in the Gardens of the Curious, where it flowers in June.

The Root is used, being of a heating and drying Quality like wild Garlick, with which it agrees in all its Properties. It is commonly worn as an Amulet by the vulgar Sort of our People, as well as the Jews, who are persuaded that it renders them secure against infectious Air, and Apparitions. Dale (from Schrodner).

Miller mentions a Sort of Garlick under the Name of *Allium bulbiferum Virginianum*, Boerh. Ind. Alt. Virginian Garlick.

D d d d

Besides

Besides the above-mentioned, there are some others, which go by the Name of Allium, as the

Allium sylvestre, Offic. Ger. Emac. 179. Park. Theat. 870. Raii Hist. 2. 1117. Synop. 3. 369. Mer. Pin. 4. *Allium sylvestre tenuifolium*, Volck. Flor. Nor. 17. Merc. Bot. 1. 17. Phyt. Brit. 4. *Allium campestre juncifolium capitatum purpurascens majus*, C. B. Pin. 74. Dill. Cat. Giff. 112. *Cepa juncifolia minor purpurascens*, Tourn. Inst. 383. *Cepa sylvestris tenuifolia, prolifera & florifera* Rand. Boerh. Ind. A. 2. 144. CROW GARLICK.

The Medicinal Virtues of this, are represented to be the same as those of common Garlick.

Moly, Offic. *Dioscorideum*, Ger. 143. Emac. 183. Park. Parad. 145. *Moly Dioscoridis parvum quibusdam*, J. B. 2. 568. Raii Hist. 2. 1123. *Moly Dioscoridis parvum quibusdam, flore candido*, Chab. 204. *Moly angustifolium umbellatum*, C. B. Pin. 75. Boerh. Ind. A. 2. 146. *Moly angustifolium umbellatum album*, Hift. Oxon. 2. 393. *Allium angustifolium umbellatum album*, Tourn. Inst. 385. MOLY OF DIOSCORIDES.

Dioscorides recommends this, made into a Pessary, with Oil of Orris, (or Meal of Orris, for the Copies differ) in Relaxations of the Uterus.

Moly Theophrasti, Offic. *Moly Theophrasti magnum*, J. B. 2. 568. Raii Hist. 2. 1122. *Moly Theophrasti magnum, floribus albis stellatis*, Chab. 204. *Moly Homericum*, Ger. 144. Emac. 183. *Moly Homericum, vel potius Theophrasti*, Park. Parad. 141. *Moly latifolium liliflorum*, C. B. Pin. 75. Boerh. Ind. A. 2. 146. *Moly latifolium flore albo*, Rupp. Flor. Jen. 122. *Allium latifolium liliflorum*, Tourn. Inst. 384. *Ornithogalum Indicum latifolium floriferum sphaericum, colore colofino aut albo*, Hift. Oxon. 2. 380. MOLY OF THEOPHRASTUS.

The Virtues of this are said to be the same as those of the *Moly of Dioscorides*.

ALLIUM GALLICUM, is a Name in *Marcellus Empiricus* for Portulaca; and also, in the same Author, for Inula Rufica, or Comfrey Root; perhaps the last is, by Mistake, for *Alus Gallica*, one of the Names of Comfrey in *Gerard*.

ALLOBROGICUM VINUM. An austere Sort of Wine, of the Growth of *Savoy* and *Dauphiné*, recommended by *Celsus* in a Resolution of the Stomach. *Lib. 4. Cap. 6.*

ALLOCHOOS, ἀλλοχοῦς. A Person who talks wandering, or deliriously; in which Sense it is used by *Hippocrates* in his second Book of Epidemics: "Οἱ πολὺ μᾶλλον καὶ δύσπνοοι, καὶ διαλεσφόροισιν ἀλλοχοῖ." "Such were much more troubled with Difficulty of Breathing, and wandering in their Discourse." But it must not be omitted, that for ἀλλοχοῖ in this Place, *Galen* reads σαλοχοῖ, which signifies those who spit much; and that *Erotian* seems to approve this Reading.

ALLOCHROEO, ἀλλοχρῶω, to change the Colour of the Skin, to appear first of one Hue, and then of another. And thus it is applied by *Hippocrates*, in his Treatise de Intern. Affect. "Ἰστέαι ἐν ἡ χροὴ ὑπὸ τοῦ δέρματι, καὶ ἐν τῇ κεφαλῇ, ὥς δὲ τοῦ ἀλλοχρῶετο τοῦ σώματος." "The Bile therefore stagnating under the Skin, and in the Head, immediately changes the Colour of the Body."

ALLOCOTON, ἀλλοκότον. *Hippocrates* makes use of this to signify what the *Latins* express by *alienus*, absurd, or improper, or unusual. Thus in his Treatise of the Diseases of Women, he says, they are perpetually desiring absurd or unnatural Food (ἀλλοκότων βρωμάτων).

ALLODEμία, ἀλλοδμήν. This Word is used by *Hippocrates* to express travelling into another Country. Thus in his Treatise de Internis Affectionibus, speaking of a Fever, attended with an odd kind of Delirium, he says, it most frequently happens in ἀλλοδμήν, (in peregrinatione) in travelling, or on a Journey into another Country.

ALLOEOSIS, ἀλλοίωσις, & **ALLOEOTICOS**, ἀλλοιωτικός (Alteratio). An Alteration induced in the Body by a proper Regimen, and proper Medicines, changing it from a morbid Condition towards a State of Health.

ALLOGNOON, ἀλλογνώω, from ἄλλος, (another) and γνῶω (to know). It imports being delirious: That is, according to the Derivation, knowing, or conceiving Things different from what they are in Reality.

ALLOPHASIS, ἀλλόφασις, from ἄλλος, (another) and φᾶω (to speak). It signifies a Delirium: That is, speaking of Things differently from what they really are. Hence ἀλλοφασσόμενος is frequently used by *Hippocrates*, to express delirious, or light-headed.

ALMA, or rather **HALMA**, ἄλμα. A Word which *Hesychius* interprets ἀνάημα, and says it signifies τὴν πρώτην τῆ ἐμβρυῶν μεταβάσιν ἐκ τῆς μήτρας. "The first Motion made by a Fœtus in the Womb towards freeing itself from its Confinement." It also signifies Water. *Rulandus*.

ALMABRI, (Lapis Ambrae similis) a Stone resembling Amber. *Rulandus*.

ALMAGER, the same with **SINOPIS**, or **RUBRICA SINOPICA**, which see. It is a red bolar Earth.

ALMAGRA, the *Bolum Cuprum*, Laton, the Stone itself, or the *Terra rubea*, the Red Earth. Or, **ALMAGRA** is the same as **LOTUM**, **LOTIO**. *Rulandus*. It is also a Name for the Sulphur album, White Sulphur of the Alchymists. *Theat. Chym. Tom. 4. P. 729.*

ALMAKANDA, **ALMAKIST**, **ALMARIAB**, **ALMARCAR**, **ALMARCAB**, (Lithargyrium) Litharge. *Rulandus*.

ALMARCARIDA, (Lithargyrium Argiritis) Litharge of Silver. *Rulandus*.

ALMARCAT, the Scoria of Gold. *Rulandus*.

ALMARGEN, **ARMALGOL**, **ALMARAGO**, Coral. *Rulandus*.

ALMARKASITA, Mercury. *Rulandus*.

ALMARTACK, (Lithargyrium cinis) Powder of Litharge. *Rulandus*.

ALMATATICA, (Metallum cupri) Copper. *Rulandus*.

ALMECASIDE, **ALMECHASIDE**, Copper. *Rulandus*.

ALMELILETU, a Word used by *Avicenna*, to express a preternatural Heat less intense than that of a Fever, and which may sometimes continue with Persons after their Recovery from that Distemper. *Castellus*.

ALMENE, Sal Lucidum, or Sal Gemmae. *Rulandus*.

ALMETAT, (Scoria Auri) Scoria of Gold. *Rulandus*.

ALMISA, Musk. *Johnson*.

ALMISADIR, **ALMISADAR**, **ALMIZADAR**, **AMIZADIR**, **ASANON**, **AMISADU**. (Sal Armoniacus preparatus) Sal Ammoniac prepared. *Rulandus* and *Johnson*.

ALMISARUB, Earth. *Johnson*.

ALMIZADIR, (viride Eris) Verdigrise. *Rulandus*.

ALMYRINTHRA, a Word used by *Myrepsus*. It is supposed, by his Commentator, to signify the same as the Arabic Word **ALMYRA**, which is Quick-Lime.

ALNEC, Allenec, or Alcalap. *Tin. Rulandus*.

ALNUS, a Plant thus distinguished:

Alnus Offic. Ger. 1294. Emac. 1477. Jonf. Dendr. 334. Raii Hist. 2. 1409. Synop. 3. 442. Chab. 60. Mer. Pin. 4. *Alnus vulgaris*, Park. Theat. 1408. J. B. 1. 151. Merc. Rot. 1. 17. Phyt. Brit. 4. Dill. Cat. Giff. 55. *Alnus rotundifolia glutinosa viridis*, C. B. Pin. 428. Tourn. Inst. 587. Elem. Bot. 460. Boerh. Ind. A. 2. 181. Rupp. Flor. Gen. 265. Buxb. 16. The ALDER TREE. *Dale*.

Its Leaves resemble those of the Hazel. The Male Flowers (or Catkins) are produced at remote Distances from the Fruit on the same Tree. The Fruit is squamose, and of a round Figure. *Miller*.

It delights in watry Places. The Bark and Leaves are in Use: The Bark is drying and astringent. The green Leaves, apply'd, discuss Tumours, and allay Inflammations: Taken internally, they are Vulneraries: Put in the Shoes of Travellers, they mitigate Pain and Lassitude. *Buxb.* Scatter'd in Chambers, while they are green, and the Dew upon them, and soon after gathered up, they rid the Rooms of the Fleas, which are apt to stick to them. *Trag.* The Bark dyes a black Colour, and may be used instead of Galls to make Ink. It is beneficially apply'd in Inflammations. *Dale*.

It contains a great deal of Oil, and but little Salt, and that almost all fixed.

Its Leaves are resolute, being bruised and apply'd upon Tumours; it serves for a Decoction to wash Travellers Feet with after being tired; and, rubb'd upon the Posts of the Bed, it kills Fleas. The Bark and its Fruit are cooling, and proper for Inflammations of the Throat, being used as a Gargarism. *Lemery de Drogues*.

Lobel represents this Plant in the Figure of the *Alnus altera Clusii*, which is very different: *Tragus*, *Gesner*, *C. Bauhine* upon *Matthioli*, *Dodonæus*, and *Stapel*, confound its Catkins with the Fruits. *J. Bauhine* distinguishes them very well: This Author supposes the little Threads at the End of the young Fruit, to be the Flowers of the Alder; but this is no more than a Dispute about the Name. I believe we had better take the Catkins for the Flowers. All these Parts are correctly engraved in the *Elemens de Botanique*: The Dyers and Hatters make a beautiful Black with the Infusion of Iron and the Bark of the Alder: The *Hist. Lugd.* relates, That a Tincture is made of Vitriol and an Infusion of the Fruit of this Tree: Thus it is probable, the Bark and Fruits may contain the same Principles as the Galls; viz. a great deal of Acid and Earth. *Tragus* and *Dodonæus* made use of its Leaves as a Cataplasm, to soften and resolve Tumours. Alder Leaves are used in the *Alps* in Paralytic Cases, especially when the Disease has proceeded from an external Cause, as lying in the Fields or damp Houses. Thus some Sack-fulls of the Leaves, either dried in the Sun or an Oven, are spread forth, upon which the Patient lies, being sufficiently covered with the same, and other warm Cloaths, till he has sweated plentifully. This Remedy is good for the Rheumatism, Sciatica, and such-like Diseases: Those that have the Pox receive no Benefit by it. *Martin's Tournefort*.

There are two other Species of this Tree in England, according to *Miller*, viz.

Alnus folio oblongo viridi, C. B. The long-leav'd Alder.

Alnus vulgaris sub conis ligulis membranaceis rubris donata.
The scarlet Alder.

This last Sort was found in a Meadow near Longleet; but is a matter of Doubt, whether it is a distinct Species, or some accidental Variety. *Miller*.

Another Tree, which is also called *Alnus*, is the

Frangula, alnus nigra, Offic. *Frangula*, Volck. Flor. Nor. 173. Tourn. Inst. 612. Elem. Bot. 486. Boerh. Ind. A. 2. 231. Dill. Cat. Giff. 66. Rupp. Flor. Jen. 34. Buxb. 116. *Frangula, sive Alnus nigra baccifera*, Park. Theat. 240. Raii Synop. 3. 465. *Alnus nigra, sive Frangula*, Ger. 1286. Emac. 1470. Mer. Pin. 4. *Alnus nigra baccifera*, J. B. 1. 506. C. B. Pin. 428. Raii Hist. 2. 1604. Chab. 45. Merc. Bot. 17. Phyt. Brit. 4. *Alnus baccifera nigra vulgaris*, Jonsf. Dendr. 436. THE BLACK ALDER-TREE. *Dale*.

This Tree never grows to any great Bigness, but shoots out into many small Branches, covered with a reddish brown Bark; it bears broad roundish, but sharp-pointed Leaves, about the Bigness of the Leaves of the Pear-tree, smooth, and full of Veins. The Flowers grow on the younger Branches, on the lower Part next the Trunk, several together, at the setting on of the Leaves, being small and white; and are succeeded by small round Berries, about as big as Juniper Berries, green at first, then red, and when ripe, blackish, full of a greenish Juice, of a bitter Taste, and having two flat Seeds in every Berry. The black Alder grows in moist thick Woods, as in *Hornsey* and *Hampstead* Woods, and flowers in May; the Fruit is ripe in September.

The inner Bark of this Tree (which is of a yellow Colour, and tinges the Spittle like Rhubarb) purges ferous and bilious Humours pretty smartly, and is commended for the Dropsy and Jaundice; but it ought to be corrected with proper Aromatics, or else it will cause cruel Gripping and Vomiting: Beaten in a Mortar, and mix'd with Vinegar, it is accounted very good for the Itch, the Parts being washed with the expressed Liquor. It is rarely used. *Miller Bot. Off.*

The Species of this Alder, according to *Miller*, are
Frangula rugosior & *amplexifolia*. *Tourn.* Berry-bearing Alder, with a larger and rougher Leaf.

Frangula montana pumila saxatilis, folio subrotundo. *Tourn.* Low Mountain rocky Berry-bearing Alder, with a round Leaf.

Frangula montana pumila saxatilis, folio oblongo. *Tourn.* Low Mountain rocky Berry-bearing Alder, with an oblong Leaf.

Frangula semper-virens, folio rigido subrotundo. *Hort. Eltham.* Ever-green Berry-bearing Alder, with a round stiff Leaf, commonly called the *Hottentot Cherry*.

ALOE, a Plant thus named.

The Aloe is like a Squill, only bigger, and with fatter Leaves obliquely striated. It has a tender Stalk, red in the Middle, and not unlike the Anthericos. The best comes from *India*, but it grows also in *Asia*, tho' the Leaves only of this latter are used for unglutinating of Wounds, for which it is excellent, even the Juice of it; and for that Reason is planted in Pots like the greater Houfeleek. Some cut the Stalk, before the Seed is ripe, for the sake of the Juice; others cut the Leaves for the same Purpose. Sometimes the Juice is found sticking to the Plant like a Tear; on which account it is usual to make a Pavement round it, that the Tear might not be absorbed in the Earth. We are told that in *Judea*, above *Jerusalem*, it is of a metalline Nature; but this is the worst Sort of all, as being the blackest and moistest. [This last Circumstance *Salmasius* treats as fabulous.]

Aloe is of an inspissating, condensing, and gently warming Quality. It is useful for many Intentions, but principally for purging, since it is almost the only thing of that Nature, which is so far from being hurtful to the Stomach in any respect, that it strengthens it. The Dose is a Dram; but in a Resolution of the Stomach 'tis usual to give the Measure of a Cochleare (about a Dram) in one sixth of a Pint of warm or cold Water, two or three times a Day, at proper Intervals, as Occasion shall require. The highest purging Dose is three Drams; and it works the better for making a Meal after taking it. *Pliny* finishes what he has to say of it, in ascribing the same Virtues to it, as you have in *Dioscorides*. *Plin. Lib. 27. Cap. 4.*

The Aloe has a thick fat Leaf, like the Squill, of a pretty wide Circumference, and convex on the Outside. On both Sides of the Leaves are here and there some blunt Prickles, which stand obliquely, and seem broken. It sends up a Stalk like the Anthericos, [the Stalk of this *Asphodel*, according to *Pliny*] which bears a Flower and Seed like the *Asphodel*. The whole Plant has a strong Scent, and a very bitter Taste. It has but one Root, which runs downward into the Earth, like a Stake.

It grows very plentifully, and extraordinary fat and rich, in *India*, whence the Juice is exported. It grows also in *Arabia*, *Asia*, and in some maritime Places and Islands, as in *Andros*: This indeed does not yield its Juice freely and copiously, but

is excellent for conglutinating of Wounds, if bruised, and applied to the same.

There are two Kinds of this Juice; one sandy, which seems to be the Dregs or Dross of the purest Sort; the other resembles the Liver. Chuse the fat, and unadulterated, which is void of Gravel, shining, yellowish, friable, resembling the Liver, easily moistened, and of an intense Bitterness; but reject the Black, and hard to break. Some adulterate it with Gum-Arabic, which may be discover'd by the Taste, and its coming short of the Bitterness and strong Smell of the true; and also in that it will not crumble to Dust between the Fingers. Some will mix Acacia with it.

As to its Virtues, it is an Astringent, procures Sleep, dries, condenses, loosens the Belly, and cleanses the Stomach. The Dose is two Cochlearia in cold Water, or Water heated Milk-warm. It stops spitting or vomiting of Blood, and purges off the Yellow Jaundice, if taken to the Quantity of half a Dram or a Dram in Water. Swallowed with Resin, or drank in Water or clarify'd Honey; it loosens the Belly. The Weight of three Drams is a complete Purge. Mixed with other Cathartics, it renders them less incommodious to the Stomach. The dry Powder sprinkled [*επιπασσιν*, according to the Scholiast, for *επιπασσιν*] on Wounds, conglutinates them, and heals and cicatrizes Ulcers. It has a peculiar Virtue in Exulcerations of the *Pudenda*, and heals the torn Prepuces of Boys. Mix'd in sweet Wine, it cures the Condyloma, and Fissures of the Arms. It stops the Flux of Blood from the Hemorrhoids, cicatrizes Pterygia, and takes off the livid Marks of Bruises and Blows in the Face, being mixed with Honey. It mollifies the Roughness of sore Eyes, and the Itching of the Canthi. Mixed with Vinegar and Oil of Roses, and the Forehead and Temples anointed therewith, it mitigates the Pain of the Head; and mixed with Wine, puts a Stop to the Shedding of the Hairs. With Wine and Honey, it is good for the Diseases of the Tonfils, Gums, and the other Parts belonging to the Mouth. When used in a Collyrium, it is roasted in a clean white earthen Saucer, and stirr'd with a Spoon, till it be equally and thoroughly done. It is usual to wash Aloes, by which the sandy Part sinks to the Bottom, and is set aside as useless; and the rest, which is of a very fat and smooth Substance, is reserved for Use. *Dioscorides, Lib. 3. Cap. 25.*

Aloes is no violent Purger; is very friendly to the Stomach, like Wormwood. Two Drams in Hydromel are a Dose; it purges Bile and Phlegm. It may be taken every Day after Supper; for it passes off the Stomach, without disturbing the Concoction of the Food, and causes no Thirst, but excites an Appetite. Bruise your Aloes, and with the Juice of Cabbage make it into Pills, of the Size of a Chick-pea or Bean, of which you may take two or three at a time, as Necessity shall require. You may also make it into Pills with Resin, or clarify'd Honey, especially for those who cannot well endure its Bitterness. It is proper also to be mixed with Scammony, or any other Cathartic, which is subject to lower the Spirits.

It is good for Quotidian Agues, Yellow Jaundice, Pains in the Liver, Nausea, and Crudities. It is as proper for Women as Men, and would be a very fit Purge for Children, were it not for its Excess in Bitterness, which Children cannot endure. *Orib. Med. Coll. Lib. 7. Cap. 27. Ruffus Ephesus, Fragment. de Med. Purg.*

Aloes is excellent for Ulcers, that are difficult to be cicatrized, especially those in the *Pudenda*, and about the Anus. *Orib. Synop. Lib. 7. Cap. 11.*

Aloes does not purge the whole Body, but is a fine gentle Cleanser of the Stomach, Belly, and Intestines, from Bile and Excrements. For this Reason, it is prescribed to such as have their Heads affected with continual Vapours from the Stomach, as it carries off the Seeds, and destroys the Original, of the Disorder. On the same Account it is proper for such as are troubled with sore Eyes, or are subject to a Dryness of the Mouth and Tongue, from a redundant Bile, or are afflicted with the Heart-burn, Nausea, or any weakening Disorder. It is also given to such as are unaccountably pale, and want Evacuation, when a Clyster, for some Reasons, cannot properly be administer'd. The Dose is two Drams in Hydromel. It may be taken every Day, either in the Morning fasting, or after Supper. Pound the Aloes, and make it up into Pills of the Size of a Chick-pea, with the Juice of the Rind of Citron; or, for want of that, with the Juice of Cabbage; it may also be done with Turpentine, or clarify'd Honey. The Pills ought to be swallowed in Hydromel, or a Draught of the same should be taken immediately after. Purging Medicines attract, like a Cupping-glass, the Causes and Seeds of Distempers, that infect the principal Parts, and evacuate them by the Belly. *Ætius Tetr. 1. Serm. 3. Cap. 24. Actuarius Meth. Med. Lib. 5. Cap. 8.*

To purge Bile, give a Dram of Aloes in the Morning. They who prescribe it in the Evening, or after a Meal, do hurt; for it corrupts the Aliment. In a less Dose, as half a Dram, it only evacuates the Belly of the Excrements. Of all Cathartics, Aloes only is grateful to the Stomach. For such as cannot

cannot endure its Bitterness, it is prepar'd in Pills. *Egineta*, Lib. 7. Cap. 4.

Medicines are generally hurtful to the Stomach; and for this Reason, all Cathartics ought to have a Mixture of Aloes. *Celsus* Lib. 2. Cap. 12. P. 32. E.

The *Arabians* call Aloes in their Language *Sabr*, and say, that the *Sabr Al Scootheri*, that is, the Aloes of *Zocatra*, excels what they call *Schegeeri* and *Hadramuthi*, or the Aloes that grows in the Countries of *Schegeer* and *Hadramuth*. *Herbelot* Bibl. Orient. Art. *Saccharab*.

Edrissi says, That the Aloes of *Zocatra* excels all others; and that *Alexander the Great*, being informed by *Aristotle*, of the Virtues of this Plant, transported the Inhabitants of the Island to *Arabia* and *Ethiopia*, and settled a Colony of *Greeks* in their Room, whom he charged with the Cultivation of the Aloe.

The Inhabitants gather the Leaves in *July*, and boil them in great Kettles to get out the Juice, which, after boiling, remains at the Bottom; this they take out, and expose it in other Vessels to the Heat of the Sun, during the Dog-days. *Herbelot* Bibl. Orient. Art. *Sabr*.

The Plants from which the Aloes, commonly used in Medicine, are procur'd, are

1. *Aloe Offic.* J. B. 3. 696. Chab. 541. *Aloe*, C. B. Pin. 286. Raii Hist. 2. 1195. Hist. Oxon. 2. 414. Tourn. Inst. 366. Elem. Bot. 294. Boerh. Ind. A. 2. 128. Hort. Beaum. 6. Herm. Hort. Lugd. Bat. 16. *Aloe Dioscoridis*, Colum. Ecph. 1. 40. *Aloe Dioscoridis & aliorum*, Sloan. Cat. Jam. 15. Hist. 1. 245. *Aloe vera vulgaris*, Munt. Alcod. 17. *Aloe vulgaris, sive sempervivum maritimum*, Ger. Emac. 507. Park. Theat. 149. *Caraguata Brasiliensis*, Marcg. 57. *Caraguata tertia*, Pison. Ed. 1658. 193. *Kadanaku vel Gatevala*, Hort. Mal. 11. 7. Tab. 3. COMMON ALOES.

It grows in both *Indies*. The Leaves are the useful Part of the Plant; and the inspissated Juice of the *Barbados Aloe*, is called the *Official Aloes*. This is sometimes of a shining Black, sometimes nearly of a Liver-colour, of a strong Smell, and extremely bitter. It is brought to us from *Barbados* in large Gourds. The Leaves are commended against Burns. The inspissated Juice has the same Virtues as the *Succotrine Aloes*. *Dale*.

2. *Aloe Guineensis Caballina vulgaris similis, sed tota maculata*, Commel. Prælod. Bot. 40. HORSE-ALOES.

The inspissated Juice is used; the impure, blackish, droffy Part of which is called *Aloe Caballina*; the purer Part, which is of a Liver-colour, is the *Aloe Hepatica*.

The above-named Author calls this Species *Caballina*, because the Leaves, when broken, shed a Juice like the Horse Aloes. *Dale*.

3. *Aloe Succotrina*, Offic. *Aloe Succotrina angustifolia spinosa, flore purpureo*, Breyn. Prod. 2. 12. Hort. Amst. 1. 91. Commel. Prælod. Bot. 40. *Aloe Indica Orientalis serrata, sive Succotrina vera, floribus phœniceis*, Hort. Beaum. 5. *Aloe Americana serrata, floribus coccineis*, Parad. Bat. Prod. 306. *An Aloe Americana Anonæ foliis, floribus suave rubentibus, ex codice Bentingiano*, P. P. Tab. 240. Fig. 4. SUCCOTRINE ALOES.

It differs from the *Horse Aloes* only in Purity, as some think. It has not only a purging, but a heating and drying Quality. It opens Obstructions, clears the Passages, provokes the *Hæmorrhoids* and *Menses*, strengthens the Stomach, kills and expels Worms, and purges bilious and phlegmatic Humours.

The Root of the common *Aloes* is pretty thick, running deep into the Ground, not much divided, but with several Fibres about it. It has many long, narrow, thick, fat and juicy Leaves, roundish on the Outside, and hollow on the In; the outer Leaves inclosing the inward; they are prickly about the Edges, and sharp-pointed, of a whitish green Colour; from among these the Stalk arises two or three Foot high, divided towards the Top into several Branches, on which grow many Bottle-like Flowers, of one single pretty large Leaf, divided at the End into five Segments, of a yellowish white Colour; each Flower being followed by a cylindrical Seed-vessel, divided into three Parts, and containing flat Seed. It grows in *Spain*, *Italy*, and the *West-Indies*. Of this Plant is made the *Aloe Hepatica* of the Shops, or the *Barbados Aloes*, which is brought over to us in Gourds, of a Liver-colour, and a very nauseous Scent. It is made by gently pressing the Leaves pluck'd from the Roots, stroaking them downwards; by which the bitter Juice, which is contain'd in particular Veins, drops into Vessels set under; and having stood all Night, the thin Liqueur is pour'd off, and the Sediment is dry'd and harden'd in the Sun, which is our *Aloes*.

The *Aloe Succotrina* is made the same way, but from another Species of this Plant; viz. *Aloe Succotrina spinosa angustifolia, flore purpureo*, Breyn. Prodrom. 2. *Aloe vera minor*, Munting *Aloedar*. This is a lesser Plant, fuller of Leaves, more neatly made, bearing red Flowers, in Form and Shape

like the other, but less. The *Aloes* made of this Species comes over from the *East-Indies* in Skins; the best being made in the Island of *Succottra*. It is blacker, more shining and brittle, and when powder'd, of a fine yellow Colour, not apt to clot together after it is powder'd, and of but little Smell, in Comparison to the other.

Aloes is a purging Medicine much in Use, and chiefly beneficial to cold moist Constitutions; it is not much given by itself, unless now-and-then to Children for the Worms; but is a main Ingredient in most of the officinal Pills, as also in the Species *Hiera Picra*; it is accounted a good Stomachic, and useful to carry off tough and slimy Humours from the Bowels, and good to mix with Steel to promote the menstrual Flux. Outwardly, it is serviceable in fresh Wounds, a little of the fine Powder being put in them; it is also mix'd with other Ingredients, and laid to Childrens Navels against the Worms.

Officinal Preparations from *Aloes*, are, *Aloes Rosata*, *Pilula de Aloe lota* and *Aleophangina*. *Miller* Bot. Off.

Miller enumerates thirty-seven different Sorts of Aloes.

The *Succotrine Aloes* grows in *Zocatra*, an Island in the Straights of *Babel Mandel*, where they formerly prepared the Aloes by expressing the Leaves, and then letting the expressed Juice stand in a quiet Place, till an oily Substance rose at the Top. This Substance they took off, and evaporated it to the Consistence of an Extract.

The *Succotrine* and *Hepatic Aloes* are both very good Purgers, but they rarefy the Blood, and therefore cause *Hæmorrhages*, and other undesign'd Evacuations, to those who are subject to them. This Medicine ought therefore never to be given to Women with Child, or to those who are subject to Piles, &c. Again, Aloes, after its purgative Effect is over, is constipating; and therefore to such Persons as are inclined to be costive, Cassia is preferable. The Dose is from four Grains to half a Dram. The resinous Part, extracted by Spirit of Wine, will purge violently; and the gummy Part, extracted by Water, is a good Vulnerary, especially in Ulcers of the Bladder and Kidneys. The Tincture of Myrrh and Aloes is used to prevent Mortification in Wounds. *Geoffroy*.

Tho' Aloes does not belong to the Class of drastic Purgatives, it has Strength enough to be sufficiently cathartic, and uses to excite vehement Commotions in the Mass of Blood; so that a few Grains are enough for a Dose. But if it be dissolved in Water, Rain-water, for Instance, and boiled a considerable time, its cathartic Virtue is weakened, so that it has no Effect at all, except the Dose be augmented. *Hoffman* Obs. Physico-Chy. Lib. 2.

Laxative Preparations of Aloes, both the *Hepatic* and *Succotrine*, are Remedies of great Efficacy, provided the Aloes, by proper Methods, be freed from its foreign volatile and sulphureous Principle, and stript of the Refin which closely adheres to the Coats of the Intestines. These Preparations must be administered in small Doses, and mix'd with bitter Extracts, and mild balsamic Ingredients. For this Reason the Pills which were perhaps casually found out by *Becherus*, and which, according to his Method, ought to be prepar'd of the best Aloes, cannot be too highly commended, because they gently open the Belly, and restore the Tone of the Intestines, when weakened by any Distemper, to such a Degree, that other Purgatives would be prejudicial to them. And tho' these Pills produce no considerable Effects upon robust Constitutions, and People of plethoric Habits, yet their Virtues are very considerable, and exert themselves very speedily in Constitutions naturally weak, or such as have been extenuated by Sickness, and in Women who are either in Child-bed, or who, thro' some Fault of the Womb, have their menstrual Discharges in an irregular manner. They are likewise proper for correcting and evacuating crude Humours, when the Digestion of those who are recovering of a Fit of Sickness happens to be bad; they are also beneficial to those who labour under hypochondriacal Disorders, whose Stomachs perpetually throw up acid Crudities. Preparations of Aloes, on the other hand, administered without a proper Corrector, or in large Doses, put the Blood into a quick Motion; for which Reason, plethoric Persons, such as are easily wrought upon, or such as are subject to Discharges of Blood, ought together to abstain from Aloes, because all aloetic Preparations have this peculiar Disadvantage attending them, that they excite very painful *Hæmorrhoids*, and drive the Blood towards the Region of the Loins, and Parts contain'd in the Pelvis. But besides the Pills of *Becherus*, there are others not to be defrauded of their Worth, nor banish'd from Use, in which Aloes is made up with other proper Ingredients, such as the *Pilula Tartarea* of *Schroder*, the *Aleophangina*, the *Marocostina*, *Pilula de Succino Cratomis*, and those of *Solomander*. *Hoffman*. Medic. Rational. Systemat. Tom. 3. Sect. 2. Cap. 5.

The Author might have added the *Pil. Ruffi*, and some others in our Dispensatory.

A L O

M. *Boulduc*, in his Treatise of Purgatives, considers Aloes in particular. It ought to be pure, transparent, bitter, and of a strong Scent. It is reckon'd among the moderate Purgatives.

By M. *Boulduc's* Analysis by Extraction, it appears, that the *Succotrine* Aloes contains scarce half the Quantity of Refin, or sulphurous Matter, and about a third more of a saline Substance, than the *Hepatic*. As for the Horse-Aloes, it is so impure, and contains so much Earth in Proportion to its Sulphur and Salts, that it deserves not to be regarded.

The different Proportion of the Principles of the *Succotrine* and *Hepatic* Aloes, might well be the Cause of their different Properties. As the resinous Part of Aloes, contrary to other Cathartics charg'd with Refin, is little or nothing Purgative; the *Succotrine*, which has the least of that Refin, has been always prefer'd to the *Hepatic* for inward Uses; and, on the contrary, the *Hepatic*, which has more of it, excels as much the other, on account of its external Usefulness, for cleansing of Wounds, and closing the Lips of recent Cuts, &c. M. *Boulduc* equals it, in that respect, to the natural Balsams. 'Tis plain enough, that these Effects are the natural Result of the resinous and balsamic Parts.

The Salts of Aloes are very active, and corrode the Extremities of the Veins, where the Fibres are finest, whence proceed Hemorrhages. Therefore it highly concerns us, that the saline Part, which wants to be restrain'd by the resinous, be not separated from it; and yet this is the Case in several Preparations of Aloes, when they have not been made by skilful Hands. They have rejected the resinous Part, as too gross, and good for nothing, because it kept at the Bottom of the Solution. M. *Boulduc* assures us, that he has been several times a Witness to the fatal Effects of a free Use of *Elixir Proprietatis*, and all Preparations of Aloes, which have either been ill made, or taken to Excess.

M. *Boulduc* is so far from approving a Separation of the resinous from the saline Part of Aloes, that, on the contrary, he would have them more strictly united by the Mediation of an Alkali, such as the Salt of Tartar. We are not only to assist Nature under Disorders by Remedies, but lend her our helping Hand in the Remedies themselves. *Hist. de l'Acad. Roy. des Sciences*, 1708.

ALOES ROSATA, Rosated Aloes.

Take of bright *Succotrine* Aloes in Powder, four Ounces; of the depurated Juice of Damask Roses, one Pint; and digest them together over a gentle Heat, till the superfluous Humidity is exhaled, and the Remainder is of a due Consistence for Pills, *S. A.*

This is ordered, in the *Augustane* Dispensatory, to be done three times over; and in the *Pharmacopœia Regia*, it is directed with an Addition of Diagyridium, and Refin of Scammony; but that is now rejected. The same Dispensatory also orders another, with Infusion of Violets; but this is the most simple of them all, and the only one, that is now used in Practice.

PILULÆ DE ALOE LOTÆ, Pills of washed Aloes.

Take of Aloes, dissolved in the Juice of Roses, and again inspissated, one Ounce; of the Troches of Agaric, three Drams; of Mastich, two Drams; Syrup of Damask Roses, a sufficient Quantity; to make into a Mass for Pills, *S. A.*

This is, in the *Augustane* Dispensatory, under the Title of *Pilulæ de Aloe lotæ incerti Authoris*, with the Addition of half a Dram of the Species *Diamoschu dulcis*. It hath stood also in the same manner in the College Dispensatories down to the present, which hath also rejected that Species out of the Number of that Class. *Zwelfer* finds Fault with the Title, because Aloes cannot properly be said in this Process, nor indeed in any other, to be washed; and directs the Aloes Rosata to be used in its stead. There are many other Compositions in this Form with Aloes, in the *Augustane*, and other Dispensatories, as particularly one with Mastich, from *Nicolaus Myrepsius*; but they are quite rejected from amongst the present Officialins. *Quincy's London Dispensatory*.

ALOEDARIA, cathartic compound Medicines, so called from Aloes, a principal Ingredient.

Aloedaria of *Philagrius*, gently purging with Honey of Roses.

Take of Aloes six Ounces; of Costus, Spikenard, Carpopalsamum, Flowers of Juncus odoratus, each one Ounce; of Cassia, one Ounce; of Agaric, four Drams; of Saffron, four Drams; the Tops of Centaury, four Scruples; of Honey, two Ounces; Juice of Roses, four Ounces; Epithymum, one Ounce; of Rheum, eight Scruples; of Asarabacca, four Scruples; of Xylobalsamum, six Scruples. Vol. I.

A L O

ples; of Mastich, eight Scruples. Make them into an Electuary with Honey of Roses, and let the Dose be according to the Strength of the Patient.

Another of the same, gently purging without any manner of Trouble, and good for Pains in the Joints and Loins, but especially for the Sciatica, and opening Obstructions of the Liver.

Take of Ilium, (supposed to be the black *Chamaeleon*) eight Scruples; of Agaric, four Drams; of Aloes, two Ounces; of Spikenard, eight Scruples; of Flowers of Juncus Odoratus, eight Scruples; of Saffron, four Scruples; of Cassia, sixteen Scruples; of Costus, eight Scruples; of Carpopalsamum, eight Scruples; of Honey of Roses, three Ounces and eight Scruples. Bruise them, and make them into Pills with the Honey of Roses, of which give five after Supper, every Day, or every other Day, as you please. It is a Detergent of the Stomach and Joints, and chiefly purges Phlegm. You may dine and sup during the taking of them as usual.

Another, that purges both Phlegm and Bile.

Take of the Tops of Wormwood bruised and strained, and of Aloes very finely powdered, each one Ounce; and with the Juice of Spurge, especially the Myrtle-Spurge, make into Pills of the Bigness of a Kidney-bean, of which give three at a time.

Aloedarium from *Philagrius*, purging Bile and Phlegm.

Take of the Medulla, or inner Substance, of the Colocynthis, Aloes, Scammony, each five Drams; Juice of Tops of Wormwood, five Drams; with the Juice of Cabbage make them into Pills, of the Bigness of a Chickpea, and give one-and-twenty at a time to adult Persons.

Another, approved by long Experience, which purges three Humours.

Take of Aloes, Epithymum, Scammony, each two Drams; of Colocynthis, Agaric, each one Dram; make them into Pills with the Juice of Cabbage, and give fifteen at a time.

Another, made in the City of Tyre.

Take of Scammony, two Ounces; of Aloes, one Dram; of Mastich, Bdellium, Pepper, Wormwood, each one Dram; make them into Pills with the Juice of Citrons, and the Rind of the same, and give seven or nine at a time. If you would have them work smartly, give the Weight of four Scruples and a half, or more.

The Aloedarium of *Oribasius*.

This is chiefly design'd for sore Eyes, and principally purges black and yellow Bile.

Take of Scammony, one Ounce; Rind of black Hellebore, one Ounce; Sal Ammoniac, one Dram; Root of All-heal, three Drams; Pepper, Penyroyal, each one Dram; make them up with Water into Pills like a Grecian Bean, and give seven of them at a time, so as they weigh nearly one Dram and a Scruple.

Another of *Oribasius*.

Take of Aloes two Ounces, of Spikenard, Asarabacca, Mastich, Saffron, Xylobalsamum, each six Drams; of Cassia, twelve Drams; of Epithymum, twelve Drams; make them into Pills of the Size of a Vetch, with a Decoction of Penyroyal, and give twenty-one for a Dose. This cures Quartan Agues. They may also be made up with boiled Honey. *Ætius Tetrabib. l. 1. Serm. 3. C. 105. &c.*

ALOFEL, according to *Rulandus*, or ALOFEL, according to *Johnson*, a Cloth made use of to cover a Vessel.

ALOGOS, ἀλογος, is an Adverb, used frequently when any thing is said to happen without sufficient Reason or Cause: Thus when a Fever disappears without any critical Evacuation, *Hippocrates* says it is resolv'd ἀλογος, without sufficient Reason, and in this Case is subject to a Relapse.

ALOGOTROPHIA, ἀλογотροφία, from ἀλογος, disproportionate, and τροφω, to nourish. Unequal or disproportion'd Nourishment, as when, for Example, in the Rickets, one Part receives a greater Degree of Nourishment than another.

ALOHAR, ΑΛΟΗΟC, ΑΛΟΣΗΟC, or ΑΛΟΣΟΤ. Quick-silver. *Rulandus*.

ALOIDES,

ALOIDES. *Aloe palustris*, Offic. Mont. 36. *Aloides*, Boerh. Ind. A. 2. 132. *Aloe palustris*, C. B. Pin. 386. Johr. Hed. Bot. Pl. Ign. *Aloe five Arizon palustre*, J. B. 3. 787. Chab. 567. *Militaris aizoides*, Ger. 677. Emac. 825. Raii Hist. 2. 1324. Merc. Bot. 2. 26. Phyt. Brit. 75. Mer. Pin. 77. *Stratiotes, five militaris aizoides*, Park. Theat. 1249. Hist. Oxon. 3. 618. *Stratiotes foliis Aloes, semine longo*, Gundelsh. 2p. Johr. Raii Synop. 3. 290. *Stratiotes aquaticus Belgicus*, Bod. in Theoph. 436. **WATER ALOES, or, FRESH WATER SOLDIER.** Dale.

It has Leaves like the Aloe, but shorter and smaller, and surrounded with short stiff Prickles, with Pods between them, like Crabs-claws, which opening, produce white three-leav'd Flowers, very much resembling those of Frog-bit (*Morsus Ranae*, Dale) and bearing small yellow Chives. Its Roots consist of long, round, white Fibres, very like long Earth-worms, or the bigger Harp-strings, which from a short Head, when the Plant puts forth Leaves, shoot down towards the Bottom of the Water, but seldom reach it. Besides these, it has other Fibres, which run obliquely, and propagate it after the manner of Frog-bit.

It grows in flow Streams, and Lakes of Standing-waters, and is often found in large Ditches by Marshes, with most of its Leaves and Flowers above Water, the rest of the Plant being hid under it.

This Herb, in the Isle of Ely, flowers in June and July, and sometimes in August.

The Fibres, with which it is furnish'd instead of Roots, are shewn by knavish Mountebanks to old Women for Worms, in a Vial full of Water, to make them look the bigger, the Cheats pretending they have brought them away from their Patients, by Virtue of their Medicines. Raii Hist. Plant.

The Herb is used, being accounted among the Vulneraries. Dale.

ALOPECES, (Lat. *Vulpes*) Muscles of the Loins, the only ones of the Back, which grows to the Loins, otherwise called *Ψαι*, *Ψοαι*, and by some *νευεμύτρες*, (read, also *νευεμύτρες*, for which some substitute *νεφεμύτρες*) *Ruffus Ephesus*, Lib. 1. Cap. 30.

ALOPECIA. A Distemper attended with Baldness, all or most of the Hair falling off. It is deriv'd from *ἀλώπηξ*, a Fox, because this Animal is said to be very subject to a Distemper which resembles it.

The Antients, amongst whom the Disorder seems to have been more common than it is amongst us, have been pretty long in their Accounts of this Disease: But as *Sennertus* has collected from them all, I shall content myself with inserting his Abridgment, after having given the Sentiments of *Celsus*.

There are two Kinds of Areas, in both which it is common for the outer Skin to grow dead, and the Hairs first to wither, and then fall off; and if the Part be wounded, a thin Blood issues out, of a foetid Smell. Both Areas in some are of a quicker, in others, of slower Growth; the worst is, what condenses and pinguifies the Skin, and renders it quite bare and smooth.

That called *ἀλωπεκία*, *Alopecia*, spreads itself under any Figure, and affects the Beard as well as the Head; the other, which, from its resembling a Serpent, is called *οφίασις*, *Ophiasis*, begins from the Back-part of the Head, and creeps about the Breadth of two Fingers, 'till it has extended its two Heads to both the Ears, and sometimes to the Forehead, 'till both Heads meet in one. The Alopecia comes at any Age, the Ophiasis seldom but to Infants; the first is very rarely taken off without Medicine, the other often goes off of itself.

Some exasperate these Kinds of Areas by scraping them with a Knife, others anoint them with Cathartics mix'd with Oil, especially burnt Paper, dipt in Oil. Others again spread over the Place Resin of Turpentine with Thapsia (deadly Carrot). But there is no better way than to shave the Part every Day with a Razor; for in cutting away by little and little the outer Skin, the Roots of the Hairs are opened; nor must we desist 'till we see the Skin set thick with budding Hairs. It is proper to rub over the Place thus often shaved with Vitriol. *Celsus*, Lib. 6. Cap. 4.

Of the ALOPECIA and OPHIASIS.

There is a peculiar Sort of Falling-off of the Hair, called *ἀλωπεκία* "Alopecia," and *οφίασις* "Ophiasis." It has the Name of *Alopecia*, because such a Defluxion of Hairs often happens to Foxes; and it is termed *Ophiasis* from the Figure of the smooth and bald Parts, which wind about in the manner of a Serpent. In both these Affections it is common for the Hair to fall off by Handfuls at a time, so as to leave whole Spots quite bare; whence the Disease has also the general Name of *Area*, [a bare Plot of Ground] and *Celsus* treats of Areas, Alopecia, and Ophiasis, in the same Chapter. It took the Name of *Area* from the Areas you see in Gardens in the Country; for as these are Plots disposed here and there, and are bare and naked, as having nothing growing on them, so does the Skin, in this Affection, at certain Places, appear smooth and bald.

However these Affections differ at least in Figure; for the Alopecia has no determinate Form, but, as *Celsus* says, extends itself under all Shapes; but the Ophiasis creeps winding like a Serpent, sometimes from the Back-part of the Head on both Sides, as far as the Ears, and of the Breadth of almost two Fingers; sometimes it passes by the Ears, and extends itself, creeping like a Serpent, to the very Forehead. Besides, in the Ophiasis there seems to be more Malignity in the Cause, since not only the Roots of the Hairs, but the Cuticle itself, is corroded as far as these Roots reach. From what has been said, the Alopecia and Ophiasis may be defined, a Defluxion of the Hairs of the Head, which lays whole Places bare at a time, and owes its Rise to a deprav'd and corrupted Humour, that corrodes the Roots of the Hairs.

The Author of the Treatise, *De Medicamentis facile parabilibus*, reckons Alopecia and Ophiasis among the Affections which change the Colour of the Hair. But we ought to take Notice, that this Alteration is not a Property of that Defluxion of the Hair, which occasions Areas; but the Change of Colour in the Hair either precedes the Alopecia and Ophiasis, as when the Hairs from a vitiated Nutriment first turn white, and afterwards fall off; or this Alteration happens after the Alopecia and Ophiasis. For when the Hairs spring afresh upon these Areas, or bare Spots, they appear white or yellow; as white Hairs use to grow upon the healed Spot of an Ulcer in the galled Back of a Horse, which owe their Colour to a vitious Nutrition, and the Tendernefs of the Skin. This is hinted also by *Celsus*, Lib. 6. Cap. 1. where he observes, that the Ophiasis affects only the Hair of the Head; but the Alopecia extends itself to the very Beard.

The Cause of both Affections is a depraved and acrid Humour, of some Kind or other, that corrodes the Roots of the Hairs; tho' they generally proceed from a salt Phlegm, adust or putrefy'd. Hence *Galen*, *De Diff. Sympt. Cap. 4.* writes, that these Maladies are the Consequence of a depraved Nutrition of the Skin of the Head. The Reason why sometimes an Alopecia, at other times an Ophiasis, are occasioned, or that the Hairs sometimes leave a strait, sometimes a crooked Area, is owing to the Quantity and Quality of the Matter: For if the Matter be thinner and more copious than ordinary, it corrodes the Hairs alike in more and larger Spots; if it be scantier, and mix'd with a gross Humour, the Defluxion of Hairs becomes unequal and crooked, because the Humours, being various and mixed, don't readily take their Course strait forward, but creep obliquely, corroding the Hairs in their Way.

The more remote Causes are the Heat of the Liver and Head, and especially a Fault in the first and second Concoction, by which means salt and acrid Humours are generated. This Infirmary is incident to all Ages, but especially to Childhood, and succeeds the *Tinea*, *Achores*, and *Favi*.

Sometimes this Disease is produced also from external and malignant Causes, among which *Galen*, *De compof. Med. Sec. Loc. Lib. 1. Cap. 2.* accounts eating of Mushrooms, because they contribute much to the generating of vitious and corrupt Humours. Among other Causes of this Kind, we may reckon the Pox, which also corrodes the Roots of the Hairs; and other malignant and contagious Distempers may have the same Effect.

The Alopecia is distinguish'd from the Ophiasis by the Form of its Area, and in that it occasions only a Falling-off of the Hair, whereas in the Ophiasis not only the Hairs fall off, but the Skin is excoriated, and changes its Colour, sometimes turning whiter, sometimes paler, or blacker; and if it be pricked, a ferous Blood issues out.

The Alopecia and Ophiasis differ from the *Tinea*; for in the Ophiasis the Excoriation in the Skin is but superficial, and when it is healed, the Hairs grow again; but in the *Tinea*, the Excoriation and Exulceration are deeper, and the Skin is oftentimes so vitiated, that the Hairs never grow again.

As to Signs of the Causes, the kind of peccant Humour may be known by the Colour of the Skin; for the better Observation of which, the Hairs which are left, are to be shaved off, and the Skin gently rubbed; and there are other Signs by which you may know what Humour abounds in the Body. The Hairs also, when they grow again, will shew by their Colour, which varies, according to the Nature of the morbid Matter, what kind of Humour is the Cause of this Affection.

The Alopecia and Ophiasis, tho' not attended with much Danger, occasion Deformity; and among the *Romans*, those Slaves, who were affected with an Area, and especially an Alopecia, were sold at a lower Price; and, in our Times, these Areas are matter of Disgrace, as giving a Suspicion of the Pox.

Whether the Alopecia or Ophiasis be most easy to cure, Authors are divided in their Sentiments. *Celsus* and *Avenzoar* write, that the Ophiasis is sooner cured than the Alopecia. *Alexander*, Lib. 1. Cap. 2. and *Serapion*, Lib. 1. Cap. 1. say the contrary. But *Celsus* seems to speak chiefly of the Ophiasis of Infants, which often goes off of itself, by the Benefit of Age and Change: But in Adults, indeed in any Age, if the Alopecia and Ophiasis be compared

pared together, the latter seems on all accounts more difficult to cure, as owing its Rise to a grosser and more malignant Humour, that corrodes not only the Roots of the Hairs, but the Skin itself, which does not happen in the Alopecia.

The more inveterate either of these Infirmities is grown, the more stubborn it is to be remedied; and the contrary.

If the Place grow red with Friction, there is Hope of a Cure; and the sooner it does so, the easier will the Cure be; if the Place grows not red with Friction, 'twill be in vain to attempt a Cure.

The worst Kind of Areas is, where the Skin is thick and fattish, and absolutely bald and smooth.

Alopecia and Ophiasis from a Leprosy, are incurable; from the Venereal Disease, are not to be cured, before that Distemper is removed.

There is good Hope of a Cure, when the Extremities of the Areas adjoining to the standing Hairs, begin to send forth Hairs: For the Parts next the sound ones, are less perverted from their natural State, and are therefore sooner restored, and begin to produce Hairs.

If a vitious Humour abounds in the whole Body, it is first of all to be evacuated; otherwise it would continually foment the Disease. And so if it accompanies the *Lues Venerea*, this latter must first be cured, before the other can be removed. So also a Distemperature of the Viscera, on which depends the Generation of vitious Humours, is to be rectify'd. The antecedent Cause being removed, the continent or immediate Cause is to be taken off. This *Galen* effects by Repellents and Digestives; but Care must be taken at the same time to restore the Skin to its natural Temperament.

First then, the whole Body is to be purged by Remedies accommodated to the Nature of the peccant Humour. After this, *Galen* prescribes an Apophlegmatism for Evacuation of the Head in particular.

As to the Matter, while it is yet fluctuating, and in its Beginning, before the Areas are formed, *Galen* makes use of Repellents. This is what *Avicenna* also advises, when he tells, that the Remedies for an Alopecia must be such as, by a moderate Astringency, strengthen the Skin of the Head, in *Septima quarti Tract. 1. Cap. 6.* "These Medicines, says he, must be of a corroborating and repelling Quality, by which means the Head may be guarded against the Influx of the malignant Matter." But where the Alopecia and Ophiasis are already formed, Repellents have no Place, neither in these Cases, nor in the Itch.

If the Areas are already formed, and the Matter lodged in the Skin, Digestives are to be used. These are to be hot in Quality, of fine Parts, and not too dry; for if they should be of a drying Nature, they would not only discuss the vitious Humours, but also what should nourish the Hairs. And if the Temperament of the Skin be too hot and dry, as it is in confirmed Areas, cooling and moistening Medicines are to be intermix'd with the other Topics.

The Remedies which remove the proximate Cause of this Malady, are called *μετασυνκριτικά*, "Metasynkritica" [See the Word]. Here, first, if any corrupt Hairs still remain, they are to be drawn out either with Tweezers, or by Dropacism; or the Place must be shaved with a Razor. Then the Head must be washed with Lye, in which Capillus Veneris, Polytichum, Abrotanum, and such kind of Herbs, have been boiled; after the Washing, let the Place be rubbed with a Linen Cloth, not too soft, nor too dry, till the Skin begins to grow red; after which let Topics be apply'd, such as Mustard, Nasturtium, and Roots of white Lilies, (which last are also said to restore the Hairs after Combustions) Rocket-seed, Nitre, Oil of Bays, Tar, Sulphur, the Powder and Ashes of Abrotanum, the Root of Sowbread, of Hellebore, the Seed of Staves-acre, Pigeon's Dung, and, which are stronger than all the rest, Thapsia and Euphorbium; these last, the fresher they are, the more they retain of Acrimony, which they lose by being kept. Choice is to be made of these, as shall appear best suited to the Case, and due Application is to be made. For not all the Medicines just now enumerated are proper for all Areas, at all Seasons, in all their Degrees, and whether more or less inveterate; for each has its proper Season and Measure: To a beginning and slight Disease, a weak Remedy; to an inveterate one, strong Medicines are best accommodated; to tender Bodies, as of Women and Children, gentle Topics; to those of adult Persons, and Men, smarter ones are to be apply'd.

Galen, De Compos. Med. Sec. Loca, Lib. 1. Cap. 1. has many Compositions to this Purpose, examin'd and approv'd by long Experience, such as those of *Heras, Crito, Orestinus, Oritho Siculus, Cleopatra, Archigenes, Asclepiades, Dionysiodorus, Soranus*, and others. He himself recommends the following:

Take of the Leaves of Arundo Græca burnt, four Ounces; of Hedgehog calcin'd, one Dram; of Mouse-dung, two Drams [in *Galen* it is two Ounces]; pound them in Vinegar, and anoint the Parts affected. Or,

Take of the Ashes of burnt Reed, Goats Hair burnt, Maidenhair, Bear's Fat, Tar, Cedar-Turpentine, of each an equal Quantity. This he calls an admirable Remedy, Or,

Take of domestic Mice burnt, Linen Cloth burnt, Horses Teeth calcin'd, Bear's Fat, Stag's Marrow, Bark of Reed, of each equal Parts; of Honey, a sufficient Quantity; make them into an Ointment. Or,

Take of Euphorbium, Thapsia, Oil of Bays, each two Drams; Sulphur vivum, Hellebore, each one Dram; Wax, six Drams; melt them up, and mix them together with Oil of Bays, or old Oil, or Tar. This is the strongest Medicine of all, and best accommodated to the Disease, when grown inveterate.

In a more moderate Degree of the Distemper, a Remedy prepared of Abrotanum, or the Roots of Reed burnt, mixed with old Oil, or Oil of Bays, or Tar, will be sufficient. Or,

Take of Rocket-seed, Nasturtium; Nitre, and mix them with Oil of Bays, or Tar. Or, which is milder, and adapted to Women and Children,

Take of Abrotanum, the Ashes of the Root and Bark of Reed, Frankincense, an equal Quantity; of Bear's Fat, and Oil of bitter Almonds, a Sufficiency. Make a Liniment. If there be Occasion to make it stronger, you may add Froth of the Sea, Sulphur vivum, Ox Gall, Rocket, Nitre, or even Thapsia. Or,

Take of Mustard, Thapsia, and Seed of Nasturtium, equal Parts; reduce them to a fine Powder, and add thereto Oil of Bays and Resin, of each a sufficient Quantity; and make thereof a Plaster by the Fire-side.

A Multitude of such Remedies are every-where to be found in the Works of *Valescus de Taranta, Rondeletius, Hallerius, Trincavellius*, and other practical Physicians.

In using the stronger Kinds of Medicines, observe to apply the softer and more liquid Sorts, and such as are temper'd with the Mixture of Oils, which moderate in some measure their Force; and then taking Notice of what Alteration is wrought in the Part affected by the first Medicine, increase or diminish its Strength, as you see Occasion. Now an Alteration may be best discover'd by attentively observing whether the Skin be grown redder, or will redden with a strong or gentle Friction. For the greatest Care is to be taken, that the Skin be not parched by the repeated Use of the stronger Medicines. It is farther to be observed, with respect to compound Medicines, that, if the Parts are quite bare, they are fittest to be used in a solid Form, as by way of Plaisters; but if the Hairs are not clean gone, more liquid and softer Forms, such as Liniments and Ointments, are most convenient.

The milder Topics must remain Night and Day on the Part, that they might be able to exert their Force; the stronger ones, till you can perceive they have made some Alteration in the Skin, and Pain begins to be felt. Therefore in using these latter, the affected Part is to be inspected once or twice every Day; and if they have had too rough an Effect, recourse must be had to milder ones; and the Part is to be anointed with the Fat of a Goose, Oil of Dill, or some such Anodyne Medicine; for if the stronger Remedies be kept on longer, they will burn the Skin. Thus *Christophorus a Vega* writes, That he had seen not a few Persons, who by the Use of too forcible Medicines, were reduced to a perpetual Baldness, or remained all their Life-time without a Beard.

A Regimen of Diet is also very effectual in the Cure of an Alopecia and Ophiasis. Such Meats are to be chosen as generate good Blood, and put a Stop to the breeding of ill Humours. Let the Food be such Eatables as contain a good Juice, which may rectify the depraved Fluids. Let the Patient abstain from Wine till the Body be purged; for Wine serves as a Vehicle to carry the detained and corrupt Humours into the Veins. After sufficient Purging, Wine that is mild, and of a sweetish Taste, may be indulged, since it nourishes much, and generates good Blood. A warm Air suits best with the Patient. *Sennertus, Lib. 5. Part. 3. Sect. 2. Cap. 4.*

ALOPECUROS, from *αλωπεκ*, a Fox, and *ουρ*, a Tail. It is a Plant thus distinguish'd:

ALOPECUROS, Offic. Ger. 81. Emac. 87. *Alopecurus genuina*, Park. Theat. 1166. Hist. Oxon. 3. 101. *Gramen Alopecurus spica brevi*, J. B. 2. 474. Chab. 186. Raii Hist. 2. 1265. *Gramen Alopecuroides spica rotundiore*, C. B. Pin. 4. Theat. 56. Boerh. Ind. A. 2. 159. Elem. Bot. 418. *Gramen spicatum tomentosum longissimis aristis donatum*, Tourn. Inst. 517. FOX-TAIL. Dale,

A L O

It is a very tender Herb, with a short Spike of about two Inches, pretty round, and nearly resembling a Fox's Tail, white and thin. The Husks that hold the Down are almost hid by the Thickness of the downy Tufts, and are pretty long-bearded, soft, and of a circular Form. The Stalk has many Joints, and grows to the Height of a Cubit, or a Cubit and half, beset with grassy Leaves, which are cover'd with very fine soft Hair. The Root is small, white, and has abundance of Filaments.

It is observed to grow in Sicily, at Baia in Italy, and in Languedoc near Frontiane, chiefly in sandy Ground, but with a short Spike, and a low Stalk, not above a Foot high, and very slender in the upper Part. *Raii Hist.* 1265.

I don't find any Virtues ascrib'd to it.

Ray, besides the above, enumerates the following Species:

1. *Gramen Alopecuro simile Glabrum, cum Pilis longiusculis in spica, Onocordon mihi denominatum, J. B. Alopecuroides Major, Ger. Phalaroides Majus, Park. Gr. Phalaroides majus, seu Italicum, C. B. & forte etiam Phalaroides spica molli, seu Germanicum, C. B. Park.* THE MOST COMMON FOX-TAIL GRASS. This grows very plentiful in Meadows and Pastures throughout England.

2. *Gramen Aquaticum gemiculatum spicatum, C. B. Fluviale spicatum, Ger. Aquat. spicatum, Park.* SPIKED FLOTE-GRASS.

3. *Gramini Caudæ Muris purpurascenti aliquatenus simile, J. B.*

4. *Gramen Alopecurinum minus, Ger. Alopecuroides spica longa majus & minus, Park. Typhoides, V. Seu spica angustiore, C. B. Cum Cauda Muris purpurascente, J. B.* THE LESSER BASTARD FOX-TAIL GRASS.

5. *Gramen pumilum hirsutum spica purpuro-argentea molli, nostras.* THE DWARF HAIRY FOX-TAIL, WITH A SILVER WHITE SPIKE INCLINING TO PURPLE.

6. *Gramen Alopecuroides spica aspera, C. B. Alopecuroides spica aspera, Park. Gra. cum cauda Leporis aspera, seu spica murina, J. B. Alopecuroides spica aspera Bauhini, Ger. Emac.* ROUGH-EAR'D FOX-TAIL GRASS.

7. *Gramen Alopecuros spica longa tomentosa candicante, J. B. Alopecuros major spica longiore, C. B. Gr. Alopecuroides alterum radice repente, seu Pseudo-Schoenanthum Monspeliensium, Park. Schoenanthum adulterinum, Ger.* GREAT LONG-EAR'D FOX-TAIL GRASS.

8. *Alopecuros maxima Anglica, Park. Altera maxima Anglica paludosa, Ger. Emac. Altera maxima Anglica paludosa, seu Gramen Alopecuroides maximum, J. B. Lob. Adv. part. alt.* GREAT ENGLISH MARSH FOX-TAIL GRASS.

9. *Gramen Alopecuroidi accedens ac Phalaridi, spica longiuscula, folio lanuginoso, J. B. Typhoides molle, C. B. Alopecuroides minus, Ger.* Long-ear'd soft-leaved FOX-TAIL.

10. *Gramen cum cauda muris, foliis hirsutis, J. B. Typhoides culmo reclinato, C. B. Alopecurinum majus, Ger.* THE GREAT BASTARD FOX-TAIL GRASS.

11. *Gramen Alopecuros altera Lobelii, J. B.* ONE OF THE SPECIES OF FOX-TAIL OBSERV'D BY LOBEL.

12. *Gramen Alopecuros minus spica longiore, C. B. Cauda vulpina Monspeliensium, Adv. Lobel.* FOX-TAIL OF MONTPELLIER.

13. *Gramen Typhoides maximum spica longissima, C. B. Typhoides maximum, Park. Typhonum tertium, Ger. Emac.* THE GREATEST CATS-TAIL GRASS. *Raii Hist.* p. 1264.

ALOPEX is a Sea-fish, mention'd by Oribasius, (*Med. Coll. Lib. 2. Cap. 58.*) among those which frequently come up the Rivers into fresh Water, and are hard of Concoction.

ALOSA five CLUPEA, the Shad: It is a Sea-fish, which often travels into Rivers; it grows to the Bigness of a Salmon; it is cover'd with large Scales, but thin and easy to be pulled off; it is sharp-snouted, and has no Teeth; there appears at the Top of its Head, above its Eyes, a Bone or a Scale on both Sides, which is bright and shines; its Tongue is blackish, the Back is of a yellowish White, the Sides and Belly of a silver Colour. This Fish loves Salt, and has a delicious Taste; it contains a great deal of volatile Salt and Oil. When this Fish is not very fresh, it has a Taste somewhat acrid, which offends the Gums of those who eat it.

They find in the Head of this Fish a stony Bone, which is Aperitive, and good for the Gravel and Stone, and to absorb Acids, being itself alkaline.

The Stomach of this Fish, dried and reduc'd to Powder, is proper to strengthen the Stomach, being taken inwardly. *Lemery de Drogues.*

It agrees in the Spring, when it is better than in any other Season of the Year, with any Age and Constitution, provided it be moderately used.

It's said this Fish is so afraid of Thunder, that the Noise thereof many times kills it out of Fear. *Rondeletius* says,

A L P

that he had seen some of them, by playing on the Lute, run and skip about on the Face of the Water.

They pickle Shad to keep, and for the exporting it into other Parts; but 'tis not so well tasted as before. *Lemery on Foods.*

ALOSANTHI, Flos Salis, Flower of Salt. *Rulandus.*

ALPAM. This is the Siliquosa Indica flore tripetalo, siliquis teretibus, pulpa absque feminibus repletis. *Raii Hist. Plant.*

The Stem of this Plant, which divides itself twice or thrice, is covered with a Bark of an ashy, green Colour, inodorous, and of an acid astringent Taste. The Branches are of a whitish Wood, have a green Pith running thro' them, and are distinguished into Joints. The Root is red, composed of a great Number of capillary Fibres, which disperse themselves on every Side. The Leaves are of a narrow oblong Form, and terminate in a sharp Point, of a Deep-green on the Outside, but pale on the Inside, have their main Rib very much branched, are interwoven with many Veins and Fibres, and are set single on thick, short Pedicles, which are flat on the Inside. They have a Smell not ungrateful, and taste somewhat acrid. The Flowers, which are of a dark-purple Colour, and inodorous, grow on very slender, round Pedicles, sometimes two or three together, and consist of three broadish, sharp-pointed Leaves, which are covered on the Outside with very white Hairs, and in the Middle have their Stylus divided into three oblong, red Stamina or Chives, that cross one another. To the Flowers succeed the Pods, which are sharp-pointed, round, and full of a carnosé Pulp, but without Seeds, at least any that are discernible.

It delights in sandy, open Soils; and is found in great Plenty in *Aregatti* and *Mondabelle*, and many other Places.

It bears Flowers and Fruit, as well at the End of the Year as in the Beginning, and is always full of Leaves.

Any Part of this Shrub, made into an Ointment with Oil, is a powerful Remedy in case of the Scab, and old Ulcers.

The Juice of the Leaves, with Calamus Aromaticus, is good against the Venom of Serpents; and the Root bruised with Juice of Lemon, tied in a little Knot, and thrust up the Nose, by way of Errhine, is esteemed a Specific against the Bite of the Serpent called *Regulus*, or *Cobra Capella*. The Poison of a young *Cobra Capella* is also expelled by the Root drank in Cow's-milk. For the same Purpose Cataplasms are likewise used, made of this Root and Calamus Aromaticus.

ALPHABETUM CHYMICUM. *Raymond Lully* has presented the World with a Chymical Alphabet, but to what End, and with what Design, will be a difficult Matter to discover, especially till it can be understood; and till then I shall beg Leave to give it in his own Words, it being very difficult to translate what one cannot comprehend.

Significationes Literarum hujus Testamenti.

- A Significat Deum.

- Ξ Significat alembicum cum cucurbita.

ALPHENIC, an Arabic Word, which signifies Sugar-candy, or Barley-sugar. *Blancard.*

ALPHESERA, the same as ALFESERA, which see.

ALPHITA, ἀλφίτα, the Plural Number of ἀλφιτον; it is said to signify, strictly, the Meal of Barley hull'd and parch'd; though some take it to be the Meal of Barley, as ἀλεύρον, according to their Interpretation, is the Meal of Wheat. It is certain, however, that *Hippocrates* uses ἀλφίτα to express the Meal of all sorts of Seeds. And *Galen* tells us, It signifies Meal of a moderate Fineness; whereas κείμια signifies the coarsest Sort, and ἀλεύρον the finest; and this Explanation seems the nearest to Truth.

Ἀλφίτα περιώνια is also mention'd by *Hippocrates*, and signifies probably Meal made of very new tender Barley, before it was

A L P

was laid to dry in the Granaries. It seems it was the Custom amongst the Antients, especially those who liv'd in moist Situations, to set a Post erect upon a Floor, and lay their Barley round it, to dry, so that the Heap resembled a Cone (κῶνος). Ἀλφίτα περὶ κῶνα then was Meal made of Barley, before it was laid to dry in this manner; though Galen says, some took it to signify Meal made of Barley unparch'd.

Hence ἄλφιτον was also taken for a kind of Hasty-pudding, which the Romans call'd POLENTA. It was generally made of Barley-meal moisten'd with Water, or any other Liquid, as Wine, Must, or Hydromel. This was a very common Food, especially amongst the Soldiery, and therefore we may conclude it was esteemed very coarse. Hippocrates frequently orders ἄλφιτα medicinally, without Salt (ἀνάλατα). Hence

ALPHITEDON, ἄλφιτιδὸν, was apply'd to a Fracture, when the Bone was broken into very small Fragments, like Alphita.

ALPHUS, ἄλφς, one of the three Species of Vitiligo, the other being Melas and Leuce, described by Celsus; in which, says he, the Skin is of a white Colour, with a kind of Roughness for the most part, not continuous, but sprinkled with somewhat like Drops; sometimes it spreads to a considerable Breadth, with some void Intervals. Celsus, Lib. 5. Cap. 18.

Some Authors make but two Species of Vitiligo, comprehending the Melas under the common Name ALPHUS.

The Alphi bear the same Analogy to the Leuce, [λευκή] as the Scabies to the Lepra: For the Leuce commonly descends deep in the Flesh, and infects the Hairs with their own Colour, but the Alphus sticks in the Superficies; though now-and-then they take deeper Root, and also change the Colour of the Hairs. The Alphus, for the most part, is of a milder Nature than the Leuce, and gives way to moderate Remedies; but when grown inveterate, it approaches more and more to the Nature of the Leuce, and has Need of the same Medicines. Aetnarius, Meth. Med. Lib. 2. Cap. 11.

The Species of Vitiligo called the Leuce, is generated from a pituitous and glutinous Blood, which by Length of Time assumes a whiter Colour. The Alphus has a like Original, but does not penetrate the Flesh, sticking only about the Skin. The Alphus is generated from a pituitous Humour, the black from an atrabilious. The Lepra is generated by a Humour that sinks deep within the Flesh, but the Scabies principally affects the Superficies of the Skin.

One of the most certain Remedies for these sort of Distempers is to wash the Parts affected with Lime and Water, made considerably strong or thick, which is done by pouring Water upon Lime-stones washed and dried. But the Alphus requires only a thin or weak Liquor, the Scabies a thicker, but the Lepra a very thick or strong one. The Root of Tarragon in Vinegar cures the Alphus, being washed therewith, and both the Hellebores do the same. The Decoction of bitter Lupines, or the Meal thereof, with Honey or Vinegar, externally used, have a like Effect. Other Remedies are, the Bark of Caper-roots and Vinegar, Lily-roots and Honey, Onion and Vinegar apply'd in the Sun, the Dung of a Lizard, Starlings fed only on Rice, and the Shell of the Cuttlefish calcined. Oribasius de Morb. curat. Lib. 3. Cap. 58.

The Alphus is so called from ἀλφαῖρα, an old Word, signifying to change, because it changes the Colour of the Skin. It has the same kind of Original with the Leuce and Lepra, only is not so deeply rooted, but like Scales sticking on the Skin, the white ones being derived from a phlegmatic, the black ones from an atrabilious, Humour.

To cure the white and black Alphus:

Take Fig-leaves, Sulphur vivum, Alum, of each an equal Quantity, and Vinegar, and anoint the affected Parts, it being an excellent Medicine.

For the black Alphus, in particular:

Take of black Hellebore, and Terra Cimolia, equal Quantities, and dilute them in Water, or Vinegar, to the Thickness of Lees of Oil, and therewith anoint the Parts in the Sun, being first well rubb'd over.

For the black Alphus, when grown inveterate, and harden'd to a Callus on the Superficies of the Skin:

Take of the Root of the black Chamæleon, nine Ounces; Sulphur vivum, two Ounces; Aphronitre, one Ounce: Macerate them in Vinegar, and therewith anoint the Parts in the Sun.

Another most effectual Medicine, and sweet-scented withal, is as follows:

VOL. I.

A L S

Take of white Hellebore, eight Drams; Iris, Aphronitre, Costus, each four Drams: Macerate them in Vinegar, and so rub them on the Parts in the Bath, without mingling any Fat with them.

Another very celebrated Remedy for both the black and white Alphus; viz.

Take of Myrrh, Sulphur vivum, Spuma Nitri, white Hellebore, each two Ounces; burnt Bastard-sponge, an Ounce and an half: Make them into a Wash-ball, and use them in the Bath, or in the Sun with Vinegar.

But here is to be noted, with reference to all that has been said, That Purging ought to precede external Applications. For the white Alphus you may begin with Galen's Hiera, or Pills of Colocynthis and Aloes; and for the black sort, you may purge with black Hellebore and Epithymium. Aetius Tetr. 4. Serm. 1. Cap. 132.

ALRAMUDI cineritious. Rulandus.

ALRATICA, a Word used by Albucasis, to signify the total or partial Imperforation of the Vagina, whether natural or accidental.

ALSAMACH, or ALSEMACH, the Arabic Name for the great Foramen in the Os Petrosum.

ALSECH, Alumen Jamei. Rulandus. That is, Alumeri Plumosum.

ALSELAT, Burnt Copper. Rulandus.

ALSINASTRUM.

1. *Alsinastrium Gratiolæ folio*, Inst. 244. & *Alsinastrium Gallii folio*; Ibid. Found by Mr. J. Sherard, on boggy Ground, on the Common just by the Road from Eltham to Chislehurst. Syn. Stirp. Brit. 346.

The Roots are composed of white Fibres coming out of the lower Joints of the Stalk, and disposed in Whirls. The Stalk is divided on the Inside, and lengthwise, into ten Cells, formed by little membranaceous Leaves, which are placed in Form of a Ray. It is channelled throughout its Length; and that Part which appears above the Water is pale, the other washed with a little Purple, and distinguished with Joints, at the Distance of two Lines, to which are fastened eight or ten Leaves, and sometimes twelve, before the Stalk gets above the Water. These Leaves are disposed in Rays, and are but about one third Part of a Line broad at their Base, to eight or ten Lines in Length. Those which appear above the Water, are much broader and shorter not much unlike those of the *Glaux Maritima*, C. B. The Flowers grow in the Bosoms of some of the Leaves, and consist of four white round Petals, about one half of a Line in Diameter, placed round a Pointal, and opposite to the Divisions of an Empalement, which is cut into four equal Segments. It has four very short Chives sustaining white Summits. The Pointal at last becomes a round flat Capsule, ribbed like a Melon, having a Navel on the Forepart, and opening into four Parts to the very Base, and disclosing many oblong Seeds. It flowers in July and August. Vaill.

2. *Alsinastrium serpyllifolium, flore albo tetrapetalo*. Vaill. 5.

3. *Alsinastrium serpyllifolium, flore roseo tripetalo*. Vaill. 5. Martin's Tournefort.

ALSINE. A Plant thus distinguished.

Ἀλσιν, Dioscorid.

1. *Alsine*, Offic. *Alsine minor*, Park. Theat. 760. *Alsine media*, C. B. Pin. 250. Hist. Oxon. 2. 550. Tourn. Inst. 245. Elem. Bot. 208. Boerh. Ind. A. 209. Rupp. Flor. Jen. 87. Dill. Cat. Giff. 41. Buxb. 16. Merc. Bot. 1. 18. Phyt. Brit. 6. *Alsine minor five media*, Ger. 489. Emac. 611. *Alsine vulgaris five morsus Gallinæ*, J. B. 3. 363. Raii Hist. 2. 1030. Synop. 3. 347. *Alsine five morsus Gallinæ*, Chab. 449. *Alsine minor media*, Mer. Pin. 5. CHICK-WEED. Dale.

ALSINE is by some called *Mousser*, because its Leaves resemble the Ears of Mice: But it has the Name of *Alsine* from [ἄλσος, lucus], it delighting in Groves, and shady Places. The Herb is like Pellitory of the Wall, but lower, and with longer Leaves, and not at all rough, but being rubbed, sends forth a Smell like a Cowcumber.

It is of a strong and refrigerating Quality, on which Accounts it is good for Inflammations of the Eyes, being apply'd in a Cataplasm with Polenta. The Juice of it, instill'd into the Ears, easeth the Pains thereof; and, in short, it has the same Virtues, and serves for the same Purposes, as the *Helxine*. Dioscorides, Lib. 4. Cap. 87.

It grows in Gardens, especially on the Walls. It springs in the Midst of Winter, and withers away in the Heat of Summer. It is weaker than the *Helxine*, but has a peculiar Virtue in Inflammations of the Eyes. It is good also in Ulcers, and Distempers of the Pudenda, being apply'd with Barley-meal. [Farina Hordeacea, by which, no doubt, Pliny means the same as Dioscorides by his ἄλφισα, commonly render'd Polenta.] Pliny, Lib. 27. Cap. 4.

F f f f

Chickweed

Chickweed is a small tender Plant, arising above half a Foot high, having its weak brittle Stalks growing thick together, which are round, and have two small roundish sharp-pointed green Leaves, growing at each Joint, opposite one to the other; on the Top of each Stalk, it bears many small, star-like, white Flowers, of five narrow Leaves apiece, with a green Calyx cut into as many Parts under them. The Seed-vessel is long and round, containing many small, round, brownish Seeds. The Root is small and fibrous, perishing after Seed-time. It grows every-where in moist Places, and in Gardens too frequently.

Chickweed is cooling and moistening, good for Inflammations of the Liver, St. Antony's Fire, Redness and Pimples in the Face, being applied to the Parts affected as a Cataplasm, or Cloths dipp'd in the Juice, laid on, and now-and-then shifted; made into a Poultice with Hog's-lard, it helps hot Swellings and Tumours; the Juice dropp'd into the Eyes, takes away Redness and Bloodshot. *Miller Bot. Off.*

It contains a great deal of Phlegm and Oil, and but little Salt.

It is sweetening and thickening, it stops the Flux of the Hemorrhoids, and it mitigates Pain, being taken in Decoction, and externally apply'd. *Lemery de Drogues.*

It grows in watery Places, by the Sides of Hedges and Paths. The Herb is in Use; it refrigerates and moistens, and has the Virtues of Pellitory of the Wall, only it has no Astringency. It is supposed to be very nutritive, and therefore a wholesome Food for Persons in an Atrophy or Phthisis. *Dale.*

The Chickweed varies according to the Place of its Growth, as *Tragus* has observed. The Figure of the *Alfine media*, *Tabern.* represents it high and spreading, as one finds it in shady Places. In *Dodonæus's* Figure it appears more low, bushy, and like that which grows frequently in Gardens. I suspect it is the *Alfine marina* of this last Author. *J. Bauhin* supposes this to be the Species which he has named *Alfine Plantaginifolia*. For my part, I do not like *Dodonæus's* Figure; and it seems to resemble neither *J. Bauhin's* Plant, nor that of which we are speaking: So that it is a Wonder, that *Lobel* should make use of this Figure to represent the Chickweed; but he had but a confused Notion of it, as *J. Bauhin* demonstrates. *Thalius* probably spoke of this Plant, under the Name of *Alfine minor*; but as he makes several Species of it, we must say *Alfine minor foliis oblongis mucronatis*, and not simply *Alfine minor*, as *C. Bauhin* has done.

The Chickweed is of an herby Taste, a little saltish. *Cordus* found something nitrous in it; nevertheless, as it gives a pretty deep-red Colour to the blue Paper, its Salt seems to resemble the Sal Ammoniac, which is natural in the Salt of the Earth, but in this Plant is dissolved in a great Quantity of Phlegm. *J. Bauhin* affirms, That the distilled Water of Chickweed, or the Infusion of it in Wine, restores those who are emaciated, after long Diseases. *Schroder* commends it highly for the Phthisic. The Use of this Plant cures Children of Convulsions; and they give a Dram of its Powder for the Epilepsy. *Solenander* says, That its Powder being laid on the Piles, stops their immoderate Flux, and assuages the Pain. The Juice of Chickweed is vulnerary and deterfive, like the Sal Ammoniac, which is good to cleanse the Mouth, and take away Inflammations. For spitting Blood, the Patients must eat Omelettes made of this Herb, minced small, instead of Parsley. Applied to the Breasts, it dissolves the curdled Milk, and dissipates the too great Quantity of this Liquor. To all these Virtues we may add that of cooling, which is attributed to the Chickweed: For the greatest Part of Remedies cool no otherwise, than by quickening the Motion of the Blood, which, because of some Obstructions in the Bowels, stagnates, ferments more violently, and heats all the neighbouring Parts. Aperitives are capable of cooling in that Sense, because they open the Passages through which the Liquors ought to circulate. The Antients, who in Remedies inquired more into the Effects than the Causes, ought not to be blamed for calling the greatest Part of those cooling, which are capable of augmenting the Motion of the Humours. Every body knows, that Chickweed is frequently used to restore the Appetite to Canary-birds, Linnets, and other caged Birds: This Use is not new, *Tragus*, *Anguillara*, and several Authors, have mentioned it.

2. *Alfine Plantaginifolia*, J. B. 3. 364. PLANTAIN-LEAVED CHICKWEED. In shady Places, and among Bushes.

Mr. Ray has described this Plant very well, but he had no Reason to suspect, that it was that which *C. Bauhin* calls *Alfine aquatica media*: That of *Bauhin* is very well engraved in *Tabernæmontanus*, and is not often found but along the Brooks, in the Pyrenees, and the Alps.

The Petals of this are intire; it is the *Spergula Plantaginifolia*. *Dillen Cat. Giff. 58.*

3. *Alfine minor multicaulis*, C. B. Pin. 250. *Alfine minima*, J. B. 3. 364. THE LEAST CHICKWEED ON WALLS.

J. Bauhin's Figure is transposed; that of *Tabernæmontanus*, who calls it *Alfine minor*, is not bad. This Plant varies according to the Place where it grows; and I believe there is little Difference between it and that which the same Author calls *Alfine petraea minima*. If *Tragus* intended to comprehend it under his four Species of Chickweed, he is mistaken; for its Flowers are whitish, and not blueish.

This also has intire Petals: It is the *Spergula multicaulis*, *Dillen Cat. Giff. 58.*

4. *Alfine verna glabra, floribus umbellatis albis*, Inst. 242. *Caryophyllus arvensis umbellatus; folio glabro*, C. P. Pin. 210. *Caryophyllus arvensis umbelliferus*, J. B. 3. 361. *Holostium Caryophyllæum arvense*, *Tabern. Icon. 233.*

This last Author's Figure is a great deal better than that of the *Alfine verna*, *Lugd. Dalechampius*, however, is the first who has ascribed this Plant to its true Genus: *Fabius Columna* has confounded it with that which he calls *Eufragia Linifolia*. Part 2. 68.

M. Vaillant has observed, That the Flower of this *Alfine*, or *Spergula*, has but three Chives; and that the Pointal ends in three Threads, which are expanded horizontally. *Martyn's Tournefort.*

5. *Gramen Leucanthemon*, Offic. Ger. 43. Emac. 47. Park. Theat. 1325. *Gramen Fuchsi sive Leucanthemon*, J. B. 3. 361. Chab. 448. *Caryophyllus arvensis glaber, flore majore*, C. B. Pin. 210. *Caryophyllus holosteus arvensis glaber flore majore*, Raii Hist. 2. 1027. Synop. 3. 346. *Holostium vernum seu Gramen Leucanthemon*, Mer. Pin. 63. *Holostium vernum, flore majore, Euphrasia Gramen Tragi*, Merc. Bot. 1. 43. Phyt. Brit. 60. *Lychnis arvensis glabra, flore majore*, Hist. Oxon. 2. 546. Boerh. Ind. A. 214. *Alfine pratensis, gramineo folio ampliore*, Elem. Bot. 209. Tourn. Inst. 243. Dill. Cat. Giff. 50. Rupp. Flor. Jen. 87. Buxb. 18. *Alfine holostea glabra, folio gramineo, flore majore*, Volck. Flor. Nor. 21. STITCHWORT.

It grows in Woods, bushy Places, and Hedges every-where, and flowers in the Spring. The Herb is used, which is of a refrigerating and drying Quality, and is good for Inflammations of the Eyes. *Dale.*

Dodonæus affirms, That the Fruit of this Species is oblong; it appears to me to be rather spherical.

The Juice of this Plant, its distilled Water, its Leaves and Flowers bruised, are good to appease the Inflammation of the Eyes; for which Reason *Tragus* calls it *Euphrasia gramen*, 329.

6. *Alfine pratensis, gramineo folio angustiore*, Inst. 243. *Caryophyllus arvensis glaber, flore minore*, C. B. Pin. 210. *Gramini Fuchsi Leucanthemo affinis, & similis planta*, J. B. 3. 361. THE LESSER STITCHWORT. Among Bushes, especially in a sandy Soil.

J. Bauhin's Figure is good for nothing at all; that of *Tabernæmontanus* is good, under the Name of *Gramen floridum minus*, Icon. 232.

Mr. Ray observes very well, That the Summits of this Species are red.

7. *Alfine altissima nemorum*, C. B. Pin. 250. *Alfine major, repens, perennis*, J. B. 3. 362. *Alfine major*, Dod. Pempt. 29. GREAT MARSH CHICKWEED. In marshy Places, and by the Sides of Brooks.

Mr. Ray had Reason to believe, that it was the same Plant with the *Alfine aquatica major*, C. B. Pin. for the *Alfine palustris*, *Tabern.* does not seem to be different from the *Alfine major* of the same Author.

8. *Alfine maxima folanifolia*, Mentz. pug. Tab. 2.

This Plant is larger than the preceding; its Leaves are waved and notched upon the Edges. Mr. Ray believes it to be but a Variety.

M. Vaillant corrects our Author with regard to the Notches of the Leaves, and denies that any *Alfine* has notched Leaves.

9. *Alfine tenuifolia*, J. B. 3. 364. FINE-LEAVED CHICKWEED. On the Borders of *Triplew Heath* in *Cambridgeshire*.

This Plant intirely resembles that which *J. Bauhin* describes to grow about *Montpelier*; and I believe that *C. Bauhin* has described it under the Name of *Alfine nodosa Germanica*. Prodr. 116.

This has intire Petals: I have called it *Spergula tenuifolia elatior*. It flowers in May and June.

To. *Alfine verna glabra*, Bot. Monsp. desc. 14. *Alfine tetrapetalos, Caryophylloides, quibusdam Holosteum minimum*, Raii Hist. 1025. *Alfinella foliis Caryophylleis*, Cat. Giff. 47. THE LEAST STITCHWORT. It is common in barren, gravelly Places.

The Flower consists of four white, blunt-pointed Petals, two Lines long, and half a Line broad. The Centre of the Flower is occupied by an oval Pointal, encompassed by four Chives, with white Summits, and divided at Top in form of a Cross. The Empalement is tetraphyllous. The Fruit is cylindrical and transparent, having eight Indentations at the Top. It flowers in April and May. *Vaill.*

11. *Alfne minima flore fugaci*, Inft. 243. *Saxifraga Anglica Alfnefolia annua*, D. Plot. Raii Hift. 1026. Synopf. Ed. 3. 345. ANNUAL PEARLWORT.

The Flower of this is like that of the former; but the Petals of this are very soon loft, whereas thofe of the former commonly ftick about the Fruit till it is ripe. The Seed-velfel of this opens at Top into four or five Segments. It is laid to be found about Hedington and Cowley in Oxfordfhire.

12. *Alfne fpergulae facie minima, feminibus nudis*, Inft. 244. *Saxifraga paluftris Anglica*, Ger. Em. 567. *Arenaria*, J. B. 3. p. 2. 723. Vaill. 7. *Spergula minor, foliis Knawel, flore majusculo albo*, Dillen. Cat. Giff. 156. ENGLISH MARSH SAXIFRAGE. In boggy Places it flowers in July.

13. *Alfne saxatilis & multiflora, capillaceo folio*, Inft. 243. *Alfne polygonoides herbacea minor, Laricis foliis capillaceis, ex uno pediculo plurimis*, Pluk. Phytogr. Tab. 75. The Fruit of this Plant (according to Mr. Vaillant) opens into three Parts, from Top to Bottom. The Petals are entire.

14. *Alfne fegetalis, gramineis foliis, unum latus fpectantibus*, Vaill. 8.

The Petals are entire; the Seeds are very fmall and brown. It flowers in May and June. Ibid.

15. *Alfne fpergulae facie, minima, feminibus marginatis*, Inft. 244. *Alfne fpergulae facie, minima*, Bot. Monfp. 14. *Spergula annua, femine foliaceo nigro, circulo albo membranaceo cincto*, Mor. H. Ox. 2. 351.

Dr. Sherard found it in Ireland, in fandy Places.

16. *Alfne fpergula dicta major*, C. B. Pin. 251. *Spergula*, J. B. 3. 722. Dod. Pempt. 537. SPURREY. It is often found amongst Corn.

17. *Alfne fpergulae facie minor, five fpergula minor, fofculo fubcaeruleo*, C. B. Pin. 251. *Spergula purpurea*, J. B. 3. 722. PURPLE SPURREY. Common in fandy Places.

18. *Alfne folio gramineo anguftiore, paluftris*, Dillen. Cap. Giff. 173. *Caryophyllus holofteus arvensis medius*, Raii Synopf. Ed. 3. 347.

This is eafily diftinguifhed by its glaucous Colour. I have found it in great Plenty on the boggy Grounds about Gamlingay in Cambridgefhire.

19. *Alfne fegetalis, gramineo folio glabro, multiflora*. D. Sherard. Raii Supp. 500.

20. *Alfne Hyperici folio*, D. Vaillant, Inft. 242. *Alfne longifolia uliginofis proveniens locis*, J. B. 3. Lib. 19. 365. *Alfne aquatica media*, C. B. Pin. 251. *Alfne fontana*, Tabern. Ic. 712. LONG-LEAVED WATER CHICKWEED. In Boggs and watery Places.

It flowers in May, June, and July. Its Flower is but too Lines in Diameter. It has five white entire Petals, ending in a Point. They are placed immediately upon the Segments of the Empalement, which they cover; the Chives are ten in Number; the Pointal is furmounted by three Threads, difpofed in a Triangle. The *Alfne fontana*, Tabern. Ic. 712. refembles our Plant pretty well. Morifon (H. Ox. 2. 551.) fays, the Petals are bifid, but he is miftaken. Mr. Ray (Synopf. 348.) is likewife miftaken; for he affirms, that they are divided in two, to the very Bafe. J. Baubin fays, the Flower has ten white Petals. Vaill.

21. *Alfne Alpina fubhirfuta, Linariae folio*, Inft. 339. *Lychnoides Juniperi folio, perennis*. Vaill. 121.

22. *Alfne paluftris minima, fofculis albis, fructu Coriandri exiguo*, Ment. Pug. Tab. 7.

ALSINEFORMIS. A Plant thus diftinguifhed:

Alfneformis paludofa aricarpos, fofculis albis inapertis, Pluk. Phytog. Tab. 7. Fig. 5. *Alfne paluftris, Portulacae aquaticae fimilis*, Raii Hift. 1035. *Portulaca exigua five arvensis Camerario*, J. B. 3. 678. SMALL WATER CHICKWEED, OR PURSLANE, BY SOME CALLED BLINKS.

It flowers in the Spring, and is not uncommon in moift and boggy Places. Dr. Dillenius fays, the Flower is monopetalous. M. Vaillant affirms it to be pentapetalous. Martyn's Tournefort.

ALSIRACOSTUM, the Name of a Compound Medicine in Mefne, which he recommends much in Fevers attended with great Heat.

ALTAFOR, Camphire. Johnson.

ALTAMBUS. Rulandus explains this *Lapis rubeus*, that is, Human Blood.

ALTANUS, the South-West Wind. Rulandus.

ALTARIS, ALTARIT, or ALOZET, Quickfilver. Rulandus.

ALTERANTIA, Alteratives. Thus Medicines are called which induce a Change in the Blood and Juices for the better, without any manifelt Operation or Evacuation. Alteratives, therefore, muft generally be either fuch Remedies as deftroy fome prevailing Acrimony in the *Primæ Viæ*, or in the Juices; or elfe fuch as refolve Concretions in the Blood-velfels, and difpofe them, when thus refolved, to pafs out of the Body by Perfpiration, or fome of the leaft remarkable Evacuations.

Hoffman has given us a Differtation on Alteratives, which I fhall infer, as it feems worthy of Perufal.

Since almoft the whole Duty of a Phyfician confifts in feafonably adminiftring fuch Things as are proper to preferve or reftore Health, and are effectual to relieve the Sufferings of his Patient; and, at the fame time, in artfully avoiding, whatever may be unwholfome or prejudicial; it is plain, that nothing is fo neceffary to accomplifh thefe Purpofes, to a defirable Degree of Perfection, as a diftinct and accurate Knowledge of the Inftuments by which Health is preferved or reftored: Now this Knowledge fupposes not only an Acquaintance with their Efficacy and Virtues, but alfo with their Elements, and Manner of Operation; by which means a Phyfician may be enabled to judge, by folid Reafon, what are the Things, in all the *Materia Medica*, which are ferviceable or prejudicial, in this or that Diftemper, to this or that particular Perfon, at fuch or fuch a Seafon, with a due Regard to all other Circumftances. That he may rightly conduft himfelf in thefe Affairs, and be ready furnifhed with proper Means to anfwer all Emergencies; nothing feems fitter, and more conducive to the Purpofe, than an artful and compendious Diftribution of all the *Materia Medica*, under certain Heads, according to their Principles, their Way of Operation, and the Effects which, under fuch and fuch Conditions, they are qualified to produce.

There are, indeed, many Catalogues and Synopfes of Medicine, and fome of them compofed by learned Men; but, if it be allowed to fpeak the Truth, moft of them are huddled together in fuch a manner, as to be rather an Obftacle than Furtherance to folid and rational Pharmacy, and can fcarce be perufed, by Men of Skill and Experience in the Art, without Indignation. There you fhall meet with many neediefs, and almoft innumerable Claffes of Remedies; as I myfelf, not long fince, in a Medley of this kind, reckoned no lefs than fifty, which the Author diverfified, with refpect to the Parts affected, the Dif eafes for which they were proper, and their internal as well as external Effects. And thefe very Heads, or Claffes, are fo diffufe, and crowded with fuch a Variety of Medicines, of a different and manifeltly contrary Nature, that whoever fhall confide in them fo far as to depend upon them, without making a new and accurate Difftinction, in the Preparation of his Remedies, muft, of Neceffity, fall into great Confufion and Miftakes.

Wherefore it is my Opinion, that Medicines may be difpofed under their general Heads in a far more proper and compendious Way; if we confider, that whatever is fubfervient to the Ends of Medicine, is directed in its manner of acting towards the Removal of the Caufes of Dif eafes. But in every Dif eafe there is a Depravation, either in the Motion, or in the Matter which is moved, or even difpofes to move: And fince Motion is exceffive or defective, either in the whole Body, or fome Part of it; and Matter is in the Fault, either upon account of its Quantity or Quality; all Remedies muft, in general, be concerned in the Regulation of depraved Matter or Motion. To Matter vitiated in Quality, we appropriate Alteratives; to Matter offending in Quantity, Evacuants; if, on the other hand, the Motion is defective or impaired, or if the Parts have loft their proper Tone, reftorative and corroborative Medicines are to be ufed; and if the Motion is too intense and accelerated, or the Parts racked with Spafms, then, and in that Cafe, fedative and compofing Medicines are, of all others, moft efficaciously adminiftered.

There are the four general Claffes of Medicines, to which all the Stores, with which bountiful and indulgent Nature has enriched the Art of Phyfic, may be reduced; for, by this means, and by the Affiftance of thefe Helps, all the feveral Intentions of the medicinal Art may be exactly and effectually answered; fo that Hippocrates has given a Definition of Phyfic, which is, at once, beautiful and truly mechanical, when he fays, That it is no more than an Addition and Subtraction feafonably made; a Subtraction of thofe Things which exceed, and an Addition of thofe Things which are defective: He who beft can do thefe two Things, is defervedly efteemed the beft Phyfician; and the lefs a Man is qualified for carrying on thefe two Defigns, the more ignorant he is of the true and genuine Principles of Phyfic. De Flatibus, Lib. 3.

Then as to what relates to the Influence and Operation of Medicines, they act directly and immediately either upon the fluid or the folid Parts of the Body; fo that alterative and evacuating Medicines are appropriated to the Fluids, and thofe of a corroborative and compofing Quality to the Solids. But as liquid as well as folid Bodies, are of different Qualities, fo they produce their refpective Effects in different Ways; for fome Medicines, by their immediate Action, affect that moft fubtile and eafily moveable Fluid which is lodged in the Brain and Nerves, and is the chief Inftument of Motion and Senfation, either by augmenting its Quantity, or accelerating its Motion; fuch as analeptic, cordial, and fweet-fcented Medicines; or by quelling and becalming its more violent Motions; fuch as antihyfteric and anodyne Medicines, Opiates, and Foetids; which, even when exhibited in very inconfiderable Dofes, produce very fudden, and almoft inftantaneous Effects. Other Medicines operate

operate immediately upon the Blood and Juices themselves; such as those of the diluting, incrassating, and attenuating Kind; and also, such as are endowed with an absorbent Quality, or are calculated for subduing any corrosive or sulphureous Acrimony.

Those Medicines which induce a Change upon the Solids, produce their immediate Effects upon the more nervous Parts; such as the Stomach and Intestines, which are endowed with a most exquisite Sensation. To this Class belong all the medicinal Preparations of Minerals, which produce their Effects when given in small Doses, resolve themselves into Particles of an incredibly small Size, without losing their Texture and Virtues, enter the minutest Recesses of the nervous Parts, and are with some Difficulty washed away: Such as, among Emetics, Emetic Tartar; among salivating Medicines, White Precipitate; among Sulphurs, the Sulphur of Antimony, prepared in my Method, to which volatile Salts may be added: Other Substances strongly stimulate the nervous Parts, by that subtle caustic Salt with which they abound; such as, among Poisons, Arsenic; among Purgatives, White and Black Hellebore, Gamboge, Resin of Jalap, and some more of the same Kind, together with all Insects, especially Cantharides. 'Tis nevertheless to be observed, that of Medicines of this Kind, some affect particular nervous Parts more than others; for Instance, Mercurial Preparations affect the Glands, the Lymphatic Ducts, and the Jaws themselves; Emetick Preparations of Antimony affect the Biliary Ducts; Preparations of Colocynth, the nervous Coats of the Intestines; Hellebore, the Oesophagus, Larynx, and Aspera Arteria; Cantharides, and other Insects, the nervous, urinary, and seminal Ducts; and, in fine, oily volatile Salts and Sudorifics, prepared of the volatile Salts of Animals, affect the Coats of the Arterial Vessels. Some others of those Medicines, that are appropriated to the Solids, insinuate their Virtues more effectually into the muscular and fibrous, than into the nervous and membranous Parts; among the Number of which are all those Corroboratives, which either abound with a sulphureous, or with a mild astringent, fixed, and earthy Principle.

The whole Body of Medicines in general, is, with Reason, distinguished in this Manner; and in this Manner are we to form our Ideas of their respective Methods of acting, and Manner of operating. I now come to treat of each Class in particular: But as the Art of Physic, in order to become rational, must be built upon most evident Causes, all obscure ones being rejected; as *Celsus* says, not only by the Physician, but also from the Art of Physic itself; so that particular Branch of Physic which displays the Virtues of Medicines, and accounts for their Methods of Operation, is, in my Opinion, to be drawn not from obscure and too remote Causes, nor from the atomical and geometrical Principles of the Magnitude and Figure of the Parts, which are in reality incomprehensible; but from Causes that are evident, immediate, comprehensible, subjected to our Senses, and made known by Experience. This Method I shall at present follow; and in my Explication of the Virtues and Powers of Medicines, proceed in a Method that is plain, simple, and easy to be conceived; but, forbearing to enumerate all the several Species belonging to each Class, I shall only touch upon the select ones, such as by their Worth have highly recommended themselves to Mankind, and, as clearly as I can, explain their Uses, and Methods of operating. I shall begin with Alteratives, which make up the first Class of Medicines, and are principally employed in correcting Matter that is faulty in point of Quality: But because the Matter to be corrected in Diseases may be faulty in different respects, so 'tis plain, that there must be various Species of Alteratives, adapted to the various Defects of the offending Matter. For Instance: If the Juices of a human Body, which, in their natural State, are benign, mild, and balsamic, should either acquire a salino-acid, and corrosive Quality, or assume a hot, subtle, sulphureous Intemperies, or become thick, viscid, and tenacious, or over-acid and corrosive; I say, in such an Instance, Alteratives of four different Kinds ought to be administered: That is, Absorbents for imbibing and blunting the Acid; tempering Medicines for checking and mitigating the Rage of the bilious Intemperies; penetrating Medicines for dissolving and attenuating the thick and viscid Juices; and, in fine, Demulcents for sheathing and mitigating the burning and corrosive Acrimony.

In the first Kind of Alteratives are included Absorbents; the principal of which are of Sea Substances, as the Mother of Pearl, Cockle-shells, Oyster-shells of all the several Species, Coral, red and white, and the Bones of the Cuttle-fish: Of Animals, the Bones and Horns, whether subjected to boiling, and softened by Evaporation, (which in Pharmacy is styled Philosophically prepared) or burnt in an open Fire, their Teeth and Claws, the Shells of Eggs, the Claws and Eyes of Crabs, the Jaws of Fishes, the animal and fossile Unicorn: Of subterraneous Substances, the *Lapis Specularis*, (or Selenite) Chalk, prepared Crystal, Osteocolla, (or the Bonebinder) all Stones calcined and burned, and various Kinds of Boles, Clays, and sealed Earths: Of Metals, the Filings of Steel: Of Chymical

Preparations, all Salts prepared by Incineration, *Cineres clavellati*, (or Pot-ash) Salt of Tartar, fixed Nitre, urinous Spirit of Sal Ammoniac, volatile Sal Ammoniac, the Magnesia alba, Tincture of Salt of Tartar, and of Antimony.

'Tis the Nature and Property of all these Absorbents, that they speedily incorporate with any Acid that falls in their Way, imbibe it, blunt and destroy its corrosive Quality, and are, along with it, changed into a third neutral and inoffensive Body. This Effect is plain, from the Example of our extremely corrosive Spiritus Nitri fumans; from Oil of Vitriol, Sublimated Mercury, Aqua-regia, Aqua-fortis, and other highly caustic Liquors; which, by the Addition of Filings of Iron, the Mixture of an alkaline Salt, or an earthy absorbent Substance, lose the Whole of their acid and corroding Qualities. But although all saline and earthy Alkalies agree in this, that they subdue any Acid, and change it into a third Substance, yet there is this Difference between them, that alkaline or lixivious Salts are quickly and totally dissolved in the Body, not only by any Acid, but likewise by any aqueous Fluid; whereas earthy Substances are not, without Difficulty, entirely dissolved, as is plain in Corals, Filings of Steel, and Quick Lime, which are never thoroughly dissolved by an Acid, especially of the vegetable Kind, but always remain a kind of fixed earthy Substances: And, which is still more, alkaline Salts, besides their absorbent Quality, do, after they have, in a manner, embraced the Acid, acquire a new and additional medicinal Virtue, which is, that of attenuating and colliquating the viscid, slimy, and tenacious Juices: They are likewise gently stimulating, and either open the Belly, or promote a Discharge by Urine, or even by Perspiration; and are, besides, attended with this Advantage, that they quickly pass through the excretory Ducts. But many other alkaline Substances, instead of being calculated to quicken and forward the Secretions, rather prove astringent by their Effects, which is usually the Case with Filings of Steel, Corals, Boles, and sealed Earths.

1. Since then, as earthy Alkalies are not dissolved but by an Acid, we ought to be cautious in exhibiting them in Disorders where the first Organs of Digestion, the Scene where Absorbents produce their principal Effects, are loaded with any Collection of crude and viscid Juices, lest they should adhere to them undissolved, and so oppress the Stomach, destroy the Appetite and Digestion, and render the Belly more costive, as has sometimes happened in Fevers of the burning, bilious, and hectic Kind, which were attended with a Decay of the Peristaltic Motion, and of the constrictory or retentive Force of the Stomach.

2. On the other hand, because these Absorbents so readily destroy and consume the Acids, and because Acidity is what principally infringes and interferes with the Efficacy of Cathartics and Emetics, they are very usefully, where there is any just Suspicion of the Redundance of an Acid, prescribed before Vomiting and Purgings, by way of Digestive.

3. Tho' all earthy Substances absorb and blunt an Acid, yet upon account of their different Natures and Textures, it sometimes happens that they produce very different Effects, and such as are often contrary to the Intention of the Prescriber; 'tis therefore necessary we should be very cautious in our Choice of such as we design to use: When, for Instance, a Physician desires, besides an absorbent Quality, a corroborative and astringent Virtue, marine Substances are chiefly proper for answering his Intention, such as Coral, Oyster-shells, the Shells of Eggs, and the various Species of Earths, or *Marls*, especially such as are generally called *sealed*. If he desires a gentler Astringent, Mother of Pearl, and Shells, best answer his Intention; and if a Flux of the Seminal Matter is to be restrained, the Bones of the Cuttle-fish are peculiarly proper for that Purpose. When, by Absorbents, a laxative Effect is, at the same time, to be produced: The Magnesia alba, duly prepared of a Lixivium of Nitre, and which is nothing else but a fine Flower of Quicklime, is to be administered, which, being entirely dissolved by an Acid, is changed into a bitter Salt of a middle Nature, which occasions a speedy Discharge of the Fæces; for this Reason 'tis of singular Efficacy in hypochondriacal Cases; and when the first Organs of Digestion abound with acid Juices, or when the Belly is costive, when the Effects of diuretic Medicines are to be produced by Absorbents, the Claws and Eyes of Crabs, Shells, or Coral, calcined, and *Osteocolla*, (or *Bonebinder*) are in that Case most efficacious. For procuring a free and plentiful Perspiration in any Disease, the Bones of Animals burned, and philosophically prepared, are, of all other Medicines, the best calculated and most effectual: And, in fine, for resolving the stagnated and condensed Humours, and the Blood itself, when coagulated, nothing is more proper than our common domestic Medicine, which consists of the Eyes of Crabs dissolved in Vinegar, and drunk.

4. Tho' absorbent Medicines are very simple, and, generally speaking, very easily prepared, yet their Virtues and Efficacies are almost superior to those of all others; nor can they be sufficiently commended; for none of all the Tribe of Alteratives are endowed with such a Power of speedily subduing the bad Qualities

ities of noxious Juices; nor are any of them so safe and innocent as Absorbents, where not used to Excess. Add to this, that the Body is very subject to be affected by an Acid, especially in those whose Bile is deficient; such as Women and old Men, those who lead a sedentary Life, or drink freely of Liquors abounding with an Acid; and in many Disorders, especially those of the melancholic and hypochondriacal Kind, the Quantity of Acid in the Body is scarce credible: But Acids, by their coagulating Quality, are hurtful to the human Constitution, obstruct the Circulation of the vital Juices, and lay too sure a Foundation for very terrible Disorders, especially of the chronical Kind. 'Tis therefore evident, that Absorbents are endowed with singular Virtues, and accommodated to a great Number of Diseases; but they were very sparingly used by the Antients, and only brought into Credit by *Helmont* and *Takenius*, and their two Followers in *Holland*, *Sylvius* and *Bonle-koe*, who assigned an Acid as the Cause of many Diseases, and prescribed Absorbents for their Cure.

The second Class of Alteratives comprehends those Medicines which are of a lenient and temperating Quality, such as check the hot intestine Motion of the sulphureous Particles of the Blood, and qualify, subdue, and cool the scorching, hot, and bilious Humours in the Intestines themselves. Of Vegetables, the Principal of this Kind are, the Root and Herb of Sorrel, Wood-sorrel, Citrons, Oranges, *China* Oranges, Pomgranates, Strawberries, Barberries, Raspberries; Cherries, and the Juices of them prepared; and likewise Syrups, and Water distilled from these; add to these the four great cold Seeds, and Decoctions of Oats. Of Animals, Whey, Butter-milk, the Juice of Craw-fish, a Decoction of Tortoises, thin Decoctions of the Shavings of Hartshorn, and Vipers-grafts, with or without Barley, Jellies of Hartshorn, and Water distilled from the Shavings of Hartshorn. Of the mineral Tribe, well-purified Nitre is the best and most efficacious, and becomes still better, if restored from Aqua-fortis to its former State, by the Addition of Salt of Tartar. Of chymical Preparations, the essential Salt of Wood-sorrel, Cream of Tartar, Phlegm of Vitriol, sulphurated Quintessence of Antimony, (*Clyffus Antimonij sulphuratus*) Tinctures of Roses, Daisy Flowers, and Violets, philosophically prepared, with Spirit of Vitriol, are good temperating Medicines.

Temperating Medicines act in three several Manners; for they either, by their acid Salts, bind up the volatile sulphureous Particles, and; by fixing and coagulating them, lessen in some measure their intestine and gyratory Motions; or they operate by an expansive and aërio-elastic Quality, such as that which is inherent to Nitre; which, consisting of an acid and alkaline Salt, contains great Store of sulphureous Particles; and also of a subtile aërio-æthereal Fluid, by means of which it dispels the hot Matter, whilst in a gyratory Motion, and forces it, as it were, from the Centre to the Circumference; by its neutral Salt attenuates, dissolves, and separates the viscid Matter, which is the Matrix of Heat and Sulphur, and, at the same time, by its subtile Acid retards the accelerated Motion of the sulphureous Parts: Or, in the last Place, they restore the Moisture consumed by the Heat, by their diluting and dissolving the sulphureous Parts, and, at the same time, lessen the too great Elasticity of the Vessels, upon which the Heat, in a great measure, depends; as is observable in the Use of watery Liquors, Whey, Decoctions of Hartshorn, and of Oats.

1. These temperating and qualifying Medicines are of great Use in Phytic, where-ever a preternatural Heat is to be extinguished; and therefore cannot be wanted in Fevers of all kinds, Inflammations, Spasms, and grievous Pains, which are almost always occasioned by too great, or too hot, a Commotion of the Blood: But nitrous Preparations are deservedly to be preferred to Acids, which fix and coagulate; for Nitre is not only cooling, but antispasmodic, and relaxes the Rigidity of the Parts; it, in like manner, promotes the Discharges by Urine and Stool. Besides, as other cooling and acid Fluids condense and coagulate, and as Nitre rather colligates, rarifies, and attenuates thick and viscid Humours, so when sprinkled either in Powder, or dissolved in Water, upon black coagulated Blood, it renders it more florid: For this Reason, Nitre is not only preferable to Acids in Inflammations, and even in inflammatory Fevers, which arise from a black, coagulated, and pent-up Blood, but is likewise a noble and efficacious Preservative against Inflammations; because it effectually fuses and dissolves the viscid Serum, which is to be observed in the Blood of those who are subject to Inflammations.

2. In chronical Fevers, such as those of the slow and hectic Kind, which, for the most part, owe their Origin to a Defect or Putrefaction in some of the Viscera; and when a Cough, or spitting of Blood, is joined with them, or when the Lungs themselves are faulty, not Acids, but nitrous and diluting Remedies, especially such as are taken from the Animal Kingdom, are to be used; such as Whey, the Water, the Decoction, and the Jelly of Hartshorn. When also a feverish Heat accompanies Diarrhoeas, Dysenteries, or a Cholera-Morbus, cooling Acids are to be abstained from, and diluting, gelatinous, and mucilaginous Me-

dicines, and temperating and absorbing Powders, with the Addition of a Grain or two of Nitre, are to be used.

In the third Class of Alteratives, are comprehended inciding and attenuating Medicines; among which may be reckoned the Roots of White Burnet, Dragons, Sweet Flag, Asarabacca, Wild Radish, Elecampane, Succory, Florentine Iris, Solomon's Seal, Swallow Wort; the Herbs, Leopard's Bane, Brook-lime, Scurvy-grass, Water Cresses, and *Indian* Cresses, Dittander, Rosa Solis, Fumitory, Buck-bean, the lesser Centaury, Hyssop, Germander, Chervil, Carduus Benedictus, lesser House-leek, the several Species of Garlick, Leeks and Onions, Guajacum Wood, and its Bark; the Spices Pepper and Ginger; the Seeds of Mustard, Scurvy-grass, and Water Cresses; the Gums Ammoniacum, Galbanum, Sagapenum, Opopanax, Myrrh, Benjamin; of chymical Preparations, Mercurius dulcis, Æthiops Mineral, Flowers of Sulphur, fixed alkaline Salts of Vegetables reduced to Ashes, especially Salt of Tartar, and of Wormwood; also neutral Salts, as the Digestive of *Sylvius*, my opening Salt, Sal Ammoniac, Sal Polychrestum, Epson Salt, Sedlitz Salt, vitriolated Tartar, Terra foliata Tartari, called also Tartarus Regeneratus, Arcanum Duplicatum, a Solution of Crabs Eyes, Nitre; and Sal Ammoniac. Volatiles, as volatile Sal Ammoniac, urinous Spirit of Sal Ammoniac, and Oxy-mel of Squills, acrid Tincture of Antimony, Essence of Gum Ammoniac and of *Indian* Pepper, Resin of Guajacum, Syrup of Tobacco, of Hedge-mustard, Fæcula of Arum, &c. Medicinal Waters also, which, besides their diluting and opening Virtue, are possessed of an attenuating and inciding Quality, such as the Waters of *Egra*, *Sedlitz*, and the *Caroline* Baths. As also, Infusions in Form of Tea, which, by their great Store of an aqueous Element, exert their Virtues, disjoin the coalescent Globules; and, lastly, sweet Whey, which, on account of the sweet and subtile Salt it contains, is deterfive, and opens the excretory Ducts.

Of these some act upon the fluid; and others upon the solid Parts of the Body: Those which affect the Fluids by immediate Contact, are very few in Number, and those either consist of aqueous Diluters; which are very efficacious for fusing the glutinous and viscid Juices, or of alkaline, fixed, and volatile Salts, and nitrous Salts; which, when mixed, especially in a liquid Form, with thick and coagulated Blood and Humours, liquify and attenuate them in such a manner, as even to be perceptible to the Eye. All the rest operate upon the Solids, by augmenting their Tone, their Strength, and contractile Force, and by adding to the elastic Powers of the Vessels, by which means they strongly press and agitate the contained Juices, accelerate their progressive and intestine Motions; and, forcibly and frequently propelling them through the Capillary Vessels, divide and disjoin the viscid Juices into small Globules, upon which Fluidity depends. This Action upon the Solids is, in some Medicines, performed by a fixed acrid Salt; as the Roots of Arum, White Burnet, Asarabacca, Florentine Iris, Solomon's Seal; the Herbs, German Leopard's-bane, Dittander; Rosa Solis, and Pepper and Ginger, which are, indeed, of an acrid Smell; but being distilled with Water, by an Alembic, neither yield a volatile acrid Oil; nor a Water of an acrid Taste; which is a sufficient Proof, that they are of a fixed Nature. Other Medicines, again, produce their Effects by an acrid, subtile and volatile Salt; such as Wild Radish, Elecampane, Water Cresses, Scurvy-grass, Mustard, and all Kinds of Onions, Garlicks, and Leeks. Some act by their stimulating neutral Salts, of which Kind are those Salts whose Acrimony, and irritating Quality, are not only discoverable by their Taste, but by their Effects; for which Reason, when exhibited in large Doses, they open the Belly, and prove diuretic. Others produce their Effects by an acrid Salt, which contains many sulphureous Particles, as is obvious in Gum Ammoniac, Sagapenum, Opopanax, Guajacum, and its Resin, which, besides their acrid Salt, contain an Oil, which, upon Distillation, they yield in Abundance. Lastly, some Medicines perform their Work by a penetrating, subtile, and metallic Salt, as Mercury, especially Mercurius Dulcis, and Æthiops Mineral.

1. The Virtues of attenuating and inciding Medicines are so extensive, that, on account of the great Variety of their Effects, they are usually ranged under different Denominations; for when tenacious viscid Humours not only stagnate in the Cavities of the Vessels, but stuff up and obstruct the small Tubes of the Intestines and Emunctories, these Medicines, by their inciding and attenuating Quality, disengage the impacted Humours, remove the Obstructions; and may, for that Reason, be called Aperients, since they produce the same Effect. They also deserve the Name of Anti-scorbutics; and Purifiers of the Blood; for since the Purity, and good State, of the animal Juices depends upon the due Secretion and Excretion of superfluous and recrementitious Matter, and since Secretion and Excretion cannot be carried on, if the small Canals of the Glands and Emunctories are blocked up by viscid and tenacious Humours, 'tis therefore plain, that those Medicines that are endowed with a Power of inciding viscid Juices, and removing Obstructions, must not only be Purifiers of the Blood, but also

Preservatives against the Scurvy, in which the Juices are of a bad Quality, and loaded with various heterogeneous, viscid, salt, sulphureous, and sharp Particles. Since attenuating Medicines produce so different Effects, the Physician ought to know what particular Attenuants are best adapted to particular given Cases.

2. In Disorders therefore of the Stomach, and first Organs of Digestion, for inciding and attenuating viscid Crudities, the following Medicines are excellently calculated. The Root of Arum, of White Burnet, and of Calamus Aromaticus, Pepper, Ginger, purified Sal Ammoniac, vitriolated Tartar, Arcanum Duplicatum, the digestive Salt of *Sylvius*, my aperitive Salt, Salt of Wormwood, Spirit of Salt, simple or dulcified, and *Moebius's* aperitive Tincture; and if crude and ill-concocted Juices are to be evacuated by way of Excrement, the neutral Salts are preferable, especially the Sedlitz, the Polychrest, and the Epform Salts, taken in large Doses, and drank in a sufficient Quantity of some aqueous Vehicle.

3. In Disorders of the Breast, when viscid Humours are to be attenuated, and thrown up by spitting, the most effectual are the Roots of Elecampene, and of the Florentine Iris, Rosa Solis, Hyssop, Germanander, Maiden-hair, Gum Ammoniac, Myrrh, Benjamin, Sulphur, Balsam of Peru, Nitrum Antimoniatum, Terra foliata Tartari, Oxymel of Squills, Solution of Crabs Eyes in distilled Vinegar, Syrup of Tobacco, and that of Hedge-mustard.

4. When the Blood is tainted with any thick tenacious Impurity, and by that means the Emunctories are clogged, and the Humours polluted and vitiated by a salt, sulphureous, and scorbutic Dyscrasy, the Medicines chiefly in Use, in that Case, are, the Wild Radish Root, Garden Scurvy-grass, Water Cresses, *Indian* Cresses, Dittander, Brook-lime, the lesser Centaury, Marsh Trefoil, Carduus Benedictus, Fumitory, the smaller House-leek, Mustard, Gum Ammoniac, Sagapenum, Myrrh, Oil of fixed Nitre, Oil of Tartar per Deliquium, a Solution of Nitre, my Elixir temperatum, Tincture of Antimony, the Essence of the Woods, Spirit of Sal Ammoniac, Salt of Wormwood, with Citron Juice; and of medicinal Waters, those of Sedlitz and of *Egra*.

5. When grumous Blood, occasioned by Contusions, Blows, or Suffusions, is to be dissolved and fused, the Medicines most to be commended, in this Case, are Solomon's Seal, German Leopard's-bane, Chervil, Vinegar distilled with Crabs Eyes, Terra foliata Tartari, and antimoniated Nitre.

6. In Diseases where the Lymph is become thick, especially from a Venereal Taint, the principal, and most efficacious, are Guajacum, Sopewort, acrid Tincture of Antimony, Mercurius dulcis, and *Aethiops* Mineral, which, if prudently used, is of uncommon Efficacy for colliquating and resolving the viscid Humours lodged in the Glands and Liver.

I come now to the fourth and last Class of Alteratives, which comprehends the emollient and softening Medicines, of which the chief are, the Roots of Marsh Mallow, of White Lilies, of Liquorice, and of Vipers Grass, the five emollient Herbs; Lettice, Bear's Breech, Pellitory of the Wall, the Flowers of Elder, of Melilot, of Mallows, of Mullein, of Yarrow, of Chamomile, of White Lilies, of Borrag, of the Wild Poppy, of the Lime Tree, of the *Egyptian* Thorn, of Violets, and, most of all, Saffron; the Seeds of Flax, (Linseed) of Fennugreek, of Anise, of Quinces, of Flea-bane, of White Poppies, the four greater and lesser cold Seeds, the Siliqua, Sweet Almonds, Figs, Pine Nuts, Pistaches, Cherry-tree Gum, Gum Arabic, Gum Tragacanth, Shavings and Jelly of Hartshorn, Human Grease, that of a Dog, of a Capon, the Marrows of their Bones, the Fat about their Omentum, Bones, and Mesentery; the native Oils of Animals, fresh Butter, Cream, Milk itself, Crystals of Milk, Sperma Ceti, Honey, the Yolk of an Egg, and its White dried, and reduced to a Powder: Of prepared Medicines, Oil of Sweet Almonds, Linseed Oil, Rape Oil, Oil of the Male Balsam Apple, Decoctions of Hartshorn, and Vipers Grass, mixed with the Juice of Citrons, the Pissan, Sweet Whey, *Fernelius's* Syrup of Marsh Mallows, Ointment of Marsh Mallows, simple Diachylon Plaster, that of Melilot, and that of Frog's Spawn.

The Virtues of these Medicines are two-fold, the one appropriated to the Solids, the other to the Fluids. In the Solids they relax, soften, and render moveable the hard, stiff and tense Fibres; and, at the same time, enlarge and dilate the Channels of the small constricted Vessels. But in the Fluids, they, by their viscid Mucilage, bind up, involve, and, as it were, inclose in a Sheath, the piercing Points of the sharp corroding Salts, and by that means prove excellent lenitive Medicines; and, when externally applied, they convert into a laudable Pus any Collection of extravasated Humours, which cannot be resolved, or taken into the refluxing Mass by the lymphatic Vessels; so that having, by their moderate Warmth, dissipated the most subtle Part of the extravasated Humour, the remaining viscous Matter is happily disposed to mature; the Pores being now gently blocked up, lest too much Moisture should be exhaled, and the

nutritious Juice, of which Pus chiefly consists, being excited to flow more plentifully through the small relaxed Tubes.

1. These lenitive Medicines are of incredible Efficacy, if any one has had the Misfortune to take a caustic Poison; and scarce can more powerful Antidotes than these be used for checking and subduing the Virulence of animal and vegetable Poisons, especially if abundance of Milk and oily Liquors are used as their Vehicles; because these not only sheath up and blunt the sharp Points of the Poison, but also relax the Membranes, contracted and rendered subject to Spasms by the violent Shocks of the Poison; and, by these means, they always promote the Evacuation of Poisons either by Vomit, or by Stool.

2. In long and violent Distempers, especially such as arise from an Acrimony of the Humours, and which prey upon the Nerves, Infusions and Decoctions of these emollient Medicines are of singular Advantage; at least, I have often known Convulsions, attended with Madness, scorbutic Contractions of the Joints, and intolerable Gripes of the Belly, cured with Decoctions of Piony Root, Marsh-mallows, Mallows, Pellitory of the Wall, Bear's Breech, Flowers of Mullein, of White Lilies, of Elder, of Borage, of Chamomile, and Wild Poppy, and by Figs and Fennel Seed, prepared with Water or Whey; but they are to be used in large Quantities, and for a long Time, with the Addition, now-and-then, of a Spoonful or two of Oil of Sweet Almonds, sometimes bathing in fresh Water mixed with Milk.

3. Fresh Fat and Grease of Animals, especially the Marrow of the Bones, which abounds with a very subtle Oil, are used internally with Success, in a sharp scorbutic Disposition of the Humours.

4. In a Dryness of the Parts, and when the Joints can scarce move without making a Noise, and in arthritic Pains, these emollient Medicines (that is, the Root of Viper's Grass, Elder Flowers, Yarrow, Chamomile, the four greater cold Seeds, but especially sweet Whey, as yet full of the fat little Particles of the Cream, or even fat Substances, reduced to the Texture of Sope, with some Alkali) produce wonderful Effects; but these fat Substances are to be used when the Stomach is empty, and not in large, but in frequent Doses, drinking some suitable warm Draught after them.

5. In Exulcerations of the Kidneys, and Discharges of bloody Urine, which sometimes happen in the Small-pox, on account of the Acrimony of the Humours, Cherry-tree Gum, or even Tragacanth, or the dried White of an Egg, dissolved in Whey, are of singular Use: But in Disorders of the Breast, for blunting the Acrimony, which is the Cause of the Cough, and disposing the Matter for Expectoration, the following Medicines are excellently calculated; Decoction of Oats, Sperma Ceti, Liquorice, Oil of Sweet Almonds, the Siliqua, Saccharum Lactis, Saffron, Figs, Syrup of Violets, and Flowers of Poppy and Elder.

6. In continual hectic Heats, and if the sweet Juices, by a continued slow Fever, acquire a saltish alkaline Acrimony, Cream and new Butter, on account of their demulcent Qualities, are found to produce excellent Effects.

7. In a Cholera-Morbus also, and in a Dysentery, a Scurvy, a scorbutic Decay, a Consumption, and, in general, where-ever the Acrimony of the Humours gives Rise to the Disease, gelatinous Decoctions of Flesh, of Bones, and especially of Hartshorn, Calves Feet, and Sheeps Feet, are of singular Efficacy and Advantage, as well used internally by way of Drink, as injected by way of Clyster.

8. When the Intestines are violently contracted, and the Excrements pent up by Flatulencies, emollient demulcent Medicines, such as Oil of Sweet Almonds, Whey, Decoction of Oats and Hartshorn, produce very great Effects; but should rather be injected by way of Clyster, than taken by the Mouth.

9. Emollient Flowers and Herbs, if boiled with a small Quantity of Saffron, inclosed in a Bladder, and externally applied over the internal Part affected, procure almost incredible Ease and Relief, as may be experienced in a Pleurisy, an Inflammation of the Liver, a Colic, or when the Anus suffers by the blind Hæmorrhoids.

10. When any extravasated and impacted Humour is to be converted into Pus, no Applications can be more properly used than Liniments and Cataplasms, made of emollient Fats, and Milk; but especially of the Flowers and Leaves of White Lilies, Saffron, Figs, roasted Onions, Bean-meal, Yolks of Eggs, and Honey: But these are not to be used when the Matter is contained in harden'd and scirrhus Parts, where it cannot be converted into Pus, unless we incline to bring on a fatal Putrefaction.

11. Mucilages made of the Seeds of Quinces, and Flea-bane, with Rose Water, or Frog's Spawn Water, often afford immediate Relief in excoriated and exulcerated Parts, attended with Heat and Pain; such as the ulcerated Aphthæ in the Mouth, blind and painful Hæmorrhoids, a Tenesmus, Dysenteries, Gonorrhœas, or a corroding Fluor Albus.

ALTERCUM,

ALTERCUM, or **ALTERCANGENON**. The same with **HYOSCYAMUS**, which see.

ALTEY PLUMBI, or **ALKY PLUMBI**, (*materia dulcis ex Plumbo*) a sweet Preparation from Lead. Perhaps *Saccharum Saturni*. *Rulandus* and *Johnson*.

ALTHÆA. A Plant much used as an Emollient. It is thus distinguished.

Althæa, *Bismalva*, *Ibiscus*, Offic. *Althæa Dioscoridis*, Breyn. Prod. 2. 12. *Althæa Dioscoridis* & *Plinii*, C. B. Pin. 315. Dill. Cat. Gift. 144. Tourn. Inst. 97. Elem. Bot. 82. Boerh. Ind. Rupp. Flor. Jen. 12. **MARSH-MALLOW**. Dale.

The Roots of Marsh-mallows are pretty large, thick, woody and tough, and much branched, of a yellowish Colour on the Out-side, and whitish within, slimy and mucilaginous. The Stalks grow to be above a Yard high, soft and downy; the Leaves are covered with a soft Pile like Velvet, of a yellowish-green Colour, more angular, longer, and sharper pointed than the common Mallows. The Flowers are also like the common in Shape, but less, of a paler red Colour, and without the deeper coloured Veins; and when they are fallen, come the like Seeds, set together in a Round, like Cheeses. It grows in salt Marshes, and maritime Places, flowering in July.

The Root and Leaves, and sometimes the Seed, are used.

They are mollifying, digesting, and souping, of great Use in the Strangury, Gravel, and Stone; in Heat and Acrimony of Urine; against sharp, corroding Humours in the Stomach and Guts, which sometimes excoriate them, and cause Dysenteries.

They are likewise balsamic and pectoral, good to help a Cough, Hoarseness, and Soreness of the *Aspera Arteria*. They are frequently ordered in Clysters for the Stone, and in Cataplasms and Fomentations against Swellings and Inflammations, and to ease Pain; as also to suppurate and ripen Tumours and Imposthumes.

Official Preparations, which take their Name from Marsh-mallows, are, *Syrupus de Althæa*; *Pulvis de Althæa*; and, *Unguentum de Althæa*. Miller. Bot. Off.

Lemery adds, it is lenient and aperitive, proper for the Diseases of the Kidneys, for the acrimonious Humours which affect the Breast, and for the Nephritic Colic. *Lemery de Drogues*.

It is found with Leaves more or less pointed; they appear a little too much so in the Figures of *Dodonæus*, *Clusius*, and *Lobel*. *Matthioli*, *Fuchs*, and *Tabernaemontanus*, have engraved it with rounder Leaves; and it is, in all Appearance, this last Species which the learned Mr. *Sutherland*, Professor of Botany at *Edinburgh*, has named *Althæa folio rotundiori, five minus acuminata*. The Leaves of the Marsh-mallow are sometimes, indeed, more or less singular. *M. Herman* has called that with the angular Leaves *Malva sylvestris, aut palustris, aut Ibiscus folio angulosiori*. *Cordus*, *J. Bauhin*, *Morison*, and Mr. *Ray*, have taken the Flower of this Plant to be pentapetalous, whereas it is really monopetalous.

The Leaves of the Marsh-mallow are glutinous and insipid, and give no Tincture of red to the blue Paper. Its Roots have the same Taste, but they stain it a little.

Its glutinous Juice, which appears to be a Mixture of a great deal of Phlegm, a considerable Quantity of Earth, Acid, and Sulphur, so clogs the acrid Salt, that it cannot discover itself but by the Fire; for it is certain, that by a chymical Analysis, we obtain from the Marsh-mallow a concrete, volatile, and a fixed lixivial Salt. The Acid is a little more disentangled in the Roots, because they give a faint red Colour to the blue Paper: Nevertheless, in all Probability, this Plant operates chiefly by its glutinous Juice, which the Fire entirely destroys. By the Consent of all Authors, it is very lenitive and emollient. By its Mucilage it not only blunts the Points of the corrosive Salts, but, by relaxing the too much distended Fibres, restores them to their natural Tone, and consequently causes the Pain to cease. The Root of the Marsh-mallow is employed in lenitive Ptisans; but it must not be mixed till towards the End, for fear of making it too clammy. These Ptisans are of great Use in a violent Cough, when the Spittle is acrid and saltish. In four Quarts of Water boil four Ounces of the Root of *Nymphæa*, and one Ounce of the Root of Marsh-mallow; strain this Liquor through a Linen Cloth, dissolve in it two Drams of Nitre, Crystal Mineral, or Sal Prunellæ; give a good Draught of it in a nephritic Colic, in a Heat and Retention of Urine, attended with a great Inflammation: But when the Inflammation is over, the Marsh-mallows must be omitted, for fear of rendering the Humours too viscid. Boil also three Pugils of Pellitory, and one Ounce of the Roots of Marsh-mallow, in three

Quarts of Water, and strain the Decoction; afterwards add as much Sugar as will bring it to the Consistence of a Syrup, and give it to drink with convenient Ptisans. For great Inflammations in the Abdomen, after necessary Bleedings, make also Fomentations with the Decoction of the Leaves, Flowers, and Roots of Marsh-mallows and Violets, the Seeds of Fenugreek, and the Tops of Chamomile and Melilot, and apply the Forces to the Part affected, in Form of a Cataplasm. These Decoctions make an excellent Semicupium; give them also in Clysters, with two Ounces of Honey of *Nymphæa*. The Syrup of *Althæa*, according to the Description of *M. Charas*, is of great Use: Dog's-grass, Pellitory, Asparagus, and the other Plants mixed with it, sharpen the Marsh-mallow a little, and make the Syrup proper to provoke Urine, and promote Expectoration. It was with this Intention that the Iris of *Florence* was used in the Lozenges of Marsh-mallows. *M. Lemery*, who has made an excellent Choice of the best Compositions, and reformed them with a great deal of Prudence, quickens these Lozenges with the Flowers of Benjamin. These are preferable to those which they call simple Lozenges of Marsh-mallows, for this Plant has need of something to stimulate it. Thus *Quercetan*, very judiciously, has mixed, in his Lohoch of Marsh-mallows, the Flowers of Sulphur, the Powder Diareos, &c. To render the Ointment of the *Althæa* more resolvent, they have added very properly Fenugreek, Squill, Galbanum; and *M. Lemery* substitutes, not without Reason, the Gum Ammoniac to that of Ivy. The camphorated Spirit of Wine may be mixed also with it, when it is given for the Sciatica and Rheumatism: For the same Reason the Mucilage of Marsh-mallows, made with the Seeds of Fenugreek, is preferable to that which is simple; because it resolves by removing the Inflammation; one ought to put this Seed in the Poultice of Marsh-mallows and Milk, to dissipate or suppurate Tumours, according to the Disposition of the Humour. The Cataplasms prepared with the Roots of this Plant, those of the Lilies and Onions, together with the four Meals, are very good for the same Tumours; especially if the camphorated Spirit of Wine, the Spirit of Sal Ammoniac, or some other spirituous Liquor, is mixed with them. We need not conclude with *M. Seger*, that the Roots of Marsh-mallows are acrid, because several red and painful Pustules have appeared on the Part where this Herb has been applied in Cataplasms. It is more likely, that the obstructed Matter of Transpiration produce these Pustules. *Martyn's Tournefort*.

PULVIS DIALTHÆÆ, Compound Powder of Marsh-mallows.

Take of the dried Marsh-mallow Roots five Drams; of Spanish Liquorice, and Medlar Kernels, each half an Ounce; of Gromwel, Parsley, and Fox-glove, each three Drams; of prepared Crabs Eyes, six Drams; of Gum Arabic, two Drams; of the Gums of the Cherry and Plumb Tree, each one Dram: Let them be pounded together, so as to make a fine Powder.

This continues as the former Dispensatory, and is likewise a modern Composition; but it is seldom prescribed, and therefore little made in the Shops.

SYRUPUS DE ALTHÆA, Syrup of Marsh-mallows.

Take of Marsh-mallow Root two Ounces; of Grass, Asparagus, and Liquorice Roots cleansed, and of stoned Raisins, each half an Ounce; of the Leaves of Marsh-mallows, common Mallows, Pellitory of the Wall, Saxifrage, Pimpinell, Plantain, and the white and black Hellebore, each one Handful; of red Cicers one Ounce; of the four greater and lesser cold Seeds, each three Drams. Infuse them for a whole Day in six Pints of Water; then boil it to four Pints, to which, when pressed out and strained, add three Pounds and a half of white Sugar, and boil it up to a Syrup in a Bath Heat. *S. A.*

This Syrup is originally ascribed to *Fernelius*, and has remained unaltered in all the College Dispensatories. If it is not boiled up to a good Consistence, it is so apt to ferment in warm Weather, that it is very troublesome to keep. *Quincey's London Dispensatory*.

The *Edinburgh Dispensatory* directs this Syrup somewhat differently.

Take of the Root of Marsh-mallows two Ounces; those of Asparagus, Liquorice, and Grass, of each half an Ounce; the Herb Maiden-hair, an Ounce; the Leaves of Marsh-mallows, Mallows, Pellitory, Pimpinell, Saxifrage, broad-leaved Plantain, and stoned Raisins of the Sun, of each half an Ounce; red Cicers, an Ounce; Spring-water, three Quarts: Boil them together till one Third of the Liquor is evaporated; then strain the Remainder, and add thereto four Pounds of the whitest Sugar, and make a Syrup

Syrup thereof, according to the Rules of Art, by boiling it in Balneo Mariæ.

This Syrup ought to be made of a high Consistence in hot Weather; otherwise it presently runs into Fermentation, and is spoiled in the Capacity of a Syrup. The four greater and four lesser cold Seeds are here dropped by the Compilers, I suppose, as being judged foreign to the Purpose.

UNGUENTUM DIALTHÆÆ, Ointment of Marsh-mallows.

Take of fresh Marsh-mallow Roots bruised, two Pounds; of Linseed and Fenugreek Seed, each one Pound: Let them macerate three Days in eight Pints of Water: Then slightly boil them, and press out the Mucilage, of which take two Pints; of Neats-foot Oil four Pounds; and let them boil together, until the more aqueous Part of the Mucilage is consumed; then add of Wax one Pound; of Resin half a Pound; of Turpentine two Ounces: Let them be again boiled into an Ointment. *S. A.*

This is titled by the *Augustane Dispensatory*, *Unguentum de Althæa simplex*, in Distinction from an *Unguentum de Althæa Compositum* there also given, and both taken from *Nicolaus*. The *London Dispensatory* likewise received them both at first; but the greater Composition is very blameable on many Accounts, as may be seen by *Zwelfer's Animadversions* upon it; and therefore hath it been, for some time, justly expunged by our College: In that which is here yet retained, the Neats-foot Oil for common Oil of Olives, always before directed, is indisputably a very good Emendation, because its mucilaginous Quality suits it much better to the Intention of the Medicine. *Zwelfer* tells us, that some put it in Turmeric Root to beautify the Colour, but blames it for being foreign to the true Intention of the Whole; and it is to be wished, that a much greater Fault was not to be found with some Medicine Merchants amongst us, who, to save both Trouble and Charge, put in little or none of the Mucilage, but give their Smell to it by a Mixture of some of the Seeds, with which it ought to be made, in Powder. And this Caution, it is hoped, will not be taken amiss by any honest Compounder; because the Composition is justly designed for some Purposes of Consequence, and which it may fail in by means of such unworthy Practices. *Quincey's London Dispensatory*.

The *Unguentum Dialthææ* of the *Edinburgh Dispensatory* is different, in some respects, from ours.

Take of the Oil of Mucilages, two Pounds; of yellow Wax, half a Pound; of white Resin, three Ounces; and of Venice Turpentine, an Ounce and a half: Mix them together, and make an Ointment, according to Art.

When the Oil of Mucilages is ready prepared, this is a very compendious Way of making the Ointment of Marsh-mallows:

The *OLEUM MUCILAGINUM*, Oil of Mucilages, is prepared as follows.

Take of fresh Marsh-mallow Root, bruised, four Ounces; the Root of white Lily, and fresh Squill bruised, of each an Ounce; of Fenugreek Seed, and Linseed, each an Ounce and half: Steep the Ingredients in a proper Quantity of Spring-water; and afterwards boil them gently till they make a thick and viscous Mucilage; which being pressed strongly out, add thereto two Quarts of Oil-olive, and boil it over a very gentle Fire, or in Balneo Mariæ, till the aqueous Moisture is evaporated; observing to keep it continually stirring, to prevent its burning.

The keeping this Oil in Readiness, as an Official, will greatly ease the Trouble of making several Medicines, particularly the *Unguent. Dialthææ*, *Emplastr. Diachylon*, *Emplastr. de Mucilaginib. &c.* as we shall see hereafter.

The Compilers of the *Edinburgh Dispensatory* have given another Ointment, called

UNGUENTUM DIALTHÆÆ COMPOSITUM, Compound Ointment of Marsh-mallows.

Take of the Ointment of Marsh-mallows, four Ounces; of Gum Ammoniac, dissolved in a proper Quantity of Spring-water, and strained, an Ounce; of Linseed Oil, two Ounces. Melt the Ointment and the Oil together; then add the Solution of the Gum Ammoniac, thickened a little over the Fire, and whilst it yet remains hot; lastly, boil all together, till the aqueous Moisture is consumed, so as to make an Ointment.

This is a judicious Composition, and not chargeable with the Faults committed by others in ordering the Compound Ointment of Marsh-mallows.

ALTHÆA, by some called *IBISCUS*, is a Species of Wild Mallow, with round Leaves like the Cyclamen, (Sow-bread) and covered with Down. It bears a Flower like a Rose; its Stalk is about two Cubits in length, and its Root of a slimy and glutinous Substance. It took the Name of *Althæa* from (*ἄλθε*, *Remedium*) its manifold and extensive medicinal Virtues. For,

A Decoction of it in Wine, or Hydromel, or the Herb itself bruised, is an effectual Medicine for Wounds, Parotides, Strumæ, Abscesses, Inflammations of the Breasts, Pains about the Anus, Bruises, flatulent Tumours, and Strains of the Nerves, being endued, for these Purposes, with a ripening and discutive, or a breaking and healing Quality. Being boiled, as aforesaid, and worked up with the Fat of a Hog or Goose, or with Turpentine, in the Form of a Pessary, it is a Remedy for Inflammations and Obstructions of the Womb. The Decoction has the same Effect, and also brings away the Lochia. The Decoction of the Root, drank with Wine, relieves those who labour under a Difficulty of Urine, or a tormenting Fit of the Stone, Dysentery, Sciatica, Tremblings, or a Rupture. The Root boiled in Vinegar, for a Gargarism, assuages the Tooth-ach. The Seed, either green or dry; being levigated in Vinegar, cleanses the Skin from an Alphus, if it be anointed therewith in the Sun; and, used with Oxylæum, prevents the Mischief from the Bites of venomous Creatures. The same is effectual in Dysenteries, Diarrhœas, and spitting or vomiting of Blood. The said Decoction of the Seed is usually drank with Wine, or Posca, (*ῥέξυρα*) by those who are stung with Bees, or any other little revengeful Creature; and the Leaves with a little Oil are applied as a Cataplasm to the Hurt; and the same is good in Burns. The Root bruised, and laid in Water, which is left to stand in the open Air, will coagulate the same. *Dioscorides, Lib. 3. Cap. 163.*

Ebiscus, or *Althæa*, digests, relaxes, and mollifies, assuages Inflammations, and maturates stubborn Phymas. The Root and Seed have the same Virtues as the Leaves, but are of finer Parts, and more drying, and appear to be more absterive, in that they deterge the Alphus, and the Seed breaks the Stone in the Kidneys. The Decoction of the Root, by its astringent Quality, cures the Gripes and Diarrhœa, and relieves those who bring up Blood. *Orib. de Virt. Simpl. Lib. 2. Cap. 1. copied by Ætius, Tetr. 1. Serm. 1.*

The Wild Mallow is gently discutive, and a little mollifying. The Garden Mallow, being of a more aqueous and humid Substance, is by so much the weaker in Virtues. The former easily passes the Stomach, not only on account of its Humidity, but Viscosity, especially when taken with Oil and Garum, mixed with a little Wine, at Meals. The Seed of the Mallow is the more effectual, as it is the drier. The Dendromolache, too, is a Species of the Mallow, but a greater Discutifive than the former; it is also called *Althæa*. *Ætius Tetr. 1. Serm. 1.*

Emplastrum ex Althæa Polletis, POLLES's Plaster of Althæa.

Take the Bark of the Root of Althæa, while the Herb is in its best State, and pound it in a Mortar. Then remove it into a Copper or Earthen Pot, and sprinkle it with old White Wine, that is fragrant and astringent, just enough to moisten it. Cover it, and let it stand three Days. Then pound it afresh, and strongly press out the Juice. This done, take of Colophonia twenty-four Ounces; of Wax four Ounces; of Oil and Verdigrease, each two Ounces; of the expressed Juice of the Plant, two Attic Heminas (*a Pint*). The Colophonia being first melted in the Oil, and then strained, boil it over a gentle Fire of Pine Wood, stirring it with a Spatula made of the same, till being dropt into cold Water, it consolidates. Then put in the Wax, and when that is melted, take the Pot off the Fire, and after it is cool, pour in the Juice by little and little, taking care of any Effervescence; for it is subject to Ebullitions, and to overflow the Brim of the Pot. After it has stood a while, remove it to the Fire, and, when it is thoroughly hot, put in the Verdigrease; which done, take it off, and, after it is cool, work it well with your Hands, that the Ingredients may thoroughly unite.

This Plaster is good for old and fresh Ulcers, and for the Bite of a Dog, or a wild Beast. It draws out the virulent Matter of Ulcers. It discuties Pain and Strumæ, or suppurates and breaks them, drawing the peccant Humour to the Superficies, and there causing it to evaporate, as in the Case of Lividness from Blows in the Face. It easeth Pains, cleanses the Scabies, and scabby Nails, the Lepra and Alphus, in which Cases it is not to be taken off till the seventh Day. It draws out Stings, or other Matters, fixed in the Flesh; mitigates the Inflammation, under an Exacerbation of the Gout; dissolves Tumours of the Joints and Ganglia; heals the Favi and Ficus; and cures Infants of the Hydrocephalus; mollifies the Hardness of the Spleen; and is a Lenitive for Cancers that are not ulcerated, and restrains their threatened Erosions. Used as a Pessary, it provokes

provokes the Menfes; and, apply'd to the Pecten, it expels the Storie, helps Difficulty of Urine, and relieves under Costiveness. Diluted with Oil of Roses, it heals Fissures in the Soles of the Feet, and cleanses and incarnates Ulcers of the Testes and Pudenda. Prepared without the Erugo; it restrains phagedenic Ulcers, and is serviceable, instead of an Embrocation, in Fractures, as an Anodyne.

There is also a very useful Medicine prepared of the Flowers, which are like Roses, in the following manner: They take the Flowers, and cutting off the Bottoms of the Leaves, first bruise, and then pulverize them. Of this Powder, they take twelve Parts, of Colophonia twenty-four Parts, of Wax six, and Oil two Parts. Prepare them as directed in the former, and work them well with your Hands. It is more convenient for Use than the former, and a greater Anodyne. *Ætius Iatr.* 4. *Serm.* 3. *Cap.* 14.

An emollient Medicine.

Take of Colophonia, Wax, each one Pound; of Oil and Juice of Althæa, each two Pints. *Actuarius Meth. Med.* *Lib.* 6. *Cap.* 9.

Althæa has been the Occasion, that many have deceiv'd themselves, who presume they know it; and imposed upon others, who are credulous enough to take their Word for it; for when they would persuade us, that Althæa is a common Herb, and known by every body, they prove their Ignorance by so doing, and demonstrate, that they know nothing of the Matter. The Greek Authors, on the contrary, who are to be found in close and select Libraries, assure us, that Althæa is a very scarce Plant, and only to be met with in *Asia* and *Sicily*. I shall give you their very Words: *Ἡ μὲρ Ἀλθαία ἐξ ἁδίας ἐνείσκειται, εὐομένη ἐν τοῖς τῆς Ἀσίας τόποις ἢ Σικελίας, ἐνείσκειται δὲ ἐν τῇ Σμύρῃ ἐν τῷ Σχελλίῳ ποταμῷ.* "Althæa is not easily met with. It grows in *Asia* or *Sicily*, particularly near *Smyrna*, by the Banks of the River *Schelis*." *Theophrastus* also hints, that it was a scarce Herb, when he tells us, that it was to be met with among the *Arcadians*, who called it *Ἀργία μαλάχη*, "wild Mallows," but the Sons of the Physicians gave it the Name of *Ἀλθαία*, "Althæa," from the medicinal Virtues with which it is endued, *Lib.* 9. *Cap.* 14. Besides, he describes it by such Characters as they are forced to confess they never saw, namely, with a yellow Flower: *Ἐχει δὲ ἡ Ἀλθαία φύλλον μὲρ ὁμοῖον μαλάχῃ, πλὴν μείζον καὶ δασύτερον, τὲς δὲ καυλὸς μαλακὸς, ἀνθὸς μύλινον.* "Althæa has a Leaf like the Mallow, but larger and rougher, soft Stalks, and a Flower of a yellow or Honey-like Colour." *Dioscorides* says, it is *ροδοειδὲς*, "like a Rose," which we may understand to be meant of the Figure of a Rose, which it may have under a yellow Colour. *Harpocration* in his Book *Περὶ φυσικῶν ὀνομάτων*, "Of physical Powers," says, that the Flower of Althæa is called a Rose; whether from its Colour or Shape, is uncertain: *Ὀνόθυρις βόταν ἐστίν, ἣν οἱ μὲρ ὀνόθυρον καλεῖσιν; οἱ δὲ ἐνομολόχον· αὐτὴ ἐστὶ τὸ ρόδον, ἐξ ἧς τὲς σερῶνες πλέκουσιν Ἑλλήνες ἐν ταῖς ἐορταῖς τῶν θεῶν, φύλλα ἔχουσα ὁμοία μάλᾳχης ἡμέρας ταύτης Ἑλλήνες καλεῖσιν Ἀλθαίαν.* "The *Onothyris* is an Herb, which some call *Onothure*, others, *Onomolochæ*. It bears Roses, which the *Greeks* weave into Crowns at the Feasts of their Gods; and has Leaves like the Garden-mallow; this the *Greeks* call *Althæa*." But it is most reasonable to interpret *ροδοειδὲς* [*rhodoeides*] of the Colour. For *το ροδοειδὲς* [*prae-scoeides*] means something of a Leek-green Colour; and *ροδοειδὲς*, [*rhodoeides*] apply'd to Metals, signifies a Rose-colour. In his following Description of Althæa, he makes its Flower to be like a Rose: *Ἀνθὸς μικρὸν ἐμμορφεὲς ρόδῳ.* "It has a small Flower like a Rose." Therefore by *ροδοειδὲς* he meant the Colour, which an ancient Transcriber of *Dioscorides* expressed by painting the Flower of Althæa of a Rose-colour. If this be so, *Dioscorides* must have spoken of quite a different Plant from the true Althæa; for that bears a yellow Flower. Some, I know not for what Reason, suppose it to be the Abutilon of *Avisena*; but *Avisena* says no more of his Abutilon, than that it was a Plant like a Gourd; to which his *Arabian* Expositors add, that the Abutilon resembled a Gourd not only in Leaves, but also in its Fruit, which is not round, but oblong, and that it was to be found in the City of *Gaza*. This, you see, is very different from the Althæa of the *Greeks*. *Dioscorides* says, that "It is called *Ebiscus* by some." Why did he not say by the *Romans*, as he usually does on other Occasions? For none but the *Romans* called the Althæa *Ebiscus*; or *Ibiscus*. The old *Greek* Horse Physicians, in that Part which is wanting in the Editions: *ἀνθὸς μὲρ Ἀλθαία, ὑπὸ τινῶν δὲ Μολόχῃ; Ῥωμαῖσι δὲ Ἐβισκῳ, ὡς Σαματάις δὲ καὶ Ἰβίσκῳ καὶ ὀνόθυρον Ἀριστῶτι.* "It is called Althæa; by some, *Molochæ*; in *Latin*, *Ebiscus*; by the *Sarmatians*, *Getes*, and *Thracians*, *Arispis*." *Neophytus*, *Ἀλθαία δὲ Ἀλβίσκος, οἱ δὲ μαλάχῃν ἀργίαν, Ῥωμαῖσι Ἐβισκῳ.* "Althæa is the *Althiscum*, some call it the *Wild Mallow*, and the *Romans* *Ebiscum*." In the Glossary, *Ἀλθαία* is *Hibiscum*; in other Glossaries it is, without an Aspiration, *Ibiscus*, *Herba mollis*; thence comes the *Italian* *Malva-visco*, for *Malva Ibisco*, for which the *French* say, *Ibisco-malva*; for thence comes their

VOL. I.

Grimaudi, we placing before what the *Italians* place after. The *Barbarians* call it *Bismalva*, which is plainly a Corruption of *Ibisco-malva*.

I don't wonder, that *Pliny*, in the Place where he speaks of *Hibiscus*, makes no mention of Althæa, nor says any thing of *Hibiscus* when he mentions Althæa. 'Tis plain, that he thought them different, as his Manner is in other Cases. But I can't help being surpris'd at his placing *Hibiscus* among the Kinds of Parsnip, and seeming willing to have it be like a Parsnip, and that in more Places than one. In *Lib.* 19. *Cap.* 5. treating of the Kinds of Parsnips, *Hibiscum a Pastinaca Gracilitate distat; damnatum in cibis, sed Medicinæ utile est; & quantum Genus in eadem similitudine Pastinacæ, quam Gallicam vocant, Græci vero Daucon.* "Hibiscum differs from a Parsnip, on account of its Slenderness: it is condemn'd as Food, but useful in Medicine. And there is a fourth Kind, resembling in like manner a Parsnip, which they call *Gallic Parsnip*, but the *Greeks* name it *Daucon*." He pretends, that the *Hibiscum* differs from a Parsnip only in Slenderness, that is to say, is more slender than a Parsnip, but like in other respects. This he repeats in another Place, that is, *Lib.* 20. *Cap.* 4. *Pastinacæ simile Hibiscum, quod Molochæ agriam vocant, & aliqui Plistolochiam.* "There is a Resemblance between the Parsnip and the *Hibiscum*, which is commonly called the *Wild Mallow*, and by some *Plistolochia*," which by all is recorded to be like the Mallow, and to be a kind of wild Mallow; but how it should come to look like a Parsnip, I am at a Loss to imagine, especially of the *Plistolochia*; for this, in another Place, he ranks among the *Aristolochia*'s, and makes a fourth Kind of it.

As to *Hibiscum* being like a Parsnip, which *Pliny* affirms, I fancy, that I see whence he derived his Conceit. He had read in some *Latin* Author, that *Hibiscum* was a kind of wild Mallow, and pass'd with some under the *Greek* Appellation of *Molochæ Agria*, and differed not at all from the *Pastinata*, but only in Slenderness. Now by the *Pastinata* is to be understood, the Garden Mallow, which is planted *Pastinato*, "in delved Ground." All cultivated Things are larger than what are wild, and therefore the wild Mallow was slenderer than the sative, or *pastinata*, "planted in delved Ground." The *Hibiscum*, he says, was condemn'd as Food, that is, the wild Mallow; for we are assured, that the Garden Kind was formerly eaten. *Pliny* therefore, having his Thoughts diverted another way, mistook *Pastinata* for *Pastinacæ*, "a Parsnip." 'Tis certain, and not a little material to the Purpose, that the most antient Manuscripts, in that Place, have *Pastinata* in express Letters; *Hibiscum a Pastinata gracilitate differt.* "Hibiscum differs from the *Pastinata* in its Slenderness;" whereas in other Places, the same Copies have the Word *Pastinacæ*, whole and uncorrupted. The Author from whom *Pliny* borrow'd his Account, doubtless wrote, *Hibiscum, id est, agrestis Malva, a Pastinata gracilitate differt.* "Hibiscum, that is, the wild Mallow, differs from the cultivated, in Slenderness." He omitted the *agrestis Malva*, and read *Pastinacæ* for *Pastinata*, as these two Letters are often exchange'd for one another, in Words of that Form; for Example, *Securiclatæ, securiclatæ; lingulata, lingulata; personata, personata; ἡ προσωπίς, [Prosopitis] by some called Personacia, a Personation.* The Glossary has *Pastinatio, ψυλά, "Pasti-nation [means] a Cultivation."* It is not to be doubted then that *ἡ ψυλάς*, "the planted," cultivated, and Garden Mallow, was properly called *Pastinata*, "planted in delved Ground." Under the same Mistake he asserts every-where, that the *Hibiscum* is like a Parsnip.

I formerly took the *Alcæa* of the *Greeks* to be meant by the Name *Hibiscum*; for the *Alcæa* is a kind of wild Mallow, which some, we are assured, have confounded with Althæa. For *Neophytus*, under the Name of Althæa, has described the *Alcæa*, which he furnishes with Leaves, *επεχρισμένα πρὸς τὰς ἰσθμὰς βόταν*, "indented like those of Vervain." Now I thought, that *Pliny* had reckon'd this indenting of the Leaves in *Alcæa*, which he took for Althæa, among the Characters in which it resembled a Parsnip; but nothing is more certain, than that he fell into this Mistake in the manner we have related.

The same Author, in another Place, thus distinguishes the Althæa among the other Mallows: *Ex sylvestribus, cui grande Folium, & Radices albæ, Althæa vocatur ab excellentia Effectus, ab aliis Aristalthæa.* "Of the wild Kinds, that with the large Leaf, and the white Roots, is called *Althæa*, from its excellent Virtues, by some named *Aristalthæa*." An antient Manuscript indicates, that this last Word is not rightly written, by reading *ab aliis Plitolochia* "by others *Plitolochia*." Hence it appears, that it ought to be read *Plistolochia*, which is confirmed by the Manuscript Index: *Malva Althæa, sive Plistolochia, "the Mallow-Althæa, or Plistolochia."* In another Place it says, that *Hibiscum* is called by others *Plistolochia*; Perhaps it took that Name from its Virtue in extracting the Secundines, which the *Greeks* call *λογία*.

Pliny, in reckoning the Kinds of *Aristolochia*, makes *Plistolochia* the fourth, which is also called *πυλῶπις*, "many-rooted;"

H h h h

"rooted;"

"rooted;" for thus it is written in the Manuscript Index: *Aristolochia, fræ Climatis, fræ Cretica, fræ Plifolochia, fræ Lochia Polyrrhizosque, quæ Malum Terræ.* So it ought to be read.

But I never read this Name *Plifolochia* in Greek Authors, and I am afraid it took its Origin from some wrong Reading, either by *Pliny* himself, or one of those who used to read to him, who hastily running over the Greek Book written in large Letters, and slightly glancing on the Words, as is too commonly done, might for *ΑΡΙΣΤΟΛΟΧΙΑ* read *ΠΛΙΣΤΟΛΟΧΙΑ*, which is not so very remote from the Truth, nor unsuitable to *Pliny's* Character. For my part, I can give no Account for the Name, the changing it into *Pistolochia* being contradictory to all the Books; nor can I see the Reason of this Word *πισολοχία* [*Pistolochia*].

Authors say never a Word of the Althæa called *Plifolochia*, or *Aristolochia*; and I am apt to think, that *Pliny* made this too out of *Theophrastus*, by wrong reading and pointing his Words. *Theophrastus*, enumerating the medicinal Herbs which grow in *Arcadia*, has these Words: *Καὶ ἡ ῥίζη Ἀλθαία, ἐκείνοι δὲ μάλαν ἀγείαν, ἢ ἰατρολόχια, καὶ τὸ σίσελι.* "And there is the Althæa, which they call *Wild Mallow*, and *Aristolochia*, "[*Birthwort*] and *Seseli* [*Hartwort*]." *Pliny* read or understood the Words, as if they had been written *ἐκείνοι δὲ μάλαν ἀγείαν, ἢ ἰατρολόχια*. "They call it *Wild Mallow* and "*Aristolochia*," where perhaps he read himself, or, deceiv'd by his Ears, imagin'd he heard another read *ἢ πισολοχία*, "and "*Plifolochia*."

That Place in *Pliny*, where he distinguishes between *μολόχη* [*Moloché*] and *μαλάχη* [*Malache*] deserves our Laughter. The Passage, as it ought to be read, *Lib. 20. Cap. 21.* runs thus: *Duo Genera earum Amplitudine Folii discernuntur. Majorem Græci Molochen vocant in Sativis, alteram ab emolliendo ventre dictam putant Malachen.* "Two Kinds of them are distinguished by the Largeness of the Leaf. The greater is called "by the Greeks, *Moloché*, and is cultivated in Gardens; the "other is supposed to have its Name *Malache* [*Greek μαλάχη*, "soft] from mollifying the Belly." But *μολόχη* [*Moloché*] is the Word in the *Attic* Dialect, and *μαλάχη* [*Malache*] in the others. This is the Rule in the antient Grammarians; but I should rather think *μολόχη* an *Æolic* Word; for 'tis their Manner to change *a* into *o*; so they say, *ονόγουρον* [*Onoguron*] for *ανόγουρον* [*Anaguron*] which is in the *Attic* Dialect; *ονωνίς* for *ανωνίς*, *βόνις* for *ανόνις*, and so in Hundreds of others; but we shall now finish what we proposed. What is commonly called *Malva-viscô*, or *Ibiscum*, is not the Althæa of the Greeks, tho' the old Latins called this *Ibiscus*. The true Althæa, at this Day, is unknown to our Botanists; for the *Bis-malva*, which is the *Roman Hibiscum*, is not determined to one thing. Perhaps the old Romans themselves were ignorant of the true Althæa; for what they called *Hibiscum*, was no other than what is called *Malva-Ibiscum*; so much is certain.

Tho' Althæa be like the wild Mallow, yet, which is strange, *Dioscorides* has not assign'd it a Place among the Mallows, as if he thought it of a different Kind from them. For he describes the common Mallows in his second Book, and defers the mentioning of Althæa to his third Book. What he thus separated, he does not seem to think of the same Kind, though he says, that Althæa is a Species of the wild Mallow.

The *ανανδενδρομαλάχη* [*Anadendromalache*] mentioned by *Galen*, and mistaken by some for the same as *Ibiscus* or Althæa, is another thing. The Authors of the Greek Farriery have these Words: *Ἐστὶ δὲ ἐτέρα βλάστη λεγόμενη ανανδενδρομαλάχη, ὅπερ τὴν ἄν σαλκίαν ἔστι τὸ φύλλον πλατύτερον ταύτης, τὴν ῥίζαν ὡσαύτως σκευάζονται, καθὼς ἐπάνω γέγραπται. χρῆσθαι.* "There is another "Herb called *Anadendromalache*, and by some *Salcies*; this has "a broader Leaf, and the Roots are prepared in the same "manner as before directed." I take this to be the *Alcæa* of *Dioscorides*, which the Name *σαλκίαν*, [*Salcies*] being a Corruption of *ἀλκαίν*, [*Alcæa*] plainly intimates. *Galen* does not mention *Alcæa*, but seems to mean the same by the Word *Anadendromalache*. *Salmasius de Homonym. Hyl. latr. Cap. 42.*

Notwithstanding the Opinion of *Salmasius* to the contrary, I find most Botanists esteem our Althæa to be the same as that of *Dioscorides*.

ALTHANACA, or **ALTHANACHA**, (*Auripigmentum*) Orpiment. It is also called **ALTERNET**, **ALBIMEC**.

ALTHERBEGIUM, the Arabic Name given by *Avicenna* to a certain Swelling, resembling those which happen in a Cachexy, and proceeding from a morbid State of the Liver, and an ill Habit of Body. The Swellings are also like those which appear under the Eyes, and in the Faces, of Persons who sleep over-much. A Tympany is a Disease of the same Kind. *Fabric. Ab Aquapendent. Lib. 1. Cap. 10.*

ALTHERIS, *ἀλθεῖς*, from *ἀλθεῖν*, to cure or heal. It signifies the Cure of a Distemper, in which Sense it is frequently used by *Hippocrates*.

ALTHOLIZOI. See **ALTOLIZOIM**.

ALTIHT. The Name given by *Avicenna* to the *Laserpium* of the Antients.

ALTIMAR, **AYCAPHER**, (*Æs ustum*) burnt Copper. *Rulandus*.

ALTIMIO, (*Fæx Plumbi*) the Dross or Scoria of Lead. *Rulandus*.

ALTINCAR, a sort of factitious Salt used in the Purgation and Separation of Metals. *Castellus* from *Libavius*.

ALTINGAT, *Flos Æris*, Rust of Copper, Verdigris. *Rulandus*.

ALTINURAUM, Vitriol. *Rulandus*.

ALTOLIZOI, a Word mentioned by *Helmont*, which is in a great measure unintelligible. In his Treatise *De Lithiâsi*, he directs the Ludus of *Paracelsus* to be well confused, calcin'd, and boil'd into the Form of an Oil, which is almost express'd by a single Word *Fel Terræ*, or **ALTHOLIZOI** *correctum*, which he says, signifies, totally converted into Oil by Ebullition. *Castellus* has made two or three Blunders under this Article. For he calls it *Altolizoin*, whereas *Helmont's* Word is *Altholizoi*, and *Altholizoin*; and he mistakes in his Explanation *Ludus*, and calls it *Lutum*. See **ALKAHEST**.

ALTUS. This is used sometimes in a medicinal Sense join'd with *Sopor*, to express a sound Sleep, inclining to a Lethargy, or Coma.

ALU. See **ARE-ALU**, and **ATTY-ALU**.

ALUACH, or **ALUECH**, pure or refin'd Tin. *Rulandus*.

ALUCO, a Bird mentioned by *Bellonius*, *Aldrovandus*, and *Johnson*.

It is a nocturnal Bird of Prey, of the Owl Species; they are of different Sizes; for some are as big as a Capon, and others of the Size of a Pigeon: They are of a Lead-colour spotted with White; their Head is large, black, without Ears, crown'd with Feathers; their Beak is white, their Eyes are large, black, and seem to be sunk in their Heads, because they are surrounded with many Feathers; their Limbs are cover'd with white Feathers, their Feet are feather'd and arm'd with long Claws, which are strong and sharp; they live in decay'd Buildings, Towers, in Caverns, and in the Hollow of old Oaks; they ramble at Night in the Fields; they live upon Mice, and little Birds; their Gullet is so large, that they swallow Pieces as big as an Egg; their Cry is frightful; they contain a great deal of volatile Salt and Oil.

Their Blood is good for an Asthma, being dried, pulverized, and taken at the Mouth: The Dose is from half a Scruple to two Scruples; their Brains are esteemed good for agglutinating Wounds. *Lemery de Drogues*.

ALUDEL. An **ALUDEL** is a chymical Vessel used in Sublimation. Many of these are generally employ'd in one Operation, in the following Manner: The Matter to be sublim'd is put into a Body, or Pot, the superior Part of which is fitted into a Hole on the lower Part of an Aludel, and the superior Part of the Aludel is received into the inferior Part of the next Aludel, and so on, till as many Aludels are set one upon another, as the Process requires; to the superior Part of the uppermost Aludel, a Head or Alembic is fix'd, to receive the Matter which sublimes. So that there is a continu'd Tube form'd by the Aludels from the Pot which contains the Matter to be sublim'd, to the Head or Alembic which receives it, in the manner, that a continu'd Chanel is form'd by a Number of Elm Pipes: The Use of Aludels seems to be to remove the Matter sublim'd in the Head to a Distance from the Fire.

ALUDIT, Mercury. *Rulandus*.

ALVEARIUM, the Bottom of the Concha, or Hollow of the external Ear; it terminates at the Meatus Auditorius, which is the Entrance of the Auris or Ear, strictly so call'd. *Drake*.

It is generally defin'd to be that Cavity where the Cerumen or Ear-wax is principally lodged.

ALUECH. See **ALUACH**.

ALVEOLI, the Sockets in the Jaw Bones, in which the Teeth are plac'd, by that sort of Juncture or Suture, which Anatomists call *Gomphosis*, by Joiners call'd *Pegging*. The Alveoli are lin'd with a Membrane of exquisite Sense, which seems to be nervous, and is wrapp'd about the Roots of each Tooth. *Drake*.

There are usually sixteen Alveoli in each Jaw.

ALVEUS. Medicinally it is apply'd to many Tubes or Canals, thro' which some Fluid flows, particularly to the Ducts which convey the Chyle from the Receptacle of the Chyle to the Subclavian Vein.

ALUFIR, *Rubedo*, Redness. *Rulandus*.

ALVIDUCA, *Medicamenta*, are purging Medicines.

ALUIS. *Rulandus* calls this *Alafor*, id est *Vabs*, without any farther Explanation. But *Johnson* explains *Alafor*, *Sal Alkali*.

ALUM, or **ALUS**. A Name in *Scribonius Largus* for the *Symphytum* Comfrey.

ALUMBOTI, *Plumhum Ustum*, burnt or calcin'd Lead. *Rulandus*.

ALUMEN, Alum, *Στυπτηρίον*. *Hippocrates* recommends **ALUM** in many Passages of his Treatise of Ulcers, as a proper Application for Ulcers, especially those of the depascent Kind (*νομάς*) sometimes burnt, and sometimes not. He thinks the Egyptian

Egyptian the best, and next that the *Melian* (that got in *Melos*). And in his Treatise on the Diseases of Women, *Lib. 1.* he orders burnt ALUM as an Ingredient in an Application he directs for Ulcers of the Uterus. And afterwards in the same Treatise he advises *Egyptian* ALUM, with some other Ingredients, to be moisten'd with Goose Grease, and then with Wool to be made into a Pessary, and apply'd to the Os Uteri, with a View of promoting Fecundity. And in his Epidemics, *Lib. 1.* he also advises *Egyptian* Alum as a beneficial Application in painful Tumors of the Gums.

Celsus, *Lib. 6. Cap. 19.* recommends *Melian* Alum prepared in the following manner, as an effectual Application to Ulcers of the Fingers, which the *Greeks* call *πρωγύα*. Melt round *Melian* Alum in Water, till it acquires the Consistence of Honey; then mix with it a Quantity of Honey, equal in Weight to the Alum when dry, and stir them about with a Spatula, till the Mixture is of a Saffron Colour. With this anoint the Uleers.

The Accounts of Alum we have from *Dioscorides*, *Pliny*, *Oribanus* and *Ætius*, are as follows:

Almost every Kind of Alum is found in *Egypt*, and among the same Metals; for the *Sciassile* Alum is, as it were, the Flower of the Solar. It is also produced in other Places, as in *Melos*, *Macedonia*, *Lipara*, *Sardinia*, *Hierapolis* in *Phrygia*, *Libya*, *Armenia*, and many other Countries, as well as *Oker*. There are very many Species of Alum; but the most serviceable for medicinal Purposes, are the *Sciassile*, the *Round*, and the *Liquid*; and of these the best is the *Sciassile*. Again, of this *Sciassile* Alum, the most valuable is what is fresh, very white, free from Gravel, smells strong, and is of an extraordinary Astringency; such as lies not close compacted like a Clod, nor falls abroad into thin Slices like Chips: but when broken into Bits, and pulled asunder, runs out into Filaments, like grey Hairs. Such is the Sort called *Trichites*, [hairy] which grows in *Egypt*. There is a Stone very like this Alum, but distinguish'd from it by its Taste, which has nothing of Astringency. The round Species, that is factitious, is to be refused as good for nothing; you may know it by the Figure. Chuse what has its Roundness from Nature, is full of Bubbles, is of a white Colour, and powerfully astringent; and has, besides these Properties, a sort of Paleness, and is somewhat fat, and comes from *Melos* or *Egypt*. The liquid Kind ought to be quite pellucid, milky, simple, and of equal Liquidness in all its Parts, clear of Sand or Gravel, and exhaling a Warmth as from a Fire.

These Alums are of a heating and astringent Nature, and have the Virtue of cleansing the Eye, and clearing it of whatever darkens the Pupil, and also of consuming fleshy or other Excrescencies that grow about the Eyelids. The *Sciassile* is more to be valued than the *Round*. They are burnt or roasted like *Chalcitis*. They restrain the Putrefaction of Ulcers, and stop Hæmorrhages. They compress the flaccid Gums, and fasten loose Teeth, if used with Vinegar or Honey; mixed with Honey, they cure the Aphthæ; used with the Juice of Knot-grass, they are good for Exanthemata and Rheums in the Ears. With Cabbage Leaves, or boil'd Honey, they are effectual in the Leprosy; and are good in warm Water to make a Fomentation for the Itch, Paronychia, Pterygia, and Kibes. Mix'd with Lees of Vinegar and burnt Galls, of each an equal Quantity, they are good to anoint phagedenic Ulcers; and with a double Quantity of Salt restrain the spreading of Nomæ. Mix'd with Ervum and liquid Pitch, they absterge all Kinds of Scurf anointed with them; and, used in Water, scour away all Nits and Lice, and are good for Scalds or Burns. They are used to anoint cedematous Tumours, and to take off the rank Smell of the *Alæ* and *Pudenda*. What comes from *Melos* promotes Conception in Women, *πρὸ τῆς οὐδοῦ παρατρέχουσα τὸ εὐαλὲς τῆς ὕλης*, and expels the Foetus. In short, the Alums are, all of them, proper for Excrescencies of the Gums, and for the *Uvæ* and *Tonsillæ*; and also for the Mouth, Ears, and *Pudenda*, when used with Honey to anoint the Parts. *Dioscorides*, *Lib. 5. Cap. 123.*

Alum is supposed to be a saline Humour of the Earth [*salugo Terræ*]. There are several Kinds of it: In *Cyprus* they have the White and the Black, where the Difference in Colour is inconsiderable, but in the Use very remarkable; for the White and Liquid are very useful in dying Wool of a bright Colour; and the Black, on the contrary, in giving it a sad and dark one; the latter is also serviceable in refining Gold. 'Tis all, however, generated of Water and Mud, that is, from the Nature of the Exsudation of the Earth. What the Winter brings together by uniting Streams, is matured by the Summer Suns, and what comes to Perfection soonest, is the whitest. It is produced in *Spain*, *Egypt*, *Armenia*, *Macedonia*, *Pontus*, *Africa*, and the Islands of *Sardinia*, *Melos*, *Lipara*, and *Strongyle*. The choicest is to be had in *Egypt*, the next in *Melos*. There are two Kinds of this, namely, the Liquid and the Solid; the first is presumed to be good, if it be limpid, and have a Milkiness, may be rubbed without emitting an offensive Vapour, but a sort of fiery Sparkles, with a sensible Heat: This they call *Phorimon*, [useful] and try whether it be adulterated by

the Juice of a Pomegranate, which turns the true Alum black. There is another Kind, which is pale and rough, and dy'd with Galls; for which Reason they call it *Paraphoron* [good for nothing].

The liquid Alum is of an astringent, hardening, and corroding Quality. Mixed with Honey, it heals Ulcers in the Mouth, Pimples, and Itching. For these Purposes, they mix two Parts of Honey with one Part of Alum, and manage the Cure in a Bath. It is taken in Pills for Disorders of the Spleen, and to remove an Itching, and for pissing of Blood. Mixed with Nitre and wild Fennel Flowers, it cures the Itch.

There is one Kind of concrete Alum, which the *Greeks* call *Schiston*, that cleaves, and when pulled asunder, runs into a sort of grey Hairs, whence some chuse to call it *Trichitis*. This is made out of a Stone, whence it is called *Chalcitis*, so that it is a sort of a Sweat of this Stone coagulated into a spumeous Substance. This Kind is drying, and not so astringent as the other; but it is very proper for the Ears, either put into them, or the Part anointed; and also for Ulcerations of the Mouth, and for the Teeth, if the Spittle be retained with it. It is also an Ingredient in Collyria, and Medicines adapted to the *Pudenda* of both Sexes. They boil it in Pans till it will melt no longer.

There is another Kind, of an inferior Nature, which they call *Strongyle*, round. Of this there are two Sorts, the Fungous, which readily imbibes Moisture, and is counted good for nothing; and the Pumicous, which is better than the other, and lax and porous like a Sponge, naturally round, bearing pretty much upon the White, has a sort of Fatness, is friable without Sandiness, and will not give a black Colour. They burn it by itself, over a clear Fire, till it turns to Ashes. All the Kinds of Alum are of an astringent Quality, from whence they have their *Greek* Name. *Pliny*, *Lib. 25. Cap. 15.*

All sorts of Alum have a remarkable Tartness, and are of gross Parts; the finest is the *Sciassile*, and next to this the *Round*, and the *Astragaline*. The Liquid consists of Parts remarkably gross, as well as that Sort called *Placitis*, and the *Plinthisis*. *Oribas. Med. Col. 15. Cap. 1.*

All Alums are extremely astringent, drying, and conglutinating: the finest is the *Sciassile*; it is usually added to other Ingredients in Medicines after they are boiled; for there is no Rule to direct us in the boiling of it. When it changes Colour, it commonly takes a Green. *Ætius Tetr. 4. Serm. 2. Cap. 25. P. 697. C.*

There are three Sorts of ALUM commonly used; the first is the

Alumen rupeum, *Offic.* *Alumen rupeum sive Crystallinum*, *Ind. Med. 7.* *Alumen factitium*, *Mer. Pin. 217.* *Alumen*, *Schw. 362.* *Alumen factitium pellucidum*, *Calc. Mus. 169.* *Alumen rupeum candidum & pellucidum*, *Aldrov. Mus. Metall. 334.* *Commune vulgò*, COMMON ALUM, *Dale.*

The second Sort of Alum is the

Alumen Rochi Gallis, *Offic.* *Alumen Romanum sive rubrum*, *Ind. Med. 7.* *Alumen Rochæ*, *Aldrov. Mus. Metall. 332.* *Worm. 23.* *Alumen rupeum seu Rochæ*, *Charlt. Foss. 9.* *Alumen factitium ex præduro lapide subrubro confectum*, *Calc. Mus. 169.* *Alumen Romanum quibusdam*, ROCH-ALUM.

It is like the common Alum, only of a pale-red Colour. We have it imported from *Italy*, *Smyrna*, &c. They make it after the same manner as they do the common Alum, but without the Addition of Urine and Kali, as I am informed by a Letter from the learned Dr. *Tancred Robinson*, M.D. It agrees in Virtues with the preceding. *Dale.*

The third Sort of Alum is the

Alumen plumosum, *Offic.* *Ind. Med. 7.* *Alumen plumosum sive Trichites*, *Schrod. 3. 477.* *Alumen plumæ, quod Sciassile*, *Latins*, *Aldrov. Mus. Metall. 331.* PLUMOSE, or FEATHER'D ALUM. *Dale.*

It is sometimes called *Alumen Iamenum*.

Alumen Catenum is a Name for the *Cineres clavellati*, Pot-ash. In order to the understanding what the modern Alum, which we make use of, is, with Exactness, it will be necessary to give an Account of its Production; and by this it will appear, that our Alum differs considerably from the Alum of the Antients; for theirs was found naturally, without the Help of Art, whereas ours is factitious, and consists of other Ingredients, besides the concreted Juice, which the Antients called ALUM.

Alum is made of a Stone, of Sea-weed and Urine.

The Stone is found in most of the Hills between *Scarborough* and the River of *Tees*, in the County of *York*; as also near *Preston* in *Lancashire*. It is of a bluish Colour, and will cleave like *Cornish Slate*.

The Mine, which lies deep in the Earth, and is indifferently well moisten'd with Springs, is the best. The dry Mine is not good; and too much Moisture cankers and corrupts the Stone, making it nitrous.

In this Mine are found several Veins of Stone call'd *Doggers*, of the same Colour, but not so good. Here are also found those, that are commonly call'd *Snake Stones*: The People have a Tradition, that the Country thereabouts being very much annoyed with Snakes, by the Prayers of St. *Hilda*, there inhabiting,

inhabiting, they were all turned into Stones; and that no *Snake* hath ever since been seen in those Parts.

For the more convenient working of the *Mines*, which sometimes lie twenty *Yards* under a Surface or Cap of Earth, (which must be taken off, and barrow'd away) they begin their Work on the declining of a Hill, where they may be also well furnished with Water. They dig down the Mine by Stages to save Carriage, and so throw it down near the Places where they calcine it.

The Mine, before it is calcined, being exposed to the Air, will moulder in Pieces, and yield a Liquor, whereof *Copperas* may be made; but being calcined, it is fit for Alum. As long as it continues in the Earth, or in Water, it remains a hard Stone.

Sometimes a Liquor will issue out of the Side of the Mine, which, by the Heat of the Sun, is turned into natural Alum.

The Mine is calcined with *Cinders* of Newcastle Coal, Wood, and *Furzes*; the Fire is made about two Feet and an half thick, two Yards broad, and ten Yards long. Betwixt every Fire, are Stops made with wet Rubbish, so that any one or more of them may be kindled, without Prejudice to the rest.

After there are eight or ten *Yards* Thickness of broken Mine laid on this Fuel, and five or six of them so cover'd, then they begin to kindle the Fires; and as the Fire rises towards the Top, they still lay on fresh Mine; so that to what Height you can raise the Heap, which is oftentimes about twenty Yards, the Fires, without any further Help of Fuel, will burn to the Top, stronger than at the first Kindling, so long as any Sulphur remains in the Stones.

In calcining these Stones, the Wind many times does Hurt, by forcing the Fire, in some Places, too quickly thro' the Mine, leaving it black and half burnt; and in others, burning the Mine too much, leaving it red. But where the Fire passeth softly, and of its own accord, it leaves the Mine white, which yields the best and greatest Quantity of Liquor.

The Mine, thus calcined, is put into Pits of Water, supported with Frames of Wood, and rammed on all Sides with Clay, about ten Yards broad, and five Feet deep, set with a Current, that turneth the Liquor into a *Receptory*, from whence it is pumped into another Pit of Mine; so that every Pit of Liquor, before it comes to the Boiling, is pumped into four several Pits of Mine, and every Pit of Mine is steeped in four several Liquors, before it be thrown away; the last Pit being always fresh Mine.

This Mine, thus steep'd in each of the several Liquors twenty-four Hours, or thereabouts, is of course four Days in passing the four several Pits, from whence the Liquors pass to the Boiling-house.

The Water or Virgin Liquor oftentimes gains, in the first Pit, two Pounds Weight; in the second, it increaseth to five Pounds Weight; in the third, to eight Pounds Weight; and in the last Pit, which is always fresh Mine, to twelve Pounds Weight; and so in this Proportion, according to the Goodness of the Mine, and the well calcining thereof. For sometimes the Liquors, passing the four several Pits, will not be above six or seven Pounds Weight; at other times, above twelve Pounds Weight, seldom holding a constant Weight one Week together. Yet many times, Liquor of seven or eight Pounds Weight produceth more Alum, than that of ten or twelve Pounds Weight, either through the Illness of the Mine, or, as usually, the bad calcining thereof. And if by passing the weak Liquor through another Pit of fresh Mine, you bring it to ten or twelve Pounds; yet you shall make less Alum with it, than when it was but eight Pounds Weight. For what it gains from the last Pit of Mine, will be most of it *Nitre* and *Slam*, which poisons the good Liquors, and disorders the whole House, until the *Slam* be wrought out.

That which they call *Slam*, is first perceived by the Redness of the Liquor, when it comes from the Pit, occasioned either by the Illness of the Mine, or, as commonly, the over or under calcining it, as abovesaid; which in the Settler sinks to the Bottom, and there becomes of a muddy Substance, and of a dark Colour. That Liquor which comes whitest from the Pits, is the best.

When a Work is first begun, they make Alum of the Liquor only that comes from the Pits of Mine, without any other Ingredients, and so might continue, but that it would spend so much Liquors as not to quit Cost.

Kelp is made of a Sea-weed call'd *Tangle*, such as comes to London on Oysters. It grows on Rocks by the Sea-side, between High-water and Low-water Mark. Being dried, it will burn and run like *Pitch*; when cold and hard, 'tis beaten to *Ashes*, steeped in Water, and the Lees drawn off to two Pounds Weight, or thereabouts.

Because the Country People, who furnish the Work with *Urine*, do sometimes mingle it with Sea-water, which cannot be discovered by Weight, they try it, by putting some of it to the boiling Liquor; for so, if the *Urine* be good, it will work like *Yeast* put to *Beer* or *Ale*; but if mingled, it will stir no more than so much Water.

It is observed, that the best *Urine* is that which comes from poor labouring People, who drink little strong Drink.

The boiling Pans are made of Lead, nine Feet long, five Feet broad, and two and a half deep, set upon Iron Plates about two Inches thick, which Pans are commonly new-cast, and the Plates repaired five times in two Years.

When the Work is begun, and Alum once made, then they save the Liquor which comes from the Alum, or wherein the Alum shoots, which they call *Mothers*; with this they fill two third Parts of the Boilers, and put in one third Part of fresh Liquor, which comes from the Pits. Being thus filled up with cold Liquors, the Fires, having never been drawn out, will boil again in less than two Hours time; and in every two Hours time, the Liquor will waste four Inches, and the Boilers are filled up again with green Liquor.

The Liquor, if good, will in boiling be greasy, as it were, at the Top; if nitrous, it will be thick, muddy, and red. In boiling twenty-four Hours, it will be thirty-six Pounds Weight; then is put into the Boiler about a Hoghead of the Lees of *Kelp*, of about two Penny-weight, which will reduce the whole Boiler to about twenty-seven Pounds Weight.

If the Liquor is good, as soon as the Lees of *Kelp* are put into the Boiler, they will work like *Yeast* put to *Beer*; but if the Liquor in the Boiler be nitrous, the *Kelp-Lees* will stir it but very little; and in that Case, the Workmen must put in the more and stronger Lees.

Presently after the *Kelp-Lees* are put into the Boiler, all the Liquor together is drawn into a Settler, as big as the Boiler, made of Lead, in which it stands about two Hours, in which time most of the *Nitre* and *Slam* sink to the Bottom.

This Separation is made by means of the *Kelp-Lees*; for when the whole Boiler consists of green Liquor drawn from the Pits, it is of a Power strong enough to cast off the *Slam* and *Nitre*; but when the *Mothers* are used, the *Kelp-Lees* are needful to make the said Separation.

Then the said Liquor is scooped out of the Settler, into a Cooler made of Deal Boards, and rammed with Clay. Into this is put twenty Gallons or more of *Urine*, more or less, according to the Goodness or Badness of the Liquor; for if the Liquor be red, and consequently nitrous, the more *Urine* is required.

In the Cooler, the Liquor, in temperate Weather, stands four Days. The second Day the Alum begins to strike, gather, and harden about the Sides, and at the Bottom of the Cooler.

If the Liquor should stand in the Cooler above three Days, it would, as they say, turn to *Copperas*.

The Use of *Urine* is as well to cast off the *Slam*, as to keep the *Kelp-Lees* from hardening the Alum too much.

In hot Weather, the Liquors will be one Day longer in cooling, and the Alum in gathering, than when the Weather is temperate. In frosty Weather, the Cold strikes the Alum too soon, not giving time for the *Nitre* or *Slam* to sink to the Bottom, whereby they are mingled with the Alum. This produceth double the Quantity; but, being foul, is consumed in the Washing.

When the Liquor hath stood four Days in the Cooler, then that call'd *Mothers* is scooped into a Cistern, the Alum remaining on the Sides, and at the Bottom; and from thence the *Mothers* are pumped back into the Boiler again; so that every five Days the Liquor is boiled again, until it evaporate, or turn into Alum or *Slam*.

The Alum taken from the Sides and Bottom of the Cooler, is put into a Cistern, and washed with Water, that hath been used for the same Purpose, being about twelve Pounds Weight, after which it is roached, as followeth:

Being washed, it is put into another Pan, with a Quantity of Water, where it melts and boils a little. Then it is scooped into a great Cask, where it commonly stands ten Days, and is then fit to take down for the Market.

The Liquors are weighed by the Troy Weight, so that half a Pint of Liquor must weigh more than so much Water, by so many Penny-weight. *Phil. Trans. Abr. Vol. 2.*

Somewhat different from this is the Account given by *Hoffman*, of the Production of Alum at the Works near *Hall*, in *Saxony*. As this Author's Experiments and Remarks upon ALUM are curious and instructive, I shall insert them here.

Of the Generation and Nature of ALUM.

As Vitriol is produced from a sulphureous Mineral, either simple or compound, that is, of Iron and Copper, so Alum, which is, as it were, a kind of white Vitriol, is also generated of a sulphureous Mineral, partly bituminous, partly luteous. Therefore the Acid which is extracted from Alum, seems to be of the same Nature and Properties with what is afforded by Vitriol, whatever Difference there is in the Earths, or Receptacles, in which both these Kinds of Salts are coagulated. For the Caput Mortuum of Vitriol is of a Metalline, that is to say, of an Irony or Copper-like Quality; but the Earth of Alum seems to be a peculiar Kind of Bole, very spongy and subtil.

The remarkable Agreement between the Acids of Vitriol and Alum will abundantly appear from the following Experiments:

1. Vitriol of Iron is prepared with Spirit of Alum, and with Iron, as well as with Spirit of Vitriol; and Aqua-fortis is as well made with Alum as Vitriol and Nitre. Again, if the Acid of Alum, by the Mixture of alkaline Salt, be converted into a neutral Salt, and this Salt, with a little Salt of Tartar and Powder of Charcoal, be melted in a Crucible, there is produced a red Mass like Liver of Sulphur, in the same manner, as it usually happens, when the Acid of Vitriol or Sulphur is fixed by Salt of Tartar, or the alkaline Salt contained in Nitre or common Salt, and converted into a neutral Salt.

Tho' Vitriol and Alum be produced, as it were, from the same Matter, and from one sulphureous Matrix, yet each of them is endued with peculiar Properties and Virtues. For Alum and Vitriol are very different in Taste; and the common Vitriol leaves no such Astringency on the Palate, as is observed in Alum. Again, a Solution of Alum makes no Commotion nor Precipitation in a Solution of Gold or Silver, which a Solution of Vitriol is known to effect. Nor will a Decoction of Galls, or Pomegranate Flowers, grow black, and be converted into Ink, by the Mixture and Solution of Alum, as we observe it does when mix'd with a Solution of Vitriol. Lastly, in Alum, the Acid may be readily separated, by the Help of Fire, from its earthy Principle, in which it is inherent; but the Case is otherwise with Vitriol.

To proceed, in Alum the Acid is very much saturated with its Earth; for an Ounce and a half of Alum, by a vehement Calcination, affords six Drams and a half of aluminous Earth, quite insipid. That there is a less Portion of Acid in Alum than in Vitriol, may be known by this, that the Acid of Vitriol, saturated with a Solution of Pot-ash, produces a far greater Quantity of Sal Enixus, than would be afforded by a Solution of Alum saturated with the same Lixivium.

Besides, the Salt this way prepared of Alum is more successful in loosening and purging the Belly, than what is prepared of Vitriol, according to the Method of *Tackenius*. And not long since I met with a Phenomenon not unworthy to be related, which is, That while I was managing and beating this Salt in a Mortar, it emitted Sparks in great Plenty, which I never observed in any other Salt.

Here we must not pass over a very fine Experiment of *Hombert's*, who with three Parts of Alum, and one Part of any combustible Matter, which turns to a Coal, by a previous Calcination, Distillation, and Ignition, in a closed Vessel, prepared a Phosphorus, or sulphureous Matter, which immediately kindled at the free Access of Air. But this inflammable Matter cannot be produced with the Acid of Vitriol; nor the Spirit of Salt or Nitre; a plain Indication, that the Acid of Alum, as being more subtil, has a freer Ingress into the phlogistic Earth, than the Acid of Vitriol itself. See below *Hombert's Memoire*.

But it happens, that tho' Alum is known almost to every body, yet its mineral Elements and Preparations are not clearly understood by the curious Naturalists. Wherefore I thought it worth my Pains in this Place, to shew the Way how some thousands of Quintals are yearly made at the Village of *Schwenzel*, near the City of *Tieben*, five Miles from *Hall*, where are very plentiful Mines of Alum.

Near this Village are Strata of bituminous Matter, of vast Extent, which Matter is the Matrix of this Salt. These Strata lie two or three Yards deep, whence they dig the Earth, which is of a blackish Colour, and of an astringent aluminous Taste. If this mineral Earth be thrown into the Fire, it not only kindles, but emits a strong and foetid Smell, like mineral Sulphur set on Fire. When burnt out, there remains a spongy tasteless Mass of an Ash-colour.

The fresh Mineral Earth is thrown into Heaps, which lie a Month expos'd to the open Air; then they remove it into Vats, and are for some Days extracting the Salt by Affusions of Water; after which, the Lye is convey'd by Pipes into leaden Cauldrons, and boiled. When the Liquor is inspissated by the Consumption of one half, they mix it with a Solution of Pot-ash. This excites a vehement Ebullition with a Spumescence, and a Powder in great Plenty subsides to the Bottom. When every thing is cool, they take off the yellow Liquor, that swims at the Top, and the white aluminous Meal at the Bottom is dissolved in Water, and boiled anew; the Water, well saturated with Salt, is poured into great Vats, which stand together closed up for some Weeks. The Vessels being open'd, Crystals of a vast Bigness, in the Figure of an Octohedron, are seen sticking to the Sides.

Besides this, it is observable, that these vast Heaps of Alum Ore are kindled merely by the Heat of the Sun, and burst into open Flames, which require the utmost Care and Pains to extinguish by Affusions of Water. For when the Salt of the Alum is dissolved by the Rains, it begins to act upon its bituminous Earth; so that a rapid intestine Motion being by this means excited, not only a Heat and Smoke, but even Flames are produced, almost in the same manner as it happens when a

Mass, consisting of equal Portions of Sulphur and Filings of Steel, is moistened with Water, where, in a few Hours, arises an Ebullition, the Mass swells, sends forth a Smoke, and at last a sulphureous Flame ascends. These Experiments directly lead us to the Explication of the Nature and Causes of subterraneous Heat.

Moreover, it is worth Notice, that if these mineral Earths, after they are deprived of their Salt, are thrown together again in Heaps, and expos'd to the open Air for a whole Year, they become impregnated with a very aluminous Salt, so as to serve for a new Preparation of Alum, and that for three Years together.

Hence it appears very plainly, that aluminous Salt is regenerated by the Air, and doubtless contains some universal Acid, which with the inflammable bituminous Parts, in Conjunction with the earthy ones, constitutes the Salt of Alum; nor do I know any Salt, that can be so soon regenerated from its exhausted Mineral Earth; for if crude Alum be calcined by a pretty strong Fire, to such a Degree, that no Mark of Salt remain in its spongy Earth, and this Earth be afterwards for some Days expos'd to the open Air, it not only increases in Weight, but recovers its aluminous Taste, and makes an Effervescence with infilled Oil of Tartar *per Deliquium*.

In boiling of Alum, there is also one thing worthy to be inquired into, which is, that Alum cannot be brought into any solid Form, much less reduced into Crystals, from its Lye, without the Addition of Pot-ash, or some alkaline Salt. The Reason of this singular Effect and Phenomenon seems to consist in what follows: The Lye of the Mineral Earth is too acid, and too sulphureous; but because the sulphureous Liquor, in which the Acid is predominant, is very difficult to be formed into a solid saline Consistence, there needs the Accession of an Alkali, which partly saturates the redundant Acid, and partly imbibes and absorbs the pinguious and sulphureous Matter, which hinders Crystallization; by which means the Spicula may wedge themselves the more closely together, and form a more perfect Coalescence. Formerly, and even now, in other Places where they boil Alum, instead of Pot-ash, they use human Urine putrefy'd, because of the urinous volatile Salt, by which the redundant Acid is temper'd; but since the Invention of so cheap and easy an Expedient, Urine is no longer used.

The Skilful in Chymistry know what Care and Industry were employ'd in finding out some Means for volatilizing the fixed Salt of Tartar, since *Helmont* attributed a wonderful Efficacy to this Salt in curing Diseases. Hence, that otherwise celebrated Physician and Chymist, *Daniel Ludovici*, in a particular Treatise of the *Volatilization of the Salt of Tartar*, communicated to the Public a Method to effect it; for while he was distilling crude Alum mix'd with Salt of Tartar, there came forth a volatile urinous Spirit. The good Man, who was perfectly sincere, believed, that this fixed Salt was render'd volatile; but he was not aware, that Alum, according to the vulgar Method, was prepared by an Addition of human Urine, and that his volatile Salt had no other Original; for when volatile Salt is fixed by the Acid of Alum, and there is afterwards an Accession of alkaline Salt, it is again set at Liberty, in the same manner as it happens with Sal Ammoniac. Wherefore if the same Experiment be try'd upon Alum, which has not been mix'd with human Urine, but Pot-ash in the Boiling, neither Salt nor volatile Spirit will manifest themselves.

In the last Place, I think it proper to advise, that the Salt called *Epsom Salt*, which in great Quantities is exported from *England* to many other Countries, and is really a very elegant and safe Cathartic, may be prepared of Alum and common Salt. Now whoever undertakes to prepare this Salt from crude Alum, and common Salt, such as it is sold in the Shops, will come short of his Aim; but whoever tries the Experiment with a Solution of the mineral Earth of Alum, and the Lixivium which remains in the Boiling of common Salt, and proceeds in a right Method, will hardly fail of accomplishing his Desire. *Hoffman. Observ. Physico-Chym. Lib. 3. Obs. 8.*

The way of making Alum in *Italy* is contain'd in the following Extract, from the History of the Royal Academy of Sciences:

M. Geoffroy had an exact Information, in *Italy*, of the way of making Roch-Alum at the Alum-Works of *Civita Vecchia*. Near that City are Quarries of a greyish or reddish Stone, pretty hard, like the Travertin. They calcine it in Kilns, and then boil the Calx in Water over a great Fire. The Water takes out all the Salt that is in the Alum, there separates from it a useless Earth; and, at last, the Water is left to cool, impregnated with a Salt, which, for several Days together, shoots into Crystals, like Tartar, about the Casks, and makes what we call *Roch-Alum*.

Alum is also made at the *Solfatara*, near *Puzzoli*, in the Kingdom of *Naples*. The *Solfatara* was formerly a burning Mountain, of which there remains nothing but the Ruins, and a Circle of Rocks, which are of a yellowish White, dry, half-burnt, and calcined; from which, in several Places, there issues forth a very thick Smoke. The Natives have it by Tradition, That the Earth, which was between these Rocks, and made

the Top of the Mountain, sunk down to a certain Height. After mounting these burning Rocks, you descend into a little hollow Plain, which must have been the Top. It is nearly oval, being one thousand two hundred forty six Feet in Length; where it is longest, and a thousand Feet in Breadth. The Earth of this Plain is a yellow and white Substance, all saline, and so hot, that in some Places you cannot suffer your Hand long upon it. In Summer the Surface of this Earth is spread with a saline Flour or Dust, which they need only to sweep together, and then shovel it into the Ditches, which are full of Water at the Bottom of the Plain; after which, to evaporate the Water, which is impregnated with Salt, and depurated from Earth, they want no other Fire than what burns under the Mountain. The Water is put into large Kettles sunk in the Ground, which is their only Method. This Alum does not bear so great a Price as that of *Givita Vecchia*. They make also Sulphur at the *Solfatara*, whence the Place too has its Name.

It appears by all the Preparations of Alum, that the same Mine which produces it, produces also, or might produce, Sulphur, Nitre, and Vitriol; and perhaps these different Minerals are no other at Bottom, than the same Principle disguised in these four Salts, according as it is mixed by Nature with other Substances, or undergoes Operations by Man. M. *Geoffroy* thinks he has Reason to conclude, that the Alum of England and Sweden participates more of Vitriol, and the Italian of Sea-salt; which Consideration might occasion a Variation in some nice Operations, and change the Effect of some Remedies, which require an extraordinary Preciseness. *Hist. de l'Acad. Roy. des Scienc. 1702.*

Alum, when united with sulphureous Substances of many sorts, has a very remarkable Quality of taking Fire itself, and communicating it to all inflammable Substances, by only being exposed to the Air. This Discovery was made by M. *Homburg*, and farther examin'd by the Gentlemen of the Royal Academy of Sciences, the Particulars of which are contained in the following Papers:

Take four Ounces of Excrement, newly voided, and mix with it the like Weight of Roch-Alum, grossly pounded. Put the Whole into a little iron Pan, which will hold about a Pint of Water, and set it in a Chimney over a small Fire of Coals; the Mixture will melt, and become as liquid as Water. Let it boil over a small Fire, and keep stirring it with an iron Spatula: Continue this Fire till the Matter be dry: It will grow difficult at last to be stirr'd, but you must continue to roast it in the Pan, always stirring it, and breaking of it into small Bits, and scraping off with the Spatula whatever sticks to the Bottom and Sides of the Pan, till it be perfectly dry. You must, from time to time, take the Pan off the Fire, that it may not grow red-hot; and also remove the Matter from the Fire, to prevent its sticking in too great Quantities to the Pan. When the Matter is become perfectly dry, and in small Crumbs, you must let it cool, and then pound it small in a Mortar of Metal. After this, you must put it again in the Pan over the Fire, continually stirring it. It will still contract a little Humidity, and gather into Clots, which you must continue to roast, still breaking them as before, till they are perfectly dry; let them cool; then pound them to fine Powder, which must be put in the Pan the third Time, and placed over the Fire, and roasted till perfectly dry. This done, pound it over again to a very fine Powder, which put up in a Paper, to be kept in a dry Place. And this is the first or preparatory Operation.

Take two or three Drams of this Powder, and put it into a small Matrafs, whose Belly is capable of containing an Ounce, or an Ounce and half, of Water, and whose Neck is six or seven Inches in Length: Order it so, that the Powder may take up no more than about one third of the Matrafs; close the Neck of the Matrafs very slightly with a Stopple of Paper; then take a Crucible four or five Fingers Breadth in Height, and in the Bottom thereof put three or four Spoonfuls of Sand: Upon this Sand place the Matrafs in the Middle of the Crucible; that is to say, so as not to touch the Sides. After this, fill up the Crucible with Sand, that the Belly of the Matrafs may be bury'd in it. This done, place the Crucible with the Matrafs in the Midst of a small earthen Stove, which has the Opening at the Top of about ten Inches wide, and is in Depth to the Grate six Inches. Put live Coals all round the Crucible, to half its Height, for the Space of half an Hour; then lay on more Coals, till they reach the Brim of the Crucible. Keep the same Fire for a good Half-hour, or till you see the Inside of the Matrafs begin to be red; then augment the Fire by heaping Coals above the Brims of the Crucible, and keep this great Fire for the Space of a full Hour, after which let it alone to go out.

In the Beginning of this last Operation there will come forth thick Fumes through the Neck of the Matrafs, across the paper Stopple. These Fumes sometimes come in so great Abundance, as to throw off the Stopple, which must be replaced, and the Fire diminished. These Fumes cease when the Inside of the Matrafs begins to grow red; then is the Time to increase the Fire, without being apprehensive of spoiling the Operation.

When the Crucible is cold enough to be taken out of the Stove without fear of burning the Hand, the Matrafs must be lifted out of the Sand as far as the Middle of its Belly, and left to cool for about half a Quarter of an Hour; then it must be taken quite out, and rested a Moment on the Sand. But if you are not in Haste, or if the Operation be performed in the Winter, it would be better to let the Matrafs grow quite cold in the Crucible before you take it out. 'Tis advisable also, at the same time, to put a Cork in the Neck of the Bottle, instead of the paper Stopple, to prevent as much as possible the Ingress of the Air into the Matrafs.

If the Matter, which is at the Bottom of the Matrafs, turns to Powder in the stirring, 'tis a Sign that the Operation is well perform'd; if it form a Cake, which will not resolve into Powder at the shaking of the Matrafs, it shews that the Powder was not roasted and dry'd enough, in the iron Pan, during the preparatory Operation.

Having successfully gone through the Operations, that is, having got your Matter in Powder in the Matrafs, pour a little of it, about the Quantity of a small Pea, upon a Bit of Paper, and quickly stop the Bottle again. In a Moment after the Powder has been upon the Paper, it will begin to smoke, and at the same time to kindle, and will set Fire to the Paper, or any other combustible Substance.

If you happen to pour too much Powder out of the Matrafs, you must not put it back, tho' it be not yet kindled; for it would be sure to set Fire to all the Powder in the Matrafs. Hence it appears, that there is no pouring of it from the Matrafs into another Vial, but it must always remain in the same Vessel where it was calcined.

This Powder is of different Colours, sometimes black, brown, red, green, yellow, and even white, according to the Vessel in which the preparatory Operation is made, and according to the Degrees of Fire given it under the two Operations. If you mix too much or too little Alum with the Excrement, the Powder will not kindle.

It kindles in the Day, as well as in the Night, without putting one to the Trouble of rubbing, chafing, or even mixing it with any other combustible Matter; and in this respect it is different from all the other facitious Phosphori as yet known to us; for that made of Urine stands in Need of a small Degree of Heat in order to make it shine or kindle. The *Smaragdine Phosphorus* requires a great deal of Heat before it can produce its Effect. The *Bolognian*, and the *Phosphorus of Baldwinus*, only shine during the Day, but produce no Effect in the Night. The distill'd Oils of Cinnamon, Cloves, *Sassafras*, and some others, do not kindle without Fire, unless they be mixed with well rectified Spirit of Nitre. The Phosphorus describ'd by me in the Memoirs of the Academy for the Year 1693, does not become luminous till briskly rubb'd, or struck with some hard Body.

I have only yet made this Powder of Ordure or Excrement: But I am persuaded it may also be made of Urine; and I even believe, that Urine, treated in this Manner, will yield a greater Quantity of its Phosphorus, than when manag'd in the common way; and that its *Caput Mortuum*, even after the Distillation of the Phosphorus, will yield this Powder.

I have made three different kinds of it. The first sets Fire to combustible Substances, without appearing to be kindled itself: The second not only kindles them, but burns itself like a Coal: And the third, at the same time that it kindles other combustible Substances, flames itself like a Wax-candle, according as it has had more or less Fire in its Preparation, or more or less Alum in its Composition.

In order to preserve this Powder good for any considerable time, it is necessary to keep it in a dry, well-air'd Place, to have the Bottle well-cork'd, with its Mouth always upright, and to cover it with Paper, or some other Substance; it is also proper it should be lodg'd in a dark Place, because a great Light spoils it as much as the Humidity of the Air, tho' not so soon.

In order to have a tolerable Idea of the precise Manner in which this Powder kindles, 'tis necessary to remember, that 'tis a Substance strongly calcin'd by the Fire, and that by that Calcination it has lost all its aqueous Part, and the greatest Part of its Oil and volatile Salts. By this means it has acquir'd a great many large Pores, which the volatile Matter driven out by the Fire have left empty; so that the Powder which remains after Calcination, consists only of a spongy Contexture of earthy Matter, which has retained all its fixed Salt, and a little of its foetid Oil; but the empty Pores retain for some time

a Part of the Flame which enter'd them during the Calcination, almost in the same Manner with quick Lime.

As this is the Case, we must consider, that the fixed Salt which abounds in this Powder, quickly absorbs, as it commonly does, the Humidity of the Air that comes into Contact with it. This sudden Rushing of the humid Air into the Pores of the Powder, occasions a Friction capable of producing a little Heat, which, being join'd to the Parts of the Flame retain'd in the same Pores, generates a Heat sufficient to set on Fire the small Quantity of inflammable Oil which had escap'd the Rigour of the Calcination, and which is a Part of the Powder.

As a Proof of this it may be alledg'd, that when this Powder is kept in a Vessel that is not closely stop'd, it absorbs slowly, and by Degrees the Humidity of the Air that reaches it, which not being able to produce a Friction sufficient to generate a sensible Heat, spoils the Powder, so that it will kindle no more; just like quick Lime when expos'd to the Air for some time, retains its Heat no longer, because it has by little and little absorb'd too small a Quantity of Humidity at a time, for producing a Friction capable of exciting Heat.

Quick Lime, which contains Particles of Fire, as well as our Powder, does not produce Heat by the Humidity of the Air alone, as our Powder does, but it must be moistened by throwing Water on it before it has the same Degree of Heat. The Reason of this is, because the Lime does not, like our Powder, contain a Salt capable of absorbing a great deal of humid Air at a time, the violent Rushing in of which might produce Heat; but Water, when thrown upon it, rushes into it suddenly enough to produce the same Effect.

And the Reason why quick Lime does not, like our Powder, produce a Flame, tho' it contracts as great a Heat, is, because in quick Lime there is no oily Matter capable of being kindled by the Heat excited, as there is in our Powder; but if an Oil be artificially mix'd with quick Lime, it kindles in the same Manner.

We said before, that a free Light spoils this Powder, tho' shut up in a glass Vessel well stop'd. The Reason of this is, that the Friction produced by the Rushing in of the Humidity of the Air, is not the only Cause of a Heat capable of kindling the Oil contain'd in our Powder: The Particles of Fire which it has retain'd in its Pores, contribute also something to that Effect: And as in the Day-time when the Matter of the Light always in great Motion perpetually strikes the Powder through the Glass, it disengages by little and little that Fire which had been lodg'd in it during Calcination; and diminishes it so much, that at last there remains no more of it to join the Heat produced by the Friction of the Air's Humidity, and is consequently render'd incapable of kindling. *Mr. Homberg, Mem. de l'Acad. Roy. des Sciences, Ann. 1711.*

An Account of different Substances, which, join'd with Alum, make a Phosphorus. By M. Lemery.

M. Homberg having given us, in the Memoires of 1711, a Description of a new Phosphorus, made with Alum and human Ordure, which being expos'd to the Air thence as well by Day as by Night, and set on Fire every combustible Matter that came near it, and need'd not to be rubb'd or chafed like what is made of Urine by Distillation, it put me upon examining whether there were no other sulphureous Matters capable of producing the same Effects in Conjunction with Alum.

My first Operation was upon Urine, whence, I thought, agreeable to Mr. Homberg's Opinion, the greatest Quantity of Phosphorus could be extract'd by a well known Method, I evaporated then a good Quantity of Urine to the Consistence of thick Honey: Of this I took four Ounces, which I mix'd with the like Weight of Roch-Alum pulveris'd in an Iron Pan over a small Fire, to consume the Humidity, continually stirring and breaking it till it was perfectly dry; and when it was cool, I reduced it to Powder, and kept it in a dry Place.

After this I put it in a small Matrafs, of which it took up a third Part, and stopp'd the Neck with a Stopple of Paper. I then took a Crucible, of the Depth of four or five Fingers, in the Bottom of which I put a little Sand, and placed the Matrafs upon it, and surrounded the rest of the Matrafs with Sand. This done, I placed the Crucible in a little Stove, and made a Fire about it of one Degree of Heat for half an Hour. When the Vessel was hot, I augmented the Fire till the Matter grew red, which took up about an Hour and a Quarter. Then I let the Fire go out, and stopp'd the Bottle very well with a Cork, taking care however to let it cool by Degrees before I quite clos'd it, lest the Vessel should burst, which indeed once happen'd, when having stopp'd my Matrafs too soon, the rarefy'd Vapour which continu'd to ascend from the Matter, finding no Vent by the Neck, burst a Hole in the Bottom of the Matrafs, and moreover destroy'd in a manner the Shape of the Vessel, which being pretty thin, the sooner gave way to the Efforts of the Vapour.

When the Matter was cool enough, I pour'd it upon a Paper, and it neither burn'd nor so much as heated it. It was of a grey Colour.

The same Process serv'd for all the other Substances I try'd afterwards. Blood with an equal Quantity of Alum made a Phosphorus that kindled pretty quick.

The Yolk of an Egg, manag'd in the same manner, made a very good Phosphorus, but the White did nothing at all.

Cantharides, and Earth-worms, did not succeed very well. Beef, Mutton, Veal, chopp'd and pounded long enough to make them pass through a Sieve, and mix'd with an equal Quantity of Alum, produced a Phosphorus like that of Blood.

Among animal Substances, Urine, and the White of an Egg, being the only ones that would not serve for a Phosphorus with an equal Quantity of Alum, I try'd what double the Quantity of Alum would do, but without Success.

Afterwards I made Trials whether those Phosphori, which had succeeded with an equal Quantity of Alum, would succeed with double the same; in which Procedure Blood, the Yolk of an Egg, the several sorts of Flesh before-mentioned, Flies, and Worms, made a Phosphorus, which seem'd to me to kindle quicker than when I us'd an equal Quantity of Alum: This gave me the Curiosity to augment by Degrees the Quantity of Alum.

I observ'd, that six Parts of Alum to one Part of the sulphureous Substances before-mention'd made a Phosphorus that burnt more briskly than those of the preceding Trials. Seven Parts of Alum did as well as six; but eight had scarce any Strength at all, and would not kindle but when it was hot, and just taken out of the Fire; and two or three Hours after it was made, would do nothing at all; whereas the others kept their Virtues above eight Days, provided they were well stopp'd.

Ten Parts of Alum to one of those sulphureous Substances never made any Phosphorus: Urine, and the White of an Egg, never succeeded with any Proportions of Alum which produc'd Phosphorus with other Matters.

From Animals I pass'd to Vegetables, and began with Seeds. The Flour of Wheat, Barley, and Rye, would not kindle with equal Quantities of Alum, as did the animal Substances; but from double to seven times the Quantity of Alum, the Phosphorus kindled better and better, and burnt almost as well as that made of Blood, or the Yolk of an Egg.

Honey likewise did nothing with an equal Quantity, but succeeded very well with six Parts of Alum.

The Leaves of Rosemary, Baum, and Senna, made a Phosphorus with two, three, and four Parts of Alum, but did nothing with five or six; but their Phosphorus did not hold long, and had no good Effect, but when it was a little hot: That of Senna seem'd stronger than the others.

Flowers with three and four Parts of Alum kindled well, especially Roses.

Woods of Sassafras and Guaiacum afforded a Phosphorus: But it must be observ'd, that in order to extract one from these Woods, the Fire must not be so great as for other Substances; without this Precaution you will obtain nothing.

The Roots of Orris and Rhubarb did not kindle well but with two or three Parts of Alum, and succeeded not with more.

As the Phosphorus is made by means of the oily Substance contain'd in those Bodies, I imagin'd that the Oils separated from the other Principles, might, as well as the other Substances above-mentioned, make a Phosphorus. But I found a great Difference, for they produced nothing with an equal, double, or triple Quantity of Alum; and though, by gradually increasing, five Parts of Alum to one of these Oils afforded a Phosphorus, yet it was very languid in Comparison of one extract'd from Animals and Seeds. What was particular, they kindled with ten Parts of Alum, which other Matters would not do. 'Tis true, ten Parts of Alum to one did not make so good a Phosphorus as five to one. The Oils I made use of were those of sweet Almonds, Olives, Guaiacum, and Hartshorn; of these the two last did best.

After this I divert'd my Operations to Minerals and Metals, as Iron, common Sulphur, Antimony, golden Sulphur of Antimony, and some others. I mix'd them with different Proportions of Alum, but not one of them produced any Flame, nor so much as Heat; whence it appears, that to make such a Phosphorus as M. Homberg's, we must have recourse to animal and vegetable Substances.

I shall next examine, whether any other Salt may be substituted instead of Alum, in order to make this Phosphorus.

By the different Analysis of Salts that are known to us, it appears, that the Acid of Vitriol, common Sulphur, and Alum, are of the same Nature, I had therefore a Mind to try if one of these might not be substituted for the other. And as M. Homberg had observ'd, that he had rare Success with Colcothar, I fancy'd that Vitriol, which is much more pregnant with Acids, might have more Effect: I us'd it then after the same manner as I did Alum, but to no Purpose; I could never make any thing even of Colcothar, whatever Trials I made. Perhaps I was wanting in some Circumstances, having several times experienc'd, that the Success of some Operations

which

which I made on Vegetables, often depended either upon a little Variation of the Fire, or the Quantity of Alum.

I next try'd Salt of Sulphur, which is known to be an artificial Salt, compounded of the Acid of Sulphur, incorporated into the Pores of Salt of Tartar, but with the same Success. Sea-salt, Crystals of Tartar, Borax, vitriolated Tartar, and Salt of Tartar, mix'd in different Proportions with these Substances, had no Effect.

Saltpetre in our Operation did as it uses to do when mix'd with other oily Substances; that is, when the Matter has been warmed, it flew out of the Matrafs with a great Noise and Detonation, and consequently no Phosphorus was to be made of it: But if to a Phosphorus made with Alum, and just on the Point of kindling, you add Saltpetre well dry'd, at the rate of two Drams to half an Ounce of Matter, which you may mix together very well in the Matrafs; after it is close stopped, you will find, that being pour'd upon Paper, the Phosphorus will burn with much greater Strength, than it did before it was mix'd with the Sulphur.

Lastly, I was willing to see if Acids, disengag'd from their earthy or metallic Parts, as they actually are in Spirits of Nitre, of Salt, and of Vitriol, would succeed better than the concreted Salts from whence these Spirits were extracted; but all these, together with the Spirit of Alum itself, had no better Success than the Salts before-mention'd. *Memoires de l'Acad. Roy. des Scienc. 1714.*

Though a vast Variety of oily Substances are proper to enter the Composition of M. *Hamburg's* Phosphorus, yet no other acid Mineral is necessary to be join'd; than what that Gentleman only used, which is Alum. We shall give a general Idea of this Phosphorus, which is of such a Nature, as at all Times, and without any Assistance, to be kindled by Air alone. For the better understanding how this is to be effected, we shall make use of two known Phosphori. The first which has not the Name, and but imperfectly the Nature, is Lime: It is full of an Infinity of fiery Particles, introduc'd by Calcination, and imprison'd in an Infinity of little Cells. This Matter, being extremely dry, greedily receives the Water poured on it; and the Water impetuously penetrating and opening the Prisons of these Particles of Fire, frees them, and so causes an Effervescence, and a very sensible Heat, over all the Substance of the Lime. This Water kindles this kind of Phosphorus, not by itself, but by the Liberty of Action which it procures to the Particles of Fire.

The second Phosphorus is the essential Oils of *Indian* aromatic Plants, which kindle into a Flame as soon as you pour on them acid Spirits well dephlegmated.

In these two Phosphori the Water does not act immediately of itself. In the first we have already prov'd it; in the second, the Acids alone act on the Oil, which is almost entirely void of them; and the Phlegm or Water, in which these Acids swim, is no more than their Vehicle. This second Phosphorus only burns, because there is nothing but Sulphurs or Oils that will burn, of which there are none in the Lime; and Oils themselves will not burn, but when they are animated by some Acid. Common Sulphur wholly depriv'd of it would not burn. We are certain then, that an oily Matter, whose Acids are separated from it, will be set on Flame, as soon as Acids of a good Degree of Purity shall come upon it, so as to penetrate it with Violence.

But if you would have the Matter be kindled by the Air only, the Air will not furnish the necessary Acids; for it either contains them not, or not in a Body strong enough for the Purpose. The Acids then must be contained in the oily Matter of the Phosphorus, but in such a manner, as not to be intimately united with it, but only, as it were, mixed with it by small separate Parcels, so as to want a more perfect Union.

For this End the Acids must be for the present shut up in their little Cells, but in so loose a manner, that the least Shock will dislodge them, and make way for their sudden Irruption into the oily Matter, and Penetration into its most intimate Parts. To this Purpose the Air will be sufficient, not of itself, but by the aqueous Humidity it contains, that is, by the very small Parcels of Water, which, by dissolving the Acids that are proportion'd to them, put them on Action. This subtle and invisible Water works the same Effect in this Phosphorus, that the gross and common Water did in the two others of which we have spoken; for besides putting the Acids in Action, it also disengages the Particles of Fire which the new Phosphorus requires in the Operation.

Here you have the System of this Phosphorus: It is no easy Matter to prove by Ratiocination, that such a thing is possible to be effected; but as we know by Experience, that it is actually so, these are probably the Principles of its Formation.

Hence we see of what a delicate Nature it is, and how the Circumstances on which it depends ought to be just, and the Quantities of Ingredients nicely proportion'd: For Example, that the oily Matter, which must be deprived of its Acids, and the concrete Salt, which is to supply the Acids, might be cal-

cined together, there is nothing but Alum which can be that concrete Salt, which in spite of Calcination preserves a Quantity of Acids necessary for the Effects of a Phosphorus, and also keeps them as loosely confined in their Cells, as the Matter requires. This depends almost upon an indivisible Point. The oily Matter having lost its Acids, which were carry'd off by the Fire of the Calcination, there remain their forsaken Cells, and it is the Alkali which absorbs the new supervening Acids: Wherefore, that there might be a sufficient Supply to fill these Cells, and to penetrate the oily Substance, it is necessary that the Quantity of Alum be exactly proportion'd to the particular Nature of the oily Matter. The more Alkali or fixed Salts remain after Calcination, the greater is to be the Quantity of Alum; for which Reason animal Oils, which have less fixed Salt than Vegetables, need a less Quantity of Alum. *Hist. de l'Acad. Roy. des Scienc. 1715.*

M. *Boulduc*, resolving to make an Examen of *Ebsom's* Salt, was immediately inclined to think, by some Marks, and especially the Swelling of that Salt, when it is begun to be distilled, in which it altogether resembles calcined Alum, that it participated much of an aluminous Nature; to discover which, he made continual Operations upon Alum combined with other different saline Substances. What succeeded best was Salt of Tartar, or Oil of Tartar *per Deliquium*.

Alum is an acid Spirit, which is impregnated in the Bowels of the Earth with earthy and alkaline Particles, enough to make it a concrete Salt. Now Salt of Tartar, pour'd on a Solution of Alum, being a more powerful Alkali than the earthy Matter united with the Acid of Alum, forces them to separate, and the Earth of the Alum precipitates, and there is a new Union of the Acid of Alum, with the Alkali of Tartar, whence results a new concrete Salt, entirely divested of its earthy Matter.

After M. *Boulduc* had made several Trials, and given his Salt all the Perfection he was able to do, he found it in all respects resembling that of *Ebsom's*, only not quite so bitter, but the Difference was too inconsiderable to be regarded. But this Salt of M. *Boulduc* had the Advantage of being discharged of its earthy Part, which the other wanted; for when mixed with the Oil of Tartar, it precipitated a white and earthy Matter, like what was precipitated from Alum after the like Mixture, and even somewhat more in Quantity. M. *Boulduc*, who thought himself the Inventor of this Preparation of Alum with Salt of Tartar, found it afterwards in *Hartman's*. *Hist. de l'Acad. Roy. des Scienc. 1718.*

M. *Geoffroy* discover'd, that the Basis of Alum was a Solar Earth dissolv'd by an Acid.

Boles are a sort of fat, soft, brittle Earth. The Pieces of Pipes in *Holland* which are made of these sorts of Earth, and the Fragments of our common Pottery-ware, which imbibe a good deal of Acid, because the Fire which bak'd them, open'd their Pores, afforded true Crystals of Alum: And it is further observable, that these Pipes, at the End of two Years, shot forth fine Threads like those of plumose Alum, which grew and vegetated in the Air. *Histoire de l'Academ. Royale des Sciences, 1728.*

M. *Geoffroy*, before quoted, says, That

Besides those Mines which contain Sulphur, Vitriol, and Alum, there are some purely of Alum. They who have hitherto written upon that Salt, have told us, that the Base which coagulates the vitriolic Acid, is a white Earth not vitrifiable, and of the same Nature as Chalk.

I have prov'd by Experiments, says he, that this Earth is dispersed and mixed in very many Substances, and especially in Boles and Clays that are bak'd, since they have all afforded me, with the Acid of Sulphur, or the Acid of Vitriol, that Salt [Alum] which I had a Mind to imitate: It is no longer surprising then, that there should be Glass which produced Alum, since it inclosed Matter capable of forming it, as soon as the vitriolic Acid should have Strength to make its Way between the Laminæ of the Glass, where that Earth was lodged, in order to join it.

My Experiment for producing Alum, that best succeeded, was thus managed: I took some of our common Potters Vessels that were not varnished, but porous and brittle, and sprinkled them with Spirit of Sulphur, and they imbib'd it more perfectly than Earths not bak'd, because their Pores are more open. They fermented slightly with this Spirit, which in the Digestion became mucilaginous; and that Mucilage, being exposed to the Air, produced Crystals of Alum, which increased by Degrees, and took the most exact Figure that was possible for that Salt to have. *Memoires de l'Acad. Roy. de Sci. 1728.*

The factitious Alum is distinguished only by the Countries where it is made, into a great many different kinds; and if it is in large Masses, like Rocks, it is termed Rock or Roch-Alum; and if it looks like the Fragments of Ice, it is termed Glacial, or Icy-Alum. Factitious Alum was entirely unknown to the Antients, but with us is the only kind in Use; for we now know very little of the natural kinds, which were formerly so common.

common. *M. Tournefort* found two Species of natural Alum in the Island *Milos*, or *Milo*; one was in *Strata*, or *Crusts*, of an astringent Taste, and an Ash-colour, covered with some filamentary Efflorescences, which smelled like *Aqua fortis*, but not near so strongly: The other was the capillaceous or filamentary kind, or true *Alumen Plumosum*; it was in small Pieces, of the Thickness and Length of a Man's Finger, and might, by beginning at the Ends, be easily divided into small greyish Filaments, resembling a Tuft, or Pencil; it was soluble in Water, and melted in the Fire, and of an astringent Taste. Even in *Dioscorides's* Time, this Alum seems to be confounded with the *Lapis Amiantus*; for that Author, talking of the Sciffile-Alum, observes, that there was a Stone very like it, and that the way to distinguish them was by the astringent Taste of the Alum, which the Stone had not: And he might have added, That it could not be melted by Fire, nor dissolved in Water. The History of Medicines being afterwards quite lost in the Ages of Ignorance and Darkness, the Name of the Salt was given to the Stone, and from thence it is, that it is still found thus mistaken in some Dispensatories.

Alum is a strong, astringent, acid Drier: The native Alum smells a little like *Aqua fortis*, but the factitious has little or no Smell; when thrown upon live Coals, it rises in Bubbles, and melts in Water: The Crystals of Alum have eight Sides, representing an hexagonal Pyramid, with the Angles cut off, or they are bounded by four hexagonal and four triangular Surfaces. A Solution of Alum coagulates Milk, turns the Tincture of Heliotropium purple, makes no Alteration in the Solution of corrosive Sublimate, turns the Infusion of Galls turbid and whitish; with Salt of Tartar it concretes into a white Coagulum, without any sensible Heat or Smoak; and often upon mixing this Solution with Oil of Tartar, an urinous Smell is perceived; but this happens only when the Alum has been purified with Urine, as in the *English Alum*; but there is no such Smell in the *Roman*.

In Fluxes of Blood Alum may be used inwardly, in the following manner:

Take Rock-Alum, a Dram; Plantane, and Knot-grass Water, of each three Ounces: Add to the Solution, Syrup of White-thorn, an Ounce: For a Julep, to be taken by Spoonfuls. Or,

Take of pure Rock-Alum, two Ounces: Melt it over the Fire, adding, in the mean time, of the finest Powder of Dragon's-blood, half an Ounce; and make this Mixture, before it grows hard, into Pills as big as a small Pea. The Dose is from a Scruple to a Dram, every four Hours, till the Flux is stopped, and then once or twice a Day for some Days afterwards. After every Dose, the Patient ought to drink a large Draught of some proper Liquor; but great Care is to be taken not to stop the Flux unseasonably, and therefore Bleeding ought to go both before and after it; and Clysters ought likewise to be administered, from time to time, to prevent Costiveness, which commonly follows on taking this Medicine. *Geoffroy*.

Something different from this, in the Proportion of the Ingredients, is that Pulvis Stypticus mention'd by Dr. *Alexander Thompson*, of *Montrose*, in the following Dissertation:

Scribonius Largus, the *Roman* Empiric, made use of simple Alum in the Evacuations of the Sex exceeding their due Bounds; and I have been told by Ladies, that it has very good Effects.

Helvetius improved on this, by adding Sanguis Draconis, whether as a Larva, to make it his own, or to prevent the Uneasiness of the Stomach, which he might suspect the Alum might give, I can't determine: But Dr. *Pitcairn*, whose Memory must continue as long as Physic is known, was the first who introduced the Use of it into this Country; at least, it was he who first desired me to make Experience of it in a Case which had resisted a great many other Medicines. Its Reputation kept up many Years, under the Name of Pulvis Helvetii, as an Astringent, especially in uterine Hæmorrhages; and I see it inserted in the *Edinburgh Pharmacopœia*, by the Name of Pulvis Stypticus, tho' in some different Proportion, and different Manner of preparing, from what I have commonly used. The Dispensary Powder being prepared of a double Quantity of Alum to one of the Gum, and made into a Powder, without being put near to the Fire, whereas what I have used was equal Parts of both, the Alum being first melted in a Crucible, and the Powder of the Sanguis Draconis added to it, and then powdered together in a Mortar, possibly the Difference of their Effects may, notwithstanding, be very little.

The Use of both, I think, is now much laid aside, which I cannot but regret, since I never found any Medicine (and I have tried several) so much to be depended on in all the ute-

rine Hæmorrhages, whether to correct the too frequent Return of the Menfes, or their too great Abundance; to stop the Flooding which Women with Child are so subject to, or to moderate the Flow of too plentiful Lochia. I have tried it in so many Cases with Success, that it would be altogether tedious to give you their Histories.

The Quantity I give of the Pulv. Helvetii is more or less according to the Exigencies of the Patient. In violent Bloodings I give half a Dram every half Hour, and seldom or never miss to stop it before three Drams, or half an Ounce, is taken.

The Success of this Medicine, in these bloody Evacuations, has encouraged me to prescribe it also in the Fluor Albus, that obstinate, pernicious Disease of the Sex, in which I have been surpris'd at its good Effects. *Edinburgh Medical Essays*, Vol. 4. p. 38.

When it is proper to prevent or check a beginning Defluxion in a Quinsy, Gargles may be made with Alum, in this manner:

Take Red-rose Leaves, and Alum in Crystals, of each a Dram: Boil them in eight Ounces of Plantane Water; and in the strained Liquor dissolve an Ounce of Syrup of Mulberries, for a Gargle.

In Inflammations of the Eyes, the following Collyrium is excellent:

Let the White of an Egg be shaken or beat with a Piece of Alum, till it acquires the Consistence of an Ointment: Spread this upon a Linen Rag, and lay it warm to the Eyes.

Riverius orders this Collyrium to be taken off after two Hours, lest it should by its Astringency so far contract the Vessels, as to fix the obstructed Fluids in them. Some Physicians are of Opinion, that repellent and astringent Collyriums should not be applied to inflamed Eyes immediately after the Inflammation appears, lest the Fluids still in Motion should be fixed in the affected Part, and thereby the Obstruction be increased; but except the Motion of the Fluids toward the inflamed Part be very violent, this Precaution is unnecessary; and, on the contrary, by increasing the Strength and Contraction of the Vessels, these Applications enable them to resist the Force of the Fluids, whilst at the same time other proper Means are to be used to divert their Course another Way, such as Bleeding, Blistering, Purging, Cupping, and the like: Besides, if we stay till the Quantity of the obstructed Fluid is very much increased, it is in vain to think of applying Astringents, which would serve only to condense them more, and prevent their being resolved. In scorbutic Disorders of the Gums, the following Wash is very proper:

Take of Camphire, an Ounce; Crystal-Alum, two Ounces; Sugar-candy, four Ounces; French Brandy, a Quart: Let them stand in a quiet Place for two Days, and then strain off the Liquor, and keep it for Use.

Alum is by some reckoned a great Specific in intermitting Fevers, when prepared in this manner:

First calcine it in an open Fire; and while it is still hot, throw it into Vinegar, and let it dissolve; evaporate the Solution, and beautiful Crystals will be formed. It is to be taken from a Scruple to a Dram, in a proper Vehicle, before the Fit.

The usual Preparations of Alum are, Purification, Distillation, and Ustion or Calcination: It is purified by being dissolved in fair Water, and then by evaporating and crystallizing that Solution in the common manner. It is distilled like Vitriol, and the first thing that comes over is an insipid Phlegm, then an acid Spirit nearly the same with Spirit of Vitriol. What remains in the Retort is a white, light, friable Substance, called Burnt-Alum; being Alum deprived of its Phlegm, and some Portion of its Acid, and by a new Solution and Evaporation, it will run into Crystals, as before Distillation. The Phlegm of Alum would be perfectly useless if pure; but as it contains always some Portion of the Acid, and some Alum also, which sticks in the Neck of the Retort, it becomes a very useful external Application in chirurgical Cases, for moderating Inflammations, and drying Ulcers. One Dram of Alum dissolved in six Ounces of this Phlegm makes an Alum-water, which is an excellent Detergent for Wounds and Ulcers. The Spirit of Alum is used the same way as Spirit of Vitriol. Burnt-Alum eats away fungous Flesh, and is usefully sprinkled upon Linen, to absorb bad Smells arising from any Part of the Body. *Geoffroy*.

Alum is thus order'd to be burnt by the College :

Take any Quantity of Alum, put it into a new earthen Pot, and let it burn in it as long as it will bubble up, and raise any Steam : When it is cold, keep it for Use.

Bates has three Preparations of Alum : The first he calls

ALUMEN DULCE, Dulcify'd Alum.

Dissolve Alum in Water, and coagulate ; repeat this three times, that the Alum may be purify'd. This is also called Saccharum Aluminis, and is commended in Diseases of the Breast, especially if they take their Rise from mineral and subterraneous Exhalations. It gives Ease in the Tooth-ach, if applied to the Gums. The Dose is half a Scruple.

The second is called **ALUMEN FEBRIFUGUM**, which he takes from *Mynsicht* :

Dissolve three Ounces of Alum, in one Pint and an half of Carduus-water, sufficiently ting'd with Dragon's-blood, and strain'd, and then exhale till dry. The Dose one Scruple before the Fit comes on. It provokes Sweat.

The third he calls **ALUMINATUM** :

Take Lemon-juice, one Pint ; Alum, half an Ounce : Boil and skim them. This is of great Service in Redness of the Face, and Pustules, drinking in the mean time the *CEREVISIA CATAPSORAS*.

ALUNIBUR, (*Luna*) the Moon, or Silver. *Rulandus*.

ALUNSEL, (*Stilla*) a Drop. *Rulandus*.

ALUSAR, Mauna. *Rulandus*.

ALUSIA, *ἀλυσία*, from a Negative, and *λύω*, to wash. It signifies a Defect, or Neglect of washing.

ALUTA. It signifies a soft thin Leather, us'd to spread Plasters upon. See *SCUTOS*.

ALVUS, the Belly in general ; but the Word is used by *Celsus* for the Belly relative to Stools, in much the same Sense that *καίμα*, or *καίμιν*, is us'd by *Hippocrates*, and the other Greek medicinal Writers. Thus *Celsus*, (*Lib. 2. Cap. 41.*) speaking of the bad Symptoms in Fevers, says, That when the Belly (*Alvus*) is entirely suppressed, that is, when there are no Stools, it is a bad Circumstance ; as it is also when the Belly is so loose in Fevers, that it will not suffer the Patient to rest in his Bed, provided what is discharg'd is very liquid, or white, or pale, or frothy : Moreover it portends Danger, if what is excreted is small, glutinous, smooth, white, and palish ; or if it is livid, or bilious, or bloody, or more than ordinarily offensive. Those Stools are also bad, which after long Fevers are sincere. See *ACRATOS*.

The Antients had various cathartic Medicines, and were very attentive to keep the Belly loose in almost every Distemper. For this Purpose they prescribed black Hellebore, Polypody of the Oak, (*Filicula*) Squama *Aëris*, called by the Greeks *λεπὴ χαλκή*, and the Milk of the Sea-lettuce, which, dropped upon Bread, purges powerfully ; or they boiled the Milk of Asses, Cows, or Goats, with a little Salt, till it curdled ; and then taking away the Curd, preserv'd the serous Part for a Draught.

But Medicines are generally hurtful to the Stomach, and therefore all Cathartics ought to have a Mixture of Aloes. If the Belly be vehemently loose, or is too much purg'd, the Body is weaken'd ; therefore it is never right to prescribe Remedies, with that Intent, in any Distemper, except it be without a Fever ; as when we give black Hellebore to such as are afflicted with black Bile, [*atra Bilis*] or in that Species of Madness which is attended with Sorrow, or to those who are paralytic in any Part ; but where there is a Fever, and we would have the Belly loose, it is best to prescribe such Meats and Drinks as are both opening and nourishing ; and there are some Diseases in which purging with Milk is most proper.

The best Way of procuring Stools, is generally by Clysters, which *Aesclepiades* censur'd, but in such a manner, as not utterly to banish them out of Medicine ; but in the present Age they are much disused. However, it is best to use the same Moderation which that Physician seems to have followed, and neither to fatigue the Patient by frequent Clysters, nor to omit giving one, or two at the most, when the Case seems to require it ; as when the Head is heavy, in a Dulness of the Sight, and in a Disorder of the great Intestine, which the Greeks call *καλόν* ; if there be a Pain in the Belly below the Navel, [*in imo Ventre*] or in the Hip ; if there be a Conflux of bilious Juices in the Stomach, or if Phlegm, or any watery Humour, infest that Part ; if there be a Difficulty of Breathing ; if there be

no spontaneous Motion to stool ; if the Forces be near their Outlet, and yet stick in the Passage ; if the Breath of the Patient, who is bound, smell of the Excrements ; if what is voided be corrupt ; if Abstinence, first try'd, has not taken off the Fever ; if the Strength will not admit of bleeding when convenient, and the proper Time for it is elaps'd ; if the Patient drank freely before the Disorder happen'd ; if a Person becomes suddenly collicive, who before was us'd to frequent Stools, spontaneously or accidentally. But this must be understood with these Limitations, that we do not administer a Clyster till the third Day ; nor whilst any Crudities subsist, nor to a Patient weak or exhausted by Sickness, or whose Belly discharges freely enough every Day, or whose Stools are of a liquid Consistence. We should also beware of giving a Clyster in the Violence of a febrile Paroxysm ; for what is then given passes not through the Belly, but is cast back, and flies up to the Head, with much greater Danger to the Patient. Abstinence is to be enjoind the Day before, that the Party may be the fitter to undergo the Operation ; and on the same Day, some Hours before the taking of it, warm Water is to be drank in order to moisten the upper Parts ; then a Clyster is to be injected of pure Water, if a slight Medicine will serve the Turn, or of Mulla, if something stronger be requir'd ; for a Lenient, take a Decoction of Fenugreek, Pisan, or Mallows ; and for a Repressive, a Decoction of Vervain, Sea-water, or any other impregnated with Salt, is of an acrimonious Quality ; but its Acrimony is increased by an Addition of Oil, Nitre, or even Honey : The more acrimonious it is, the stronger is its Force, but the more difficult to be born. What is injected must be neither hot nor cold ; for either may do hurt. After Injection the Patient ought to keep in Bed as much as possible, and not be too hasty to give way to the first Motion, but go to the Stool when he can no longer contain it. Much after this manner are the superior Parts relieved, and the Violence of the Disease abated, by depriving it of the Matter that supports it : Moreover when the Patient has gone to the Stool as often as Necessity requir'd, and is pretty well exhausted, he ought to take a little Rest, and to eat something the same Day, that his Strength may not fail him ; but whether little or much is to be indulg'd, is to be regulated according to the more or less Apprehension we are under of the Approach of the Paroxysm. *Celsus, Lib. 2. Cap. 12.*

Purging the Belly [*Alvus dicta*] often relaxes the Rigour of the superior Parts. *Celsus, Lib. 4. Cap. 3.*

Nothing more contributes to the Cure of Deafness, than a bilious State of this Part. *Celsus, Lib. 2. Cap. 8.*

Costiveness of the Belly for several Days together, indicates either a sudden Motion to stool, or a slight Attack of a Fever coming on. *Celsus, Lib. 2. Cap. 7.*

They who are of a loose Belly in their Youth, are generally collicive in their old Age ; and they who are bound in Youth, are often loose when old. A laxer State in Youth, and rather bound than loose in old Age, is most desirable. *Celsus, Lib. 2. Cap. 3.*

Binders of the Belly are Labour, sitting in a Chair, Fullers-clay laid over the Body, Diminution of Food, and eating once a Day instead of twice, little drinking, and that only after a full Meal, Rest after Meals. On the contrary, Things which loosen the Belly are walking and eating more than usual, stirring after Meat, intermixing Draughts with eating. And it ought to be observed, that a Vomit binds a loose Belly, and loosens a bound one ; and that a Vomit taken immediately after Meat binds the Belly, but delay'd till a considerable time after loosens the same. *Celsus, Lib. 1. Cap. 3.*

The Belly various in its Excretions prognosticates Death ; as when it voids Strigments, (roapy Strings) Blood, Bile, green Excrements, sometimes at different Seasons, sometimes all together, and in a sort of Mixture, tho' distinct. But under these Symptoms Death may not be immediate, which however comes on precipitately, when the Excretions are liquid, and black, pale, or fat, and exceedingly fetid. *Celsus, Lib. 2. Cap. 6.*

A Whiting [*Astellus Marinus*] boiled with Dill, and season'd with a little Oil and Salt, cures all Diseases of the internal Parts, especially of the Belly when infested with acrimonious Humours. *Actius, Tetr. 1. Serm. 2. Cap. 184.*

In Wounds of the Head, a spontaneous Excretion from the Belly portends Death, but the contrary gives Hope of a Cure. *Cassii Problem. 11.*

If Constipation of the Belly occasion a Pain in the Head, let it be your principal Care, by a proper Diet, and mild Cathartics, to render it soluble. Of these there is great Variety, and among these Salt. If Costiveness be owing to viscous Humours, use the following Medicine :

Take of Sal Ammoniac, two Drams ; of Pepper, and Euphorbium, each a Dram : And give three or four Scruples, or two or four Drams, in an Egg, or in Pisan, for a Dose.

If the Fault be not in the Viscosity of the Humours, make use of such Remedies as have Scammony for an Ingredient; the following, for Example:

Take of common Salt torrefy'd, three Drams; Pepper, two Drams; Scammony, a Dram. The Dose is a Cochlearium in an Egg, Bread, or in whatever you please.

These Salts are admirable for opening and purging the Belly, in the most gentle manner, without Gripping or Sickness. You may safely use these Medicines, and also those which have a Mixture of Euphorbium. But if the Belly is too loose, and the Head is in Pain by reason of a too great Dryness of the Habit, endeavour to restrain it by a proper Regimen, and proper Medicines. *Trallianus, Lib. 1. Cap. 11.*

Costiveness of the Belly is accompany'd with Heaviness of the Head, Vertigo, a Bitterness in the Mouth, with a Disrelish of, and Aversion to, Food. In this Case a Clyster gives immediate Relief; for it certainly very much concerns us, that the Belly should perform its Office. We meet with some who, at certain Seasons and Intervals, have the Benefit of spontaneous and copious Evacuations that way, and at the same time get rid of a Multitude of infesting Humours, whereby their Health is repaired. Others, by a plentiful Discharge, by vomiting of all sorts of Crudities, have prevented many threatening Disorders. But if these Evacuations don't happen at their usual Seasons, after they are grown into a Custom establish'd by Nature, many grievous Distempers usually come in their room. We ought, therefore, by all means, when these customary Excretions fail us, to be provided with the necessary Assistance of Art. The same Advice is no less proper with respect to stated Hæmorrhages by the Nose, or Hæmorrhoidal Veins; for if the Blood refrain its usual Course, without manifest Cause, either the Passages must be open'd for it, or its Redundancy diminished by breathing a Vein, except where a great deal of Exercise consumes, or Abstinence diminishes, the abounding Superfluity: For as too great and immoderate Evacuations render the Body weak and cold, and blunt the natural Faculties, so it is as certain, that the Retention of what ought to be eliminated and expell'd, depresses, clogs, and disturbs the Mind, and supplies Matter for Pains and Distempers to arise one out of another, which in Process of Time subvert the Strength, and dissolve the Fabric, of the Body. *Aëtuarius de Spir. Anim. Cap. 16.*

In all Fevers the Belly ought to be loose, unless Pus be evacuated, as it happens in Pleurisy, Peripneumonies, and Consumptions; for in these Cases, the greater the Evacuations, the worse is the State of the Patient. *Aëtuarius, Meth. Med. Lib. 3. Cap. 18.*

The Belly makes not salutary Excretions, when they are either too plentiful, or various and multiform. The Excretions offend in Quantity, when they bear too great a Proportion to the Aliment received; and the Cause of this is either a medicinal Quality in the Food, or some internal Disorder. When it proceeds from the former, it is easily remedy'd by Alteration of Diet; but when it is the Effect of some internal Affection, it must be either because the Body receives no Nourishment, or the Intestines are irritated by some Humour. The Body ceases to be nourished, and falls into an Atrophy, [*ἀτροφία*] either on account of its Dryness, or the Obstruction of the Passages, by which the Aliment is distributed over the Body. In this Case then we are to use such Medicines as are distinguish'd for their moistening Quality, in Conjunction with those that attenuate, and open, and cleanse the first Passages. But if some internal sharp Humour affect the Intestines, and still irritate them to the Expulsion of their Contents, we are directed to such Remedies as are best adapted to sweeten the Humours, and blunt their Acrimony. *Aëtuarius, Meth. Med. Lib. 4. Cap. 6.*

Excretions of the Belly, of the most approved sort, are soft, smooth, brown, or yellowish, and answering in Proportion to the Food received. When they transgress or change in these respects, they indicate an Alteration in the Temperament, either of the whole Body, or of the Stomach and Intestines. If the Temperament change to cold, the Excrements appear whiter, and more humid; if to Heat, they become of a redder or yellower Hue; if they fall short in Quantity, they are either dissipated by too much Exercise, or are diverted into the Urine: But if neither of these be the Cause of the Defect, it shews the Belly to be oppress'd with a Load of Excrements, and that it wants to be eased by a Suppository, or Clyster. If the Excretions are more than in Proportion to what is taken in at the Mouth, it indicates either, first, a less than usual Exercise and Motion of the Body, or an imperfect Distribution of the Aliment; or, lastly, shews the Stomach and Intestines to be infested with an acrimonious and stimulating Humour. In this Case, while the natural Colours continue to appear, there is no great Mischief to be apprehended; but Excrements of divers Colours, bloody, or like Abrasions, or

voided with Pain, and a Tenesmus, portend more grievous Disorders. One thing here especially deserves our Consideration, that in all Evacuations, whether spontaneous, or procured by Art, if nothing be carry'd off, but what Expediency requires, Nature bears it well, and is refresh'd thereby; but the contrary Management will be sure to produce an answerable Effect. *Aëtuarius de Spir. Anim. Cap. 14.*

When more Food is taken into the Stomach than can well be concocted, Plenty of liquid and whitish Excretions are made, and sometimes a sort of Looseness succeeds, during which some of the Contents of the Stools remain as they were from the Beginning; others alter their Colour, either into a better, which denotes Concoction, or into a yellow, accompany'd with liquid and bilious Excretions. All this while the Body feels little or no Inconvenience; for when the expulsive Faculty is irritated, and hastens to discharge itself of infesting Humours, it takes this Opportunity of a Looseness, to expel, besides Crudities, whatever is noxious: Wherefore we ought to be very careful, lest, while we inconsiderately labour to restrain the Violence of the Looseness, we put a Stop to the Current of a Humour which Nature endeavours to discharge. Further, it is to be observ'd, that sometimes the Humours conspire to bring on a Cholera-Morbus, and discharge themselves sometimes both ways, sometimes only downwards, by Excretions of an aqueous and bilious Matter, [*ὕδατος χολα*] which, if suffer'd to continue long without Help, bring on a Weakness and Lowness of Spirits, and even a Coldness and Syncope. The whitish, milky, and incoherent Contents of the Stools, denote the great Weakness of the digestive and alterative Faculty, from too great a Refrigeration, as the brownish and yellow always proceed from a Redundancy of Bile, occasion'd by an immoderate Heat. Sometimes the Excrements are white and consistent, like those of Dogs, but not often, nor in Abundance. The same thing happens in a Looseness, and is a Sign of the Obstruction of the biliary Duct that leads to the Stomach; whence the Urine generally becomes bilious, the Bile being diverted that way, and is also very often discharg'd by vomiting. But such Excretions are principally incident to those afflicted with the Yellow-jaundice, because the Bile, which should colour them, is diverted to the Skin. Moreover the yellow, with the brown and reddish, receive their Dye from yellow and red Bile, as the æruginous, porraceous, and the cabbage-colour'd, proceed from one kind or other of the same Humour. Black Excrements sometimes are from over-heated and extravasated Blood, and sometimes from a deleterious Bile. Sometimes the Stools appear of various Colours, mix'd one among another, which is still worse than any before-mention'd, because it denotes the Violence and Strength of the Humours.

Now all those Humours which we have mention'd, if voided freely, and without Pain, and on the critical Day, after Concoction, and the Patient finds Relief from their Expulsion, are accounted salutary Signs in all respects; but if they proceed from contrary Causes, a contrary Judgment is to be formed: For a Fainting and Lowness of Spirits, Privation of Sense, and a Delirium, and sometimes sudden Death, are their Attendants.

With what has been said may be connected, that Disorder of the Stomach called the Celiac Passion, which is owing to the Intemperies of the Stomach. For when that Part happens to be affected with too much Heat or Cold, Foulness, or Moisture, and the Intemperies passes into the Habit, the Celiac Passion thence takes its Original. In this Disorder, the Patient is thirsty, and somewhat feverish, has yellow and brown Stools, and is refresh'd by the Application of Coolers. Some are slow of Concoction, are seldom thirsty, and have crude Stools. They who suffer from an Excess of Humidity, are rack'd with Pain, and void nothing but a liquid and palish Excrement; but such as labour under this Disorder, through excessive Dryness, have small, but colliquative Excretions: These are more thirsty, and more difficult to cure, because they are more spent and wasted under the Distemper, by the exhausting of their natural Moisture. The Vomiting and Looseness together are very troublesome, and the Vitioufness of the Excretions are Matter of no small Concern; but their Quantity proves of the worst Consequence, because when more is excreted, than can well be spared, the natural Heat exhales at the same time; and the Body being exhausted and dry'd up by a too plentiful Evacuation, ceases to receive Nourishment. On the other Side, in a frequent Desire of going to stool, commonly called a Tenesmus, in a Diarrhoea, and what is vulgarly called an Hepatic Flux, or a Dysentery, or Lientery, it is not only the Quantity, but the Malignity, of the Matter excreted, that kills the Patient. For when the Bile becomes effervescent, and very acrimonious, and the Intestines subject to morbid Impressions, the bilious Humour corrodes and abrades them in its Passage; and if the Disorder be seated principally in the strait Intestine, it is called a TENESMUS, a Word that signifies *stretching*, because the affected Part is on the Stretch, and is perpetually urged to Excretion. In this continued and violent

violent Straining, there is nothing excreted but some mucous, bloody, liquid, and viscous Contents, which will hardly come away; so that by the repeated Labour of often going to stool, and rising from thence, the vehement Solicitation thereto, and the Tension of the Part, rather than by the Quantity evacuated, the Strength of the Patient is worn out.

If the Intestines are infested with an acrimonious Humour, it grates, and stimulates to Dejection, which Distemper is called a Dysentery. Here the Part affected is known by the Pain, which never leaves the Patient. If the Pain be felt below the Navel, the great Intestines are affected; if above, the Disorder lies in the small ones. In this Disease, if the Bile that comes away be not extremely bad, as in the porraceous, and the æruginous, (for the black in the Beginning is mortal) and if there be no great Fever, nor the Body full of putrid Humours, the Patient has not much to fear, especially if the Disease be seated below the Navel; but if the Case be otherwise, and the most remarkable Symptoms of the worst kind, the Patient is in great Danger. When the Distemper lies in the strait Intestine, the Excrements of the Aliment, and the Abrasions of the affected Part, are voided separately. But if the Disease be seated higher, the Superfluities of the Food, and the Abrasions from the distemper'd Part, come off mix'd together, and so much the more, in proportion to the higher Situation of the Malady. When the Colour and Consistence of the Excrements come nearly to those of a sound State, when the Pains are alleviated, and what comes off from the corroded Parts is less in Quantity, and of a better kind, as being voided at longer Intervals, the Physician may reasonably hope, that his Patient is out of Danger: But the contrary shews, that the Disease is exasperated. While the Distemper is moderate, the Abrasions are few, and but lightly tinged with Blood; and the Pains are remiss, with long Intervals. If the Disorder increases, the Stools are for the most part bloody; but if it still rises to a greater Height, and the Intestines begin to be ulcerated, first, Blood comes away in Abundance, then carnosus Abrasions, which are still larger as they grow worse, fetid, and of a Colour next to black. But the worst Symptom of all in this Case is, a Loathing of Food. Hence it is known, whether the Disease be of a malignant Nature, or otherwise.

A Lientery commonly owes its Original to an inveterate Diarrhoea, or Dysentery, into which one of these degenerates, and is the more grievous, as it finds the Patient already debilitated and exhausted. The Nature of this Disease is known by its Name; for it levigates and lubricates the Intestines, so that they can by no means, tho' but for a short time, retain the Food. This Case nearly resembles theirs who labour under a Subversion of the Stomach, so that they can't retain what they eat, but are forc'd to throw it up, in which Disorder, if the Patient happen to be molested with acid Eructations, it is a good Sign, that the Stomach will come to itself, and resume the Exercise of its Office. *Actuar. Meth. Med. Lib. 1. Cap. 20.*

If the Food does not lie heavy upon the Stomach, nor incommode it by its acrid Qualities; and if the Substance and Faculties of the Stomach itself, and the Belly, be sound and vigorous, the Work of Concoction is perform'd in a light and easy manner, and none, or but very slight, and no way troublesome, Eructations attend. The Belly, which receives the Aliment after Concoction, not feeling the least Oppression, after it has assumed to itself the humid Part, at some reasonable Distance of Time, discharges itself of what is superfluous, without Pain, and with no great matter of Trouble. What is thus excreted, is of a soft, smooth, and slippery Contexture, and of a pale, or at least a yellowish, Colour, unless it has received another Tincture from the Aliments. But further it must be observ'd, that these Contents preserve some Agreement, both in Quantity and Quality, with the Food. For if the Things received by the Mouth, transgress the Bounds of Moderation in either of these respects; if the Organs appointed for the Preparation of Aliment be subverted, or corrupted, by Meats of undue Temperament, or bad Juice, many and various are the Disorders that will ensue.

An Oppression from too great a Quantity of Meat or Drink is usually succeeded by Vomiting or a Looseness; or, if it be not carry'd off by Vomiting or Urine, it hinders Concoction, and breeds Crudities. If the Food be endu'd with some Quality much beyond Moderation, as with Heat for Instance, there arises a biting or pricking Sensation, and Uneasiness in the Stomach and Intestines, Head-ach, with nidorous and unfavoury Eructations. If Cold be too predominant, Flatulencies are excited, and sour Eructations, or such as indicate the Quality of the Food; with a Fluctuation, and Pains in the Intestines about the Region of the Navel (*σπέρη*). All these Disorders are composed, and Matters set to Rights, by Vomiting, or a plentiful Stool, with a spare Diet on Meats of good Juice. *Actuar. Meth. Med. Lib. 1. Cap. 18.*

The Belly happens to be bound, when the Excrements are diverted another Way, or are otherwise disposed of. In this Case there usually succeeds a greater Plenty of Urine and Sweat,

and more is digested and carried off by insensible Perspiration: While this lasts, no Inconvenience is felt; since the Superfluities find a Vent, and no Damage, provided they return to their proper Chanel: But when the Belly is coftive, and the Excrements find no other Canals, or Ways, to dispose of themselves, various Pains, and much Uneasiness afflict the Patient. For, in this Case, either the humid Part of the Fœces, that were first lodged, is exhaled, whence the rest is hardened; and the Intestines being lined with a tough and viscous Phlegm, the natural Passage is by that means stopped; or the expulsive Faculty languishes, and is too weak to perform its Office, either on account of its being inflamed, or from a Blow received, or the Confluence of some Humours. The Consequences of this Disorder are, an Aversion to Food, Pains in the Intestines, and moderate Eructations; which, at first, afford some Relief to the Patient. If the Disease continue long, the lower Parts grow cold, and the superior more hot, the Heat contracting itself; then arise fetid and unfavoury Eructations, which don't afford the same Relief as at first. In the Progress of the Distemper, the Food is vomited up, mixed with the Humours, and all Communication between the upper and lower Passages is cut off; whence, as the last Act of the Tragedy, the Excrements are voided by the Mouth, under which Symptom the Case is reckoned desperate. This Disease is called the Iliac Passion, (*εἰλεός*, *Lat. Convulsus*) from a Word which signifies to roll together, or twist; because the Orbs of the Intestines are rolled together, or twisted by it, from the Causes before related.

The Pains, Inflatons, (*εμπνευμάσεις*) and wringing Sensations, (*σπέρη*) which affect the great Intestine called the Colon, arise also from the forementioned Cause; or may be owing to the too frequent Use of cold and moist Eatables. For, by a cold Diet, Phlegm is accumulated in abundance, which is received into the Intestines, and especially into the Colon; because its Form and Situation particularly dispose it for such Reception. This Phlegm being burdensome, on account of its Quantity, and of a noxious Quality, and not easily making its Way through the Intestine, by reason of its viscous Property, stretches the Part, to the great Pain and Misery of the Patient, who sometimes throws up his Food mixed with the Humours, while nothing passes through the Body but with much Difficulty; however, after a copious Evacuation of Phlegm, by means of a Clyster, or some other Medicine, the Patient is relieved, and the Pain mitigated: But if the noxious Phlegm, being not purged off, should fix its Seat in the Hip or Bladder, a Sciatica or Dysury are formed. If the morbid Humours take their Course down towards the Feet, and affect them with their ill Qualities, and having once taken Possession, and paved their Way, the Affection passes into the Habit; and the Patient suffers on every Occasion. The Humours, which are rendered incapable of Expulsion by Purging, or Discussion of any kind, but discharge themselves upon the Hands and Feet; where they form the Gout in those Parts, are observed to be of a simple as well as a complicated Nature; but the Humour which, above all others, is best adapted to cause and maintain the Gout, is generated by a continued Coacervation of Crudities. For when Errors in Diet are every Day committed, and fresh Food is still thrown in upon Crudities; a crude Juice is bred between them; which not being, either by Art or good Fortune, expelled by Vomiting, nor finding a clear Passage through the Belly, sometimes lodges in the Colon, affecting the Part with those Pains which we call the Colic; sometimes is thrown upon the Hip, and causes the Sciatica; or on the Bladder, whence follows a Dysury, or Difficulty of Urine; or, in the last place, discharges itself upon the Extremities, where it forms the Gout in the Hands and Feet. *Actuar. Meth. Med. Lib. 1. Cap. 21.*

When the Belly is bound, either by binding Medicines or Diuretics, these Obstacles being removed with small Assistance, it returns to its Duty. The Remedies, in this Case, are only a Clyster or two; and a mollifying or loosening Diet; but if a Constipation of the Belly succeeds an Inflammation caused by a Wound of the Intestines, the Cure is not so easy. It must, however, be attempted by Emollients, and proper Dressings, I mean when the great Intestines are affected; for sometimes it happens to succeed; but a Wound in the small Intestines cuts off all Hopes of a Cure: If then any considerable Obstruction happens, or some Humour falls into the Intestines, whatever may be the Cause, the Belly is to be mollified by the daily Use of Clysters, which, in order to mitigate the Inflammation, are to consist principally of Emollients; such as Oils of Chamomile and Lilies, and Fats of a Hen, Goose, and Swine; with Herbs of a mollifying Quality, well and carefully boiled; for all such Medicines digest an Inflammation, relax the stretched Parts, and ease the Pain. The Distemper being thus mitigated, we are to betake ourselves to Remedies endued with more Acrimony, by which the Intestines being irritated, might discharge themselves of the hardened Fœces, together with any crude and pituitous Matters that might be mixed with them. The Passage being thus cleared, we may afterwards administer some gentle Cathartics. The

Diet may be Hens, Rock-fish, and Broths of Chich-pease; and all Meats of a firm Consistence, and hard of Concoction, are to be forbidden: The Drink must be thin and cooling Wines.

If the Intestines are affected with an Inflammation, from an Influx of Humours, especially of a hot Kind, we must begin with Bleeding, and end with Clysters: The Diet must be the same as before, only a little more refrigerating, and less nourishing: The Medicines taken at the Mouth, are to be of fine Parts, and of an incisive and emollient Quality: To these, Stomachics are to be added, which, by restoring the Tone of the Stomach, may free it from the Necessity of lying unactive, and enable it to perform its Office to the Body. Fluctuations and Inflation are Affections of less Moment, but troublesome enough to the Patient; however, they may be mitigated by Injection of Clysters, and dry Fomentations with Millet or Bran. If the noxious Flatus will not yield to these Remedies, a dry Cupping-glass is to be affixed to the grieved Part. Discutient Remedies also, composed of the Carminative Seeds, are of Service here; and the Patient finds some speedy Relief from moderately heating Food, if taken in small Quantities: Bathing also, and moderate Walking, are esteemed beneficial.

When the great Intestine, called the *Colon*, is affected, many troublesome Symptoms attend the Disorder: In the Beginning of this Distemper all Food is forbidden, except Broths made on Chich-pease and Rock-fish, and mixed with Oil of the finest Parts, and prepared with Anise, Fennel, Dill, or others of the like Kind. The Belly also is to be loosened by Infusions of Mercury and Beets, or Centaury and Wild Cucumber, or with the Oils of Chamomile and Dill, and such-like. Those Antidotes also which go by the Name of *Colical*, are not to be omitted. When the Pain is remitted, you are to purge with Pills of Colocynth and Aloes, or such others as you think most suitable to the Condition of the Sick; and when the Disorder is over, let the Patient take some Chicken-broth, and afterwards go into the Bath.

If the noxious Humour takes its Course to the Bladder, or the Thigh, in the first Case it causes a Dysury, and in the latter the Sciatica: This Disease must be treated with Infusions of more acrimonious Simples, and with heating and discutive Plasters, and Cathartics, that properly purge such Humours: The Diet must incline to Heat; and Bathing must every Day be used, that the Humours may exhale.

If the Humour, by the Strength of the Parts, be driven out as far as the Feet, or thrown upon the Hands, there is formed what they call the Gout in the Feet or Hands; and here we are to consider whether the Humour be simple or complicated. In treating this Distemper, we are first to injoin Abstinence; the Belly is to be washed with Clysters, if it be needful; and Cerares of Oils and Fats are to be applied to the pained Parts. If the Gout be violent, it will be convenient for the Patient to go into the Bath. And because the Humours are very subject to a Conflux, and to renew their Excursions into the same Parts, they are to be cut short and restrained by a proper Diet; and the most predominant of them is to be carried off, or diminished by Purging, or corrected by suitable Food; and the Body is to be plied with much Exercise and Bathing. All Crudities are to be avoided, and Meats of bad Juice; for which End the Patient ought to rise from Meat with an Appetite, that the Concoction might be the more perfect; and Disfluents, which generate Crudities, restrained. *Aetnarius, Meth. Med. Lib. 4. Cap. 6.*

After these Quotations from *Aetnarius*, and those under the Article *Alimenta*, I need not inform the Reader, that *Aetnarius* is an admirable Author, and that he has shewn great Judgment, Genius, and Knowledge of his Profession, in making his Collections.

ALYCE, ἀλύχη, from ἀλῶ, to be anxious or uneasy. It signifies Anxiety, considered as a Symptom of a Fever, and is used by *Hippocrates* in much the same Sense as ALYSMOS. See ALYSMOS.

ALYPUM, ἄλυπον. A Plant called also ALYPIA, or ALY-PON, from α Negative, and ἄλπον, Pain, *Herb-terrible*. In a Memoir sent from *Montpellier* to the Royal Academy of Sciences in 1712, Notice is taken of the Alypum of *Montpellier*, which is there said to be different from the Alypum of *Dioscorides*. But it should seem, by the Description of *Dioscorides* compared with that of more modern Authors, and the medicinal Virtues, that the antient and modern Alypum is the same Plant. That the Reader may judge for himself, I shall insert the Accounts of it from *Pliny*, *Dioscorides*, *Ray*, *Dale*, and the above-quoted Memoir.

ALYPUM is a Plant with a slender Stalk and a soft Head, not unlike Beet, of an acrid and viscous Taste, and extremely biting and inflaming. Taken in Hydromel, with a little Salt, it proves a Cathartic. The least Dose is two Drams, a moderate one four, and six the largest, in Cock-broth. *Pliny, Lib. 27. Cap. 4.*

ALYPUM is a spriggy Plant, reddish, with slender Sprays, and fine Leaves, and a thin soft Flower. Its Root is like that of Beet, slender, and full of an acrid Juice. The Seed is like

that of Epithymum. It grows in maritime Places, and, in particular, very plentifully on the Sea Coasts of *Lybia*; it is to be met with also in many other Places.

The Seed purges Black Bile downwards, being administered with an equal Quantity of Epithymum, and an Addition of Vinegar and Salt; but it causes a slight Exulceration in the Intestines. *Dioscorides, Lib. 4. Cap. 180.*

It is the same with *Alypias*, and is administered in Aqua Mulsa. *P. Egineta, Lib. 7. Cap. 4.* The Dose is six Scruples. *Aetnarius, Lib. 5. Cap. 8.*

Alypum, Offic. *Alypum*, *Herba terribilis*, Mont. Ind. 36. *Alypum Montis Ceti*, Ger. 408. Emac. 506. *Alypum Montis Ceti*, five *Herba terribilis Narbonensium*, Raii Hist. 11. 1443. *Alypum Monspeliensum*, Park. Theat. 198. *Alypum Monspelianum*, five *Frutex terribilis*, J. B. 1. 598. *Frutex terribilis*, *Empetrum*, *Alypum Monspeliensum*, Chab. 48. *Thymelæa foliis acutis*, *Capitula Succisæ*, five *Alypum Monspeliensum*, C. B. Pin. 463. *Jonf. Dendr. 235. Globularia fruticosa*, *Myrti folio tridentato*, Tourn. Inst. 467. *Elem. Bot. 371. HERB-TER-RIBLE. Dale.*

It is a Shrub a Cubit or a Cubit and half high, divided into many slender woody Branches, covered with a reddish, or dark-purple-coloured Bark, and covered with Leaves nearly of the same Colour, and about the Size, but not the Shape of the common Myrtle. For beginning from a very narrow Bottom, they continually widen almost to the Extremity, where they are sometimes marked with one or two Dents, making an obtuse Point. They are thick, solid, and of a bitterish Taste. The Flowers generally grow at the Ends of the Branches, and sometimes hang in Bunches to the Middle. They are of a purple Colour, and consist of thin Scales. According to *Clusius*, the Flower-cups grow single, and close to the Tops of the Sprays, and consist of Scales, and are about the Size of the inferior Orb of the Flowers of Scabious, or Devil's-bit, containing a hairy and lanuginous Flower of an azure Colour, inclining to white in the Middle, and wholly azure all round it. The Root is of a thick, hard, black, and woody Substance. The whole Plant (says *Lobel*) is bitter, and has the unpleasant Taste of the Spurge Laurel, or the Mezereon, and even a stronger, after six Years keeping.

It grows plentifully on the South-side of the Mountain *Cetus* in *Frontinac*, where it runs into the Sea; and on many other Declivities of *Languedoc* and *Provence*, that face the Sea and the South. We have observed it to grow, in great Plenty, on the Stony Hills about *St. Chamas*, a Town in *Provence*.

It is a very strong Cathartic, and purges Phlegm, Bile, and watery Humours, with no less Violence than Spurge (*Tithymalus*); and is therefore to be used with Caution. *Ray's Hist. Lib. 26. Cap. 8.*

It grows on Hills, flowers in the Spring, and the Herb is used. It is said to be a violent Purger. *Clusius* assures us, that the Decoction has been given with great Success in the *Lues Venerea*. *Dale.*

ALYPUM.

Tho' the Plant now called by that Name be quite different from what *Dioscorides* described under the same Appellation, as all who have written since him are agreed, I chose rather to keep its Name entire, and to make use of that of *John Bauhine*, than to give it a new one, and so, by multiplying Names, to embroil Botany.

Caspar Bauhine, in his *Pinax*, calls it *Thymelæa foliis acutis*, *Capitula Succisæ*, five *Alypum Monspeliensum*. *Clusius* has described it by the Name of *Hippoglossum Valentinum*; and *M. Tournefort*, in the sixth Section of his Institutions, has placed it under the Genus of *Globularia*, by the Name of *Globularia fruticosa*, *myrti folio tridentato*. But its Characters are quite different from those of the *Thymelæa*, or from any of the Species of *Hippoglossum*, or *Globularia*, as will appear by the following Description.

The *Alypum* is a Shrub about a Cubit high; its Root, which is covered with a blackish Bark, is about four or five Inches long, and near an Inch thick at the Neck, shooting forth three or four thick Fibres. The Branches, which are covered with a thin Pellicle of a brown-red Colour, are slender and brittle. The Leaves are of different Figures, and placed disorderly, sometimes in Tufts, sometimes single, or in Conjunction with another small one at their Bosoms. Some of them pretty much resemble the Leaves of Myrrh; others, widening towards the Top, run out into three Points in the Shape of a Trident; others again form but one Point. The largest are about an Inch long, and three or four Lines broad, of a good Thickness, and of a bright Green. Each Branch bears a single Flower, seldom two, which are about an Inch in Diameter, and of a very fine violet Colour. They consist of two half Flowers, at whose Bottom arise a few small white Stamina, with little blackish Apices, which terminate in three Points, and are no more than about three Lines long, and one Line broad. Each half Flower bears an Embryo, which, after the Flower is gone, becomes a Seed, adorned with a kind of Tuft. The whole Flower is supported

ported by the Calyx, consisting of Leaves, lying one upon another like Scales, and no more than two or three Lines long and one broad.

Clusius relates, that *Empirics* and *Mountebanks*, who strolled about in *Andalusia*, used the Decoction of this Plant for the Venereal Disease, and boasted of their never-failing Success. And we have Men of this Character in our Parts, who use it as a Cathartic, instead of Senna. But it were to be wished, that their Avarice might not be attended with these fatal Consequences to which the violent Operation of this Medicine naturally tends, and of which the Name of *Herb-terrible* ought to put them in mind. *Mem. de l'Acad. Roy. des Sci.*

1712.

By these Accounts of *HERB-TERRIBLE*, it should be the same as the *ἀλυσος*, or *Alysum* of *Dioscorides*, notwithstanding what the more modern Botanists have said.

I find this Plant sometimes called White Turbith.

ALYSMOS, *ἀλυσμος*, from *ἀλύνω*, to be uneasy, or anxious. This Word is very frequently used by *Hippocrates*, to express that excessive Restlessness, and Anxiety, which many People feel in acute Disorders, or otherwise, and which will not permit them to remain long in the same Posture, but obliges them to be perpetually tossing about, in order to find an easy Situation; which, however, is not readily to be met with. Every one who has seen or felt the Thing, cannot help understanding what the *Alysmos* is by this Description.

Duretus distinguishes the *Alysmos*, into the *ἀλυσμος ναυτιώδης*, and the *ἀλυσμος ἀνέμετος*; the first is caused by a Sickness at the Stomach, by something contained in it which irritates; the second by an utter Oppression of the vital Powers.

But the *ALYSMOS*, or Restlessness and Anxiety, here spoken of, may be reduced to four different Species, two of which are Symptoms of a Fever, and two frequently happen without any febrile Disorder.

Those which happen without a Fever, are caused,

1. By something acrimonious contained in the Stomach, which irritates and stimulates the Nerves thereof, and consequently all the Nerves which are Branches of the same large Nerves, from whence the Nerves of the Stomach proceed. Hence the Contraction of the Heart is rendered irregular, and therefore the Circulation of the Blood thro' the pulmonary Arteries and Veins, and also thro' the Aorta, must labour, and be carried on with some Degree of Difficulty; whence a perpetual Uneasiness and Restlessness.

It is observable, that any thing which stimulates violently, and offends any of the Contents of the Abdomen, may, in some Degree, produce the same Effect. For a Sickness, and Inclination to vomit, are universally Symptoms which arise, when any of the Viscera, contained in the Abdomen, suffer an uneasy Sensation; as is remarkable in the obvious Example of the Gravel, or Stone, in the Kidneys, or Ureters.

When it proceeds from something acrimonious contained in the Stomach, the Cure consists in procuring its Discharge by Vomit, or other Evacuations; or in correcting the Acrimony by something of an opposite Quality; or in diluting plentifully.

But when it is caused by any Affections of the Abdominal Viscera, the original Distemper must be removed before the Symptom can be expected to cease.

2. The *ALYSMOS* is frequently caused by Spasmodic Contractions of the Viscera, arising from too large Quantities of fermenting, fermented, or fermentable Substances, taken into the Stomach; or from Hysterics.

For the Cure of that caused by fermenting Substances, see *CHOLERA MORBUS*; and of that caused by Hysterics, see *HYSTERICA*.

But the most general Species of this Restlessness, and Anxiety, attended with perpetual Tossings, and frequent Sighs, are those which attend Fevers, and inflammatory Disorders. These are immediately caused,

1. By some Impediment to the Blood's passing out of the Heart into the Aorta; but more frequently from its difficult Circulation thro' the Lungs.

The Blood is prevented from circulating freely through the Aorta, when the Obstructions in the several Branches thereof are become almost universal.

It is impeded from circulating thro' the Lungs, either when the Branches of the Pulmonary Artery are too dry, or affected too much by Spasmodic Contractions, to permit the Blood to pass readily through them; or when the Blood is in such an inflammatory or viscid State, as to be incapable of circulating through the Vessels of the Lungs.

These are attended with great Oppression at the Breast, a slow Pulse, and Difficulty in Respiration.

2. These Anxieties arise, when, either from a Viscidity of the Blood, or a Stricture of the Branches of the *Vena Porta*, the Blood cannot pass freely through the Liver; hence that which is brought by the Coeliac and Mesenteric Arteries, must stagnate, and distend the adjacent Parts.

This is attended with a great Weight and Oppression at the

Region of the Hypochondria; which Parts the wiser Antients had much greater regard to, than their less sagacious Posterity.

It is of infinite Importance, both to the Physician and Patient, to distinguish accurately the different Species of Anxiety above-mentioned, from each other; and to remove their Causes immediately, if that is, by any Ways, practicable. Those particularly which accompany Fevers, require our utmost Attention; for, if suffered to remain, fatal polypose Concretions, Inflammations, and Gangrenes are soon excited, (and these near the Heart, provided the Causes reside in, or nearly affect, the Thorax) which are attended with intolerable Oppression and Restlessness.

But if the Branches of the *Vena Porta*, or those adjacent to them, are principally affected, sudden Gangrenes of the Parts about the Hypochondria, or Putrefactions of the Liver, are almost unavoidable, which terminate in a putrid Diarrhoea; in which the Stools are extremely offensive, and have the Appearance of Blood and Water, and these seldom or never fail to terminate in Death.

Hence the Reasons are evident, why this great Anxiety, and Restlessness, which *Hippocrates* calls *ἀλυσμος*, is, according to the Doctrine of that great Man, a fatal Symptom, when it happens in febrile and inflammatory Distempers; but is less dangerous when caused only by Hysterics, or the Irritations of something offensive to the Stomach: And why, in almost every Distemper, it is the immediate Fore-runner of Death.

Boerhaave lays down a very rational Method of obviating the ill Consequences of these febrile Anxieties, by removing their immediate Causes. This, according to his Doctrine, is to be done by resolving and diluting the Mass of Blood, by relaxing the Solids, and by moderating the too violent Motion of the circulating Fluids. This End is to be attained by drinking plentifully, and almost continually, warm Decoctions of the farinaceous Vegetables, rendered somewhat acid, and very slightly aromatic, with an Addition of Honey, or Nitre, or both.

Emollient, relaxing, and anodyne Cataplasms, Fomentations, Epithems, and Plasters, applied to the Region principally affected, are also of great Service, as they resolve and relax.

Frequently repeated Clysters, prepared of emollient Ingredients, without any Addition of Cathartics, given in small Quantities, and retained long, are of excellent Use, as they carry on the same salutary End.

The Vapour of hot Water, in which emollient Ingredients have been boiled, received at the Mouth and Nostrils almost continually, is of much Importance; especially when the Circulation thro' the Lungs is impeded, as it contributes to the Relaxation of the Part, and Resolution of the Juices.

ALYSSOIDES, a Plant thus named from *ἄλυσος*, *Form*, and *ἀλυσσον*, *Alyssum*, as being like in Form to the *Alysmos*.

The Characters of this Plant, according to *Miller*.

It hath a Flower in Form of a Cross, consisting of four Leaves, out of whose Flower-cup arises the Pointal, which afterwards becomes an elliptical thick Fruit, divided into two Cells by an intermediate Partition, which is parallel to the demi-elliptical-turgid Valves, and filled with round flat Seeds, having Borders round them.

I do not find, that any Virtues are ascribed to this Plant.

Boerhaave mentions three Sorts of this Plant:

1. *Alyssoides saxatile Creticum*, folio angulato, flore violaceo. *Leucoium saxatile*, folio viridi, flore purpureo eleganti, *Cupani*. Ind. 137. *Alysson Creticum*, foliis angulatis, flore violaceo, *T. Cor.* 15.

Rocky, Cretic *Alyssoides*, with an angulated Leaf, and a violaceous Flower.

2. *Alyssoides incanum*, foliis sinuatis, *T.* 218. *Leucoium incanum*, siliquis rotundis, *C. B. Pin.* 201. *Leucoium*, cum siliquis rotundis, flore luteo, *J. B.* 2. 931. *Eruca peregrina*, *Clus. Hist.* 421. *ic. & Desc. & Hist.* 134. *Leucoium marinum Patavinum*, *Lob. Obs.* 180. *Leucoium incanum*, siliquis tumidis subrotundis, *M. H.* 2. 247. a, b.

Hoary *Alyssoides*, with sinuated Leaves.

3. *Alyssoides fruticosum*, leucii folio viridi, *T.* 218. b. Shrubby *Alyssoides*, with a green Stock-gilly-flower Leaf.

To these *Miller* adds a fourth, which is, the *Alyssoides orientalis annua*, myagri sativi folio, *Tourn. Cor.*

Oriental annual *Alyssoides*, with a *Myagrum* Leaf. *ALYSSUM*, *ἀλυσσον*, Madwort, from a Negative, and *λύω*; that particular Madness which is caused by the Bite of a mad Dog, and not from *ἀλυσσον*, as *Miller* derives it, nor from *ἀλύνω*, according to *Lemery*.

There is a Sort of *Alyssum* taken Notice of by *Dioscorides*, another by *Pliny*, and a third by *Galen*, which are thought by Botanists to be different from each other.

The *Alysson* of *Galen* is thought, by *Dale*, to be the *Marrubium album*, foliis profunde incis, flore caeruleo of *Morison*, (see *MARRUBIUM*) of which *Galen* speaks in these Terms:

Alysson is an Herb like Horehound, but has rougher and more prickly round Heads on the Tops of its Stalks. It bears a Flower inclining to an azure or sky-blue Colour. It ought to

to be gathered in the Dog-days, and dried and sifted, that the Parts of Efficacy may not exhale.

The Dose to a Person bit by a mad Dog, is a Cochlearium ($\frac{1}{12}$ of a Pint) in a Quarter of a Pint of Water and Mulsum, for forty Days together from the first Day; at least for the first seven Days. *Galen de Antidotis*, L. 2. C. 11.

It is of a moderately drying and digestive Quality, with something of Astringency, whence it clears the Skin from the Vitiligo and Sun-burns. *Galen de Simpl. Med. Lib. 6. Orib. Med. Coll. Lib. 15. Cap. 1. Paulus Aegineta, Lib. 7. Cap. 3.*

The Alyssum of *Pliny*, *Dale* takes to be the *Mollugo vulgaris* of *Parkinson*, Bastard-madder, (see MOLLUGO) of which *Pliny* speaks thus:

It differs from Madder (*Erythrodanum*) only in the Largeness of the Leaves and Branches, and took its Name on account of its preventing Madness from the Bite of a mad Dog, being drank in Vinegar, and bound to the Place. What they say further of it is wonderful indeed, that as soon as the wounded Person sees it, the Sanies of his Wound dries up. *Plin. Lib. 24. Cap. 12.*

The Characters of Alysson, according to *Miller*, are, The Characters consist of four Leaves, which are expanded in Form of a Cross: The Fruit is short and smooth, in which are contained many roundish Seeds.

Boerhaave, in his *Index*, takes Notice of twenty different Sorts of Alysson.

1. *Alysson Creticum saxatile, foliis undulatis incanis*, T. Cor. 15.

The Alysson of *Candia*, with hoary undulated Leaves.

2. *Alysson folio leucosii-incano, flore luteo. Thlaspi Austriacum, leucosii folio incano, flore luteo.* Bocc. H. Mauroc. 171.

3. *Alysson incanum luteum, serpilli folio, majus*, T. 217. *Thlaspi Alysson dictum campestre majus*, C. B. Pin. 107. M. H. 2. 291. *Thlaspi minus quibusdam, aliis Alysson minus*, J. B. 2. 928. *Alysson minimum*, Clus. H. 133. a.

Larger yellow hoary Madwort, with a Mother of Thyme Leaf. *Clusius's* Figure is good; but he is mistaken in the Description of the Flower, which is tetrapetalous, and not pentapetalous, as he affirms: The Figure which *Label* and *Tabernaemontanus* have given of this Plant, under the Name of *Thlaspi Polygonati folio*, is bad: I believe they have put, thro' Inadvertency, *Polygonati* for *Polygoni folio*. The last of these Authors has given a second Figure of it, which is much better, and which he calls *Thlaspi minus Clypeatum* 2. The Difference of these Figures has determined *C. Bauhine* to divide this Plant into two Species, great and small; *Morison* has follow'd him in this Point. It is true that the Plant varies, according to the Place where it grows; but we must distinguish them no otherwise than as Varieties: For the Seed of the smaller, sown in Gardens, produces a pretty large Plant. *J. Bauhine* observes, that *Schwenkfeldius* confounds this Plant with the *Thlaspi angustifolium* of *Fuchs*, which is the *Nasturtium sylvestre Osyridis folio*, C. B. Pin. 105. *Martyn's Tournefort*.

4. *Alysson incanum, serpilli folio, minus*, T. 217. *Thlaspi Alysson dictum, campestre minus*, C. B. Pin. 107. M. H. 2. 291. a.

Lesser hoary Madwort, with a Mother of Thyme Leaf.

This, in the Opinion of *Dale*, is the Alysson of *Dioscorides*, of which the last-mentioned Author gives the following Account:

The Alysson is a small Shrub, somewhat rough, with round Leaves, near which grows the Fruit like double Bucklers, which contains a flattish kind of Seed. It grows in Hills, and in rugged Places.

The Decoction, drank, cures the Hiccups that are not attendant on a Fever. It has the same Effect, if held in the Hand, or smelled to. Bruised with Honey, it cures Freckles, (oxalis) and Sun-burning (epidura). Pounded and eaten with Food, it is thought to cure the Bite of a mad Dog; hung up in the House it is said to be a Preservative of Health, and an Amulet to Men and Beasts against Witchcraft. Besides it keeps off Distempers from Cattle, if tied about them in a red Cloth. *Dioscorides, Lib. 3. Cap. 105.*

This is but a Variety of the former.

5. *Alysson parvum, capitulis glabris, flosculis luteis. Thlaspi umbellatum Smyrnaeum luteum.* Volk. 2.

6. *Alysson fruticosum incanum*, T. 217. *Thlaspi fruticosum incanum*, C. B. Pin. 108. *Thlaspi Machliniense incanum*, Lob. Ic. 216. Clus. H. 132. *Thlaspi capsulis sublongis, incanum*, J. B. 2. 929. *Thlaspi incanum, flore albo, capsulis oblongis*, M. H. 2. 192. *Thlaspi Alysson, folio leucosii, latissimo aspero viridi*, Ind. 137.

Hoary Shrub Madwort.

7. *Alysson fruticosum incanum, flore pleno.*

8. *Alysson balimi folio sempervirens*, T. 217. *Thlaspi balimi folio sempervirens*, H. L. 594. Descr. 595. Ic. b.

The Alysson with Sea-purflane Leaves.

9. *Alysson vulgare polygoni folio, caule nudo*, T. 217. *Bursa Pastoris minor, loculo oblongo*, C. B. Pin. 108. *Bursa Pastoria minima, oblongis siliquis, verna, loculo oblongo*, J. B. 937. *Parony-*

chia vulgaris, Dod. p. 112. *Bursa pastoris minor, loculo oblongo*, M. H. 2. 305.

Common Whitlow Grass.

It is very common on Walls, and in dry Places, in the Spring. *Dr. Dillenius* has observed very well, that the Petals are bifid, which is a singular Character in the Tribe to which it belongs.

This Plant appears to me very different from that which *Casalpinus* calls *Humilis quaedam herbula affinis Bursa pastoris, foliolis Thymi rotundioribus candicantibus subhirsutis, &c.* He describes it to grow common in Sicily, and about Piombino. *C. Bauhine* was in the wrong to refer it to this, the Leaves of which vary in their Incisures; but are always very different from the Figure of those of Thyme: These Varieties are represented in the *Hist. Ludg.* The *Paronychia Alsine folio Lobelii* *Lugd.* represents them with Incisures: The same Leaves are cut in the Figure of the *Myosotis parva Dalechampi* *Lugd.* 1318. *Martyn's Tournefort*.

10. *Alysson vulgare, polygoni folio, loculo rotundo.*

11. *Alysson vulgare, polygoni folio trifido. Bursa pastoris minor, foliis trifidis, aliquando multifidis, florum petalis bifidis, loculo oblongo*, M. H. 2. 306. *Bursa pastoris minima, oblongis siliquis, verna, loculo oblongo*, J. B. 2. 937.

12. *Alysson fruticosum aculeatum*, T. 217. *Thlaspi fruticosum spinosum*, C. B. Pin. 108. M. H. 2. 291. *Leucoium spinosum, sive Thlaspi spinosum aliis*, J. B. 2. 931. *Thlaspi fruticosum spinosum Narbonense*, Lob. Ic. 217.

Prickly Shrub Madwort.

13. *Alysson segetum, foliis auriculatis acutis*, T. 217. *Myagrum sativum*, C. B. Pin. 109. *Myagrum majus seu sativum*, M. H. 2. 315. *Myagrum dictum camelina*, J. B. 2. 892. *Myagrum Turcicum*, J. B. 2. 893. *Camelina sive myagrum*, Dod. p. 532.

Corn Madwort, with auriculated sharp-pointed Leaves.

Dodonæus is in the wrong to compare this Plant to the Madder. The *Myagrum sativum* is no more like the Figure of the *Myagrum* 1. *Tabern.* than like the *Myagro similis siliqua rotunda*, Pin. It's not ill represented in *Camerarius*, Fig. 1. though ill engraved by him under the Name of *Pseudo-Myagrum*; that Figure, being only a Copy from *Matthioli*, has the Fruits very ill drawn, and Flowers pentapetalous; which does not belong to any of the cross-like Flowers. *Martyn's Tournefort*.

14. *Alysson segetum, foliis auriculatis acutis, fructu majore*, T. 217. *Foliis est magis dissectis dentatis minoribus, fructu longe majore, tota planta humiliore.*

Corn Madwort, with auriculated sharp-pointed Leaves, and a larger Fruit.

15. *Alysson Siculum supinum, leucosii folio angusto, flore albo, odore mellis. Thlaspi Siculum supinum umbellatum, leucosii folio angusto, flore albo odore mellis*, ex H. Cath. H. Mauroc. 170. *Thlaspi Alysson dictum, campestre minus, folio breviori*, Ind. 137. a.

16. *Alysson montanum incanum luteum, serpilli folio, majus. Thlaspi montanum luteum, serpilli folio, majus*, C. B. Pin. 107. M. H. 2. 292.

I suppose this is the same that is mentioned in *Tournefort's* History of Plants, by the Name of *Alysson perenne montanum incanum*.

This is a Plant whose Leaves are oblong and white, particularly underneath, rough to the Touch; its Stalks are about a Foot high, Ash-coloured, garnished with many Flowers, composed of four Leaves set cross-ways, of a fine yellow Colour: The Flower is succeeded by a small flat Fruit in Bunches, divided length-ways into two Cells, full of small round Seed: Its Root is long, woody, dividing, and spreading itself very much: It grows in mountainous Places.

It is esteemed aperitive and proper against the Bite of a mad Dog. *Lemery de Drogues*.

Its Root is fibrous, white, five or six Inches long, about two Lines thick: It usually sends forth three or four Stalks, lying on the Ground, seven or eight Inches long, hard, woody, reddish towards the Bottom, wreathed, divided from the very Bottom into several small Branches, covered with a white Down, and garnished with Leaves of the same Colour; their Surface is a little shagreened, and they are shaped something like Olive Leaves, according to *J. Bauhine*; but they are about five Lines long: the Ground Leaves are much whiter than the rest, more ferrated, and shorter. The Flowers grow at the Extremity of the Branches, in a kind of Head, and afterwards part upon a kind of Spike two or three Inches long. Each Flower is composed of four yellow Petals, two Lines long, almost oval at the End; the Chives are very slender, charged with yellow Summits: The Empalement also consists of four narrow, pointed Leaves, a Line and a half long, and soon falling off: Out of the Middle arises a flat, round Pointal, ending in a pretty fine Point; it afterwards becomes a Fruit of the same Shape, about two Lines Diameter, raised in Form of a little Bos, divided into Cells by a membranous Partition: There are usually in each Cell two oval, flat, red Seeds, a Line long. The Figure of the *Thlaspi montanum luteum*, *J. B.* represents this

this Plant well enough, only the Petals are too much cut; and besides, *J. Baubine* has not noted whether it be perennial or annual. Our Plant lasts several Years. That which *M. Magnol* has called *Thlaspi Alysson dictum minus, capsulis majoribus retundis non foliatis*, is annual, and its Stalks are less crooked: Thus *J. Baubine's* Figure suits it less, than it does that which we just now described; and this Figure is much better than that which *Label* has given of it, under the Name of *Thlaspi supinum luteum*. The Capsules of these Plants appear, only because the Leaves of their Empalements fall off easily. *Martyn's Tournefort*.

17. *Alysson Alpinum hirsutum luteum*, T. 217. *Sedum Alpinum hirsutum luteum*, C. B. Pin. 284. *Sedum petraeum montanum*, Lob. Adv. 163. *Sedum minus*, 12. *Alpinum*, 6. Clus. H. 62. *Leucoium luteum aizoides montanum*, Col. 2. 62.

The yellow Alpine Alysson, with hairy Leaves.

18. *Alysson argenteo folio, flosculis luteis. Thlaspi folio majoranae Ciasii. Hoc nomine misit Amplissimus Sherard. Thlaspi Creticum, majoranae folio, supinum, flore luteo*, H. Maurocen. 171. Alysson with a Silver Leaf, and yellow Flowers.

19. *Alysson folio angustissimo viridi, flosculis albis spicatis confertum natis*.

20. *Alysson maritimum*, T. 217. *Thlaspi Alysson dictum maritimum*, C. B. Pin. 107. M. H. 201. *Nasturtium vel Thlaspi maritimum*, J. B. 2. 927. *Thlaspi centunculi angusto folio*, Lob. Ic. 215.

All these Plants are endowed with a very subtle, penetrating and diaphoretic Virtue, by which they expel Poison. The ninth and tenth are received, in Medicine, under the Title of Whitlow-grasses, and have the same Virtues as Scurvey-grass and Water-cresses. They spring up in Winter, and flower in January; and their Seeds also are used in Medicine, as Emollients, from which they express an Oil. The thirteenth and fourteenth are also called the German *Sesamums*, and the *Myagra of the Shops*. Bruised and drank, to the Weight of three Ounces, they are sudorific and stomachic, and a very good Remedy in cold Affections. *Boerhaave, Hist. Plant.*

ALZEGI, (*Atramentum*) Ink. *Rulandus*.

ALZEMAFOR, (*Cynobrium*) Cinnabar. *Rulandus*.

ALZILAT, (*Pondus trium Granorum*) a Weight of three Grains. *Rulandus*.

ALZIMAR, (*viride*) green. *Castellus* from *Rulandus*.

ALZOFAR, (*Æs ustum*) burnt Copper. *Rulandus*.

AMA, AME, or rather AMES, *ἄμς*, a Sort of small Cake. *Aretaeus* uses this Word to compare the Quantity of Hellebore to, which is sufficient for a Dose in strong Constitutions, when given in a Vertigo: His Words are *μυγδοῖς ἄμς*, by which it should be *ἄμς*, or *ἄμς*, making *ἄμς* in the Genitive Case. But this properly signifies a Sort of Scythe, or Instrument, used by Labourers: But *Aristophanes* uses *ἄμς* in the Accusative Case, which *Suidas* explains, a Sort of Cake made with Milk, which should seem to be the same that *Aretaeus* means; and then it should be *ἄμς*.

AMALGAMA. This, in Chymistry, is a Substance produced by an Incorporation of Mercury with a Metal: The Chymical Character is A. A. A. The best Methods of making an Amalgama, are thus specified by *Boerhaave*.

1. Melt some of the purest Lead in a clean Iron Ladle, and then put into it an equal Quantity of hot Mercury, and stir them about with an Iron Rod: Let them grow cold, and you will have a homogeneous Mass of a Silver Colour, which will be considerably hard, but by rubbing will grow softer and softer: Put this Mass into a Glass Mortar, rub it, and then add to it what Quantity of Mercury you please, and it will be united to it, as Salt with Water.

2. An Amalgama of Tin is made exactly in the same manner; and this will also receive more Mercury.

3. Take a Solution of the best Copper in Aqua-fortis, so much saturated with the Metal, that it will dissolve no more; dilute this, with twelve times as much clean Water: Into the Liquor, when hot, put Plates of polished Iron, and the Copper will be precipitated, to the Bottom, in the Form of a Powder, and the Iron will be dissolved: Proceed in this manner till all the Copper is precipitated: Pour off the Liquor, and wash the precipitated Powder with hot Water, till it is perfectly insipid: Dry the Powder perfectly, put it into a Glass Mortar, and, by rubbing, incorporate with it an equal Weight of hot Mercury, and they will unite into an Amalgama; which will also receive a farther Addition of Mercury. An Amalgama of Copper, in any other manner, is very difficult to make.

4. Pure Silver, precipitated from Aqua-fortis, may, in the same manner, be made into an Amalgama.

5. Dissolve the purest Gold in Aqua-fortis, till it can take up no more; dilute the Solution with twelve times as much pure Water; put into it some polished Plates of

Copper, and a Powder of Gold will be precipitated to the Bottom of the Vessel, and upon the Copper. Let it stand in Heat, till the Liquor will no longer be rendered turbid by an Addition of Copper; shake the Plates, that all the Gold may fall to the Bottom; pour off the Liquor, wash the precipitated Powder with Water, dry it, and then in a Glass Mortar reduce it to an Amalgama with Mercury; and afterwards it will receive more Mercury, like the other Amalgamas. Or, take a Mixture of Gold and Silver, coppel it with Lead, and, by means of a good assaying Aqua-fortis, separate the Silver; then wash the black Powder of Gold that remains at the Bottom, dry it, and, whilst it is hot, rub it with Mercury, and it will presently be reduced to an Amalgama, which will receive more Mercury, as before. All Amalgamas are white, from whatever Metal they are prepared.

REMARKS.

By these Methods an Amalgama may be made, without any Loss, from all Metals except Iron: There are also other Ways of doing it, but not without considerable Loss of Mercury, and Danger from the Fumes: Hence we see, that Mercury is the true solvent Fluid of Metals. These, when they are thus reduced to an Amalgama, may be mixed and confounded together, and lie concealed among each other. This Solution of Metals by Mercury, I look upon to be the Foundation of Alchemy. By these means, some cheating Sophisticians adulterate Mercury with Lead; but, by exhaling a Grain or two of it, the Fraud is easily discovered. And thus, perhaps, the Coagulation of Mercury, ascribed by *Paracelsus* and *Van Helmont* to the fixing Fume of Lead, and a wonderful fixing metalline Spirit, is brought about: For if you melt some Lead, and when it is beginning to cool, but is not hardened, you make an Impression on the Surface with a Stick, and gently drop a little cold Mercury, in a short time it will acquire a solid Consistence: But does not this happen from the hot Lead's being received into the Mercury, and so amalgamated, and of consequence forming a pretty hard Mass? Certainly, if you take a little of this fixed Mercury, and, in a proper Vessel, expose it to the Fire, you will find it so. This Art of making Amalgamas has given Rise to a common Cheat; for if you combine Gold or Silver with Mercury in this manner, by only adding Lead to them in the Fire, you may recover them again, and thus make a plausible Shew of producing these Metals: But only take a little of this Mercury, put it into an Iron Ladle, and set it on the Fire; and then the Mercury flying off, and leaving the Metal, will at once discover the Fraud. On these Principles depend the Art of Gilding with Gold and Silver.

The Ablution of Metals by Mercury.

Take an Amalgama, rub it in a Glass Mortar, the longer the better, and it will begin to grow black. Pour clean Water upon it, and continue to rub it, and the Water will grow black and turbid. Pour this out, add more Water, and rub again, and this will be changed as the former. Repeat this till the last Water, after rubbing, remains clear. You will then have a pure Amalgama, that looks like Silver. And here all Amalgamas, treated in this manner, make Water thus black, more or less, that of Gold however least of all. The Powder that comes away, when it is dried, is neither found to be Mercury nor Metal. The Amalgamas of other Metals will scarce ever, by thus washing, become perfectly clean, so as to communicate no more Blackness to the Water.

REMARK.

Hence we learn, that pure Mercury, by being mixed with Metals, becomes so united with them, that something which lay concealed in one or both of them, is by this means expelled. If in this manner you procure a large Quantity of this Powder from Gold and Silver, as the Matter of both these Metals remains exactly the same in Weight, without the least Addition or Diminution, the Powder must necessarily be produced from the Mercury.

There is something very surprising in this Ablution of Metals by Mercury, that the Amalgama should never cease to communicate this Blackness to Water.

AMALGAMATIO. *Rulandus* defines Amalgamation a Calcination of Metals by Mercury.

AMAMELIS, *ἀμαμνίς*, a Fruit mentioned by *Hippocrates* in his first Book of the Diseases of Women, where he directs them in a Sort of Emulsion he there advises for Women whose Milk is deficient. It is generally agreed, that the Amamelis of *Hippocrates* is the same as the Epimelis (*ἐπιμυλῖς*) of *Dioscorides*, which is the SMALL BASTARD MEDLAR.

There is another Kind of Medlar, which grows in Italy; some call it *Epimelis*, other *Setanium*. The Tree is like an Apple-tree,

Apple-tree, only has smaller Leaves. It bears a round, esculent Fruit, with a large Eye, somewhat affringent, and slow in ripening. *Dioscorides, Lib. 1. Cap. 170.*

AMANDINUS LAPIS, a Gem of various Colours, which is fabled by *Albertus Magnus* to resist and expel Poisons. *Johnson* calls it, by Mistake, *Amandicus*.

AMANITA, *amanita*, a Sort of Fungus, of which I meet no Account amongst the Antients, except in *Oribasius, Paulus Aegineta*, and *N. Myrepsus*.

Of the Clafs of Fungi, the Boleti boiled in Water, as they ought to be, become nearly of the Nature of those Aliments which are void of Qualities. They afford but a cold and phlegmatic Nutriment; and, if freely used, breed ill Juices. These, indeed, are the least hurtful of all the Fungi, and the next to them are the *Amanita*. As for the rest, it is safest to let them alone; for many have been poisoned by them. *Oribas. Med. Coll. Lib. 2. Cap. 25.*

Amanita, Fungi, and Tubera, (Trubs or Truffles, *Dalé*) being of a cold and humid Nature, generate a thick and crude Juice, and, upon that, agree with a hot and dry Constitution: *Astruc. de Spir. Anim. Cap. 6.*

Let those who are dangerously ill with eating *Amanita*, Boleti, or Fungi, eat heartily of fresh Radishes, drinking, between whiles, some moderately strong Wine, sweetened with a little Honey; and let them try to vomit; or let them drink Nitre; or Rye finely powdered in Posca. *Myrepsus de Propom. Sect. 38. Cap. 171.*

Paulus Aegineta, L. 1. C. 77. repeats what has been quoted from *Oribasius*.

I don't know that it has been determined what Sort of Fungi those were, which *Oribasius* calls *Amanita*; it seems probable, that they took their Name from the Place where they were produced: But *Amanita*, as now understood, seems to signify much the same as *Fungus Terra*.

The only Fungi, which commonly enter into Food amongst us, are the common esculent Mushroom, or Champignon, and the Morille: The true Champignon is known by its external Whiteness, and by being of a palish Red within, when very young, and of a more saturated Red as it grows larger and older. These are a delicious, but very hazardous Food; for they will not agree with all Constitutions, nor always with the same Person; for many who have, all their Lives, indulged themselves in eating Mushrooms, have, at last, been greatly injured by a moderate Use of them: And it is remarkable, that some Seasons produce Mushrooms much more unwholesome than those produced at other Times. *Claudius the Roman Emperor*, and *Charles the sixth*, the late Emperor of Germany, are both said to have lost their Lives by eating Mushrooms: And I once was Witness of a violent Disorder, which was brought upon a Gentleman by eating Mushrooms, which had all the Appearances of being good in their Kind, which I had an Opportunity of knowing; because I saw them before they were dressed, saw them eat, and was in the House with the Patient during his whole Illness.

In the Morning, at Eleven o'Clock, he eat about a Dozen Mushrooms of a moderate Size: That Day he eat heartily of Beans and Bacon, and some other Things; and at Night he supped moderately as usual. The next Morning he complained of a great Pain and Uneasiness about four Inches below the Navel, and a disagreeable Aromatic Taste in his Mouth. The Pain continued all that Day; but moved gradually higher: The next Day the Pain, and disagreeable Taste, were the same, except that the Pain was got above the Navel; about Noon he fell into a violent Diarrhoea, which lasted that Day, and the two next, with very few Minutes Intermision. The Day after, his Pain was got to the Region of the Stomach, and gave him much Uneasiness; but immediately after drinking a large Draught of Sherbet, he vomited plentifully, and brought up the Mushrooms, without the Appearance of having been digested, or undergone the least Alteration in the Stomach, and with them the Beans, Bacon, and whatever he had eat since the Mushrooms. After this he was very easy, and recovered immediately.

I have heard, that Leeks are esteemed a Specific against the Poison of Mushrooms; but I never have known it used, nor do I recollect my Authority.

Lemery's Account of Mushrooms is as follows:

There are several Sorts of Mushrooms, which spring up in a short time out of the Earth, in Meadows, amongst Shrubs, and on Dunghills. The best, and most safe for Mens Health, are those which grow up in one Night upon a Dung-bed, where Gardeners have found the Art to make them grow all the Year round; they ought to be white above, reddish underneath, pretty large, plump, tender, easy to be broke, and of an agreeable Taste and Smell. The Mushrooms that grow in Meadows are also very good, as appears by these Lines:

----- *Pratenfibus optima fungis*

Natura est; aliis male creditur.

Mushrooms are restorative, nourishing, and strengthening; they increase the seminal Fluid, create an Appetite, and have all those Properties that are necessary to please the Palate.

VOL. I.

Mushrooms sometimes work violently upwards and downwards, cause the Palsy and Apoplexy, and often kill with a malignant Quality, which they suddenly impart to the Humours. Now-and-then those of them which are looked upon to be the best and safest, suffocate and hinder Respiration, if taken never so little to Excess. There are also some of them, according to the Account given by divers Authors, which poison People, if they smell to them.

All Mushrooms contain much Oil, and essential Salt.

They agree at no time to any Age or Constitution, because they always do more Hurt than Good; and if Use be made of them, it ought to be done with much Moderation; and it is necessary you drink good Wine upon them.

R E M A R K S.

It's said, if you steep Mushrooms in Water, and afterwards pour that Water upon the Ground, Mushrooms shall grow there; and this arises because the Water is filled with the Seed of Mushrooms, which afterwards are, as it were, hatched in the Earth; or because that this same Water hath dissolved some of the essential Salts of the Mushrooms, which serve to dilate and rarify the Seeds of other Mushrooms, which are scattered on the Ground.

It's said, that at *Naples* and *Rome* there are Rocks, and stony Places, upon which, if you throw hot Water, Mushrooms will grow at any time. 'Tis probable, this hot Water softens the Seeds of the Mushrooms that are in such Places, and opens their Pores, so that these Seeds more abundantly receive the remote Juices that are proper to extend and make them grow.

Mushrooms are a Sort of Victuals that you cannot be too cautious of. *Dioscorides* divides them into two Classes, one of which are very dangerous, and may be reckoned of the Number of Poisons; the other does no Harm: However, we cannot but say, that these last, which are commonly made use of, are sometimes pernicious; since we see, every Day, whole Families brought to their End by eating them; which gave *Pliny* occasion to exclaim against the Luxury of Mankind, who, to gratify their Appetites, very often run the Risque of their Lives by eating Foods of that Kind. *Nero* called Mushrooms *βρώμα θεῶν*, that is, the Victuals of the Gods; because the Emperor *Claudius*, whom he succeeded, died with eating of Mushrooms, and was afterwards deified.

There are two different Parts in a Mushroom, viz. the oily, and saline, which last are of an acrid, volatile, very coagulating and malignant Nature: However, when they are strictly united with the others, they are not so dangerous; because they are kept down and embarrassed: But when there is not a strict Union between these two Parts, these Salts we have spoken of, getting the Ascendant, produce many ill Effects. For Example; the Mushrooms commonly used by us, spring up out of the Earth in a little time; they are presently to be gathered; for if you let them lie by for some time, they become a deadly Poison; because their Salts, which, at first, were sufficiently bound up by their ropy Parts, insensibly free themselves from the Fetters that shackled them, and, resuming all their Force, cause the Fermentation that is wrought in the Mushrooms.

Hence we may conclude, that the more oily Parts the Mushrooms have in them, the less dangerous they are; and that those which grow upon Dung-beds cannot produce such bad Effects as the others; because that Bed imparts a great Quantity of sulphureous Principles to them.

Mushrooms may also be pernicious by their spongy Substance, which coming to be diffused and rarified by the Heat of the Body, presses the Midriff, and those Parts which serve for Respiration, and hinders the Air to pass into the Lungs; and 'tis from thence that the best Mushrooms, being taken to Excess, sometimes suddenly suffocate.

When you eat Mushrooms, you ought to drink a good deal of Wine; because this Liquor, by the Help of the Sulphurs abundantly contained therein, embarrasses the Salts of the Mushrooms, and moderates their Operation. Honey is also accounted a Remedy against the ill Accidents caused by Mushrooms, and, upon this Occasion, operates in the same manner as Wine does.

Here it's to be noted, that if the Mushrooms do not retain their natural Colour after they are washed, but turn either blue, red, or black, they are very dangerous. *Lemery on Foods.*

The Morille is a kind of Spring Mushroom, as large as a Nut, of an oblong, pyramidal, or oval Figure, shriveled, tender, porous, cavernous, or pierced with large Holes, somewhat resembling Honey-combs, of a whitish or yellowish Colour; sometimes its Colour is white, inclining a little to red; and sometimes it is blackish.

The Morille contains a good deal of Oil, of Phlegm, and of volatile Salt, but very little Earth. It grows in grassy moist Soils, in Woods, and at the Roots of Trees. It is delicious when used as an Ingredient in Sauces; besides, 'tis of an in-

M m m m

vigorating,

vigorating, restorative Quality, and proper to excite an Appetite. *Lemery de Drugues.*

You are to chuse such as are tender, of the Bigness of a Nut, oval, or oblong, of a yellowish Colour, or whitish, and full of large Holes like Honey-combs.

These Mushrooms create an Appetite, are of a strengthening and restorative Nature, and of great Use in Sauces.

The frequent Use of them heats much, and makes the Humours sharp.

They agree, in cold Weather, with those that are phlegmatic, and such in general whose Humours are gross, and have little Motion; but Persons of a hot and bilious Constitution ought to abstain from them.

The Use of this Sort of Mushroom is not attended with such bad Accidents as the other; and that, in all Likelihood, because their Salts are less injurious and pestilential than those of the common Mushrooms; or else, because they are more confined and embarrassed by sulphureous Principles. *Lemery on Foods.*

Tournefort takes Notice of Eighty-three different Sorts of Amanitæ, which are as follows:

1. *Amanita campestris, alba superne, inferne rubens*, Dillen. Cat. Giff. 177. *Fungus pileolo lato, & rotundo, livido*, C. B. Pin. 370. *Fungus campestris, albus superne, inferne rubens*, J. B. 3. 824. *Fungi vulgatissimi esculenti*, Lob. Icon. 271. CHAMPIGNON, or esculent Mushrooms, common in Pastures.

2. *Amanita Kremlinga alba*, Dillen. Cat. Giff. 178. *Fungus pileolo lato orbiculari candicante*, C. B. Pin. 370. *Fungus Sylvarum, esculentus candicans*, J. B. 3. 828. Found with the former. *M. Vaillant* has repeated this in p. 75. under the Name of *Fungus totus albus edulis*. The white esculent Mushroom.

3. *Amanita vernâ, pileo rotundiori, odorato & esculento*. *Fungi verni, Mouceron dicti, odori & esculenti*. J. B. 2. 823.

4. *Amanita alba, pileo inverso*. *Fungi albi, pileolo inverso*. J. B. 3. 847.

5. *Amanita lutea perniciofa*. *Fungi lutei perniciosi, sub Pinu habitantes*. J. B. 3. 832.

This is engraved in the *Elemens de Botanique*, Tab. 328.

6. *Amanita piperata alba, lacteo succo turgens*, Dillen. Cat. Giff. 179. *Fungus piperatus albus, lacteo succo turgens*, J. B. 3. 825. *Fungi pileolo lato orbiculari candicante*, C. B. Pin. 370. THE PEPPER MUSHROOM.

Found by Dr. *Lifter*, in *Marton-Woods*, under *Pinno-Moor*, in *Craven, Yorkshire*, plentifully. *R. Syn. Ed. 3. p. 4.* I have found it near *Dulwich*, about the End of October.

7. *Amanita major, rubescens aut subfulva, pediculo brevi, lamellis crebris albenitibus*, Dillen. Cat. Giff. 181. *Fungus lignosus fasciatus*, Vaill. 61.

Under Oaks in August. *R. Syn. Ed. 3. p. 4.*

The Stalk is about an Inch in Length, and as much in Thickness, of a dirty white Colour, full and fleshy. The Head is about three Inches in Diameter, hollowed, reddish, with whitish Circles. The Gills are set pretty close to each other, and are white, as is also the Flesh. It yields a glutinous and acrid Milk. *Vaill.*

8. *Amanita major lactescens, pileo ex albo purpurascens, lamellis crebris, caule brevi*. *Fungus lacteus maximus-infundibuli forma*. Vaill. 61.

This resembles, pretty much, the two preceding ones. The Edges are, at first, turned down, but afterwards raise themselves so as to form a kind of Funnel, from three to nine Inches in Diameter. The Head, Flesh, and Gills are white, with a little Wash of Purple. The Gills are very close, and intermixed with shorter, and, as it were, half Gills. The Stalk is about an Inch long, and from half an Inch to an Inch thick. The whole Plant abounds with a very acrid Milk. *Vaill.*

9. *Amanita major lactescens, pileo subfusco, lamellis fulvis, caule brevi*. *Fungus lactescens prægnantissimus*. Vaill. 61.

Its Head is flat, and a little hollowed at the Centre, two or three Inches in Diameter, of a very dirty white Colour, inclining to a Box Colour, unequally indented about the Edges with rounded Divisions. It is exceedingly full of acrid Milk. *Vaill.*

10. *Amanita lactescens fulvâ*. *Fungus lactescens piperatus rufus*. Vaill. 62.

The Head, Gills, and Stalk are of a reddish, or Copper Colour. It yields an acrid Milk. *Vaill.*

11. *Amanita major, pileo subfusco, lamellis albis*. *Fungus piperatus non lactescens*. Vaill. 62.

The Flesh of this has an acrid Taste, but yields no Milk. *Vaill.*

12. *Amanita fasciculosa purpurascens arborea*, Dillen. Cat. Giff. 180. *Fungus nostras pediculo brevi, in pileolum didymum abeunte*, Cistel. Reg. Vaill. 62.

The Head is of a bright and shining Chestnut Colour, the Gills yellowish, and the Edges turn down. *Vaill.*

13. *Amanita major palustris albida*. *Fungus albidus, infundibuli forma, palustris*. Vaill. 62.

14. *Amanita pileo flavo viscido, caule rufescente*. *Fungus glutine flavo limacino resplendens*. Vaill. 62.

The Head is of a Conic Figure at first, and afterwards expands, so as to become two or three Inches in Diameter. *Vaill.*

15. *Amanita major pileo griseo holosericeo, lamellis carneis, caule albo*. *Fungus griseus holosericeus, pileolo crenelato*. Vaill. 63.

The Head is sometimes five Inches in Diameter, turned up at the Edges like a Saucer. The Stalk is two or three Inches long, and about an Inch thick. *Vaill.*

16. *Amanita citrini coloris*, Dillen. Cat. Giff. 181. *Fungus pileolo stramineo*, Vaill. 63.

17. *Amanita media tota alba*. *Fungus mediæ magnitudinis, totus albus*. Vaill. 63.

The Stalk is from an Inch to three Inches in Height, soft, usually full, and sometimes fistular, thicker at Top than at the Bottom, sometimes strait, and sometimes wreathed; sometimes round, and sometimes a little flat, with a Furrow on each Side, from one to three Lines thick. The Head is from four to eighteen or twenty Lines in Diameter, cut at first into a Hemisphere or Cone, which afterwards growing flat, forms another Cone, inverted. The Gills are very far distant from each other, but the Spaces are filled with half and quarter Gills, proceeding from the Circumference. The whole Plant is milk-white, and a little shining. *Vaill.*

18. *Amanita pileo gilvo, lamellis albis crebris, superne ad margines apparentibus, caule albido*. *Fungus gilvus, margine tenuissimus*. Vaill. 63.

19. *Amanita pileo coniformi albo maculato*. *Fungus pileolo conico maculato*. Vaill. 63.

20. *Amanita plana orbiculata aurea*, Dillen. Cat. Giff. 179. *Fungus planus orbiculatus aureus*, C. B. Pin. 371. *Fungi lutei magni dicti faseran speciosi*, J. B. 3. 831.

Found in *Hornsey Wood* by Dr. *Dillenius*, *Syn. Stirp. Brit. Ed. 3. p. 2.*

21. *Amanita purpurascens, pileo sursum repando, caule albo*. *Fungus margine per maturitatem sursum rependo*. Vaill. 64.

22. *Amanita orbicularis, pileo & lamellis fuscis*, Dillen. Cat. Giff. 184. *Fungus late fusco colore*. Vaill. 64.

I have found this near *Dulwich*, in October.

23. *Amanita pileo fusco, lamellis & caule albis*. *Fungus late fusco colore, pediculo brevior*. Vaill. 64.

24. *Amanita clypeiformis major*. *Fungi multi ex uno pede clypeiformes lutei & rubri*, J. B. 3. 835.

25. *Amanita clypeiformis minor*. *Fungus clypeiformis minor*, C. B. Pin. 373. *Fungi parvi lutei & clypeiformes albi letiales*, J. B. 3. 847.

26. *Amanita fasciculosa viscida arborea mollis alba*, Dillen. Cat. Giff. 187. *Fungi albi lucentes ex uno principio plures ex radice arborum*, J. B. 3. 835.

27. *Amanita fasciculosa lutea dumetorum*, Cat. Giff. 186. *Fungi multi ex uno pede perniciosi*, J. B. 3. 835. I have counted above a Thousand of these from one Root. *M. Vaillant* has repeated this *Amanita* in p. 68. under the Name of *Fungi plures ex uno pede, & prunorum radicibus enati*, *Raii Hist. 1. 99. App. 32. 8.* *Fungus multiplex parvus luteus, pileolo mollior convexo*, Cistel. Reg. And again, in p. 71. under the same Name, where the whole Description is also repeated.

28. *Amanita colore lacteo*. *Fungus colore lacteo*. Vaill. 64.

29. *Amanita piperata non lactescens viscida, pileo ex fusco rufescente, lamellis & caule albis*. *Fungus piperatus, non lactescens, coloris brasiliici*. Vaill. 65.

30. *Amanita obtuse coniformis cinerea, aut ex livido nigricans, utrinque striata*, Dillen. Cat. Giff. 182. *Fungus parvus, pediculo oblongo, galericulatus striis lividis aut nigris*, *Raii Syn. Vaill. 65.* In Pastures on Dung, in September and October, *Syn. Ed. 3. p. 8.*

31. *Amanita pileo albo, centro rufescente, lamellis carneis, caule albo*. *Fungus pileolo albo, centro rufescente*. Vaill. 65.

32. *Amanita parva, pileo viscido, ex albido luteo, lamellis lividis, caule longo*. *Fungus capite hemisphærico pallide lutescente*, Vaill. 65. It is common on Cow-dung and Horse-dung, in September and October. *M. Vaillant* seems to have repeated this *Fungus* in p. 71. under the Name of *Fungus parvus, pediculo oblongo, pileolo hemisphærico, ex albido subluteus*. *Raii Syn.*

33. *Amanita parva verna utrinque striata fusca, pileo obtuse coniformi, musco palustri ramoso majori, foliis membranaceis acutis Vern. innascens*, Dillen. Cat. Giff. 184. *Fungus capitulo conico pallide cineritio, centro fusco*. Vaill. 65.

34. *Amanita tota alba*. *Fungus totus albus*. Vaill. 65.

35. *Amanita tota grisea*. *Fungus totus griseus*. Vaill. 66.

36. *Amanita fasciculosa sordide carnea*. *Fungus multiplex sordide carneus*. Vaill. 66.

37. *Amanita fasciculosa buxæ*, Dillen. Cat. Giff. 187. *Fungus nostras multiplex, pileolo lato mammoso*. Vaill. 66.

38. *Amanita exigua, sanguinei coloris*, Dillen. Cat. Giff. 66. *Fungus parvus coccineus*, Cistel. Reg. Vaill. 66.

39. *Amanita exigua*, pileo umbilicato nigro, lamellis nigricantibus. Fungus minimus, totus niger, umbilicatus. Vaill. 66.

40. *Amanita minor umbilicata*, tota rufa. Fungus minor, totus rufus. Vaill. 66.

41. *Amanita minor*, tota citrina. Fungus minor, citrino colore, pedunculo flavescente. Vaill. 66.

42. *Amanita minor*, pileo villosio fusco, lamellis ex cinereo purpurascens, caule fusco. Fungus minor, pilei superficie flocculis fuscis, villosa. Vaill. 67.

43. *Amanita parva*, capitulo conico, violacei dilutioris coloris, Dillen. Cat. Giff. 181. Fungus minor Amethystinus. Vaill. 67.

44. *Amanita fasciculosa*, ex fusco violacei coloris. Dillen. Cat. Giff. 186. Fungus major violaceus. Vaill. 67.

45. *Amanita pileo incarnati coloris*, lamellis albidis, caule albo, ad imum tuberoso. Fungus dilute carneus, vel incarnatus. Vaill. 67.

46. *Amanita major*, pileo pallide violaceo, lamellis & caule candidis. Fungus magnus albus, pileolo lato, prona parte sordide caeruleo. Vaill. 67.

47. *Amanita pileo aurantii coloris*, lamellis & caule lividis, Hist. Plant. rar. Cent. 1. Dec. 3. p. 31. Fungus aurantii coloris, capitulo in conum abeunte, Inst. 559. Near Fulborn in Cambridgeshire.

This is of a red Orange Colour, and its Head is a perfect Cone.

48. *Amanita pileo conico aureo viscido*, lamellis pallide flavis, caule aureo. Fungus aureus, capitulo in conum abeunte. Vaill. 67.

49. *Amanita ex livido albicans*, oris intus converfis, Dillen. Cat. Giff. 182. Fungus colore castaneo, margine per maturitatem introrsum convolutus, Vaill. 68.

50. *Amanita minima*, pileo & lamellis cinereis, caule fusco conico. Fungus minimus, pediculo conico. Vaill. 68.

51. *Amanita pileo clypeato rufescente*, lamellis & caule cinereis. Fungus clypeatus, in medio protuberans. Vaill. 68.

52. *Amanita parva*, utrinque striata, pileo coniformi, murini coloris, lamellis & pediculo albis, Dillen. Cat. Giff. 183. Fungus capitulo mammoso, centro papillari, Vaill. 69. It is found in Pastures in Autumn. This seems to be the same with what M. Vaillant has called, in p. 69. Fungus pileolo candicante, lamellis paucis, pediculo fusco splendente.

53. *Amanita exigua*, incarnati coloris. Funguli incarnati, coloris minuti, musco innati. Mentz. Pugil. Tab. 6. Vaill. 69.

54. *Amanita parva*, utrinque striata, pediculo tenui longo firmo lento, pileolo in medio fastigiato, Dillen. Cat. Giff. 183. In Pastures.

55. *Amanita ochroleuca viscida*, pileo clypeiformi. Fungus colore homogeneo pallido, pileolo & pediculo glutine obducto. Vaill. 69.

56. *Amanita grisea viscida*, pileo clypeiformi. Fungus colore homogeneo griseo, pediculo glutine obducto. Vaill. 69.

57. *Amanita arborea mollis*, coloris exacte crocei, Dillen. Cat. Giff. 182. Fungus pileolo croceo, splendoris participat. Vaill. 69. On Trees and rotten Wood.

58. *Amanita viscida*, pileo expanso sordide albo, lamellis candidis, caule solido. Fungus capite expanso, viscosus. Vaill. 70.

59. *Amanita viscida*, pileo primum conico, postea plano. Fungus cono primum obtuso, postea plano, pileolo & pediculo glutine obducto. Vaill. 70.

When this is young, the Head of it is usually of a dirty White, and the Top of a Box Colour: Sometimes it is of a dark Green, and sometimes of a Russet. The Stalk and Gills of this last are of the same Colour with the Head; but the Gills of the White and Green are usually of a Brimstone Colour, and sometimes washed with a little Green. The Stalk also is of a Brimstone Colour, with a Tinge of Verdegri towards the Top. Vaill.

60. *Amanita pileo obtuse coniformi*, e cinereo fulvo, lamellis albidis, caule longo firmo striato gracili, castanei coloris. Fungus fmi equini, capitulo pileum Romanum referente. Vaill.

71. It has been found in Woods in England by Mr. Dale.

61. *Amanita pileo cinereo utrinque striato*, caule longo fistuloso. Fungus capitulo mammoso. Vaill. 70.

62. *Amanita fasciculosa*, pileo obtuse coniformi, utrinque striato pallido, lamellis nigris, caule albo fistuloso. Fungus nostras multiplex, pediculo fistuloso. Vaill. 70. I have often found this about the latter End of Summer; it soon rots; and is perhaps the same with that mentioned by Dr. Dillenius, (Syn. 7.) under the Name of Fungus parvus lethalis galericulatus. Lob.

63. *Amanita fasciculosa*, pileo ex luteo fusco, lamellis virentibus, caule pallido. Fungus medice magnitudinis, pileolo superne e rufo flavicante, lamellis subtus sordide virentibus, Raii Hist. 3.

17. Fungus luteus, pileolo molliter convexo, lamellis viridibus, Cimel. Reg. Vaill. 71. I found this on rotten Wood in the Apothecaries Garden at Chelsea in October.

64. *Amanita exigua candidissima*, pileo umbilicato. Fungus minimus albus umbilicatus striatus. Vaill. 71.

65. *Amanita fasciculosa*, pileo obtuse conico griseo, lamellis albis, caule griseo. Fungus multiplex obtuse conicus, colore griseo murino. Vaill. 71.

66. *Amanita pileo viscido luteo*, Hist. Plant. rar. Cent. 1. Dec. 3. p. 31. I suspect this to be the same with that which M. Vaillant describes under the Name of Fungus glutinosus, colore aurantio, p. 72. The Plant, which I mean, is very common in Pastures in Autumn.

67. *Amanita ovum referens*, humorem nigrum per maturitatem effundens. Fungus Typhoides. An Fungus non vescus, 7. Flor. Pruff. 89. An Fungus albus ovum referens, D. Doodii, Raii Hist. 3. 22. Vaill. 72. On a Moor betwixt Rood-Lane and Somerset-Bridge in Hampshire, Mer. Pin. I have seen it in great Plenty at Chesterton in May.

68. *Amanita fasciculosa*, ovum referens, minor, humorem nigrum per maturitatem effundens. Fungus multiplex ovatus cinereus minor. Vaill. 72.

69. *Amanita orbicularis alba*, lamellis & pediculo villosis, ac veluti farina conspersis, Dillen. Cat. Giff. 184. An Fungus minor tenerimus, farina respersus, pileolo superne cinereo, lamellis subtus tenuissimis nigris, Raii Syn. Vaill. In Pastures in September and October.

70. *Amanita fusca*, pileo infundibuli-formi. Fungus foliaceus vel lamellatus infundibuli forma, fusco-lividus. Vaill. 73.

71. *Amanita fasciculosa*, pileo fusco, lamellis & caule griseis. Fungus multiplex campaniformis, colore fusco. Vaill. 73.

72. *Amanita fasciculosa*, pileo & caule castanei coloris, lamellis ex sordide albo pallide rubentibus. Fungus multiplex campaniformis, colore castaneo. Vaill. 73.

73. *Amanita fasciculosa*, pileo rufescente, margine araneofo, lamellis crebris fuscis, caule albo fistuloso. Fungus capitulo mammoso rufescente. Vaill. 73.

74. *Amanita fasciculosa*, pileo ovato sulcato cinereo, lamellis crebris lividis, caule albo. Fungus multiplex ovatus. Vaill. 73.

75. *Amanita sicca & levis*, pileo magno plano orbiculari, pediculo longo, plerumque bulbiformi, Dillen. Cat. Giff. 180. Fungus pileolo lato, longissimo pediculo variegato, C. B. Pin. 371. Vaill. 74.

Observed frequently in England by Dr. Lister; as in Chesterton-Close near Cambridge, and in the Woods in Lincolnshire; who also experienced it, in eating, to be more savoury than the Champignon. R. Syn. Ed. 3. p. 3.

76. *Amanita pileo lato rufescente*, micis surfuraceis asperso, lamellis albis, caule tuberoso. Fungus pileolo lato, micis surfuraceis asperso. Vaill. 74.

77. *Amanita pileo virescente*, ex pila erumpens. Fungus phalloides annulatus, sordide virescens & patulus. Cimel. Reg. Vaill. 74.

78. *Amanita pileo lato albido*, lamellis candidis ex pila erumpens. Fungus phalloides. Vaill. 74.

79. *Amanita pediculo bulbiformi*, pileo maculato, Dillen. Cat. Giff. 184. Fungus pediculo in bulbi formam excrecente. C. B. Raii Hist. 1. 95. Vaill. 75.

80. *Amanita pileo lato puniceo*, lamellis albis. Fungus pileolo lato puniceo, lacteum & dulcem succum fundens. C. B. Pin. 371. Vaill. 75.

81. *Amanita pileo candido*, tuberculis flavo-fuscis variegato, lamellis creberrimis. Fungus colore candido, tuberculis flavo-fuscis elegantissime variegato. Vaill. 75.

82. *Amanita pileo clypeato castaneo*, centro rufo, circulo sordide albo circumdato, lamellis creberrimis flavescens. Fungus centro mammoso rufo, circulo sordide albo circumdato. Vaill. 76.

83. *Amanita minima*, pileo aurantii coloris, lamellis ex albo rufescentibus. Fungus minimus aurantius mamillaris. Vaill. 76. Martyn's Tournefort.

Something like the Mushroom is the Truffle, except that it never appears naturally above Ground. Of this there are two Sorts, the first sometimes used in Medicine, (see BOLETUS) the second much used in Food.

The second is thus distinguished:

Tubera, Offic. C. B. 376. J. B. 3. 849. Chab. 591. Raii Hist. 1. 110. Synop. 20. Sterb. 308. Tab. 32. A. Hist. Oxon. 3. 638. Tubera Matthioli, El. Bot. 442. Tourn. Inst. 565. Tubera terræ, Ger. 1385. Emac. 1583. Tubera terræ edibilia, Park. 1319. TRUFFLES or TRUBS.

Mr. Geoffroy the younger having given several curious Particulars, relative to Mushrooms and Truffles, in the following Memoir, it will be of some Importance to insert it.

Observations upon the Vegetation of Truffles.

All Substances which appear to vegetate, may, generally speaking, be divided into two Classes; such as have all the Characteristics of Plants, and such as want some of these Characteristics. Among those of the latter Kind, some have no Appearance of Flowers; as the Fig-tree, whose Flower is thought to be wrapt up in its Fruit: Others want the Appearance both of Flowers and Seeds; such as the most Part of Sea Plants, whose Seeds are suspected to lie concealed in particular Vessels, destined for the Purpose: Others have only Leaves without Stalks, such as Liver-wort, Sea-lettice, and Nostoch: Others have Stalks without Leaves, such as the Euphorbium, the Horje-tail,

Horse-tail, the *Sea-oak*, *Corals*, and the most Part of stony Plants. Lastly, others have scarce any Appearance of Plants, not having visibly either Leaves, Flowers, or Seeds. Of this kind are most *Mushrooms*, *Sponges*, *Morilles*, and especially *Truffles*, which are likewise without Roots. Botanists have only ranked them among the Class of Plants, because they are observed to grow and multiply, not doubting but they contained the essential, tho' they were destitute of the apparent Parts of Plants; as Insects have the essential Parts of an Animal, tho' their outward Form should have a different Appearance. Having made some Observations on the *Nostock*, I was led to examine the *Truffle* also, which is still more singular, and, for ought I know, has, as yet, had nothing positive advanced concerning it: I shall therefore give an Account of the Observations I have made upon its Analysis, and the uncommon Manner of its Vegetation.

This Sort of Plant is only a fleshy Tubercle, covered with a hard Sort of Crust, rough, and somewhat regularly furrowed on its Surface, almost like the *Cypress-nut*. It does not rise above the Surface of the Earth, but lies concealed about half a Foot below it. Great Numbers of them are found in the same Place, of different Sizes. Some of them are, now-and-then, found of a Pound Weight, or even a Pound and a Quarter: These last are but rare, and *Pliny* only mentions their being of a Pound Weight.

Certain it is, however, that some of them are very large: They grow in different Countries; and, in *Pliny's* Time, the most valuable were brought from *Africa*. They are now found in *Europe*, in *Brandenburgh*, and several other Parts of *Germany*; and are very common in *Italy*, *Provence*, *Dauphiné*, *Languedoc*, *Anjou*, and *Perigord*. They grow also in *Burgundy*, and some of them are found about *Paris*: It is observed, that they are ordinarily found in Fields, that are uncultivated, of a reddish-coloured Earth, and sandy, but somewhat rich. They grow at the Feet, and under the Shades of Trees; sometimes about the Roots of Stones, and sometimes in clear Earth: Their favourite Trees are, either the white or the green Oak; as the *Elm* is that of the *Morille*. They begin to be found when warm Weather first succeeds the cold, sooner or later, as the Season is more or less mild; for they have sometimes been very rare after hard Winters. At first they appear only like little round Pease, red without, and white within. These Pease grow larger by degrees; from that Time they begin to take out of the Ground what they commonly call *White Truffles*: These are of themselves insipid, and People dry them as an Ingredient for *Ragouts*; because they keep better when dried than marbled ones do. 'Tis a common Opinion, that *Truffles*, which have once been removed from their Places, are never after capable of being nourished; even when put into the same Earth from which they were originally taken: But if one leave them there for a certain Season, without disturbing them, they grow insensibly larger; their Bark becomes black, rough, and unequal, tho' they always retain their Whiteness within. Hitherto they have very little Smell or Taste, and can only be used in *Ragouts*. These are always called the *first White Truffles*, and are not to be made a different Species from the *marbled or black ones*, gathered in the End of Autumn, and even in Winter after the Frosts are begun; for, in my Opinion, they are only the same, arrived at different Degrees of Maturity. I look upon the *White Truffle*, in its first State, as a Plant which is, at one and the same time, Root, Stalk, and Flower, whose *Parenchyma* swells every Way, and whose Parts are insensibly unfolded: In proportion as the *Truffle* swells, its Bark becomes hard and furrowed in different Places, that so it may convey the more Nourishment to the grosser Mass: Then the *Truffle* changes its Colour, and, instead of white, it insensibly becomes marbled with greyish Streaks; and that which was formerly white, now looks like a Congeries of small Pipes, which spread themselves in the Heart of the *Truffle*, and terminate in the Furrows of the Bark.

The greyish Substance, which is wrapt up amidst these Canals, when viewed with a Microscope, appears to be a transparent *Parenchyma*, composed of Vessels or little Bladders: In the Middle of this Substance appear black round Points, distinct from one another, which have all the Appearance of Seeds nourished in that Substance, whose Colour they have darkened, and in which there remains nothing white, except the Vessels and some Capsulæ. I look upon that white Substance as hollow Pipes, because I always see them terminate in the Bark.

When the *Truffles* are arrived at this Degree of Maturity, they are of a very good Smell and Taste: The Heat and Rains during the Month of *August* forward their ripening very fast, which may possibly be the Reason why some Authors have said, that Storms and Thunder first produced them. The Truth is, good *Truffles* are not dug but from the Month of *October* to the End of *December*; and sometimes to the End of *February* and *March*, when they are, even at that Time, marbled; whereas those gathered from the Month of *April* till *July* and *August*, are only white. If People neglect to gather the *Truffles* when arrived at their due Degree of Maturity, they rot; and then

we may observe the Re-production of the *Truffle*, because, after some time, we see several Bunches of other young *Truffles* filling up the Places of the rotten ones. These young *Truffles* are nourished till the first Colds come on; and if the Frosts are not intense, they get over the Winter, and furnish us betimes with the white Spring *Truffles*.

The excessive Cold in the Year 1709, is an additional Proof of what I advance, since *Truffles* were not found till the Autumn of that Year; the most forward ones, which should have appeared in the Spring, having perished by the Rigour of the Season; whereas they were very common the foregoing Year: We observe neither Hairs nor Filaments of Roots at the *Truffles*, when taken out of the Earth, with which they are covered in such a manner as to leave the Traces of their Bark imprinted in it, without appearing to have any other Communication with it. They are subject, like other Roots, to be eat into by Worms. The Worm which preys upon the *Truffle*, is white, small, and different from that which is hatched by its Corruption: Afterwards this Worm forms a kind of Bean, shut up in a very slender Covering of a white kind of Silk; from which, some time after, comes forth a bluish violet-coloured Fly, which makes its Way, from the *Truffle*, thro' the Furrows or Clefts observed in it. These Flies are infallible Signs; that there are *Truffles* to be found near the Places where they are observed.

If a dressed *Truffle* has been pierced by a Worm, it may be discovered by its being bitter to the Taste; and by a little Attention, one may observe the Place, where the Hole is, to be blacker than the rest, and that the Bitterness is caused by it, since the rest of the *Truffle* tastes well. Upon laying open the Place where the Hole is, one may easily discover the Nest of the Worm, and a Space round it free from Marbling, of a different Colour from the rest of the *Truffle*, and resembling that of rotten Wood. Upon viewing the Surfaces of *Truffles* with a Microscope, I have found, that certain white Specks, which I saw there, were so many small Insects, which prey'd upon them. They follow the Furrows of the Bark, that they may the more commodiously suck their Nourishment. These Insects are white, transparent, and of a round Figure, almost like Mites. They have only four Feet, a small Head, and creep pretty fast. These Insects are nourished by the nutritive Juice of the *Truffle*; for I have found some of them lodged in the same Cell which had formerly been inhabited by the Worm: They were become, tho' transparent, of a Coffee-colour, like the Place where the Worm had nested. It is to be observed that the Earth which produces *Truffles*, bears no other Plants upon it; for the *Truffle* absorbs its nutritive Juice, or rather by its Smell destroys or prevents the springing of other Herbs. This Reason appears to me so much the more probable, because the Earth, in which they grow, smells perfectly like them. The Peasants in some Parts receive Profits so considerable from the Sale of *Truffles*, as to render them very industrious in discovering the Grounds where they are, so that they are now become very skilful at it. They know the Extent of the Ground where the *Truffles* are, by its bearing nothing, and being void of all Herbs. In the second Place, according to the Quality of the Earth, if the Ground abounds with *Truffles*, it is chapp'd in several Places. They also know it by its being more light than other Earth, by these little bluish violet-coloured Flies I have mentioned, and by another Sort of Flies which are large, black, long, different from those produced from the Worm, but which are ingendered by the Corruption of the *Truffle*, and like those which are hatched in every other corrupted Matter. There is a Dexterity in digging *Truffles* without cutting them, especially if they are big. The Peasants have a kind of *Planting Stick* for digging them. In other Parts they do not trouble themselves with searching for them, but have recourse to another Method mentioned by *Pliny*, and other Authors. Swine are known to be very greedy of *Truffles*; they therefore make use of one of these Animals, which they train up to discover and dig them; but there is a Necessity for being very quick in taking the *Truffles* they find from them, and giving them something in their stead, lest they should be discouraged, and give over a Pursuit from which they receive no Advantage: And in *Montserrat* they have Dogs trained up for this very Purpose.

These are, in general, the Observations I have made upon the *Truffle*, and its Origin. 'Tis now my Business to determine the several Species of it.

Mr. *Tournefort* only admits of two, which he distinguishes by their Figure. The first is round, the Figure of which may be seen in his *Elements of Botany*, and is the same with that represented in *Matthioli*, and other Botanists: This is the Species which *Mentzelius*, in his *Pugillus rariorum Plantarum*, styles *Tubera subterranea testiculorum forma*, or, *The Subterraneous Mushroom in the Form of Testicles*. This *Truffle* differs from others, both in its Figure, and its internal Colour; which, as this Author says, is of a greenish Red, like the internal Colour of the Fuz-balls in our Woods; but perhaps, if he had opened them at another Season, he would have found them of a different Colour. He also compares them to another certain Substance,

Substance, which changes Colour like them. *Mentzelius* discover'd this Species in the Months of *August* and *September*; at which Season they are not perfectly ripe; he found them in a Province on the Frontiers of *Brandenburg*. According to this Account, we have as yet only two Species of Truffles; which differ in their external Appearance; and we ought not to look upon the Variety of internal Colours, or the different Degrees of Bulk, as Characteristicks, or Marks of different Species, since the Roots or Stones they meet with in their Growth, may model them into different Forms. The Truffle then appears to me to be a Plant, and not a conglomerated Substance, or an Excrement of the Earth, as *Pliny* thought; and as a Proof of his Opinion, told a Story of the Governor of *Carthage*, who, upon biting a Truffle, found a Piece of Brass Coin in his Teeth. But this Circumstance is no satisfactory Proof of his Assertion, since the Truffle, in its Growth, must by chance have inclosed this Coin, as we sometimes observe in certain Trees, of whose Vegetation we are fully persuaded. I have Reason to think, that *Pliny* knew not well what to determine concerning this Matter, since he afterwards tells us, that no Truffles were found about *Mitylene*, in the Island of *Lesbos*, only when the overflowing of the Rivers carried the Seeds of them from a Place called *Tioves*, in the main Land of *Asia*, where were Truffles in Abundance. Perhaps we might be able to multiply Truffles, by trying different Means for that Purpose, since we plainly find, that they multiply in the Earth. This Reproduction would confirm my Opinion, that the Seeds are inclosed in the Heart of the Truffle, and that it is by this means, that the Colour of the Parenchyma is obscured. This Parenchyma is supported by Fibres, which run irregularly from the Circumference to the Centre, and all intersected by white Pipes, which form the Marbling of the Truffle. Sometimes these Pipes extend themselves, and form white Plates, composed of transparent little Bladders, which are slenderer than the rest; so that, when view'd Sideways, they form an even white Surface; and when observed perpendicularly, black Points may be observed scattered up and down them: If these Points are the Seeds of the Truffle, I should suspect, that the white Plates are, as it were, the Flowers of them, it being very probable, that the Flowers, together with the Seed, are included in the Truffle. Tho' the Fibres of the Truffle are very slender, yet the Whole of them, taken together, make a considerable Resistance, when an Attempt is made to break them in a longitudinal Direction. The Fibres are more distinctly observed in a faded Truffle, than in a fresh one, because the plump Contexture being wither'd, allows their Bags to be the more easily discovered, which, upon pressing them, yield their Contents; if, on the contrary, these Fibres are drawn in a lateral Direction, they easily separate into many fibrous *Laminae*. As a Proof, that these are real Fibres, the Place spoiled by the Worm, when view'd with a Microscope, appears like rotten Wood; so that they are in this State nothing more than Fibres or *Laminae*, without Juice, without Vesicles, and without Grains, which I take to be the Seed. We find them, as it were, pierced like a Sieve in the Places, where these Substances should have been contained; whence we may conjecture, that the Worms or Insects have extracted the nutritive Juice, since the Insects which I have found there, were of the same Colour with that Part of the Truffle where they made their Entrance.

But to come to the Analysis of this Plant, I first endeavour'd to discover whence its Smell proceeded; and that I might not alter their Principles by the Action of the Fire, I inclosed some of them in a Glass Cucurbit, covered with its Top, in which I had suspended Shreds of Paper, ting'd of a bluish Colour with the Tincture of *Turnsole*, and others ting'd with the Juice of Violets. In less than twenty four Hours, these latter Shreds assum'd a beautiful Emerald Colour, whereas the Paper ting'd blue with the *Turnsole*, did not change its Colour. This Experiment confirm'd me in the Opinion I had, that the Smell was no more than the unfolding and breaking forth of a *volatile alkaline Salt*, mixed with some Quantity of Sulphur. It also proves the Analogy of this Substance with Plants and Fruits; which only acquire a Smell by the Fermentation rais'd in them; and which ripens them. If this Fermentation becomes too strong, the Fruit rots, and yields a Seed perfectly ripe, as may be observ'd in Cucumbers, Gourds, and other soft Fruits. I find the same Circumstance to hold in the Truffle. It is insipid till the Fermentation has drawn forth its Principles, and put them into such a Motion as is sufficient to render them perceptible by the Smell and Taste. This Vapour is in the Truffle impregnated with such a Quantity of volatile Salts, that they discover themselves from the very Beginning of the Fermentation; whereas in other Plants, Wood alone excepted, the urinous Principle does not discover itself but in the Putrefaction. This is what I have observed with regard to Wormwood, from which I extracted an urinous Spirit, by allowing it to rot. The Smell of the Truffle is only agreeable in a certain Degree; for when there are many of them together, or when they are shut up close, they ferment to such a Degree, as to send forth a Smell like that of Musk; then they become mouldy and viscid.

VOL. I.

If Truffles are gathered in dry Weather, they keep much longer, especially if Care be taken to lay them at a Distance from one another, as People do other Fruits. I believe they might be preserved a considerable time in Oil, which would hinder the Fermentation, by blocking up the external Pores. The Country People pretend, that they are better after the first Frosts; which seems probable enough, since the Cold suppresses the Fermentation, and thereby qualifies them for being preserved longer than otherways they would have been. Those who keep them, chuse for that Purpose either Sand or Earth, according as they stand in need of Moisture or Dryness.

To continue the Analysis, I got some Truffles, took off their Bark, cut them into Slices, and put them into Water, which became impregnated with the Smell of the Truffle; and was of a nasty greyish Colour. I pour'd some of this Tincture upon Syrup of Violets, which alter'd its Colour, and assum'd a greenish Cast; I pour'd also some of it upon a Solution of corrosive Sublimate, which it at first darkened; and then insensibly produced a Precipitate of a dirty White: At last, the Water and the Truffles became putrid, of a very ill Smell, and viscid. I put into six Ounces of Spirit of Wine, three Ounces of Truffles, cut and clear'd from the Earth like the former; the Spirit extracted a red Tincture, which had exactly the Smell of the Truffle. This Tincture coagulated the White of an Egg, as Spirit of Wine uses to do, and produced a white Precipitate in corrosive Sublimate, because of the volatile Salt it contains. When I had suffered the Spirit of Wine to stand about two Months on the Truffles, its Smell was a little alter'd, and approach'd to that of a Quince. The Slices of Truffle, which I took out of it, were dry and tough like a Horn; and immediately after appear'd white; and cover'd, as it were, with an insipid saline Flower, which did not incorporate with the Spirit of Wine, as we daily observe, that volatile Salts do not mix with Spirit of Wine, or at least, that Liquor can only be impregnated with a very inconsiderable Quantity of such Salts. This Tincture of Truffles and Spirit of Wine, thrown into limpid Water, gave some Marks of a sulphureous or resinous Quality, since it a little disturb'd the Water. After having observed the volatile Principles of the Truffles; by the Help of a simple Fermentation, I afterwards call'd in the Assistance of a very mild Fire: For this Purpose I put twenty four Ounces of Truffles fresh, entire, and as thoroughly clear'd of their Earth, as they could possibly be, into a Cucurbit placed in a Sand Bath. In three Days I extracted two Ounces seven Drams and one Scruple of a limpid Liquor, which smelted very agreeably of the Truffle. This Liquor turn'd the Syrup of Violets green; but on mixing some of it with a Solution of corrosive Sublimate, both Liquors became milky, and assum'd the Colour of *Opal*, and then a white Precipitate was insensibly produced. In two Days and a half, I extracted five Ounces and six Drams of a Liquor, that was equally clear and fragrant, and which produced the same Effects as the former. In three Days more, I extracted three Ounces and a half more of a limpid Liquor; of a Smell somewhat empyreumatic, which considerably whiten'd a Solution of corrosive Sublimate, and even produced a kind of white and pretty thick *Coagulum*, but did not alter the *Turnsole* any more than the former Liquors, and fermented but very little with acid Spirits. In four other Days, I quite exhausted the Moisture of the Truffles, from which I drew, in that time, twelve Drams of a Liquor, which had the same Smell with the former, and produced the same Effects. I then found the Truffles in the Cucurbit entirely dry, and weighing only nine Ounces and five Drams. I put them into a Retort placed in a reverberatory Furnace, and drew from them, by a mild Fire, three Drams of a Liquor tolerably clear, which turned red after some Days, and had a volatile kind of Smell like that of Spirits, which have lost somewhat of their Strength. It turn'd the Syrup of Violets green, produced no Effect upon *Turnsole*, but coagulated, and even clotted a Solution of corrosive Sublimate. The second Liquor weigh'd three Drams, was of a milky Colour, and of a Smell like that of the volatile Salts of Animals. The third Liquor weigh'd one Ounce six Drams, was very red, and mix'd with a little Oil. These two last Liquors produced the same Changes as the former, in the Substances with which they were mixed.

The fourth Liquor weigh'd six Drams, was red, rich, thick, like Butter, and loaded with volatile Salt. This Oil did not change the Tincture of *Turnsole*.

There was about a Dram of volatile Salt in Crystals, loaded with Oil, and easily dissolv'd. The *Caput Mortuum* weigh'd four Ounces six Drams and thirty-six Grains. I calcin'd this Substance, and after the Calcination perceiv'd, that it was load'd with a great deal of Earth, which by the Force of the Fire had become red. I separated as much of it as I possibly could from the rest of the Mass, and procur'd of it an Ounce and two Drams; which amounts to the same as if I had only analysed twenty two Ounces and six Drams of Truffles; so that there only remain'd of the *Caput Mortuum*, after a Subduction of the Earth, three Ounces four Drams and thirty-six Grains. After the Calcination of this Substance, there only

N n n n

remain'd

remain'd two Ounces and a Dram of white Cinders, from which I drew, by way of Lixivium, a Dram of fix'd alkaline Salt, mixed with Earth, and which produced a yellow Oker-colour'd Precipitate in a Solution of corrosive Sublimate. It turn'd the Syrup of Violets into a faint-green Colour, and fermented with Acids. This Analysis proves, that the Smell of the Truffle depends only on the vast Quantity of volatile Salt, which it contains.

As to the Virtues of Truffles, the common Opinion is, that they are hot: *Galen* however, according to *Matthiolus*, looks upon them as indifferent, and the Basis of all other Seasonings; and indeed it is to this Purpose, that they are used in all Ragouts. *Avicen* speaks of them in a manner quite different, and says, they ingender thick Humours more than any other Food; that they are of hard Digestion, heavy on the Stomach, and that when much used, they have a Tendency to bring on an Apoplexy and Palsy. For my part, I believe these two Authors may be reconciled, if we consider two Qualities in the Truffle, which are capable of producing two different Effects: First, they may prove hot of themselves, by emitting their volatile Salts in the Stomach, or by being mixed with Salt, Pepper and other Spices, which they drink up like a Sponge. In the second place, they may prove of hard Digestion, when eaten immoderately by a Person of a weak Stomach, in which Case they produce bad Effects, stagnate and form themselves into a glareous Substance, which disorders the Stomach, which may be occasioned by the cold Quality ascrib'd to them by *Galen*. As a Proof, that the Truffle is of hard Digestion, it has this in common with other Fruits, that it grows hard in Spirit of Wine, and is with Difficulty dissolv'd in Water. I kept one six Months in Water, without its being entirely rotten, the Bark still remaining, and not rotten, after all the rest. *Memoirs de l'Acad. R. des Scien. A. 1711.*

AMARA, Bitters. Of these there are many Sorts, especially amongst Vegetables, of which proper Notice is taken under the respective Articles as they occur, and under the Disorders in which they are useful. Let it suffice to say in general, that Bitters seem to exert their Efficacy, first, by bracing up the weaken'd and relax'd Fibres of the Organs of Digestion; and, secondly, by supplying the Place of a languid and inert Bile. Hence, in Constitutions that require it, Bitters, by promoting the Digestion and Assimilation of the Aliment, mend the Blood and Juices; and by fortifying both the Solids and Fluids, enable them to perform the respective Offices, which are necessary to a State of Health.

AMARACUS, *Αμαράκω*, Sweet Marjoram.

The Antients, in the Opinion of *Salmasius*, understood by *Amaracus*, two different Plants; the greater *Amaracus*, which is Sweet Marjoram; and the lesser, which is Marum.

But it has not been easy to determine, whether the *Amaracus* and *Sampsuchum* were the same Plant, or different from each other, for Reasons which will be given in the Dissertation quoted at the End of this Article from *Salmasius*.

This Plant is thus distinguish'd:

AMARACUS *Majorana Sampsuchum*, Offic. *Majorana vulgaris*, C. B. Pin. 224. Raii Hist. 1. 538. Tourn. Inst. 199. Elem. Bot. 168. Boerh. Ind. A. 178. Rupp. Flor. Jen. 190. *Majorana vulgaris aestiva*, Park. Theat. 11. Hist. Oxon. 3. 358. *Majorana major*, or, Great Sweet Marjoram, Ger. 538. Emac. 664. *Majorana majori folio & semine nota*, J. B. 3. 241. *Sampsuchum, Amaracus, Majorana*, Chab. 419. SWEET MARJORAM.

This Herb has many Branches, which creep on the Ground, with hairy round Leaves, and thin, like those of Calaminth, of a very fragrant Smell, and heating, and folded into the Shape of Crowns.

It was usual to make this Herb an Ingredient in Acopas and Malagmas, on account of its warming Quality. *Dioscorides, Lib. 3. Cap. 47.*

The *Majorana vulgaris*, &c. Sweet Marjoram, is a little shrubby Plant, that grows to the Height of eight, and even nine Inches, is thick set with lignous Branches, which are of a square Form for the most part, somewhat hairy, and reddish. The Leaves stand opposite, and are shaped like those of *Origanum*, but of a much smaller Size, are covered with a hoary Down, have a fragrant Smell, and a somewhat acrid, bitterish, aromatic, and grateful Taste. About the Tops of the Stem and Branches, at the Bottom of the Leaves, and consequently from the Extremities of the little Sprays, shoot forth imbricated Ears, with hairy Leaves compacted like Scales, from the Middle of which proceed small whitish gaping Flowers, with a quadrid Lip hanging down, under a Leaf, that stands upright. From the Centre of this gaping Aperture, arises a whitish Style divided in two. The Seed is like that of the common *Origanum*, being small, round, and of a dark-red Colour.

It is produced of Seed imported from *Narbonne* or *Provence* in France. *Raii Hist. Plant.*

Diocles the Physician, and the *Sicilians*, called the same Plant *Amaracus*, which the *Egyptians* and *Syrians* named *Sampsuchum*. It is propagated both ways, that is, both by Seed and

Slip. It is more spirituous, and of a sweeter Odour, than those we have mentioned [*Origanum, Thymus, Abrotanum, &c.*]. It is as full of Seed as *Abrotanum*. *Pliny, Lib. 21. Cap. 11.*

The finest and most odoriferous *Sampsuchum*, or *Amaracum*, grows in *Cyprus*. With Vinegar and Salt it cures the Bite of a Scorpion, the Place being anointed with it. The Application of it powerfully provokes the Menfes; it is of less Efficacy when drank. Mix'd with Polenta, it restrains the Defluxion of Humours to the Eyes. The Decoction cures the Gripes, and provokes Urine, and is good for hydropical Persons. When it is dry, it excites Sneezing. There is an Oil made of it, called *Sampsuchinum*, or *Amaracinum*, which is warming and mollifying to the Nerves and Uterus. The Leaves, apply'd with Honey, discuss Lividness and Swellings, arising from Blows or Contusions in the Face, and are good for Luxations, if apply'd to the Place with Wax. *Pliny, Lib. 21. Cap. 22.*

The best *Sampsuchum* grows in *Cyzicus* and *Cyprus*: Next to these for Goodness, is the *Egyptian*. The *Cyziceni* call it *Amaracus*.

Amaracus is recommended by *Ruffus Ephesus*, and *Oribasius*, as a Purger of black and pituitous Humours. The Dose is four Drams of the Powder in Honey or Oxymel. *Ruff. Fragm. p. 127. Oribas. Med. Coll. Lib. 7. Cap. 27.*

The *Amaracus* grows with us in Gardens, and flowers in July; the Herb and Seed are used. It is a Cephalic, and an Anti-hysterical; and on that account is principally used in Disorders of the Head and Nerves, as well as of the Uterus and Stomach. It provokes the Menfes, used in a Pessary; comforts the Brain, and discusses the Flatulencies, that molest it. *Dale.*

'Tis of fine Parts, digests, and attenuates. Taken any way, it helps cold Diseases of the Head and Brain. The Powder of the dry'd Herb, taken by way of Snuff, excites Sneezing, and draws out Phlegm, and strengthens the Head; the Juice of the Leaves, infused into the Nostrils, has the same Effect. It corrects also the Defects of the Thorax, and is friendly to the Stomach. Taken any manner of way, it relieves such as labour under Distempers of the Liver or Spleen; and helps Flatulencies, and other cold Diseases of the Uterus. Drank, it is a Diuretic, and purges watry Humours by Urine; and, chew'd or apply'd, it eases the Tooth-ach. It is an Ingredient in many Antidotes.

The Oil of it warms and strengthens the Nerves.

Nicolas Chesneau, M. D. of *Marseilles*, commends the following Errhine, as often experienced by him in the Head-ach:

Take of the Root of white Hellebore, half a Dram; of the Leaves of *Sampsuchus*, two Pugils; boil them in six Ounces of Water, to the Consumption of a third Part. When you use it, fill your Mouth with Water, and putting some of the Decoction, a little warm, in the Hollow of your Hand, draw it up your Nostrils, when the Pain is very violent, for it exasperates a slight one.

The Water of *Majorana* helps a Catarrh, if, instead of an Errhine, you fill your Mouth with Wine, or pure Water, and taking some of the Water of the Herb in the Hollow of your Hand, you stop one Nostril, and draw it up the other as far as the Root of the Nose, or the *Os Ethmoides*. If you don't take this Method, the Errhine will not ascend to the aforesaid Place, but will be diverted and drawn back upon the Fauces, or *Narium Foramina*.

This Errhine (says *Simon Paulus*) my Father used with the highest Reputation in the Case of Prince *Walenstein*, who was afflicted with a Rheum.

If the Sides of the Nostrils (*Pinnæ Narium*) or the Space between the Eyebrows, be anointed with the Balsam of *Majorana*, it has a wonderful Effect in a Catarrh, or rather a Rheum (*Coryza*). The Nape of the Neck, (*Nucha*) and the Temples, are usually anointed with the same Balsam, not only in the aforesaid Disorder, but in other cold Distempers of the Head. These three Observations were communicated to Mr. Ray by Dr. E. Hulse. *Raii Hist. Plant.*

The Oil of *Amaracus* (*αμαράκων*) is thus prepar'd:

The finest *Amaracinum* is made in *Cyzicum*. It is prepared of the Oleum *Omphacinum* and Oleum *Balanum* is perfumed with *Xylobalsamum*, the *Juncus Odoratus*, and *Calamus Aromaticus*, and sweetened with *Amaracus*, *Costus*, *Amomum*, *Spikenard*, [*σάπυ*] *Carpobalsamum*, and *Myrrh*, to which some add *Cinnamon*, who prepare it more sumptuously. In its Preparation they make use of a Quantity of Wine and Honey, which serves as well for anointing the Inside of the Vessels, as to macerate the powder'd Aromatics.

It heats, promotes Sleep, opens the Pores, [*ἀνασπασίμων*] mollifies, kindles a Fervor, [*πύρεσιν*] provokes Urine, is effectual in Putrefactions, [*σύνπας*] and Fistulas, and in an Hydrocele, after the Operation. It cleanses and takes away the crusty Scabs round the Edges of exasperated Ulcers. It helps Difficulty of Urine, if the Patient be anointed with it about the Anus, and cures Inflammations of the said Part, and the Hemorrhoids,

morroids, if anointed in like manner. Apply'd to the Uterus, it provokes the Menfes, and diffuses any Hardness or oedematous Tumours which affect it; and, spread upon thin Woolen, and apply'd, is good for wounded Nerves and Muscles. *Dioscorides, Lib. 1. Cap. 68.*

This is directed in a manner somewhat different by *P. Ægineta*:

Take of Elecampane, [ἐλέγιον] ten Pounds; Xylbalsamum, twenty Pounds; Cyperus, eight Pounds; the Flowers of Juncus Odoratus, Aspalathus, [ἀσπλάθη] Savine, each eight Pounds; Opoponax, Seeds of Amaracus, each two Pounds; of the finest Oil, [ἐλαιον πρῶτον] eighty Pints; fragrant Wine, five Pints; macerate them all in Wine, except the Savine, and then boil them six Hours, but the Savine only three. Some add three Ounces of Ærugo, to give it a Colour. *P. Æginet. Lib. 7. Cap. 20.*

The Σαμψύχινον, or Oil of Sampsuchum, is thus prepared:

Take of Serpyllum, Cassia, Southernwood, Flowers of Symbrium, Myrtle-leaves, Sampsuchum, of each such a Quantity as you think fit, due regard being had to their Strength, and bruise them all together: Then pour on them as much Oleum Omphacinum as shall be sufficient, without over-powering the Virtues of the things macerated in it, and after four Days strain it: This done, take the like Quantity of fresh Ingredients, and macerate them in the same Oil, the same Length of Time, and then strain it; by which means the Oil will have the more Strength and Efficacy. Chuse your Sampsuchum of a black Colour, inclining to a Green, very odoriferous, and of a moderately acrid Taste.

It is of a heating, attenuating, and acrid Quality, is good for the Occlusion or Distortion of the Uterus, and brings away the Menfes, Birth, and After-birth, and relieves under Hysterics. It mitigates the Pains of the Inguina and Loins. It is best used with Honey, because by its vehement Astringency it hardens the Places. It dispels Lassitudes from the Parts anointed with it, and is a very useful Ingredient in Cataplasms. *Dioscor. Lib. 1. Cap. 58.*

Salmasius de Homonym. Hyl. Iatr. Cap. xiii. Of the Amarus and Sampsuchus.

Ἀμάραξ, with the Greeks, was not the Name of one Herb only: Some Writers, who are neither inconsiderable for Number nor Authority, would have the Sampsuchus so called. It is strange, that *Dioscorides* should tell us, that the σαμψύχον (so the Copies have it) was called by the *Cyzicini* and *Sicilians* ἀμάραξ, and yet make the σαμψύχινον and ἀμαράκινον Ointments two different things: But these Inconsistencies are customary with *Dioscorides*, as I have observed. *Hesychius* has it, Σαμψύχον πλείον, &c. "Sampsuchus grows very plentifully in Egypt; others call it Amaracus." But see, in Answer to this, *Meleager*, one of great Antiquity, who, in that Poem, where he compares each Poet with his proper Flower, makes σαμψύχον and ἀμάραξ two distinct things:

Τὸ δ' ἄμα καὶ σαμψύχον ἀφ' ἡδονῆς Πιανῆ,
καὶ γλυκὺν Ἑστῆναι παρθενόχρῳα κρόνον.

"There was present the Sampsuchus from *Rhianus*, famous for its pleasant Air, and the sweet Virgin-colour'd Saffron, of *Herinna*." And a little after,

Ἐν δ' αὖ ἀμάρακον ἦκε πολυτράχην ἀνθὸν ἀοιδῶν,
φθινοῖαν τε νέκυν κούρεον ἀπ' Ἀντιπάτρους.

"And there came the Amaracus, the Flower sung by *Polystatus*, and the mournful Phœnician Cypress, worn at Funerals, from *Antipater*." *Galen* also, and *P. Ægineta*, treat of the Amaracus and Sampsuchus in different Chapters, which they would not have done, if Amaracus and Sampsuchus had been all one. They who are mov'd by the Authority of *Dioscorides*, to think them the same, are not aware of what Stress ought to be laid upon it. Nor indeed do they apprehend, that his Words, as they sound, are not levell'd against the opposite Opinion, which holds them to be distinct Species of Plants, but rather, if you take them aright, tend, not a little, to support it. "The *Sicilians* and *Cyzicini*, he says, call that Amaracus, which others call Sampsuchus." This does not make them to be the same: Himself plainly shews the contrary, when he makes the μέγαν σαμψύχινον and ἀμαράκινον different Ointments. *Diocles*, quoted by *Athenæus*, has ἀμάραξ, ὃ τινες σαμψύχον καλεῖσι. To confirm this by an Example: Some of the Greeks call τὸ κρίνον also λεῖον, according to *Dioscorides* himself, and many more. Nor did this hinder others from calling *Narcissus* by the same Name; and indeed more used this Word λεῖον for *Narcissus*, than for the Lily, which the Greeks called κρίνον. But more than this may be said for Ama-

ratus, which they would have to be Greek, but σαμψύχον an Egyptian and Syriac Word. *Pliny* says, *Diocles* the Physician, and the *Sicilians*, called Amaracus, what Egypt and Syria named Sampsuchum. So that ἀμάραξ, it seems, is the Greek, and σαμψύχον, the Syriac Name for the same Herb. And indeed this latter Word plainly seems to be of a Syriac or Egyptian Turn; for Σάμψις is a City in Egypt, and Σάμψα a Village in Arabia, and Σαμψάσι another in Judæa, a Province of Syria, which they interpret ὁμοιοί, and Σάμψα ὁμοιον, whence also comes Βάισαμψα on the Arabian Gulf, which *Stephanus* interprets οἶκος ἡλίου, "the House of the Sun." The Sun in Hebrew, 'tis well known, is called שמש Shemesh, which is the same in Arabic. There is Mention made of ἀμάραξ in the Writings of *Theophrastus*, but none of σαμψύχον. In vain therefore would they draw him over to the Party of those who have inform'd us, that Sampsuchum is the same as Amaracus; I don't doubt but the Amaracus of the Greeks answered to the Sampsuchum of the Egyptians; but the Greeks called something else besides the Sampsuchus by this very Name. The *Cyzicini*, who had the best, and the greatest Plenty of Sampsuchum growing in their Territories, called it ἀμάραξ, and so did the *Sicilians*. But all the rest of Greece did not agree in that Name; for some called ἀμάραξ, *Parthenium*, of which *Dioscorides* speaks; viz. Παρθένιον, ὃ δὲ ἀμάραξ, ὃ δὲ λευκάνθημον καὶ τὸτο καλεῖσι (so I read it from a very ancient Copy). "Parthenium, some call it Amaracus, others, Leucanthemus." Therefore *Pliny* is to be corrected in this Word, *Lib. 21. Cap. 30.* *Parthenium alii Leucanthemum, alii Tamnatum vocant*, read alii Leucanthemum, alii Amaracum vocant. In the Index it is written *Parthenium, sive Leucanthemum, sive Amaracus*. Λευκάνθη is the same as λευκάνθημον. *Pliny* adds, *Celsus apud nos, Perdicium & Murarium*. He confounds, as he uses to do, two Parthenia. The Parthenium, which was also called Perdicium, was different from the Murarium, which grew on the Walls. There is a ridiculous Mistake of *Pliny's* in what follows, *Flore albo, odore Mali, sapore amaro*. The Greek, from which he translated, reads thus; ἄσπι λευκὰ κύκλα, τὸ δὲ μέσον μέλινον, ὁσμήν ὑπὲρ βρωμῶν. *Pliny* read μέλινον ὁσμήν, ὑπὲρ βρωμῶν, and render'd it *Odore Mali*, which is most absurd. The Greek Author means, that the circling Leaves of the Flower were white, but the Middle of the Calyx yellow. This sort of Parthenium grows not in the Hedges, or on the Walls, but the other, which is called ἑλξίνη. And this Helxine itself is homonymous to another Helxine named κισσάμπηλα and ἀμείριον, which is a Species of Convolvulus. The Parthenium Helxine, or Murarium of *Celsus*, is now called *Parietaria*, [Pellitory of the Wall] by a very ancient Name. *Constantine* called *Trajan*, *Herba Parietaria*, because his Name was inscrib'd on many public Buildings. *Ammianus* also calls it *Herba Parietaria*. The Authors of the *Hippiatrica*, *Cap. 390.* Σαίρων Γαλλικὸν καλὰ κρόνον, καὶ σιδηρίτιν περδίκιον τὴν ὀσμήν Ρωμαίοις λεγόμενὴν παρειάειαν βοῶντων. "Bruise Gallican Garlick, and *Sideritis* Perdicium, called by the Romans; Herba Parietaria." And *Cap. 496.* Καὶ εὐλλαν βοῶντων σιδηρίτιν, ἢ Ρωμαῖοι παρειάειαν καλεῖσι. And *Cap. 562.* καὶ περδίκιον βοῶντων σιδηρίτιν, ἢ Ρωμαῖοι καλεῖσι παρειάειαν. "And the Herb Sideritis, which the Romans call Parietaria." And so in many other Places. Now because there are several Species of Plants which bear the Name of *Sideritis*, they would be understood to mean what the Romans called *Parietaria*. *Paulus Ægineta* has, ἑλξίνη, ὃ δὲ περδίκιον, ὃ δὲ παρθένιον, ὃ δὲ σιδηρίτιν, ὃ δὲ ἑλξίλειαν, δύναμις δὲ αὐτῆς ῥυτίκη. "Helxine, called also Perdicium, Parthenium, Sideritis, and *Heracleia*; it is of an absterfve Quality." This was the same with the *Urceolaris* of the Latins so called, because they scoured their Urcei [Pots] and Glasses with it. The Greek *Hippiatrica* [Farriers] *Cap. 520.* πρὸς ἀνάπνοιαν, ἢ καὶ βήχα, "for a broken Wind, or a Cough." Βοῶντων, ἢ Ἕλληνας καὶ περδίκιον, Ρωμαῖοι δὲ ὑπερλάρεν ὀνομάζουσι. "The Herb which the Greeks call Perdicium, and the Romans, Urceolaris." Also *Pelagonius*, Βοῶντων περδίκιον, ἢ Ρωμαῖοι ὑπερλάρεν καλεῖσι. "The Perdicium, which the Romans call Urceolaris." The modern Italians call it *Vitreda*, from the Use it is put to in scouring of Glasses. An ancient Arabian Author, who added Arabic Nomenclaturas to a very old Copy of *Dioscorides*, calls this Helxine, *Hassjis Alzagiagi*, that is, Glasswort, because it was used to scour Glass Vessels. He adds, in the same Place, that it was a Species of *Lebleb*, that is, of a *Convolvulus*. Thus he confounded it with another Helxine, which climbs up whatever is near it. But that it serv'd the ancient Greeks for the same Use, that is, scouring of Glass Ware, its Name shews us; for they call'd it κλύβαλις, *Klubatis*, ἀπὸ τοῦ κλύειν τὰς βάσεις, or βάτιας, "from rinsing the Bases or Batiakes," which were a sort of Drinking-glasses. There is a Mistake in *Apu-leius*, *Cap. de Perdic.* of *Ulcioraria* for *Urceolaria*. *Pliny*, *Lib. 22. Cap. 17.* makes the Perdicium Helxine different from the Perdicium Urceolare. "Helxine, says he, is by some called Perdicium, because the Partridges especially feed on it; some call it Sideritis, others Parthenium." To this he subjoins its medicinal Virtues. A little after, as if he were speaking

Speaking of another Herb, he begins again thus: "Perdicium, or Parthenium, (for it is the same as Sideritis) is called among us, *Herba Urceolaris*, by others, *Astericum*. Its Leaves are like those of *Ocimum*, only blacker; it grows on Walls, and Roofs of Houses." He separated them also in the Index: "Helxine XII. Perdicium, or Parthenium, or Sideritis, which is *Urceolaris*, or *Arterium* XI." He transcribed those Accounts from two Authors, and therefore supposed they spoke of different things. For the Helxine of the Greeks is the same as *Urceolaris*, which was also called *Abstergium*, (for so it should be read in both the forementioned Places) because it was used in absterging or scouring of *Urcei*, "small Vessels." Helxine, in *Dioscorides*, which is the same as Parthenium, has Leaves like those of Mercury (*λινόζωσι*). Parthenium, which is the *Urceolaris* of *Pliny*, has Leaves like *Ocimum*. They are the same thing, for *λινόζωσι*, or Mercury, has Leaves also like those of *Ocimum*. But *Pliny* says, that Helxine has Leaves, that bear a mix'd Resemblance of those of Plantane and Horehound. How so? Why because he confounded the Helxine Sideritis with another Sideritis, the *Heraclia*, whose Leaves are of the Size of those of Horehound.

Parietaria, *Urceolaris*, *Abstergium*, *Perdicium*, and the *Herba Muralis* of *Celsus*, are Synonyma of the same Herb, which, with the Greeks, is that Helxine, whose different Names you find in *Dioscorides*, according to a very antient Copy, as follows: "Ἑλξίνη, ἡ δὲ παρθένιον, ἡ δὲ σιδερίτιν, ἡ δὲ ἡράκλειαν, ἡ δὲ ὑγιεινὴν ἀργύρεαν, ἡ δὲ κλύβαν, ἡ δὲ πολυώνυμον καλεῖται. φύεται ἐπὶ θέρυγας καὶ τοίχους." Helxine, which goes by the various Names of Parthenium, Sideritis, *Heraclia*, wild Hygieine, *Klybatis*, and *Polygonum*; it grows on Walls of Towns or Houses." The Reason of its Name *Helxine* [from *ἔλκω*, to draw] is taken from its rough Seeds about the Stalk, which stick to Clothes. *Pliny* expresses it, by lappaceous, [Dock-like] Heads. "Seeds, says he, in lappaceous Heads, which stick to Clothes, whence they would have it to be call'd *Helxine*." He seems to call whatever implies a Faculty of drawing and sticking, lappaceous. *Dioscorides* has it, Σπέρματα τραχέα ἀσπιδωδὲς τῶν ἱμασίων, "rough Seeds, that take hold of the Garments."

Another Helxine, *ἑλξίνη*, of a quite different Species, is so called, because to whatever it applies itself, it uses to climb up, and twist itself about it: "Ἑλξίνη, ἡ δὲ ἀμφοσίννι, ἡ δὲ κισσάμπελον, φύλλα ἔχει ὅμοια κισσοῦ, ἐλάττω δὲ, καὶ κλώνια μακρὰ περιστρεφόμενα ὅτε ἀντύχοι." Helxine, by some called *Hemifine*, by others *Cissampelus*, has Leaves like the Ivy, but less, which twine themselves about every thing they meet with." The Greeks, according to their usual Custom, transfer the Properties of one Helxine to another, without making any Difference. So the Parthenium *Amaracum* is quite different from the Parthenium Helxine, or *Murale*, between which *Pliny*, according to his careless way, makes no Distinction. None then shall persuade me, that he had any Knowledge in Botany, who shew'd so much Ignorance in his Notions about an Herb so very common as *Parietaria*.

Well, but there are also two *Amaracums*; one, otherwise called Parthenium, another also called *Sampfuchum*, which is either an Egyptian or Syriac Name. However I can hardly believe, that *Galen* and *Paulus*, when they gave us distinct Descriptions of the *Amaracus* and *Sampfuchum*, are to be understood of this Parthenium *Amaracum*; much less should I be able to prove, that the Unguentum *Amaracinum*, which in *Dioscorides* is different from the *Sampfuchinum*, was usually made of this Parthenium *Amaracum*; for it is an Herb of a very rank Smell. Besides, when *Galen* speaks of the Preparation of *Amaracinum*, he intimates as though he would be understood of that Sort of *Amaracum*, which was produced to the greatest Perfection in *Cyzicus*, and was called by the Egyptians, in their own Tongue, *σαμψύχον*. But *Neophytus*, under the Name of *Amaracum*, has described the Parthenium of *Dioscorides*, and ascribed to it the same Virtues, that *Galen* did to his *Amaracum*, which he separated from *Sampfuchum*. "Ἀμάρεον, says he, ἡ δὲ ἀνθεμὶν, ἡ δὲ λευκάνθεμον, ἡ δὲ παρθένιον, ἡ δὲ χαμαίμηλον, ἡ δὲ χρυσοκαλδὲς, ἡ δὲ μαλάβαθρον, ἡ δὲ ἀνθὸς πεδινός. Ῥωμαῖοι σάκκον ἐκκόλουν, ἡ δὲ μιλφόλιον. Ὅσοι καλεῖται. *Amaracum* is called by some, *Ἀνθεμὶς*, by others, *Leucanthemus*, *Parthenium*, *Chamamelum*, *Chrysocalus*, *Malabathrum*, and *Ground-flower*; by the Romans, *Oculus Solis*, *Millefolia*, and by the *Tuscans*, *Cantar*; to which he subjoins from *Galen's* *Amaracum*, Γαληνὸς ἀμάρεον θερμὸν ῥῶδ τῆς τριτῆς τάξεως, ξηρὸν δὲ τῆς δευτέρας. *Galen* makes *Amaracum* to be hot in the third Degree, and dry in the second." But I have long since resolved with myself to give but little Credit to those *Greeks* of the lower Ages; for believe me, who am pretty well acquainted with them, they are not to be trusted. Here this Writer has coupled together several Flowers of quite different Kinds, as if the Names of Plants were their only Characteristics.

Nor can we pay a jot the more Deference to the Opinion of very celebrated Medico-Botanists; [*ιστορίαι βοτανικαί*] who would

persuade us, that the *Amaracus* of *Galen* and *Paulus* is not the *Sampfuchus* of *Dioscorides* and *Pliny*, but *Marum*; as if *Galen* had not made distinct Mention of *Amaracus* and *Marum* in the Composition of the Ointment *Hedychroum*, where he also tells us, that *Marum* is of a stronger Smell than *Amaracus*. "These three, says he, are of different Kinds, according to *Galen*; viz. *Sampfuchus*, *Amaracus*, and *Marum*." *Pliny* also, *Lib. 13. Cap. 1.* in express Terms, makes the *Sampfuchinum* Unguentum to be quite different from the *Amaracinum*: "The best *Sampfuchinum*, says he, is to be had in *Cyprus* and *Mitylene*, where there is the most *Sampfuchus*." A little after, in the same Chapter, he mentions *Amaracinum* separately, as a distinct Thing, thus: "The Juices of each Plant make the celebrated Ointments. The choicest of these Herbs is the *Malabathrum*; next to this are the *Illyrian Iris*, and the *Amaracus* of *Cyzicus*." You see, that the most *Sampfuchus* is in *Cyprus*, whence comes the *Sampfuchinum*; but the greatest Plenty of *Amaracus* is in *Cyzicus*, whence we have the *Amaracinum*. But I would beg Leave to observe here, that by *Amaracus* in this Place, is not meant *Marum*. For, in the same Chapter, *Amaracus* and *Marum* are both Ingredients together in some Compositions. *Telino Amaracum* & *Maron pariter adduntur*. The Royal Ointment also, and very many more, contain both *Amaracus* and *Marum*.

These Inconsistencies are owing to the Heedlessness and Inadvertency of Authors, who transcribing from different Places into their own Writings, took no Care, for the most part, to distinguish between things which ought to be separated; but, on the other hand, made Distinctions without Foundation, and supposed a Difference between things which ought to be accounted one and the same. There is no doubt, but that the *Sampfuchus* was of the same Species with the *Amaracus*, this under a Greek, the other under an Egyptian Name. But to this Difference of Names we ought, perhaps, to add another resulting from the Nature of the Soil. For oftentimes the same Plant which grew in Greece, was of a different Habit and Figure from one growing in Egypt or Syria, as might be observed in the Cypress and Ligustrum, and not a few others. And so there might be also some Difference between the *Sampfuchus* and *Amaracus* as to their Juices, arising from their native Soil and Air. *Columella* makes Egypt the Country of *Sampfuchus*, and reckons it among exotic Herbs:

Nataque jam veniant hilari Sampfucha Canopo.
Come *Sampfuchus* from Egypt's merry Land.

Nicander makes this only Difference between *ἀμάρεον* and *σαμψύχον*, that *Amaracus* grows in Greece, but the *Sampfuchus* is an Exotic. Amongst Remedies, that are effectual against the Bites of Serpents, he reckons up *Amaracus* and *Sampfuchus* separately:

— μάλα δ' ἂν καὶ ἀμάρεον εἴη
Χρηστέον, περὶ τῆς τε καὶ ἀνδρησι χλοάζων.

"Let *Amaracus*, in particular, contribute its friendly Virtues, the Herb that flourishes in Garden-plots and Terraces." Here he plainly speaks of that *Amaracus* which was the usual Ornament of the Walks and Areas of Gardens. So in another Place, he distinguishes the medicinal *Nasturtium* from the common, in the following Words:

— πῶς φύλλον ἐναλλόμενον περὶ τῆς
Καρδαμίδος, Μῆδον τε —

"The Leaf of the *Cardamis*, that usually grows in Garden-plots, and the *Median*." He calls it the common *Cardamis*, which was brought from *Media*. This Place was never understood by antient nor modern Interpreters.

Amaracus then was proper to Greece, and, as *Nicander* tells us, was common in Gardens. But a little after, he places *Sampfuchus*, as though it were a different thing from *Amaracus*, amongst *Alexipharmacs*:

— ἑστὲ καὶ αἰλῆς
Καυλὸς ἡνεμόνιος, ἰδὲ πλεῖστα πολλὰ καὶ ἄνθη
Σαμψύχου.

"Nor (forget) the waving Boughs of the Elder-tree, with good Store of the Branches and Flowers of the *Sampfuchum*." No Reason but this can be given, why he should distinguish them. That *Sampfuchus* was not of the Growth of Greece, the Name itself sufficiently shews.

After this manner are Authors to be reconciled, who sometimes make *Amaracus* the same with *Sampfuchus*, at other times suppose them different. Have we not the like Instance in *Ligustrum*? which some would have to be the same with the Cypress, others contradict it. We have asserted in another Place, that Cypress is the Eastern *Ligustrum*, and *Ligustrum* the common Cypress; and yet there is no small Difference between them both in Figure and Smell.

They who have describ'd the *σκευασία*, [Preparation] of the *Amaracinum* Unguentum, as it is prepared in *Cyzicus*, where the Name *ἀμάρεον* obtains, call'd it *ἀμαρέκινον*. But they who

who left us in Writing the Egyptian way of Preparation of the same Ointment, called it *σαμψύχων*, because the Plant had the Name of *σαμψύχων* in Egypt. Others transcrib'd these different *συνασπασίας*, "Preparations," into their Books under distinct Titles. That *Dioscorides* did so, is plain; though in another Place he had owned, that *ἀμαράκων* and *τάμψυχων* were the same, and only differed in the Language. Hence *Galen*, and *Paulus*, who followed him, put them asunder, and enumerate them distinctly, as if they were really different.

I wonder too, that *Galen* and *Dioscorides* both write; that *Amaracus* was usually added to the *Amaracinum Unguentum*. But *Theophrastus*, in his Commentary on Smells, affirms this Appellation of *Amaracinum* to be Pseudonymous (*ψευδώνυμον*) because nothing of *Amaracus* used to enter that Composition: And 'tis observable, that *Amaracus* is the only fragrant Simple, that is left out in all Ointments by *Myrsus*. Τὸ δ' ἀμαράκων τὸ χρεῖν ἐκ τῶν βελίστων ἀρωμάτων συντίθεσθαι χρεῖς ἀμαράκων, τίτλη δ' ἐχρεῖται μόνον τῶν ἀρωμάτων τὰς μυρσίδας, ὅδ' εἰς ἐν μύρον. "Good *Amaracinum* is compounded of the best Aromatic, except *Amaracus*, which is the only thing of that Kind, that never enters the Composition of any one Ointment." Ἄλλα ψευδώνυμον ἢ ἐπικλησις, "the Appellation is pseudonymous," it is called *Amaracinum*, without a Mite of *Amaracus* in it.

With this agree *Servius's* Notes on the third *Æneid*. "*Amaracus* was a Boy, that was the King's Ointment-bearer; who happening to fall while he carry'd the Ointments, occasioned the greater Fragrance by their Confusion." Hence the best Ointments came to be called *Amaracina*. The *Amaracinum* then was so called from the Boy *Amaracus*, and not from the Herb of that Name, which had no Place in this Ointment.

Theophrastus informs us, that the *Amaracinum* was made of *Costus*. Ἀπὸ βίβλων δὲ τὸ τε εἶναι καὶ νάρδιον, καὶ τὸ ἀμαράκων ἐκ τῆς ὕλης τῆς γὰρ ὀνομάζεται τὴν βίβλον. "The *Itinum* and the *Nardinum* are made of Roots, and the *Amaracinum* of *Costus*; for they call this a Root." At this Rate indeed, the Unguentum *Amaracinum* must be different from the *Sampfuchinum*: But *Dioscorides* and *Galen* assure us, that the *Amaracus* was as usually added to the *Amaracinum*, as the *Sampfuchus* to the *Sampfuchinum*, in Defence of whose Assertion, the least that can be said is, that the Preparation of the *Amaracinum* in their Time, was different from what it was in the Days of *Theophrastus*. But what shall we do with *Pliny*, who tells us, that the Ointment was made of *Amaracus* alone, without the Mixture of any other odoriferous Ingredient? Why, we will say, that he was quite wrong; and, no doubt, he drew this contrary Sense from these Words of *Theophrastus*; viz. Τίτλη δ' ἐχρεῖται μόνον τῶν ἀρωμάτων τὰς μυρσίδας ὅδ' εἰς ἐν μύρον. He either read these Words wrong himself, or heard others read them so, as if they run thus: Τίτλη δ' ἐχρεῖται μόνον τῶν ἀρωμάτων ὅδ' εἰς ἐν μύρον. "This Aromatic is used to make up an Ointment by itself." But this same *Theophrastus*, who denies that *Amaracus* was used in the Composition of *Amaracinum*, assures us, that τὸ μάρον, "*Marum*," was an Ingredient in it: Τὸ δὲ μάρον καὶ τὸ χρώμα τὸ εἰς τὸ ἀμαράκων ἐμμιγνύμενον θερμαίνετα. "But the *Marum*, and the *Chroma*, (*Cyperus*) which is an Ingredient in the *Amaracinum*, are healing; and the τὸ μάρον, and τὸ ἀμαράκων, seem to have the same Original, and the latter derived from the former, μάρον, μάρον, and ἀμαράκων; so that they are Species of the same Genus, as appears by the Name. As the last descended from the other by Production, so it declin'd, and became inferior to it in Goodness and Virtue. The *Maron* then is better and more fragrant than the *Amaracum*, as is acknowledged by all.

As for the *Sampfuchus*, or *Amaracus*, then, we are certain it is that aromatic Herb which we call *Majorana* (*Sweet Marjoram*). The *Latins* of the lowest Ages so named it, by way of Difference, to distinguish it from the lesser *Amaracus*, which was called μάρον, "*Marum*." Nor are we to seek for any other Difference between *Amaracus* and *Maron*. The more modern *Greeks* interpret *σαμψύχων* by *μαϊωρίνα*, *Majorana*, which is the greater *Amaracus*, as *Marum* is the lesser. This latter is of a stronger and more fragrant Smell, according to *Galen*, and is really so. It is commonly called *Franca Majorana*, "*French Marjoram*." But, perhaps, this is a Corruption of the *Arabic* Name, of which by-and-by. It is also called in *Greek* ἰσόβρυον, *Isobryon*, because it is covered with a Multitude of small Leaves, resembling those of βρύον, "*Moss*." *Dioscorides*, μάρον, ἢ ἰσόβρυον (so it should be read). The more modern *Greeks* call it *βεργανίς*, *Neophytus* μάρον, ἢ *βεργανίδα*, *πία βεργανίδης*. "*Marum*, by some called "*Origanis*, is a shrubby Plant." *Calamintha* also is by some called *Origanis*, which *Calaminth*, we are told by *Dioscorides*, resembles *Sampfuchus*, at least, τῇ λεπτοφυλίᾳ, "in Thinness of Leaves." The Scholiast on *Nicander* makes *Sampfuchus* to resemble *Hyssop*. This *Hyssop* some interpret *Casia*, as *Neophytus*, who writes; that ὕσσωπος, "*Hyssopus*," was by the *Romans* called *κασίολα*, "*Casiola*." Ρωμαῖοι ὕσσωπον, ὡς

δὲ *κασίον*, ὡς δὲ *κασίολα*. "The *Romans* call *Hyssop* *Later*, and "some *Casiola*." Some have also expounded *Sampfuchus* in *Latin* by *Casia*. Glossæ, *σαμψύχων*, *Sampfuchum*, *Casia*. These Herbs were scarce in ancient Times, and not to be met with every-where. *Pliny* reckons *Marum* an exotic Shrub, of the Growth of *Lydia* and *Egypt*; but *Dioscorides*, that it was *πῶς γινώσκον*, "a noted Plant," which grew very plentifully in *Lydia*. It appears to be a noted Plant in *Asia*, the Country of *Dioscorides*, whose Ancestors were of *Anazarba*. It was so little known to the *Romans* in those Times, that *Pliny* makes it a large Shrub, worthy to be mentioned with the *Cypress* and *Aspalathum*. "*Egypt*, says he, produces also *Maron*, but not so good as *Lydia*. It has larger and various Leaves, but the *Lydian* has short, very small, and fragrant Leaves." I could venture to lay any Wager, that this *Egyptian* *Maron*, with the larger and less fragrant Leaves, is the same with *Sampfuchus*, or the *Egyptian* *Amaracus*. For the *Marum* had short and minute Leaves, and more fragrant than those of the *Sampfuchus*, which some also called *Marum*.

Sampfuchus was very plentiful in *Egypt*; whence the ancient Critics have expounded *Ναυκρησίτην* *σεβανον* in *Anacreon*, by *Sampfuchus*. *Athenæus*, Παμπόλλης δὲ οἶδα λέγουσιν ἐκ τῆς σαμψύχης ἐστάναι ἔλαι τὴν ναυκρησίτην, πολὺ δὲ τὸ ἀνθ' αὐτὴν κατὰ τὴν Αἴγυπτον. "I know many who are of Opinion, that the Garland of *Naucratis* was made of *Sampfuchus*, which Herb grows very plentifully in *Egypt*." *Dioscorides* says, that *Marum* grows in great Abundance about *Tralles* and *Magnesia*, which are Cities of *Lydia*; and *Theophrastus*, among the Flowers used in Garlands, mentions the *Phrygian* *Amaracus*, which is the same with that of *Cyzicus*. *Galen* tells us, that he saw *Amaracus* in *Italy*, but does not say so of *Marum*. Therefore *Marum*, at that time, was found in fewer Places than *Amaracus*.

In a very ancient *Dioscorides* it is written, that *Sampfuchus* was called in *Arabic*, *Marzangius*, but *Marum*, τὸ μάρον, *Marmarhanzi*. In *Avicenna* it is written *Marmarhanzi*; for it is certain, that *Marum* is described by him under that Name, in Chap. 465: of the *Latin* Edition. An ancient Interpreter reads it *Marmacor*, from the Transposition of a single Punctum, διακρίνον, "distinguishing Point." From this *Marzangius*, the *Barbarians* hammered out their *Majorana*; as if they would say *Marzangiana*. In both the *Arabic* Words you may trace the Term μάρον. There is room for Conjecture, that different Species of *Marum* are signified by these two Words. In the preceding Chapter, *Avicenna* reckon'd an Herb called *Maru*, among whose Species was found one named *Marmabuki*. *Belunensis*, in his Lexicon, remarked, that *Marmacor*, or *Marmarhanzi*, was an Herb, which the common People at *Venice* called *St. John's Wort*, and that its Seed was called the Seed of *Maron*. But *Marmarhanzi*, in *Avicenna*, is the Term for the *Maron* of the *Greeks*, as appears from the Description. But what is called *Maru* in that Author, of which *Marmabuki* is a Species, is another thing. *Alpagus* assures us, that it is the Herb *St. John's Wort*. *Leoniceus* pretends, that the *Bacchar* of the Antients is so called by the *Italians*. Whether this be true, I cannot say; but this is certain, that most of the Remedies, which *Avicenna* relates of the *Almaru*, agree to the *Bacchar*. Of the Species of *Marum*, one, he says, resembles an Ox's Tongue, or the Herb *Bugloss*, yea, is that very Herb. Nay in Chap. 436. where he treats of the *Bugloss*, he says, in express Terms, that its Leaves are like those of the *Almaru*. In a very ancient Copy of *Dioscorides*, *λεβανώσις*, is interpreted *Bezer Almaru*, "the Seed of *Maru*." Among the Species of *Libanotis*, *Dioscorides* reckons one, from *Theophrastus*, which has Leaves like the wild Lettuce. Θειράρας δὲ ἰστέ μετὰ τῆς ἐρείκης λεβανώσις, θρίδασι ἀγρία τῇ περὶ ὁμοία φύλλα ἔχουσαν, βίβαν δὲ βραχέειαν φύδα. "*Theophrastus* relates, that the *Libanotis* grows with the common *Erica*, Heath, and has "Leaves like the wild bitter Lettuce, and a short Root." The Place of *Theophrastus* is in Book 9. Chap. 12. of the barren *Libanotis*: Ὁ δ' ἀκαρπὸς ἔχει τὸ φύλλον ὅμοιον θριδάκων τῆς περὶ, τετραχύτερον δὲ καὶ λευκότερον φύλλον δὲ ὅσον περ ἐρείκου πλείον. "The barren Sort has a Leaf like that of the bitter "wild Lettuce, but rougher and whiter, &c." In this there is a remarkable Corruption, which must be amended by the Authority of *Dioscorides*, who, it is plain, read this Passage in *Theophrastus* thus: φύλλον δὲ ὅπου ἐρείκων πλείον, "it grows where "there is plenty of Heath." This is what *Dioscorides* expressed, by saying, that this *Libanotis* did μετὰ τῇ ἐρείκῃ φύδα, "grow with the Heath." 'Tis plain, that this is the *Libanotis*, which *Avicenna* reckons among the Species of *Almaru*, and likens to an Ox's Tongue. As to its having Leaves like the wild Lettuce, the more modern *Greeks* say the same of their *Bugloss*. *Neophytus*: Βεγλωσσὸν φύλλον μὲν ἔχει ἔξ ἢ ὀκτώ, μῆκος σπιδάμις, ὡς αὐτὴ ἀγρίας θριδάκος, πλάτος δακτύλου δὲ ἢ ἑκατὸν. "The *Bugloss* has six or eight Leaves, a Span long, like those "of the wild Lettuce, of the Breadth of two Fingers, or less." This *Bugloss* is different from that of the ancient *Greeks*, whose Leaves are compar'd by *Dioscorides* to those of *Mullein*, φλόκω, and is nearly the same with ours. The Leaf is less than the Breadth

Breadth of two Fingers. The Greeks of the latest Ages call'd *Βεράριον* what the Antients named *Βεράριον*. The barbarous Nations call'd it *Borrage*.

From what has been said, it appears, that partly *Baccharis*, and partly *Libanotis*, were, by *Avicenna*, comprehended under the Appellation of *Almaru*. In another Place, he puts *Libanotis* under the Title of *Scegiar Mariem*, that is, *The Tree of Mary*, which, he says, was also called *Buchur Mariem*, that is, *Thymiana Maria*. This I would have to be understood of the *Libanotis* used in Garlands, which the *Latins* called *Rosmarinus*; but *Avicenna* took it for the other, of which there are three Sorts; and they are mistaken who comprehend these under the Appellation of *Rosemary*, since there is but one Sort which goes by that Name, and serves both for Garlands and Suffumigations, and was also used by the Antients in Ointments.

In an antient *Dioscorides*, *Baccharis* is spelt the same, almost Letter for Letter in *Arabic*. There is no mention of this, so far as I know, in *Avicenna*. But his Account of *Almaru* is taken partly from this, and partly from the *Libanotis*, which, 'tis pretended, is the same with what is commonly called *St. John's Wort*. But this latter is a Name imposed on several Herbs in different Countries. The superstitious old Women, 'tis certain, gather several Sorts, out of a religious Motive, on *St. John's Eve*. *Fuchs* observes, that the *Hypericon* was called *St. John's Wort*, by his Countrymen, the *Germans*. There is another Sort, which our Peasants call by that Name, and a third, which is honour'd by that Title in *Venice* and the *Ferrarese*.

AMARA-DULCIS, a Plant thus distinguish'd:

Solanum lignosum Dulcamara, Offic. *Solanum lignosum*, seu *Dulcamara*, Park. Theat. 350. Raii Hist. 1. 672. Synop. 3. 265. Merc. Bot. 1. 69. Phyt. Brit. 115. *Solanum scandens*, seu *Dulcamara*, C. B. Pin. 167. Tourn. Inst. 149. Elem. Bot. 124. Boerh. Ind. A. 2. 67. Dill. Cat. Giff. 82. Rupp. Flor. Jen. 36. Buxb. 306. *Amara-dulcis*, Ger. 279. Emac. 350. *Dulcamara*, seu *Amara-dulcis*, Mer. Pin. 34. *Glycy-picos*, seu *Amara-dulcis*, J. B. 2. 109. Chab. 114. BITTER-SWEET. Dale.

It sendeth forth woody, brittle, slender Stalks, two or three, and sometimes five or six Feet long, which twine themselves about the adjacent Hedges or Shrubs, or otherwise lie flat on the Ground. The Bark of the young Sprays is green, but that of the old ones and the Stalks is rougher, and of a whitish or ash Colour on the Outside, but of a beautiful Green on the Inside. The Medulla, or Pith, is a fungous Substance. The Leaves stand alternately, resemble those of the *Solanum Hortense*, are of a dark Green, and sometimes furnish'd with two Lobes or Auricles at their lower Part, and a Pedicle of about an Inch long. The Flowers grow in small Umbellas, are fecund, but fine enough to the Eye, being of a coeruleo-purple Colour, and sometimes white, and divided into five narrow sharp-pointed Leaves, bending back outwards, in the Middle of which are yellow Chives forming an Umbella. These are succeeded by soft slimy Berries, somewhat long in Shape, of a scarlet Colour when ripe, of an unpleasant Taste, and full of small, flat, whitish Kernels. It has a fibrous Root.

It delights in moist and watery Places, and therefore is often found about Pits and Ditches. It flowers in *June* and *July*.

Sebizius says, that the green *Dulcamara* bruised, and apply'd in Form of a Cataplasm, mitigates Pains in Womens Breasts, mollifies their Hardness, and dissolves grumous Milk in them.

It is said to provoke Urine, and to be successfully prescribed against the Dropsy.

Take (according to *Tragus's* Receipt) a Pound of the Wood of this Plant, cut it into Pieces as big as those you play with at Draughts, and put them with a Measure of White-wine into a new Pot, and stop it well with a Pot-lid, which has a small Hole bor'd in the Middle of it, and paste it all round with Water and Bran. Set the Pot over a slow Fire, and let it boil to the Consumption of above a third Part, and use the rest.

An ordinary Glass of this Liquor taken in the Morning, an Hour before you rise, and just as you are going to bed in the Evening, purges off the Yellow-jaundice, tho' never so inveterate, in a gentle manner, by Stool and Urine.

The Juice of it drank, is said to be good for Ruptures, and Bruises by Falls or Blows, being esteemed as effectual in dissolving concremented Blood any-where in the Viscera, and healing the Parts that are hurt. It is held to be useful also in opening Obstructions of the Liver and Spleen. *Parkinson* writes, that whenever he knew it prescribed, it work'd with sufficient Violence. And *Prævotius* gives the Decoction of the Wood of *Dulcamara* the first Place among the gentle and kindly Evacuants of Bile.

The following Receipt is from Dr. *Hulse*:

Take four Handfuls of the Leaves of *Dulcamara* shred, with four Ounces of Linseed finely pulverized: Boil them in Muff Wine of Candy, or in Hogs Fat, to the Consistence of a Cataplasm, and apply it warm.

This Remedy, in the Space of one Night, dissolved a Tumour as big as a Man's Head, and healed deplorable Contusions of the Muscles. Raii Hist. Plant.

AMARANTHUS, a Plant thus distinguish'd:

Amaranthus flos amoris, Offic. *Amaranthus maximus*, C. B. 120. Raii Hist. 1. 201. Boerh. Ind. A. 2. 97. Tourn. Inst. 234. *Amaranthus paniculâ sparsâ*, Ger. 254. Emac. 322. *Amaranthus purpureus major*, paniculis sparsis, Park. Parad. 371. *Amaranthus paniculis procumbentibus*, semine albo, seu *Quinua*, Hist. Oxon. 2. 602. *Blitum maximum* seu *Amaranthus major*, semine albo, J. B. 2. 968. Chab. 304. FLOWER GEN-TLE. Dale.

The *Helichrysus*, which some call *Chrysanthemos*, others *Amarantus*, of which they make Garlands to adorn the Images of the Gods, has a greenish-white, strait, firm Stalk, with narrow Leaves, set at Distances, like those of *Southernwood*, a globous Head of the Colour of Gold, a round Umbella of dry Clusters of Flowers hanging downwards. It grows in rough and rugged Places.

The Top, drank in Wine, is effectual in a Dysury, and against the Bites of Serpents, is good for the Sciatica and Ruptures, and provokes the Menfes. Drank in Mulsium, it wastes Concretions of Blood in the Belly or Bladder. The Weight of half a Dram, taken fasting in White-wine diluted, restrains Catarrhs. It is also put among Clothes, to preserve them from the Moths. *Dioscor. Lib. 4. Cap. 57.*

Pliny, speaking of the Combat between Nature and Luxury in point of Colours, says, we are fairly outdone by the *Amarantus*: This, says he, is rather a purple Spike than a Flower, and has no Smell. What is to be admir'd in it is, that it loves to be cropt, and springs out again fairer, and with more Lustre. It blossoms in *August*, and lasts till Autumn; and, what is strange, after it is cropt, and all the Flowers fallen off, if it be water'd, it springs afresh, and bears Flowers for Winter Garlands. Its Nature is well express'd in its Name, *Amarantus* [from a Neg. and *μαραινω*, to wither]; for it never withers. *Plin. Lib. 21. Cap. 8.*

The *Amaranthus*, or *Floramour*, grows to be three or four Feet high, with big chanell'd Stalks spread into several Branches, bearing pretty large broad Leaves, ending in a long Point, of a light, green Colour, and frequently a little reddish: On the Tops of the Stalks grow long Spikes of deep, red, staminous Flowers, hanging downwards, which, if gather'd in time, keep their Colours a long while; among these Flowers grows the Seed, small, round, and somewhat flattish, of a reddish-white Colour, and very shining. It is sown in Gardens, and flowers in *July* and *August*, perishing in the Winter. The Flowers only are used, and that but seldom.

They are cooling, drying, and moderately restraining; and from their Colour are suppos'd to be good to stop Bleeding and Fluxes of all kinds, in any Part of the Body. *Miller Bot. Off.*

It is cultivated in Gardens, and flowers in *August*. Dale.

It is mollifying and agglutinating, but it is not much made use of in Medicine. *Lemery de Drogues.*

AMARANTOIDES, *Globe Amaranthus*, or *Everlasting Flower*, called by the French *L'Immortal*. It is deriv'd from *Αμάραντος*, *Amaranthus*, and *ἑίδος*, Form or Shape.

Amarantoides, lychnoidis folio, capitulis purpureis, T. 654. *Amarantho affinis, altera species, seu flore purpureo*, Breyn. Cent. 1. 110. *Amarantho affinis, Indiae Orientalis, floribus glomeratis, Ocymoidis folio*, H. A. 1. 85. *Gnaphalio affinis, ocyastri folio, flore ex purpureo violaceo*, H. L. 294. a *Pregn.*

The Flowers are small, and cut into four Segments, which are collected into squamose Heads; from each of these Scales is produced a single Flower. The Ovary in the Bottom of the Flower becomes a roundish crooked Seed, which is contain'd in a thin Pellicule or Skjn.

There are at present four or five Varieties of this Plant, but none used, as I can find, in Physic.

The two best Sorts were originally imported from the *East-Indies*, the rest we have received from *Barbados*. *Miller's Dictionary.*

AMARELLA, a Name given by *Gesner* to the *POLYGALA*. See *POLYGALA*.

AMATORIA Febris, the same as *CHLOROSIS*, which see. *Castellus.*

AMATORIA Veneficia, the same as *PHILTRA*, which see. *Castellus.*

AMATORII Musculi, the Obliquus superior, or *Trochlearis*, and Obliquus inferior, are sometimes thus call'd. *Cowper.*

AMATZQUITL, seu *Unedo Papyracea* *Nieremberg.*

Its Substance is light, and not unlike that of the Fig-tree. Its Leaves resemble those of the Lemon-tree, but are hairy and more acuminate or pointed. Its Fruit are as large as *Pontic Nuts*, divided into white Grains of the same Shape and Nature with those of a Fig. It grows in warm Countries; such as *Chietla*. A Decoction of the Bark of its Roots is of considerable Service in feverish Disorders. Its Leaves are only useful, by the agreeable Shade they form.

AMAUROSIS, *amaurosis*, is an Impediment of Vision, when the Patient, without any manifest Fault in the Eye, can discern nothing at all. It is usually call'd a Gutta Serena. *Actuarius de Meth. Med. Lib. 2. Cap. 7.*

Mr. de St. Yves, the famous French Oculist, distinguishes the Gutta Serena into the perfect and imperfect.

The perfect GUTTA SERENA.

The Disease, call'd Gutta Serena, is a total Blindness, proceeding from a Palsy in the principal Parts of the immediate Organ of Vision.

Whatever Part of the Body a Palsy attacks, it has different Degrees, which render it perfect or imperfect. The same may be said of a Gutta Serena, which entirely destroys the Sight, or at least leaves so little, that it is of small Service to the Patients.

In order to give a clear Idea of this Disease, it shall be the Subject of two Chapters. In the first, I shall treat of that sort in which the Sight is entirely lost: And in the second, of that in which part of it remains.

There are several Causes which may produce a Gutta Serena: The first is a light Apoplexy, in which the Humour, instead of falling on the other Parts of the Body, is discharged on the Optic Nerves only, by which they are obstructed, and become paralytic.

This Disease depends on other Causes, as when some other Humour is filtrated into the Nerves, or by lodging on them causes a Compression, which hinders their Action; so that, whether these Nerves be obstructed or compressed, either by Blood, Pus, or Phlegm, all these different Matters may produce a Gutta Serena. If the Blood becomes too saline, it gradually causes this Disease by its Saltiness, which decays and dries up the principal Organs of Vision; and, if the Comparison may be admitted, as salted Meat grows dry. By this means the Sight entirely perishes.

We often see a Gutta Serena succeed acute Fevers, when the Humour that caused them is removed to the Visual Nerves; a violent Fever, which has too much rarefy'd the Blood in the Vessels adjacent to these Nerves, sometimes produces the same Effect; when a Venereal Humour is discharged on the Visual Nerves, causing violent Pains, and the want of Sleep, a Gutta Serena often follows.

This Disease commonly begins with violent Pains in the Head; and as they decrease, the Disease increases. Several People, however, have been struck blind at once, without any previous Pain; in others, the Pains accompany'd the Disease, which strengthened gradually, and their Sight diminished daily, till at length it totally perished.

When a Gutta Serena comes without Pain, and one Eye only is attacked, nothing can be perceived by looking at both Eyes, whilst they are open; but if the well Eye be shut, you may observe the Pupil of the distempered Eye dilate itself, tho' exposed to the Light, and it will remain in that State, till the well Eye be opened again; then the Pupil of the diseased Eye contracts itself, in like manner as that of the good Eye, from which the distempered Eye borrows its Motion. By this Sign only, we are assured there is no Sight in the distempered Eye. This Sign is peculiar to this Disease, and cannot be found in a Glaucoma, in which the Pupil continues always dilated. There is likewise another Species of *Gutta Serena*, in which the Pupil is always contracted, whether the good Eye be open or shut.

The Signs of a Gutta Serena are visible; for from the Inspection of the Eyes, we may see whether the Pupil be dilated or contracted.

As some Muscles of the Body are called Antagonists, because they perform opposite Motions, such as Flexion, Extension, &c. in the same manner, amongst the Motary Fibres of the Iris, some serve to dilate it, whilst others contract it; therefore, when in a Gutta Serena the Pupil remains dilated, the Fibres, which should contract it, are paralytic, in the particular manner I have described: But if the Pupil be contracted, these Fibres, which should dilate it, are affected; the Sight is equally lost in both these Cases.

A Gutta Serena has been hitherto deemed incurable. I can, notwithstanding, produce many Experiments to the contrary. I have, for the most part, observed that Species to be incurable which succeeds an acute Fever, when its productive Humour has been discharged on the Visual Nerves. If this Humour damages but one Eye, there is room to fear, lest the Fever return in the Year, and the other Eye be affected in the same

manner. I have hitherto observed this Misfortune happen to all those, whose Gutta Serena began by a light Inflammation, attended with violent Pains in their Head on the Side of the disorder'd Eye. This Observation has induced me to think, though I never dare attempt it, that by extirpating the decayed Eye, one might prevent the good Eye from falling into the same Misfortune. It would be a great Comfort to the Patient to have his other Eye preserved from the Discharge of this destructive Humour, which for the most part happens a Year or two after the Loss of the first Eye.

I have cured several of a Gutta Serena, when they were committed to my Care, in the Beginning. My Method is to bleed them in the Arm, in the Foot, and in the Neck, in Proportion to their Repletion; afterwards I prescribe them an Emetic, to be taken once or twice in the Interval of two Days.

All Remedies for a Palsy are likewise good in this Disease. A Seaton or Blistering-plaster may be laid to the back Part of the Neck. I find the Caustic too slow in its Operation, and the productive Humour of the Gutta Serena has Time to thicken, and thus the Disease becomes incurable.

Twelve Years since, a Country Curate, after the Diocese of *Paris*, came to consult me, a few Days after he had been attacked with a Gutta Serena in one Eye. I gave him a Vomiting the first Day, the next Day he was let Blood in the Neck; two Days after he took a second Vomiting, upon which his Sight began to return, and was gradually restored by holding his Eye over the Steam of hot Spirit of Wine.

Besides the Gutta Serena, of which we have now treated, there is another sort. It generally attacks Maids that are not regular, or Women with Child; and Men are likewise subject to it, through a Suppression of the Hemorrhoidal Flux. Some Authors ascribe the Cause of this Disease to an excessive Distention of the vitreous Humour; and in order to prove their Assertion, they pretend the Globe of the diseas'd Eye is bigger than it should naturally be. I have tried all Means possible to discover, whether the Cause of this Disease was owing to the pretended Increase of Size in the said Humour; but I could never perceive the least Difference from its natural State.

I judge this Disease proceeds from some Humour that is thrown upon the Visual Nerves, by which they are compressed. The Symptoms seem to strengthen my Opinion; for the Patients feel a Heaviness, attended with Pain more or less acute, in the back Part of the Globe of the Eye. This shews the Optic Nerves suffer by some Humour which is settled upon them, before they enter into the Eye: Besides, this Species of Gutta Serena is more frequently cured than the preceding; for, without Doubt, it proceeds from a simple Compression of the Nerves, and not from the excessive Size of the vitreous Humour.

Remedies for this Species of Gutta Serena are, Bleeding in the Foot, and these Medicines that provoke the Menstrues in Women, and the Hemorrhoidal Flux in Men. To make a Derivation of the Humour from the Eyes, Wood-lice, Eye-bright, either in Substance or Infusion, and Viper-broths, will be of Service.

We find Infants are not exempted from this Disease, since some are born blind. At first, their Blindness does not appear; but as they grow up, it is perceived. I have cured several with an Ophthalmic Water. Some of these Children, at the Age of two Years, had no apparent Signs of Sight. It is to be observed, the Pupil of these Children, though it has no Movement, is no more dilated than in its natural State; which Observation shews this Disease is only a Numbness, or Weakness, in the principal Parts of the Organ of Vision.

Of the imperfect GUTTA SERENA.

I call a Gutta Serena imperfect, when the Patients continue to see but imperfectly. It has different Degrees, according to the Number of Fibres which are attacked by the Palsy. Sometimes it is only a sort of Numbness in these Fibres; sometimes only half an Object is seen, whilst the other half is not perceived, because only half the Eye can see, the other half being paralytic. You may easily find out the Degree of this Disease, by desiring the Patient to shut his good Eye, and look into a Book with his other Eye; for then he sees only a certain Part of the Page, whereas he can see the whole Page with his well Eye.

Sometimes the Fibres are quite emerg'd in the Humour which causes the Palsy; then the Patients can only perceive the Light, but not distinguish Objects. This Disease is often procured by what we call Vapours. I have frequently seen Women deprived of their Sight for the Space of half an Hour, an Hour, and sometimes for two or three Days. This last Case is incident to Women, in their Delivery.

This Disease has the same Causes with the perfect Gutta Serena, that Species which proceeds from Vapours excepted; but the Humour is in less Quantity, for which Reason the Eye is not so much injured.

I have

I have seen Persons afflicted with this Disease, from the Use of a Pomatum that had repelled a Tetter which was spread round their Eyes: They recovered their Sight by the Help of Aperitive Broths, and Sudorifics, which expelled the Tetter: Others have been attacked with this Disease, from a Cold they have taken in their Head, after a violent Heat.

The Signs of an imperfect Gutta Serena are easily known. By examining the Eye, whether the Pupil be dilated or contracted, the Degree of Sight may be soon learned; for in either of these Cases, if the Iris has one Quarter of its Movement, we judge that Quarter of the Sight remains; if it has half its Movement, half of the Sight remains.

In the Cure of this Disease, after the general Remedies, and these prescribed in the perfect Gutta Serena, Viper-broths, or the hot mineral Waters, should be drank, if the Disease seems to proceed from a viscous thick Humour; but if it is produced by a sharp thin Humour, the cold mineral Waters are to be preferred.

Let the Eye be held over the Steam of hot Spirit of Wine, or of Coffee; the Steam must pass thro' a Funnel. This must be repeated twice or thrice a Day.

I have cured several Persons afflicted with this Disease, by the Use of these Remedies. I shall only relate one Experiment, on account of its Singularity: Eleven or twelve Years ago, a Canon Regular of Rheims came to Paris to consult me. I perceived one of his Eyes was seized with an imperfect Palsy; there was a Dilatation of the Pupil, which had but a Quarter of its contracting Movement. I was very much surprised when he told me, if he looked into a Book, his well Eye being shut, that he could see the perfect Representation of his diseased Eye. At first, I judged him to be hypochondriac; but in order to be satisfied of the Truth, I desired him to close his well Eye, and to look into a Book; then I asked him, What he could see in the Page? He answered me, That he perceived the Lines like black Strokes, without distinguishing the Letters; and that, in the Middle, he saw the Representation of his Eye. I asked him, when he assured me he saw his Eye, of what Colour was the Iris, and the Disposition of certain Rays which cross it? He answered me so justly, and described them so accurately, that I could not see them better myself in his Eye. This young Canon was cured in thirty Days, by the Use of Purges, cooling Broths, and spirituous Applications to his Eye. He saw to read perfectly well, and was rid of the false Image of his Eye, which was so uneasy to him before.

Mr. Petit, of the Academy of Sciences, assured me, that he had seen the like Disease. St. Yves.

But Amaurosis, ἀμαυρωσις, in Hippocrates, does not seem to signify what we call a Gutta Serena, but only a Dimness of Sight, or temporary Loss of it. Thus, in his first Book of Prognostics, he mentions Dimness of Sight (ἐμμετὴν ἀμαυρωσις) amongst the Signs of approaching Convulsions. And in this Sense it is generally to be taken in the above-mentioned Author.

To what has been said on the Subject of the Amaurosis, it will be proper to add the Sentiments of Hoffman.

I.

That sort of Blindness which the Greeks call ἀμαυρωσις, and the Latins a GUTTA SERENA, is a terrible Disorder. It is caused by an Interception of the Influx of the nervous Fluid into the Optic Nerve, which occasions a Loss of Sight; the Eyes, in the mean time, remaining, to all Appearance, unaffected; for if, in this Case, you look at the outer Part of the Eye, it appears sound and entire; nor is there any Defect to be observed, either in its Coats or Humours, unless that the Pupil appears larger, black, and more dilated than usual; it likewise appears to be stiff and immoveable, when the Rays of Light strike upon it: But notwithstanding all this, the Faculty of Seeing is either quite destroyed, or there only remains a Power of distinguishing Light from Darkness.

II.

This Disease is therefore different from a Vertigo, in which the Patient imagines himself in a gyratory Motion, and consequently staggers; but the Influx of the nervous Fluid is not quite intercepted, but only impaired and diminished, and that not always. The Gutta Serena is also different from a Cataract; for, in this latter, the Crystalline Humour appears to be opaque, and the Pupil, when exposed to a free Light, is contracted, but in dark Places dilated; whereas in a Gutta Serena, the Crystalline Humour appears pellucid thro' the Pupil; and the Pupil itself, whether in a light or in a dark Place, is neither contracted nor dilated, but remains immoveable.

III.

Nor are the Circumstances of this Disease always the same; for it sometimes seizes the Patient suddenly and unexpectedly, which is generally the Case when it proceeds from violent and external Causes; such as a Fall from any high Place, or severe

Blows on the Head; Instances of which may be found in *Hildanus, Cent. 5. Obs. 8.* and in *Amatus Lusitanus, Cent. 5. Obs. 64.* At other times the Sight is gradually lost, which is generally the Fate of old People, who are affected with an Hemiplegia, or Palsy, and of such as have the Misfortune to have weak and languid Constitutions. On other Occasions this Disease is accompanied with Head-aches, Vertigoes, Drowsiness, Noise, and Singing of the Ears: And at other times it appears without any of these Symptoms, and only afflicts the Patient with Blindness. There is likewise a periodical Gutta Serena, which seizes the Patient suddenly, and lasting for some Hours; goes off, of its own Accord; but its Returns are frequent: This is often the Case with hypochondriac and hysteric Persons, and with Women in Labour. The Gutta Serena is divided into Perfect and Imperfect; in the former, not only the Sight, but every the least Remains of Perception of Light, is destroyed; in the latter, Light can be distinguished from Darkness; to this Class seems to belong the *Visus dimidiatus*, when the Patient sees only half the Object; a particular Species of which is described by *Chr. Sigism. Wolffius*, (in a Dissertation, *de Amaurosi imperfecta*, 1709. Trajecti) where the Patient could only see the Feet, and under Part of the Trunk of a Man's Body.

IV.

As, in a Gutta Serena, the external Parts of the Eye seem to be free from all manner of Fault, we may reasonably conclude, that the Cause of the Disorder is to be sought for in the Optic Nerve, rather than in the Eye itself; and this may be even demonstrated, by dissecting such People as, during their Lives, had been blind in this manner; for, upon accurate Observation, we find, that their Optic Nerves were either too much extenuated, flaccid, and, by half, too little (of which see Instances in *Bonetus's Sepulchretum Anatomicum, Lib. 1. Sect. 18. Obs. 3. and 4.*); or surrounded and compressed by Blood, extravasated from the Brain, as hath been observed by *Wepferus de Plex. Hist. 4.* or incompassed by a hard Tumour, such as *Bonetus, Lib. 1. Sect. 18. Obs. 1.* takes Notice of, about their Origin. *Pewius, Observat. Anatom. 2.* observed a Bladder full of a watery Humour upon the above-mentioned Nerves, near their Conjunction. *Platerus* found a globular Tumour near the Optic Nerves of a dead Person, who, when alive, had laboured under a Gutta Serena; and *Bonetus, Lib. 1. Sect. 18. Obs. 5.* found the carotid Artery turgid with Blood, at the Place where it enters the Orbit of the Eye.

V.

Almost all the Authors, who have wrote upon this Subject, have judged the Gutta Serena to proceed from the Optic Nerves being obstructed by a thick Lymph, whereby the small Tubes, of which the Nerve is formed, being rendered impervious, the free Afflux of the nervous Fluid to the Retina, was, of course, either checked, or entirely intercepted; but 'tis not, as yet, proved by Anatomists, that Nerves consist of small Tubes, or Pipes, thro' which their contained Fluids circulate; neither is a thick and tenacious Lymph, but a Fluid, the most subtle of all others, and least likely to coagulate, circulated through the Brain and Medulla oblongata. That an Obstruction of the Nerves should arise from this Cause, is by no means credible; and much less can we suppose, that an Obstruction of the Optic Nerves should happen from any Matter conveyed to them from the Brain. In all Cases of this Nature, there must be so strong a Compression of the Optic Nerves as to prevent all Influx of the nervous Fluid into them, and by that means induce a Paralysis: Hence it follows, that the immediate Cause of a Gutta Serena, is a Paralysis of the Optic Nerves. 'Tis now evident, from the Structure of the Eye, that the Optic Nerve, as soon as it has entered the bony Orbit of the Eye, together with the Periostracum, which lines its inner Side, and has disposed of the external Covering, which it receives from the Dura Mater, for the Formation of the Tunica Cornea; I say, 'tis evident, from the Structure of the Eye, that after this, by another Membrane, or Covering, which it receives from the Pia Mater, it forms the Tunica Uvea, the Processus Ciliaries, and Pupil of the Eye, and that its medullary Substance constitutes that soft and pulpy Coat called the Retina. Besides, 'tis well known, that the Retina receives the Images of visible Objects, and conveys them thro' the Optic Nerve to the common Sensory, where, by their means, the Ideas of Sight, or Vision, are excited; but 'tis equally plain, that, in order to perceive external Objects, a certain Tension of the nervous Parts is necessary; which Tension consists in a due Influx of the nervous Fluid: But since, in a Gutta Serena, there is a Paralysis of the Optic Nerve, and consequently of the Retina, the Uvea, and Processus Ciliaries; hence it must follow, that these Parts are neither tense, nor transmit the Rays of Light, but the Pupil appears enlarged and dilated, by reason of the Relaxation of the Processus Ciliaries. Nor is there, in this Case, any other Fault to be observed in the Eye, since the Motion of the Humours, and of the Muscles, which serve to move the Eyes, is regular and natural; which may be owing to this additional Reason, that the Mus-

cles and Vessels, conveying the Juices, take their Origins not from the Optic Nerve, but from other Nerves, that are not affected.

VI.

The Cause therefore which, by compressing the Optic Nerves, renders them paralytic, resides either about their Origin, that is, their *Thalami*, along which they run, or about those Parts of themselves which enter the Orbits of the Eyes: The Cause may also lie concealed in the Optic Nerve itself, and that too in the Blood-vessels, wrapt up in the very Middle of it; the Reality of which Vessels, not only our later Anatomists, but even *Wepfer* himself, (*L. de Cicut. aquat. p. 127.*) have demonstrated. If these Vessels, which are so many Branches, as it were, from the Carotids, or any of the rest of the Branches of the Carotids which surround the Orbit, should happen to be stuffed with stagnant Blood; they press upon and distend the medullary Tubes of the Nerves; and, at the same time, hinder the Return of the Lymph thro' the Vessels which surround the Nerves. This seems to be the Cause of a periodical *Gutta Serena*, which ceases upon the Removal of the Stagnation of the Blood: It is, besides, very probable, that, in a spurious Amaurosis, a Serum lodging itself within the Coats of the Eye, especially within the *Tunica Cornea*, is to be looked on as the Cause; in which Case, the Afflux of the nervous Fluid being too slow, a small Quantity of it only enters, which leaves no more of the Faculty of Seeing, than is sufficient to distinguish Light from Darkness.

VII.

Tho' the Disease now under Consideration may afflict Persons of all Ages, and of every Sex, when violent external Causes concur to its Production; such as Blows on the Head, Concussions of the Brain, or any other Accident, that may occasion a Stagnation of the Humours about the Optic Nerves; yet when it arises from internal Causes, it generally falls to the Lot of the Plethoric, the Phlegmatic, the Cachectic, and the Old, or of those who have a weak Head, and a frail System of Nerves, either thro' preceding Excesses of Passion, long Grief, anxious Care, too much Watching and Application, unseasonable Studying, reading small Print in a full Light, frequent Debauches; and, in fine, by being long exposed to the Cold, or labouring under the Misfortune of an hereditary Weakness. This Disease agrees with the other Disorders of the Brain, in this Circumstance, that it is founded on the Want of a due Tone and Spring in the Parts of the Brain itself.

VIII.

If we consider the secondary and more remote Causes of a *Gutta Serena*, they may be properly enough reduced to Repletion and Inanition. To the Class of Repletion belongs that *Gutta Serena*, which takes its Rise only from a Stagnation of Blood, more or less thick in those Nerves of the Brain which are contiguous to the Optic Nerve. This Species of the Disease is not only sometimes transitory and periodical, but even admits of a Cure, when it happens not to be of a long standing. This Degree of the Disease is incident, *First*, to those who are of a very plethoric Habit of Body, upon their using too violent Exercises, Baths that are too warm, or giving way to immoderate Transports of Anger: A Case of this Kind is to be found in *Consult. Med. Sect. Case 42.* *Secondly*, to Women that bear Children, either in the Birth itself, and then it is occasioned by the violent Constrictions of the lower Belly, throwing the Humours up to the Head with uncommon Force; or after the Birth, if it has been difficult, and especially if there has been any Defect in the *Lochial Evacuations*: *Mauriceau*, in *CENT. 5. Obs. 568.* mentions a Case of this Kind, which, he says, was soon cured by Bleeding: It is likewise to be observed, that the *Hemicrania*, or Megrin, which succeeds Childbirth, most frequently terminates in Blindness. *Thirdly*, to Women who labour under a Suppression of their Menstrual Discharges, or any hysterical Disorder; a Case of which kind I have given in *Consult. Med. Sect. Cas. 44.* *Pechlinus* also, *Lib. 1. Obs. 24.* makes mention of a *Gutta Serena*, which, in Conjunction with a Head-ach, every Month afflicted a Patient who had her Menstrual Discharges defective. *Fourthly*, to those who labour under hypochondriacal or hysterical Disorders; and to those who are racked with violent Spasms of the lower Belly, by which the Humours are forced up to the Head: Hence is that remarkable Case which is related of a *Gutta Serena*, which succeeded a vehement Colic, accompanied with a Constipation of the Belly, which being cured by a Clyster, the *Gutta Serena* was forthwith removed.

IX.

But as a *Gutta Serena*, which arises only from a Stagnation of Blood, is transitory; so, on the other hand, if it continues long; or seizes phlegmatic Patients, or such as are of a bad Habit of Body, by letting fall its serous Part, as a Load, on the Nerves, it renders the Disease long, and very often incurable:

It is therefore no unprecedented Thing, that a *Gutta Serena* should arise from a *Purple Fever*, the *Itch*, *Ulcers*, or *Achors*, struck back into the Mass of Blood (*vide Act. Berol. Dec. 2. Vol. 6. P. 28.*); nor is it surprising, that Children who are weakly, or abound with Humours, should be subject to it; especially in Cases where the Measles have not come out well; or where the Intestines abound with Worms. A *Gutta Serena* also happens after acute Diseases, malignant Fevers; the Small-pox, or a Phrenitis, the Humours falling, by Translation, upon the Optic Nerves. Sometimes Persons of a plethoric, or of a bad Habit of Body, become blind by strong Purges or Vomits (as *Guldenklec*, *L. 1. Epist. 20. P. 498.* has observed): But Mercurials, unskilfully administered to Bodies abounding with impure Juices, do, of all other Medicines, contribute the most effectually to the bringing on this Disorder, by occasioning an obstinate Stagnation of the Lymph.

X.

These Causes belong to the Class of Repletion; but under the Title *Inanition*, are comprehended all excessive and immoderate Profusions or Dissipations of the vital Juices, which, as Experience teaches us, are frequently succeeded by a *Gutta Serena*, which more especially comes on after great Hemorrhages; and a Blindness has been particularly observed to follow a plentiful Vomiting of Blood, too great a Quantity taken away by Bleeding from a Woman with Child, and after taking a large Quantity from the Vein of the Forehead (*Bonetus, Lib. 1. Sect. 18. Obs. 2. App.*); for while the vital Humour is drawing away, the Vessels, which are distributed thro' the Brain, collapse, the Secretion of the nervous Fluid is diminished, and thence arise Vertigos, *Gutta Serenas*, Faintings, and other Calamities: But what deserves our principal Attention, is, the remarkable Consent which, in this Case, is found betwixt the Eyes and the genital Parts; since we observe, that Blindness is frequently the Result of immoderate and ill-timed Embraces, of which Circumstance I have made frequent Mention, and related a Case of this Nature, *Cons. Med. Cent. 2. Sect. 3. Cas. 104.* For the lymphatic seminal Fluid is much of the same Nature and Quality with that which is secreted in the Brain, and distributed through the Nerves; for which Reason the more liberal and copious the Excretion of the former is, the more scanty and deficient the Secretion of the latter must be: Hence the Want of a due Tone in the nervous Parts, Weakness of Sight, and even Blindness itself, usually follow.

XI.

The *Gutta Serena* is a very terrible and a very obstinate Disorder; and 'tis particularly to be observed, that if it is a perfect and inveterate one, or seizes old and worn-out Subjects, it is so far from admitting of a Cure, that the most terrible Train of apoplectic and paralytic Disorders generally supervene. This Distemper, on the other hand, when of a short standing, when imperfect, or when its Cause is only seated in the Coats of the Eye, sometimes admits of a Cure, especially in young and robust Patients. That Kind of *Gutta Serena* also, which is periodical, and the Effect of a Stagnation of the Blood, yields to Medicines, and may be cured; but that Species of the Disease which is accompanied with paralytic Disorders, or other Distempers of the Head, generally portends a Danger that can scarce be surmounted or avoided.

The CURE.

I.

The Cure of the *Gutta Serena* is very hard and difficult; for this Reason, that the Force and Energy of Medicines can have but little Influence upon those Parts which lie, as it were, remote, and hid within the Bones of the Skull: But this Circumstance should not discourage the Physician from trying the Extent of his Art, and attempting the Cure by a Method accommodated and adapted to the Causes of the Disorder: This he may do by pursuing these two Intentions, that of dissolving the stagnant Humours, which compress the Nerves; and that of strengthening and invigorating the Parts affected.

II.

For obtaining the former, which is indeed the more difficult of these Intentions, generous, and what we call *Herculean Medicines*, are to be called in to our Assistance. Thus, if a serous Humour, poured in upon the Brain, should happen to stagnate there, which is commonly the Case with Patients that are phlegmatic, cachectic, of bad Habits, or who have had Pustles struck back into their Blood, and especially if the Disorder be of a short Date, great Good may be expected from the actual Cautey applied to the back Parts of the Head, or the Nape of the Neck; in lieu of which a Seton may also be substituted. These Remedies operate in a two-fold Manner; that is, partly by exciting Pain, for thus they communicate a tremulous and vibratory Motion to the minutest Fibres of the Brain; and partly by promoting the Afflux of the Humours to

the Parts where the Wound is made, to which they generally drain, they draw off the stagnated Juices from the Brain, and Parts affected: And, indeed, if, in this Case, any Relief is to be expected, it is rather to be looked for from these Remedies, than from Vesicatories and Fontanels.

III.

But if this Malady takes its Rise from a Stagnation of the Blood, which is the Case with Persons of plethoric Habits, of florid and ruddy Complexions, of full and strong Pulses, and of those who have any habitual Excretions of Blood retained; I say, in these Cases, we are to beware of the afore-mentioned Remedies, and must rather begin the Cure by Bleeding. In this Intention, it is very proper to take Blood from the Feet; but 'tis still more useful and advantageous to open the Veins of the Forehead, and the temporal Arteries; and, indeed, Nature herself seems to have pointed out this Method of Cure; for Examples have sufficiently proved to us, that blind Persons, who have received Wounds in the Forehead, which were followed by plentiful Hemorrhages, have, by that very Means, recovered the Use of their Sight. Leeches may also be used at proper Seasons, and even applied to the *Anus*, in case an hemorrhoidal Flux is stoppt. If an Hemorrhage from the Nose should be suppressed, a Probe may be thrust up them, in order to bring it on again, that so a speedy and efficacious Vent may be given to the Blood.

IV.

In a *Gutta Serena*, as well as all other Disorders of the Eyes, it is of singular Use to keep the Belly loose, that so the stagnating Humour in the Head may be drawn downwards: For this Purpose, the Medicines to be used should not be strong and violent Purgatives, but mild and gentle Laxatives, in Conjunction with Corroboratives, of which Kind are the *Balsamicocephalic Pills*. My balsamic Pills may likewise prove useful, if made up with *Mercurius Dulcis*, and the *Extractum Panchymagogum* of *Crollius*. Nor are pretty sharp Clysters to be despised in this Case; nay, their Efficacy is very considerable, if Costiveness of the lower Belly should happen to accompany the Disease.

V.

When the Disorder is very inveterate, and founded on an obstinate Stagnation of the Lymph in those Vessels which surround the Optic Nerves, then, after the Use of the Medicines already proposed, our only Hopes are placed in strong Discutients, especially when used internally; of which Kind there are two, which have the Advantage of all others; that *Sulphur of Antimony* corrected in the Manner ordered by me, and *Cinnabar*; of these two the following Powder may be made:

Take of native Cinnabar prepared, of Crabs-eyes, of prepared Amber, each two Drams; of the volatile Salt of Amber, and of Hartshorn, each ten Grains: Mix them up into a Powder, which divide into twelve Parts; to each of which, three or four Grains of the Sulphur of Antimony may be added. This Powder is to be taken every Evening, and next Morning an Infusion of Balm, Fennel-seed, and Valerian-root, is to be drank; and if the Disorder will not yield to these Medicines, we are to have recourse to a gentle Salivation, by which I have known some cured of an Amaurosis.

VI.
